Provencal (*prō'von'sal'*) **Language, The,** is one of the so-called Romanic languages, all of which are directly descended from the language of ancient Rome. Wherever Roman law, Roman custom, and Roman trade established themselves, the language of Rome followed. In this way the inhabitants of northern Italy, Spain, France (Gaul), and parts of Switzerland, received a new tongue. The language which came into common use in these places, however, was the "low" Latin of the provinces, a colloquial form of the Latin tongue, lacking much of its grammatical precision. This "low Latin" mingling with the languages or dialects of the various places mentioned, produced, in time, a number of new languages having the same background, but little else in common. Writers distinguish six such Romanic languages: the Italian, the Moldavian, the Spanish, the Portuguese, the French and the Provençal, the latter a dialect language of the south of France, whose use extended from Lake Geneva to the bay of Biscay on the west, and south to the Mediterranean. This section of France had not only a language of its own, but a literature also, which in the 12th and 13th centuries was especially rich in poetry. It was in this language the songs of the troubadours were mostly composed, so that Provençal and troubadour are often used as synonymous terms. The conquest of southern France by northern France, in the 13th century, reduced the old Provençal tongue to the level of a mere dialect; nevertheless, its effect upon the language which has superseded it is marked, and the relation of the two affords a battleground for modern philologists.

Prov'erbs are very hard to define; but nearly everybody knows one when he sees or hears it. Perhaps the best description is that of Cipriano de Valera: "Proverbs are short sayings, sententious and true, and long since accepted as such by common consent." The distinctive characteristic of the proverb is that it is a popular current saying, adopted as a convenience by the community. It must indeed have shortness, sense, salt, pith, and other qualities, but it is also necessary that these should be so combined that it will strike the popular fancy, and thereby come into general use. It has been well said that no one man ever made a proverb. He may have made an original saying, but the proverb is a creature of popular suffrage. Not only is this the case, but they pass from one nation to another, and thus become the property of the race; and for this reason it is impossible to determine even the nationality of some of our best and most popular proverbs. The office of the proverb is to "hit the nail on the head," to "put the matter in a nutshell," to speak the last word, to settle the issue without further argument or discussion. Of all national groups of proverbs the Spanish contains the greatest number, some 25,000 or 30,000; and they are as racy as they are numerous. Among oriental proverbs, the Arabic hold the first place in quantity and perhaps also in quality; but the Persian and Hindustani are also excellent, and in the Turkish there is sometimes a vein of poetry that is very striking. It is a question whether the "tender beauty" of our proverb, "God tempers the wind to the shorn lamb," is not rivaled by its Turkish parallel, "God makes a nest for the blind bird."

Prov'idence, a seaport and capital of Rhode Island. It is the second city of New England in point of wealth and population, and an important center for manufacturing and shipping, and for its railroad and financial interests. It is celebrated for its manufacture of jewelry and silverware. It also produces tools, stoves, engines, locomotives, cottons and woolens, corset laces, shoe laces, lamp-wicks, etc., and has many bleaching works. It is situated at the head of navigation on an arm of Narragansett bay (called Providence river), 35 miles from the Atlantic, and 44 miles from Boston. Among the many notable public buildings and institutions of Providence are a city hall of granite, costing $1,000,000, with the state soldiers' monument

facing it; the state house, the custom house, and post office; the Athenæum, and the buildings of the Rhode Island Historical society; the Arcade and the Butler exchange; a great number of churches, schools, and libraries, hospitals and asylums, including a noble charity, known as the Dexter asylum for the poor; the Quaker college, and Brown university, a Baptist institution founded in 1764 and amply endowed. It has a faculty of 77 professors and lecturers, and 872 students, and ranks among the leading colleges of the United States. The college library embraces 110,000 volumes, besides some 30,000 pamphlets. Providence was settled in 1636 by Roger Williams. Population 175,597.

Prunes are the dried fruit of a certain variety of plum trees, largely prepared in France and exported from that country. Considerable quantities also come from Bosnia, Servia, and California.

Prun'ing, the removal of branches from trees and shrubs for purposes of ornament or to increase the production of fruit. Forest trees are sometimes pruned to increase the size of the trunk for timber purposes. In pruning it is necessary to understand the particular nature of the tree or shrub that is to be pruned, but it may be laid down as a general rule that the branches cut off should be small in proportion to the size of the trunk.

Prussia (*prush'i-ă*), the largest and most important state in the German empire, is bounded on the north by the German ocean, Jutland, and the Baltic; on the east by Russia; on the south by Austria, Saxony, the Thuringian states, Bavaria, Hesse-Darmstadt, and Alsace-Lorraine; on the west by Luxemburg, Belgium, and the Netherlands. The total area is 134,603 square miles, with a population of 34,463,377; that is, nearly two-thirds of the German empire in territory, with about three-fifths of the population. The frontier line has a circumference of 4,720 miles. About one-fifth of the present area of Prussia has been acquired since 1853, the largest gains being made after the victorious war of 1866. The greater part of Prussia belongs to the north European plain, while less than a third, chiefly in the southwest, can be described as hilly or mountainous. The northern plain is watered by five large rivers—the Niemen, Vistula, Oder, Elbe, and Weser—all of which rise beyond the borders of the kingdom, and also by the Pregel, Eider, and Ems, which are wholly Prussian. In the west, the chief river is the Rhine, which enters Prussia at Mainz (Mayence), and thence flows north through a narrow valley; it is navigable throughout its entire course in Prussia. The capital of Prussia, and also of the German empire is Berlin (population 1,884,151). The other chief towns of Prussia are Breslau (population 422,738), Cologne (Köln) (population 372,229), Frankfort-on-the-Main (population 288,489), Hanover (population 235,666), Magdeburg (population 229,663), etc.

Education is compulsory in Prussia between the ages of six and fourteen, its management and direction being under the control of the state. Prussia has ten universities, Königsberg, Berlin, Greifswald, Breslau, Halle, Göttingen, Münster, Bonn, Kiel, and Marburg, which number 1,500 professors and 21,000 students. In addition to the libraries of the universities, there is the Royal library at Berlin, with 800,000 volumes and 15,000 manuscripts. Among the numerous scientific and literary schools and societies of Prussia are the Academy of Arts, the Royal Museum of Arts, the Academy of Sciences, etc.

In 1900, the strength of the Prussian army on a peace footing was 465,000, of whom 54,000 were cavalry and 73,000 artillery. Every able-bodied Prussian between 20 and 39 years of age, is liable to be called on to serve, clergymen of the Roman Catholic and Evangelical churches and indispensable supporters of families being exempt. For the history of Prussia, especially since her successful wars with Austria in 1866, and with France in 1870, at which latter date King William I. became the then emperor of Germany. The present king of Prussia, who is also German Emperor, is William II., who came to the throne on June 15, 1888. See GERMAN EMPIRE.

Pruth River, an affluent of the Danube, rises in Austrian Galicia, on the northeast side of the Carpathian mountains, and flows eastward past Kolomea and Czernowitz. Length about 520 miles.

Pseudonym (*sū'dō-nim*) (Greek *pseudes*, "false," and *onona*, "name"), a false or assumed name adopted by an author, which conceals his identity. In recent times young authors, especially, have frequently risked the publication of their first work under a pseudonym—otherwise called *nom de plume*—and have kept it up afterward, and this to such an extent that the real name of the author is, in some cases, almost unknown to the general public. For instance, the name of *George Eliot* is familiar to book readers on both sides of the Atlantic; but few would recognize a work by Marion Evans, her maiden name. Among the famous pseudonyms of the 19th century we may mention *Currer Bell*, Charlotte Brontë; *Hosea Biglow*, James R. Lowell; *Bystander*, Goldwin Smith; *Boz*, Charles Dickens; *Pisistratus Caxton*, 1st Lord Lytton; *Grace Greenwood*, Mrs. Lippincott; *H. H.*, Helen Hunt Jackson; *Gail Hamilton*, Mary Abigail Dodge; *Marion Harland*, Mrs. M. V. Terhune; *Orpheus C. Ker*, R. H. Newell; *Owen Meredith*, Earl of Lytton; *Petroleum V. Nasby*, D. R. Locke; *Ouida*, Louise de la Ramé; *George Sand*, Madame Dudevant; *Timothy Titcomb*, J. G. Holland; *Mark Twain*,

Samuel L. Clemens; *Josh Billings*, Henry W. Shaw; *Uncle Remus*, Joel Chandler Harris; *Artemus Ward*, Charles F. Brown, etc.

Psyche (*sī'kē*). According to Grecian mythology, Psyche was the youngest daughter of a king, and was so lovely that she aroused the jealousy of Venus, who sent Cupid to the maiden to inspire her with love for the basest of men; but Cupid himself was so impressed with her charms that he at once loved her, and desired to make her his own. As she reciprocated his passion, he visited her every night, earnestly requesting her not to inquire or seek to know who he was. But her jealous sisters, working upon her fears and her curiosity as well, represented to her that she was embracing a monster in the darkness of the night, and to satisfy herself she lighted a lamp while Cupid was asleep, when to her great delight she saw that her lover was the handsomest of gods. In her excitement, however, she let a drop of hot oil fall on his shoulder, when he arose, and after upbraiding her for her doubts, left her alone. After wandering about for some time, she came to the palace of Venus, when she was seized by the goddess, and kept as a slave. Cupid, however, still loved her, and after a time was united to her in immortal wedlock. The story of Psyche is considered by all critics as a beautiful representation of the progress of the human soul through earthly passion and misfortune to eternal peace and happiness.

Psychology (*sī-kol'ō-jy*) (Greek *pyschos*, "soul," and *logos*, "discourse"), the science of mind, or, in more general terms, the science of man's immaterial nature. The dividing line between mind and matter cannot be definitely drawn, because neither of them can be accurately defined; but our reason plainly teaches us that there is a fundamental difference between them, notwithstanding the intimate relation they sustain to each other. To escape the difficulty of properly distinguishing between mind and matter, one school of extremists, whose chief apostle was the famous Bishop Berkeley, maintains that mind is the only reality in the universe, and that all external or visible objects are, at most, but expressions or manifestations of mental states. Another school, much more numerous than the former, regard all mental acts, and states, as mere qualities of matter, or, at most, as mere results of the *force* with which matter has been endowed. Thought, feeling, volition, this school tells us, are the product or output of man's brain and physical organization, as a flame of heat is the output of a fire, or as rays of light are the output of the sun, under all the physical conditions to which it is subject. It ought to be a sufficient answer to both these schools, that we are conscious of living in both a material realm and in one that is not material; we know that there is an external world, and we also know — to use the language of Scripture — that "there is a spirit in man"; we know that we have bodies made of flesh and bone and blood, and we also know that we have a *being* that is not flesh, or bone, or blood; we know that we have "senses, affections, passions," and we know, too, that we have qualities within us that unite us to the unseen and the eternal.

The division of the mental faculties which is now generally accepted is threefold, (1) the intellect, (2) the sensibilities or emotions, (3) the will. Under each of these there are numerous subdivisions. Of late years, the science of psychology or mental philosophy has received a large measure of attention; not only in schools and colleges, but from the general public; and we can only refer the reader to the various essays and textbooks — their name is legion — that have been written and published on the subject. See *Elementary Psychology*, by Sorley, and Höffding's *Outlines of Psychology*.

Pteridophytes (*ter'i-dō-fits*), one of the four great groups of plants, which includes the ferns, the scouring rushes or horsetails, and club mosses. The ferns are the most abundant and representative forms, containing about 4,000 species; the club mosses are represented by a little over 400 species; while the horsetails are represented by only 25 living species. The group as a whole is characterized by having a leafy and vascular sporophyte, in this way decidedly differing from the bryophytes (mosses) and resembling the spermatophytes (seed plants). From the seed plants it differs in that its members do not produce seeds. The group as a whole is most extensively developed in the tropics, where especially the ferns and "little club mosses" (*Selaginella*) are luxuriant both in forms and numbers. The three great divisions of pteridophytes differ exceedingly from one another in external appearance, but they are all held together by important similarities. One of their important characteristics in common is the possession of a large coiled and multiciliate sperm, very distinct from the simple biciliate sperm of the bryophytes. See EQUISETALES, FILICALES, and LYCOPODIALES.

Ptolemy (*tŏl'e-mĭ*), **Clau'dius Ptolemæ'us**, an eminent mathematician and astronomer. He was born probably either in the year 70 or 77 A. D., and died at Alexandria in 147 A. D. As a mathematician he is especially to be remembered as having written the first treatise on trigonometry, a branch of mathematics invented by Hipparchus.

In astronomy he wrote a complete treatment upon the entire subject as it was known in his time. This volume, called the *Almagest*, remained a standard work until the time of Copernicus. Ptolemy here assumes that the earth is spherical, that it is placed in the center of the spherical heavens, and that it is

a mere point compared with the distances of the fixed stars.

As a geographer Ptolemy was the first to point out the fact that the position of any point on the earth's surface can be accurately stated only after its longitude and latitude have been determined. In addition to his works he wrote a volume on optics, in which he stated the correct laws of reflection for plane surfaces and for concave mirrors, as well as the law of refraction. Ptolemy must be considered as one of the earliest types of the modern scientific investigator.

Pub'lic Schools. See SCHOOLS.

Puck or **Rob'in Good'fellow,** a familiar figure in the fairy world of English folklore, immortalized by Shakespeare in *Midsummer Night's Dream.* The name is really a generic term for a fairy. Although the Pucks are noted for mischievous tricks, they sometimes perform kindly domestic functions; are small and dwarf-like in appearance. and are easily propitiated by offerings of cream and kindly epithets. The name *Puck* was adopted by an illustrated weekly published in New York.

Puebla (*pwĕb'lä*), the second city of Mexico, stands on a fruitful plain, 7,000 feet above the level of the sea and about 100 miles by rail from the City of Mexico. It was founded in 1531, and is one of the handsomest cities in Mexico. During the French occupation of Mexico, in 1862–63, it was besieged by Maximilian's troops for two months, and then taken by storm May 17, 1863. Population 88,684. Puebla is also one of the inland states of Mexico, area 12,204 square miles, with a population of 973, 876.

Pueblo (*pwĕb'lō*), a city of Colorado on the Arkansas river, a little over 100 miles from Denver. Through its iron and steel industry it has become the second city in the state and an important railway center. In 1890, a mineral palace was here erected to hold a permanent exhibit of Colorado's mineral productions — gold, silver, coal, etc., — at a cost of nearly $1,000,000. Population 28,157.

Pueblos (*pwĕb'lōs*) (Spanish *pueblo*, "village"), a semi-civilized family of Indians living in New Mexico and Arizona, dwelling in single habitations, which are sometimes large enough to contain a whole tribe. These buildings, which are sometimes five or six stories high, and from 100 to 500 yards in length, are generally made of sun-dried brick; the ground floor is always without doors or windows, entrance being effected by a ladder leading to the second story. Each family of the tribe has a separate apartment, and there are also large rooms for general council chambers and for tribal dances. Under Roman Catholic missionaries, the Pueblos are making steady progress in education and civilization, although they have grafted upon their Christianity many of their old pagan beliefs and customs, to which they still cling. The Cliff-dwellers were doubtless the ancestors of the Pueblos, ruins of whose dwellings are seen in the cañons of the Rio Mancos, the Rio Plata, and the San Juan rivers in southwest Colorado, New Mexico, and Arizona. In these cliffs the strata of sand stone or lime stone were separated by layers of soft clay which had worn away, leaving ledges of rock with caverns between. Upon these terraces are remains of clusters of dwellings, one ledge forming the floor and another the roof, the opening being faced so skillfully as to resemble the rock of the cliff. Some of these dwellings are now inaccessible. The marks of dangerous doubling paths, hardly a foot wide, formerly used, can be seen on the cañon walls. The San Juan cañon is shut in by walls of rock several thousand feet high, and one settlement is 1,000 feet above the Rio Mancos. Cliff villages or towns are found in the bottom lands, with round stone towers near them, evidently used as watch towers.

Puer'to Rico. See PORTO RICO.

Puff'balls, fleshy fungi related to the mushrooms, but in which the spores fully develop without being exposed. See BASIDIOMYCETES.

Puget (*pū'jet*) **Sound,** a large inland sea northwest of the state of Washington, communicating with the Pacific ocean by the Admiralty inlet and the strait of Juan de Fuca. It penetrates far into the interior, and is everywhere navigable for the largest vessels, which, in most cases, can ride close to the shores and load and unload without wharves. Great quantities of pine and fir are shipped from the region, which is rich in timber. Seattle and Tacoma are the chief towns on the sound.

Pulas'ki, Cas'imir, a Polish count and general, who fell in the American Revolutionary war, was born in Podolia, March 4, 1748. On account of the active part he took in the Polish war against Russia, he was stripped of his estates and outlawed in the partition of Poland in 1772. In 1777, he offered his services to the American colonies in their contest against England, and for his gallant conduct at the battle of Brandywine was given a brigade of cavalry, which he commanded until March, 1778. In May, 1779, he entered Charleston at the head of "Pulaski's legion," a corps of lancers and light infantry which he had organized, and held it until the place was relieved; he afterward followed and harassed the British until they left South Carolina. At the siege of Savannah, on the 9th of October, he fell in an assault at the head of the cavalry, and died on board the brig *Wasp* two days later.

Pull'ey, one of the mechanical powers much used in lifting stone and heavy timber. It consists of a wheel with a grove around its

circumference, which revolves on an axis. The wheel, which is commonly called the *sheave*, is placed in a mortised block of wood, which is pierced by the axle of the sheave. The cord which passes over the sheave is

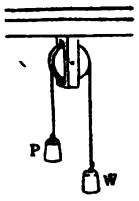

FIG. 1.

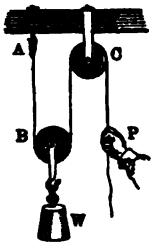

FIG. 2.

called the *tackle*. The *fixed pulley* (Fig. 1) gives no mechanical advantage; it merely changes the direction in which the force is applied; thus W can be raised by merely pulling P down. The *single movable pulley* gives a mechanical advantage, equal to two

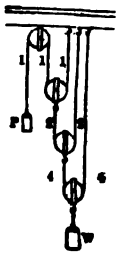

FIG. 3.

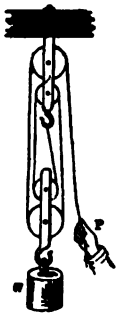

FIG. 4.

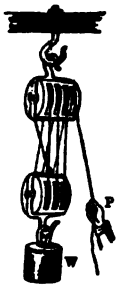

FIG. 5.

(Fig. 2); for as the weight W is supported by two strings, the strain on each string is just half of W; since the strain on one being supported by the hook A, the power P has to support only the stress of the other string which passes around C. A still greater mechanical advantage is secured by a combination of pulleys, as shown in the second illustration. Theoretically, the larger the number of movable pulleys in any one combination, the greater is the mechanical advantage; but the enormous friction produced and the lack of perfect flexibility in ropes prevent any great increase in the number of pulleys. See BLOCK AND TACKLE.

Pull'man, George M., an American inventor and business man, was born at Brocton, Chautauqua county, N. Y., March 3, 1831. At the age of twenty-two he engaged in moving buildings out of the way of the Erie canal, then in process of widening. He made his home in Chicago in 1859, and in the same year he prepared models of sleeping cars, which became the foundation of his fortune. He made a success of raising buildings to the new level of the city by means of a great many jack-shrews, operated simultaneously. But in 1863 he began building the coaches that are called by his name the world over. A few years later, he organized the Pullman Palace Car company which was to build them. In 1880, he founded the town of Pullman, near Chicago, where the coaches were built. In 1887, he added the vestibule to his cars, which greatly increased their comfort. These car shops turn out $15,000,000 worth of railway carriages annually. He died in 1897, (Oct. 19), having amassed a large fortune from his inventions and his various business enterprises.

Pulque (*pul'ka*), a favorite beverage of the Mexicans and of the inhabitants of Central America and some parts of South America, made from the fermented juice of the agave plants.

Pulsatilla (*pŭl'sȧ-tĭl'la*) or **Pasque Flower**, is a native of many parts of Europe and of chalky pastures in several parts of England. It has bell-shaped, bluish-purple flowers. It is narcotic, acrid, and poisonous. Pulsatilla is one of the favorite medicines of the homœopathists; and Easter eggs are sometimes colored purple with the petals of the flower.

Pulse (Latin *pulsus*, "a pushing or beating"). The phenomenon known as pulsation is due to the distension of the arteries when blood is sent through them by the contraction of the heart. The pulse is usually examined at the radial artery at the wrist, the advantage of that position being that the artery is easily compressed against the bone. The frequency of the pulse varies with age, from 130 to 140 beats per minute in infancy, to 70 to 75 in adult age. It also varies somewhat with sex, adult females having six or eight more beats per minute than males. It is increased by exertion or excitement, and is diminished by lying down or sleeping. In some diseases, the pulse may reach 150 to 200 beats per minute; and, on the other hand, in certain organic affections of the heart it may be as slow as 25 or 30. The force of the beats is a measure of the vigor and efficiency of the heart's action, a strong pulse being regarded as a sign of health and vigor, and a weak pulse as a sign of debility. The full significance of any changes of pulse in disease can be clearly understood only by considering them in connection with other signs and symptoms in the case.

Puma (*pū'mȧ*), a member of the cat family, inhabiting the Americas from Canada to Patagonia. It goes under a variety of names in different parts of the country, as catamount, panther, American lion, etc. It is about 40 inches long, without the tail, tawny in color above, and soiled white below. They are good climbers, but are not confined to wooded districts. They prey upon deer, antelope, and other animals, near habitations; they kill

calves, pigs, and sheep. See True's *The Puma or American Lion*, Report United States National Museum (1889).

Pumice (*pŭm'ĭs*), a light mineral, full of pores like a sponge, found near volcanoes. This highly porous and froth-like structure is due to the escape of vapors through the lava while it was in a state of fusion. It is much used for polishing wood, ivory, metals, glass, marble, etc. Great quantities are exported from the Lipari islands to all parts of Europe.

Pump, a machine for lifting water or other liquids to higher levels. The simplest form of a pump is the common suction pump, which is shown in Figure 1. A is the barrel; B is a pipe reaching down into the water which is to be raised; C is the spout; D is a fixed valve opening upward only; E is a movable valve opening upward only, and this is carried in the bucket F, which is a hollow piece of wood or metal which, by leather or other packing, is made to fit in the barrel so closely that the water cannot pass between the bucket and the barrel; G is the piston rod which is operated by hand, by steam, wind, or other power, and moves the bucket up and down in the barrel. The up stroke of the piston at first lifts air, and as the air cannot return past the air-tight bucket, a partial vacuum is produced in B. The external pressure of the atmosphere causes the water to ascend in B. By repeated strokes of the piston, the air below E becomes exhausted and the water continues to ascend until the valve D is under water; thereafter the strokes of the pump lift the water above D and force it into the spout C.

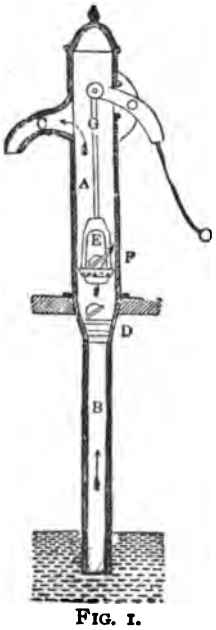

FIG. 1.

The force pump shown in Figure 2 is used to force water up into buildings. The piston is solid and the valve E, instead of being carried by the piston, is fitted in the discharge pipe. When the piston is raised up, the water rushes in between the piston and the valve below and with the downward motion of the piston the water is forced past the valve E; it cannot return, and by repeated strokes the water may be forced to a considerable height. Force pumps are used for deep wells and mines, hydraulic presses, steam and fire engines, etc. There are other and more complicated forms of pumps, but all depend on the principles here explained. See article AIR PUMP.

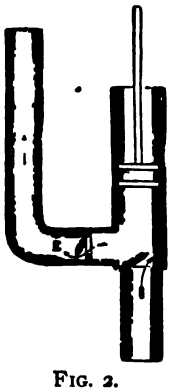

FIG. 2.

Punch, or the *London Charivari*, an English comic journal, is a weekly magazine of wit, humor, and satire, in prose and verse, copiously illustrated by sketches and caricatures. It draws its materials from the highest and lowest conditions of life, and while stern in the exposure of sham and vice, is yet kindly in spirit when making merry over innocent foibles. The first number of *Punch* appeared in 1841, and under the joint editorship of Henry Mayhew and Mark Lemon it soon became a household word as well as an acknowledged power throughout England. It has done much to purify and elevate the standard of current wit in England. Mr. F. C. Burnand is its present editor.

Punch and Judy, the chief characters in a popular comic puppet show of Italian origin. It is generally ascribed to Silvio Tiorillo, an Italian comedian, who flourished about 1600. The performance of the play requires only two persons, one to carry the theatre and work the figures, the other to bear the box of puppets, blow the trumpet, and sometimes keep up the dialogue with the hero of the piece.

Punctua'tion may be defined as the art of dividing sentences or clauses with certain marks, so as to make the sense more complete. Manutius, a Venetian printer of the 16th century, is generally regarded as the father of our present system of punctuation. Its principal marks are the period (.) generally placed at the end of a sentence, and the end of abbreviated words; the comma (,) used to separate words or pairs of words, and sometimes clauses; the semicolon (;) used to separate clauses or divisions of a sentence requiring a more marked separation than is indicated by the comma; the colon (:) used where the sentences require a more marked separation than is indicated by the semicolon; the dash (—) sometimes performing the offices of the comma, the semicolon, or the colon, but generally used to indicate a break in the thought or a change in the structure of a sentence; the interrogation point (?) used to denote a question; the exclamation point (!) used to express surprise or any special emotion; the hyphen (-) used between the divisions of a compound word and to divide any word at the end of a line; the apostrophe (') used as a sign of the possessive case and to supply the place of any letter or letters omitted from a word; the parentheses or curves ( ) used to inclose any word or words essential to the meaning of the passage; the brack-

ets [ ] used to include the words or remarks of the author within the writing of some other person; the quotation marks, consisting of two inverted commas and two apostrophes (" "), used to inclose any word or words quoted from another person; the ellipsis (* * * * *), or dots (. . . .), used to denote the omission of words from a quotation; the index (☞) used to point out any particular sentence or statement; the star or asterisk (*), the dagger (†), the double dagger (‡), the section (§), the parallel (‖), the paragraph (¶), which refer to notes at the bottom of the column or page, or at the end of the article or chapter. There are numerous rules for the use of these various points, but perhaps no two writers or printers would agree as to the proper point to be used in all cases. Good judgment and taste and a certain amount of practice are essential to anyone who would punctuate in such a manner as to secure the fundamental object of punctuation — the expression of the sense.

To illustrate the aid that punctuation will sometimes render to an understanding of the sense of any composition, take the following example: —

Every lady in the land
Has twenty nails on each hand
Five and twenty on hands and feet
This is true without deceit.

Now read the same properly punctuated: —

Every lady in the land
Has twenty nails; on each hand
Five, and twenty on hands and feet;
This is true without deceit.

To show how punctuation may sometimes vary the sense of any speaker or writer, the following example will serve: A member of the English house of commons called one of his fellow members a liar and was compelled publicly to apologize for the offense. He did so by rising in his place and meekly saying: "I said he was a liar, it is true; and I am sorry for it." The apology was deemed sufficient; but in the newspaper which published an account of the matter the next day, the apology was printed thus: "I said he was a liar; it is true, and I am sorry for it."

Pu'nic Wars. This is the name commonly given to those contests which occurred between Rome and Carthage for the supremacy of the western world. The Romans called the Carthaginians Punici, in allusion to their Phœnician descent. The Romans never trusted their foes in the matter of their treaties, and so came to speak of "Punic faith" as synonymous with treachery. The various wars waged between Rome and Carthage will be found under the name of these cities, or told in the biographies of the commanders of the forces engaged. The first Punic war broke out in 264 B. C., the third in 149 B. C.

Punjab (*pun-jäb'*) or **Panjab,** a province of India, occupying the northwest corner, is watered by the Indus and its five great affluents — the Jhelum, Chenab, Ravi, Beas, and Sutley. The area under direct British administration (it was annexed by that power in 1849) is 110,667 square miles; that of the native states under British control, 22,509 square miles, with a population of 4,232,074. Population in the entire province 22,000,000. The whole of the northern part is traversed by spurs from the Himalayas which inclose deep valleys; but in the south the surface is not broken by any elevations, except the Salt range, varying from 2,000 to 5,000 feet in height. More than half the population are Mohammedans. The Punjab is the country of the Sikhs.

Pu'ritans, the name first given — according to Fuller, in 1564, and according to Strype, in 1569 — to those clergymen of the church of England who refused to conform to its liturgy and discipline as arranged by Archbishop Parker and his coadjutors. During the reigns of James I. and Charles I., the spirit of Puritanism continued to spread in English society and in parliament, in spite of all efforts made by the government to suppress it, the tyranny of Laud and the outrages of Charles on the English constitution leading many who were not strictly Puritans to oppose both church and king, for the sake of their national liberties. Before the war between Charles and the parliament broke out, a considerable number of the Puritans emigrated to America, where they became the founders of the New England states, and practiced the form of religion to which they were attached. For an eloquent description of the character and virtues of the Puritans, see Macaulay's *Essay on Milton.*

Pusey (*pū'zi*), **Edward Bou'verie,** a distinguished divine of the English church, was born at Pusey, in Berkshire, in 1800, and graduated with high honors at Oxford, in 1822. In the year 1827, he was appointed professor of Hebrew at Oxford, a position he held until his death. In connection with Keble and Newman, Pusey took a very active part in the "Tractarian movement"; and, in 1843, was suspended from preaching for three years on account of a sermon on the Holy Eucharist. But he did not follow Newman into the Roman Catholic church, preferring to remain in the Anglican communion, and exerting all his talents and learning to sustain the evangelical doctrines and standards of life that were so dear to him; and in spite of all difficulties in his way he continued his labors to this end until the close of his life. In private life, Pusey was a man of warm affection, and was widely known for his gentleness, sincerity, and humility. His charity was limited only by his income; besides abundant gifts to the poor, he spent large sums in helping to provide churches in East London, and in founding and supporting sisterhoods. He died at Oxford, Sept. 16, 1882. See *Life*, by Canon Liddon.

Put'nam, Israel, a general of the American Revolution, was born in what is now Danvers, Mass., Jan. 7, 1718. In the year 1739, he bought a farm near Pomfret, Conn., and devoted himself to its cultivation and to wool-growing. During the years he was engaged in this occupation, a she-wolf committed considerable ravages upon his sheep and those of the neighborhood, and all efforts to capture or kill her were in vain, until Putnam entered her den in a rocky cavern with a torch in one hand and a gun in the other, and shot her before she had time to spring upon him. Putnam distinguished himself in the French and Indian war, and at the breaking out of the Revolutionary war was placed at the head of the Connecticut troops. He was very active and conspicuous at the battle of Bunker Hill, soon after which he was commissioned major-general in the Continental army, and in 1777 was appointed to the defense of the Hudson river highlands. While at Peekskill, a lieutenant in a British regiment was captured as a spy and condemned to death; and when Sir Henry Clinton sent a message under a flag of truce, threatening reprisals if the sentence should be carried out, Putnam returned the following famous answer: "Headquarters, Aug. 7, 1777. Edmund Palmer, an officer in the enemy's service, was taken as a spy lurking within our lines; he has been tried as a spy, condemned as a spy, and shall be hung as a spy, and the flag is ordered to depart immediately — Israel Putnam. P. S. He has accordingly been hung." In 1778, Putnam made his famous escape from Tryon's dragoons by riding down a steep declivity at Horseneck, Conn. The next year he suffered a stroke of paralysis, and the remainder of his life was spent at home. He died at Brooklyn, Conn., May 19, 1790.

Put'nam, Rufus, cousin of Israel Putnam, was born at Sutton, Mass., April 9, 1738, and served against the French from 1757 to 1760. In 1778, he helped his cousin to fortify West Point, and had command of a regiment afterward until the close of the war, being made brigadier-general in 1783. He helped to found Marietta, O., in 1788, was made a judge of the supreme court of the Northwest territory in 1789, and was surveyor-general of the United States from 1793 to 1803. He died at Marietta, O., May 4, 1824.

. **Putrefac'tion** is the term applied to the decomposition of organic substances when accompanied by an offensive smell. It is now known to be the result of the activity of certain minute plants, called bacteria, which also cause fermentation and many diseases. The spores of these plants are present in great numbers in the air and water, and on the surface of the earth; but if we boil an infusion of organic matter, and while the steam is coming freely off, close it up in such a manner as to prevent any germs or spores from reaching the fluid, it will remain without any change for many years, but will begin to putrefy in a day or two if the plug be removed. Of the precise chemical changes that take place from the life of bacteria, we are still largely ignorant.

Pygma'lion, in Greek mythology, grandson of Agenor, king of Cyprus, fell in love with an ivory statue of a young maiden he himself had made, and prayed to Aphrodite to give it life. His prayer being granted, he married the maiden, who bore him Paphus.

Pym, John, was born at Brymore, near Bridgewater, England, in 1584. He entered Oxford university in 1599, but left in 1602 without taking a degree, and then studied law at one of the inns of the court. Entering parliament in 1621, he at once attached himself to the country party, and proceeded to war against monopolies, papistry, and absolutism with a force and vigor that brought him three months imprisonment. In the "Short Parliament" of 1640, "when" — to use Clarendon's words — "men gazed on each other, looking who should begin, Pym broke the ice by a two hours discourse, in which he summed up shortly and sharply all that most reflected upon the prudence and justice of the government, that they might see how much work they had to do to satisfy their country." In the impeachment of Strafford, and in all other proceedings of the "Long Parliament" which assembled in 1641, Pym took a leading part, his power and ability being acknowledged by the Royalists in the derisive epithet of "King Pym." He was one of the "five members" whom Charles I. attempted to arrest in the chamber of the house of commons, thus precipitating the civil war, which resulted in the defeat and execution of the king. Soon after hostilities began, Pym was appointed lieutenant of ordnance; but died at London, Dec. 8, 1643. He was buried in Westminster abbey, but at the restoration of Charles II. his remains were cast into a pit in St. Margaret's churchyard. See Goldwin Smith's *Three English Statesmen.*

Pyr'amids, structures erected in different parts of the east, the most important being the pyramids of Egypt, which were reckoned by the ancients as one of the seven wonders of the world. They are about seventy-five in number, of different sizes, and are masses of stone (or rarely brick) with square bases and triangular sides. Various opinions have prevailed as to the purpose for which they were built; but in all probability they were simply tombs or monuments of the Egyptian monarchs who flourished from the first to the twelfth dynasty. The Egyptian monarch was ever careful in the preparation of his "eternal abode." The most remarkable pyramids are those of Gizeh, situated on the edge of the Libyan desert, near Memphis, on the west bank of the Nile. Of the three largest and most famous, the First or Great Pyramid was the sepulchre of Cheops, the second king of

the 4th dynasty. Its height was originally 481 feet, and its base 774 feet square, covering about 13 acres of ground; but it has been much despoiled and stripped of its exterior blocks for building the mosques and walls of Cairo. The original sepulchre chamber, 46 x 27 feet and 10 feet 6 inches in height, was hewn in the solid rock, and was reached by a passage, 320 feet long, which descended to it from the entrance at the foot of the pyramid. According to Herodotus, 100,000 men were employed on this pyramid for thirty years. The second pyramid was built by Chafra or Chephren, third king of the 4th dynasty. It is 450 feet in height, on a base of 700 feet square (over 10 acres) and has two sepulchral chambers, which were opened by Belzoni in 1816. The masonry is inferior to that of the first pyramid; but it was anciently cased below with polished stones, only a portion of which remain, while the top still retains its original casing. The Third Pyramid, built by Menkaura or Mycerinus, fourth king of the 4th dynasty, is much smaller than the other two, being only 215 feet in height, by 350 feet square at the base. The masonry of this pyramid is most excellent; and it was anciently cased half-way up with granite, the remains of which are still visible. The third pyramid is regarded with superstitious dread by the natives, on account of a supposed woman's ghost, and there is a legend connecting it with the courtesan Rhodope.

There are six other pyramids in Gîzeh; others at Abou Roâsh, six miles to the northwest. In Nubia, the ancient Ethiopia, are several pyramids, the tombs of the monarchs of Meroë from 600 to 100 B. C., and of some of the Ethiopian conquerors of Egypt. They are higher in proportion to their base than the Egyptian pyramids, and generally have a sepulchral hall or propylon, with sculptures, which faces the east. Cleopatra's Needles were obelisks built for sepulchral use and are described under the topic OBELISK. See *The Great Pyramid* by R. A. Proctor; *Our Inheritance in the Great Pyramid*, by C. Piazzi Smith; and *A Miracle in Stone*, by Joseph Seiss, D.D.

Pyr'amus and This'be, two lovers whose tragical history is told by Ovid in the 4th book of his *Metamorphoses*. They were natives of Babylon, and tenderly attached to each other; but as their parents would not consent to their marriage, they had to content themselves with secret interviews by night. On one occasion they arranged to meet at the tomb of Ninus, where Thisbe, who was first at the trysting spot, was startled to discover a lion. She immediately ran away, but dropped her robe, which the fierce animal that had just torn an ox in pieces, covered with blood. Soon after Pyramus appeared, and seeing Thisbe's robe, concluded she had been murdered and killed himself. When Thisbe returned soon after, and saw her lover lying dead on the ground, she immediately put an end to her own life.

Pyr'enees, the mountain chain that divides France from Spain. It stretches across from the Mediterranean to the southeast corner of the bay of Biscay, a distance of 270 miles, the breadth of the system varying from 15 to 70 miles. The chain is divisible into three distinct portions — the western, the central, and the eastern. On both north and south the mountains sink down to the plains in a series of terraces with precipitous faces, the general slope on the Spanish side being somewhat steeper than that on the French side. See *Voyage aux Pyrénées*, by Taine.

Pyrenoids (*pi-rē'noidz*) (in plants). In the chloroplasts of certain algæ, as in Spirogyra, there are usually seen embedded one or more colorless bodies, each one often surrounded by a jacket of starch. These bodies are reserve proteid and are known as pyrenoids.

Pyrites (*py-rī'tēz*), a name employed by mineralogists to designate a number of minerals which are compounds of metals with sulphur, or arsenic, or both. They are hard, brittle, have a metallic appearance, and are frequently yellow. The kinds most usually mentioned are iron, copper, and arsenical. Iron pyrites is sometimes mistaken for gold, on account of its yellow color, and is therefore called "fool's gold." It is much used in the manufacture of sulphuric acid, and sulphur is obtained from it by sublimation. It is also used for the manufacture of alum. Copper pyrites is the most abundant of all the ores of copper, and yields a large proportion of the copper used in the world. Arsenical pyrites or mispickel is of a silver-white color, and is the most common natural compound of arsenic. It is sometimes valuable on account of containing cobalt. In addition to these three kinds of pyrites are pyrrhotite or magnetic pyrites, which sometimes contains nickel, and marcasite or white iron pyrites. Both of these consist chiefly of iron and sulphur.

Pyrometer (*pī-rŏm'ē-tẽr*), a term in engineering, used to describe an instrument for measuring temperatures so high or so low that mercurial thermometers cannot be used. All the older forms of this apparatus, depending upon the expansion of solids with rise of temperature, have entirely gone out of use.

Modern pyrometers are practically all dependent upon either one or the other of two electrical principles. The first of these types is based upon the discovery of Seebeck, that when an electric circuit is made up of two different metals a current will flow in that circuit which is proportional to the difference in temperature between the two junctions. By placing a galvanometer in the circuit this current may be measured. And after the circuit has once been calibrated we may infer the temperature of one junction by knowing

the current and the temperature of the other junction. This form of pyrometer has been perfected principally by Le Chatelier, a Frenchman.

The second type of pyrometer depends upon the fact that the electrical resistance of a platinum wire varies with its temperature. Having selected a definite piece of pure platinum wire and having measured its resistance at various standard and known temperatures, we have only to place this platinum wire in the region whose temperature is desired and measure its resistance. The temperature of the region is then given by interpolation. This form of pyrometer has been perfected especially through the efforts of the English physicist, H. L. Callendar. It is frequently called a "platinum thermometer."

Pyrotech'ny. See FIRE'WORKS.

Pyrrhus (*pĭr-us*), king of Epirus, was born about 318 B. C. He became sole king of Epirus in 295 B. C., and in the following year increased his territories by the addition of the western parts of Macedonia. In the year 280 B. C., he engaged in a war against the Romans, the first battle taking place on the banks of the river Siris, in Lucania. After an obstinate and bloody contest, Pyrrhus won the day by bringing forward his elephants, and thereby exciting the terror of the Romans. Pyrrhus' loss of soldiers was so great that after the fight he is said to have exclaimed: "Another such victory, and I must return to Epirus alone." Hence the phrase, "Pyrrhic victory." After continuing the war another year without any substantial results, a truce was made between the belligerents, and Pyrrhus withdrew to Tarentum. In a second war with Rome, a few years afterward, he was utterly defeated by the Consul Curius Dentatus near Beneventum, escaping to Epirus with only a few followers; but in less than a year after this he was induced to enter on a war with the Spartans. He marched a large force into the Peloponnesus, and tried to take their city, but was repulsed in all his efforts. He then proceeded against Argos, in Greece, where he was killed in 272 B. C. by a tile hurled at him by a woman from the roof of a house.

Pythagoras (*pi-thag'ō-ras*), a Greek philosopher, and founder of a school of philosophy, was born on the island of Samos about 582 B. C.; but his history has been so obscured by a mass of legend that it is difficult to arrive at anything certain in reference to his life. He is said to have been a disciple of Thales and other distinguished philosophers, and to have undertaken extensive travels for the purpose of acquiring knowledge. In the course of these travels, which continued nearly thirty years, we are told that he visited Egypt and the more important countries of Asia. We have reason to believe that he visited Egypt at least, and that he learned from the priests of that country the doctrine of the transmigration of souls, which is one of the famous tenets of his school. He is even said to have asserted that he had a distinct recollection of having himself passed through other stages of existence. On seeing a dog beaten and hearing him howl, he bade the striker to desist, saying, "It is the soul of a friend of mine, whom I recognized by his voice." Pythagoras is said to have been the first to assume the title of *philosopher* (which means "lover of wisdom") in place of the name *sophos* (which means "a wise man"). We have reason for believing that he was a man of much learning, especially in mathematics. His school taught that in number alone is certainty to be found; that number is the essence of all things; that in some mysterious way numbers are things themselves. The moral teaching of the Pythagoreans was of the purest and most spiritual kind; virtue was regarded as a harmony of the soul; self-restraint, sincerity, and purity of heart were especially commended, and conscientiousness and uprightness would seem to have been their chief characteristics. Of the fate of Pythagoras different accounts are given, but he is generally supposed to have died at Metapontum, Magna Græcia, 500 B. C., where his tomb was to be seen in the time of Cicero.

Pyth'ian Games, one of the four great national festivals of the Greeks, are said to have been instituted by Apollo after vanquishing the snaky monster Python. They were at first under the management of the Delphians; but about 590 B. C., the Amphictyons were intrusted with the conduct of them, after which they were held every four years at Adelphi, in honor of Apollo. Some writers claim that they were not called Pythian till after this date. Originally, the contests were restricted to singing and cithern playing; but the Amphictyons added the flute, athletic contests, and horse racing. By and by, contests in tragedy and other kinds of poetry, in historical recitations, and in works of art, were introduced and long continued a distinguishing feature of these games, which are believed to have lasted for three or four centuries after Christ. The prize was a laurel wreath and the symbolic palm branch.

Python (*pī'thŏn*). See BOA.

Pyxis (*piks'is*), a peculiar pod which opens at its apex by a circular lid, as the common twinleaf (*Jeffersonia*).

Q

Quadrant (*kwŏd'rant*), an astronomical instrument, invented by Hadley in 1731, for use in measuring angles at sea and in other places where a fixed divided circle is not available.

The quadrant, in a crude form, had been used for several hundred years before the time of Hadley, if we admit the astrolabe graduated through 90° as a species of quadrant. But Hadley so improved the instrument by introducing a fixed and a movable mirror, and by bringing into the same line the images of the two objects whose angular distance is to be measured, that he really made a new and highly valuable piece of apparatus out of it. The quadrant is merely a brass frame, provided with a radial arm carrying a mirror, whose polished surface contains the axis of the quadrant. By looking through the small telescope and a half-silvered mirror (attached to the quadrant) at any particular object, one may, by rotating this radial arm, make the image of a second object appear in the same direction as the first. The angle through which the arm must be turned to secure this coincidence is half the angle subtended by the two objects; and this angle is read directly from the graduated edge of the quadrant. Sometimes only 60° of the edge is graduated, in which case the instrument is called a *sextant*.

Hadley's invention immediately displaced the astrolabe and the cross-staff which had hitherto been used for taking latitudes at sea. A considerable part of the accuracy of the quadrant is due to the use of the vernier, which was invented by Pierre Vernier in 1631. About the same time, the telescopic sight was invented by Gascoigne and the tangent screw by Helvelius. These all combine to make the quadrant or sextant a thoroughly accurate instrument, and one which is now in daily use by all navigators.

Quadrilat'eral, the name given in history to the four fortresses of northern Italy — Mantua, Verona, Peschiera, and Legnago — which form a sort of outwork to the bastion of the mountains of the Tyrol, and divide the north plain of the Po into two sections by a powerful barrier. They have figured in all the later wars that have been fought in northern Italy, especially in the wars between Austria and the different Italian states. Russia has a similar combination of four fortresses in Poland, called the Polish Quadrilateral.

Quad'ruple Alli'ance, a league against Spain, formed August, 1718, between Britain France, Austria, and Holland, to counteract the ambitious schemes of Alberoni. It was made upon the basis of the Triple Alliance, which was formed in January, 1717, between England, Holland, and France, and by which the clauses in the treaty of Utrecht having reference to the accession of the house of Hanover in England, the renunciation by the Spanish king of his claims to the French throne, and the accession of the house of Orleans to the French throne, should the young king, Louis XV., die without issue, were guaranteed. The Spanish fleet was destroyed by Byng off Cape Passaro, while the French crossed the Pyrenees and defeated the Spaniards several times; at length, Philip was compelled to dismiss his ambitious minister, Alberoni, and accept the terms of the Quadruple Alliance.

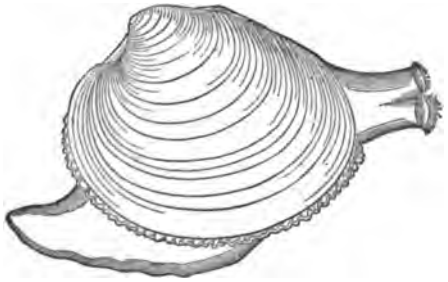
Quæstor (*kwĕs'tor*), was anciently the title of a class of Roman magistrates, reaching as far back, according to all accounts, as the period of the kings. The oldest quæstors were the *quæstores parricidii* ("investigators of murder," finally public accusers), who were two in number. Their office was to conduct the trial of persons accused of murder, and to execute the sentence that might be pronounced. They ceased to exist as early as 366 B. C., when their duties were transferred to the *Triumviri Capitales*. But a far more important, though later office, was the *quæstores classici*, to whom was intrusted the charge of the public treasury. They seem to have gained the name of classici from their having been elected originally by the centuries. At first they were only two in number, but in 421 B. C. two more were added. Shortly after the breaking out of the First Punic war the number was increased to eight; and as province after province was added to the Roman republic, they amounted in the time of Sulla to twenty, and in the time of Cæsar to forty. At first, only patricians could be quæstors; but after 421 B. C. the office was open to plebeians also.

Quagga (*kwăg'ga*), a striped wild ass, related to the zebra, and, like the latter, peculiar to Africa. It was formerly abundant, in

QUAGGA.

herds, on the plains south of the Vaal river, but is now rare, if not extinct. During the period of its abundance, thousands were killed annually by Boer hunters, for their skins. It is easily distinguished from the three other members of the family, although Burchell's zebra is often erroneously called quagga. The head, neck, mane, and shoulders are striped, but the stripes fade out behind the shoulders, and the hind quarters and legs are unstriped. It is of stouter build than the zebra, but has ears and tail more like a horse. Its color is reddish brown above with dark brown spots, the under surface and the legs being nearly white.

Quahaug (*qwa'hŏg*), the common round clam of the Atlantic coast found from Texas



CLAM.

to Cape Cod. It is frequently seen in the eastern markets and is much esteemed as food.

Quail, a small game bird of the Old World, belonging to the partridge family. There are six species. The common European quail is about seven inches long, with a very short tail. They are of a brown color, streaked with buff. They are ground birds. They winter in Africa, and are trapped in large numbers for the market. The birds called quail in the United States belong to a different family. The bob-white is a good type. They nest on the ground, laying from ten to eighteen white eggs, but sometimes they perch on trees. They remain throughout the year, and should be protected and fed, for they are helpful to the farmer in destroying many injurious insects. They are especially fond of the Colorado potato beetle.

COMMON QUAIL.

Quakers or **Society of Friends,** a sect founded by George Fox in 1648–66. In spite of severe and cruel persecutions, the Quakers succeeded in establishing themselves both in England and in America. Although not a large denomination, they have exerted a strong and good influence on the public at large, by their purity of life and the stand they have taken in certain great questions, such as war and slavery. As early as 1727, they commenced to censure the traffic in slaves, and opposed it more and more warmly, until the whole British nation felt the glow and set their slaves free. Their leading doctrine is that of "internal light." They believe that the Holy Spirit or the indwelling Christ alone maketh wise unto salvation and illumines the mind with true and spiritual knowledge of the things of God. Hence they do not consider human learning essential to a minister of the gospel, and have no theological schools or classes for students. Their ministers do not receive a salary, but bestow their labor freely, and in return are freely entertained when their work takes them away from home. The Friends have from the start, by example and precept, urged "plainness of speech, behavior, and apparel"; and hence a Friend could always be distinguished by certain outward peculiarities, such as "thee and thou, first month, second day," etc., instead of the usual terms used, and by their quaint garb. In 1827, Elias Hicks denied the divine authority of the Scriptures, the divinity of Christ and his atonement, and carried with him about one-half of the society in America. These are now known as the Hicksite Friends, while the remainder are called Orthodox Friends. The more eminent leaders of this sect have been George Fox, Robert Barclay, Thomas Ellwood, William Penn, John Bright, etc. They number about 120,000, less than 20,000 of them being in England. See Fox's *Journal;* Sewell's *History of the Quakers.*

Quarantine (*kwar'an-tēn*), ("a period of forty days"), is a forced abstinence from communication with the shore which ships are compelled to undergo when they are last from some port or country where certain diseases held to be infectious, as yellow fever, plague, or cholera, are, or have been raging. Where a quarantine is established, it is a punishable offense for any person in the suspected ship to come on shore, or for anyone to disembark any merchandise or goods from her, except at lazarettos, which are establishments provided for the reception of goods or passengers or crew, and where such purifying processes as the sanitary science of the time prescribes are applied. Until a ship is discharged from quarantine, she displays a yellow flag at her masthead if she has a clean bill of health, and a yellow flag with a black spot if not clean; at night a white light is shown at the same place. The permit to hold intercourse after performing quarantine is called "pratique." Quarantine is not of necessity limited to a sea-frontier; it is enforced at the frontiers between adjacent states, and by cities and towns on houses in which are cases of infectious diseases.

Quar'termas'ter, an officer whose duty is to provide quarter, provisions, storage, clothing, fuel, stationery, and transportation for the army, and superintend the supplies. In the navy, the quartermaster is a petty officer who attends to the helm, binnacle, signals, and the like, under the direction of the master.

Quartet', a piece of music arranged for four solo voices or instruments, in which all the parts are obligato — that is, no one can be omitted without injuring the proper effect of the composition. A mere interchange of melody, by which the parts become in turn principal and subordinate, without the interweaving of them, does not constitute a quartet. Quartets for stringed instruments are generally arranged for two violins, a viola and a violoncello, and are sonata in form — that is, have a progression of thought and movement. They originated with Haydn, and were further developed by Mozart, and notably by Beethoven, who perfected the art of part-writing in music. Subsequent writers are Schubert, Spohr, Mendelssohn, Schumann, and Brahms. Vocal quartets were a frequent feature in oratorios and operas, up to the time of Wagner.

Quartz (*kwarts*), the name of the commonest mineral substance of nature. Chemically, quartz is silicon oxide ($Si O_2$). Quartz occurs in nature in both the crystalline and non-crystalline forms. When crystalline, it occurs in six-sided prisms, terminated by pyramids. Well-developed crystals are most commonly found in veins or open spaces in rocks. By far the larger part of quartz, even that which is really crystalline, does not occur in the form of prisms, but in the form of sand grains, pebbles, etc., which were themselves derived from crystals. Quartz is one of the constituent minerals of most light-colored igneous and metamorphic rocks, is the chief constituent of most sandstone, and an important constituent of most other sorts of sedimentary rock, except limestone. It is the hardest of the common minerals. Pure quartz is transparent, but it often contains impurities which give it distinctive, and sometimes beautiful, colors. Several varieties of quartz constitute gems, some of them of great value. Here belong *amethyst*, a transparent purple variety of quartz; *agate*, the banded variety of quartz from which cameos are cut; *chalcedony*, a translucent variety; *smoky quartz; cat's eye quartz; jasper*, a red, opaque variety; various so-called *topazes* (not the true topaz); *rose quartz*, a pinkish or rose-tinted variety; *rock crystal*, or crystals of pure quartz. *Flint* and *chert* are impure varieties of quartz.

Quassia (*kwosh'i-a*), from the name of a negro, Quassy or Quash, who prescribed this article as a specific for fevers — a bitter wood obtained from the various trees of the quassia family, all of which are natives of tropical America or the West Indies. The wood and bark are used as medicine. Cabinet wood made from it is safe from all attacks of insects.

Quay (*qud*), **Matthew Stanley,** United States senator and Republican politician, was born at Dillsburg, Pa., Sept. 30, 1833, graduated in 1850 at Jefferson college, and four years later was admitted to the bar. In the Civil war, he served as colonel of one of the Tennessee volunteer regiments, was military state agent at Washington, and military secretary to the governor of Pennsylvania. He entered the State legislature in 1865, was twice state secretary, state treasurer, and chairman of the Republican National committee during the Harrison campaign of 1888. In 1887, he was made United States senator for Pennsylvania, and two years later was tried for alleged misappropriation of public funds, but was acquitted. He was re-elected to the United States senate in 1901.

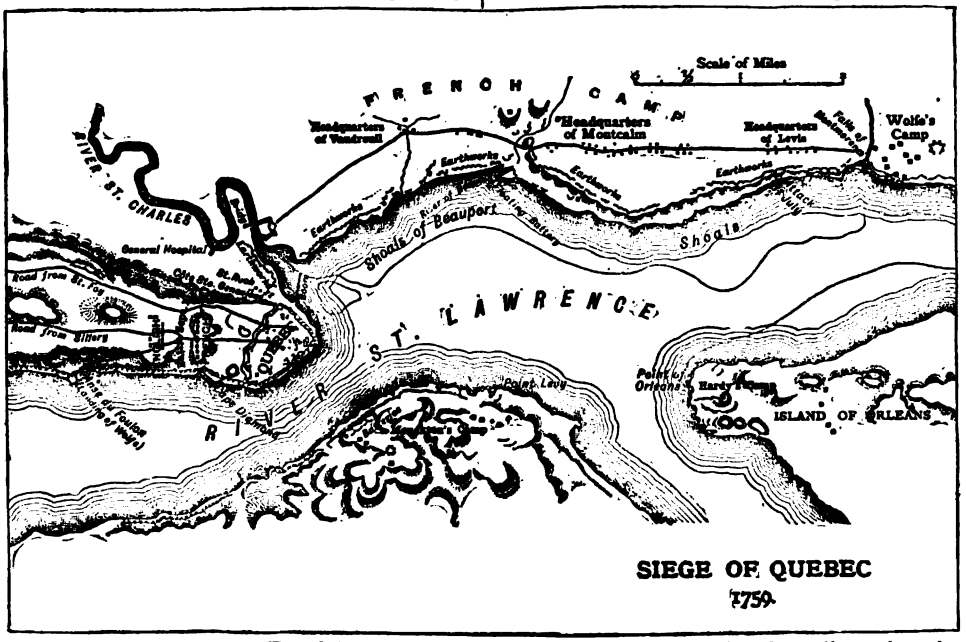
Quebec', Province of. This, the oldest province of the Canadian Dominion, with an area of 228,900 square miles, entered Confederation in 1867. Its population to-day is returned as 1,620,974. It extends northeastward from the Ottawa river (the boundary between it and Ontario) to Labrador, the northeastern confines of the Dominion. It is bounded on the north by the Wotshish mountains and the Northeast territory, of which Ungave is the chief, though as yet an unorganized district. Its southern and eastern boundaries are Ontario, New York state, Maine, and New Brunswick; while the St. Lawrence divides it, and, below Quebec, begins to branch out to a noble estuary, when it reaches the gulf of St. Lawrence. The latter forms the southern exit to the Atlantic (between Newfoundland and Cape Breton), while beyond the large island of Anticosti, at the mouth of the St. Lawrence, the straits of Belle Isle form the northeastern exit. The St. Lawrence is navigable, for the largest ocean-going steamers, as far as Montreal, nearly 600 miles from its mouth. Beyond this the channel is obstructed for a space by rapids and falls, but these hindrances to navigation are overcome by a system of canals which permit vessels of 500 tons to pass up to the western lakes. The chief tributaries of the St. Lawrence are the Ottawa, the St. Maurice, and the Saguenay, upon the northern bank, and the Richelieu, the St. Francis, and the Chaudière, upon the southern. The Ottawa has several falls and rapids, but below the federal city of Ottawa it is navigable, with one short interval, to Montreal. The Saguenay is the gloomy outlet for the cold water of Lake St. John. Few sights in Canada are more grand and awe-inspiring than this grim river (sometimes called "the river of death"), chasm-cleft through the heart of a mountain wilderness. On the way to the Saguenay, from Montreal, the tourist will come to the ancient capital of

Quebec, curious as a survival of the past, and an interesting specimen of the half monastic, half military towns of Old France in the days of the Grand Monarque.

Just below the city of Quebec are the noted falls of Montmorency, which empty into the St. Lawrence. Several of the rivers are navigable for the greater part of their course, while others are used in floating timber, and besides supply almost unlimited water-power to manufacturing industries. Quebec has numerous lakes, of which the best known are Temiscamingue, Metapedia, Temiscouata, Memphremagog, and St. John.

The climate of Quebec is very much like that of the other parts of eastern Canada, excepting, perhaps, that the winter is slightly colder; but the air is generally dry and bracing, and the cold is not felt to be unpleasant, and the climate is exceedingly healthy. The soil is rich and loamy. Cereals, hay, and root-crops grow everywhere in abundance. Indian corn, hemp, flax, and tobacco are also raised in many parts of the province. Fruit is grown in quantities, especially apples and plums, which are exported largely. Small fruits, grapes, and tomatoes are abundant. Cattle breeding is carried on largely, and many thousands of animals are exported to Great Britain yearly, the region east and north of the St. Lawrence being especially excellent for pasturage. The fisheries in the river and gulf of St. Lawrence are very productive, and all the smaller rivers teem with fish. The province is rich in minerals. Iron is very generally distributed; other minerals, such as lead, silver, platinum, zinc, copper, and alluvial gold are found in various places, while the asbestos deposits and those of phosphate of lime are being increasingly worked. Agriculture and dairy-farming form the chief occupation of the people, but manufactures, the fisheries, and commerce, lumbering, mining, and shipbuilding employ a considerable part of the inhabitants.

The province is governed by a lieutenant-governor, who is appointed by the governor-general, an executive council, consisting of 24 members appointed for life, and a legislative assembly of 74 persons, elected every four years. The seat of the local government is Quebec. The province is represented in the Dominion senate at Ottawa by 24 members, and in the house of commons by 65 members. The population consists largely of French-Canadians, descendants of the French settlers living in the country when it was transferred to Great Britain in 1763. In religion the Roman Catholics prevail, but the Protestant churches flourish in the different cities, and the rights of the minority, both in religious and educational matters, are protected by statute. Education is under the supervision of a council, which is divided into two committees for the government of Roman Catholic and Protestant schools respectively. The two Protestant universities are M'Gill at Montreal and Bishop's college at Lennoxville; Laval, the Catholic university is at Quebec. The principal city in the province is Montreal, which is the commercial metropolis of the Dominion of Canada. Quebec, the next city in importance, is, as has been said, the seat of local government, and



SIEGE OF QUEBEC
1759.

the most historic city in Canada. See *Quebec, Past and Present*, by Sir J. M. Lemoine; *Picturesque Quebec; Sketch of the Province*, by the Hon. Honoré Mercier; Cassell's *Picturesque Canada*, edited by Principal Grant.

Quebec', capital of the province of that name, stands on a steep promontory of the St. Lawrence at its junction with the St. Charles river, 300 miles from the gulf of St. Lawrence, and 180 miles below Montreal. Quebec is the most important military position in Canada. The citadel occupies an area of 40 acres and commands a magnificent view. The harbor is spacious, and the docks and tidal basin are perfect specimens of engineering skill. The city is divided into an upper and a lower town. In the latter, are situated the banks, warehouses, and wholesale and retail stores. In the upper town are the principal residences, public buildings, churches, gardens, and retail shops. Toward the west are the thriving suburbs of St. John, St. Louis, and St. Roch's. The last named has become a place of commercial importance, with its immense warehouses and stores. To the southwest of St. John are the plains of Abraham, the historic battlefield, where a column 40 feet in height has been erected to the memory of General Wolfe. Another monument, 65 feet high, dedicated to Wolfe and Montcalm, is situated in the governor's garden and immediately overlooks the St. Lawrence. Four martello towers occupy elevated positions. In the upper town is Dufferin terrace, 1,400 feet long and 200 feet above the water level, commanding a noble view. Three handsome modern gates have replaced the old gates. The principal buildings are the courthouse, post office, customhouse, city hall, masonic hall, basilica, archepiscopal palace, Anglican Cathedral, Church hall, Young Men's Christian Association building, and the parliamentary and department buildings. Laval university, named after the first Roman Catholic bishop of Quebec, who founded the seminary in 1663, is an important institution. The building is spacious, well equipped, and contains a library of 90,000 volumes. Quebec is connected with all the cities in America by various lines of railroad, and on the St. Lawrence is, with Montreal, at the head of ocean steamship navigation to Europe. See *Illustrated Quebec*, by G. Mercer Adam. Population 68,834.

Queen Char'lotte Islands, a group lying to the north of Vancouver island, off the coast of British Columbia. Area 5,100 square miles. The two principal islands, Graham and Moresby, have a length of 160 and a greatest breadth of nearly 70 miles. The climate is healthy, but very rainy. Anthracite coal, copper, and iron ore, and gold-bearing quartz have been found, and forests abound. The inhabitants are about 2,000 Indians, who engage in fishing.

Queen Char'lotte Sound is a strait separating Vancouver island, B. C., Canada, on the north, from the mainland.

Queens'land. The youngest and third largest of the Australian colonies, has an area of 668,497 square miles, about twenty-five times the size of Great Britain. The colony, which forms a province in the British commonwealth of Australia, was organized December, 1859, on its separation from New South Wales. It occupies the northeast part of the continent, to the north of New South Wales, and to the east of the Northern Territory of South Australia. Its population is 512,604. It is 1,300 miles in length from north to south and its greatest breadth is 800 miles; and lies between the 10th and 29th parallel of south latitude, and its western boundary is the 138th parallel of longitude. The coast line is 2,250 miles in extent. About 50 miles from the sea, and more or less parallel with the eastern coast, is a backbone of mountains, and upon this belt of land settlement has chiefly taken place. The main dividing range is a continuation of the bolder Australian Alps of Victoria and the famous Blue mountains of New South Wales. The highest peaks are Bellenden-ker (5,500 feet) and Mt. Dalrymple (4,250). The mean altitude of the range is 2,000 feet. On the east side, Queensland is ridgy and thickly timbered with the eucalyptus. The country to the west of the mountains is very largely open downs and plains, making the finest pasturage in the world. It is fairly well watered, having rivers flowing in four directions, and those in the east have helped to create important industries and thriving ports along the island-studded coast. As two-thirds of Queensland lie within the tropics, there is a wide variety of climate and productions. For seven months of the year the climate is most enjoyable and healthy, being free from the scourges of consumption and contagious diseases. Invalids sent here in what appear to be the last stages of consumption often regain health, and usually live to become old. The rainy season commences in the tropical portion at midsummer (Christmas time) and lasts till March. Much of the marked prosperity of Queensland is due to her facilities of steam communication by ocean and with other colonies. Great progress has been made in the development of railways, and the system is now directly connected with that of New South Wales. The railways, telegraphic service, and the post office is under state control. Queensland is rich in mineral resources, especially gold. It is estimated that since 1868 its mines have produced $120,000,000. The gold production for the year 1899 amounted to 946,894 ounces of the value of $1,410,000. The province yields also silver, tin, copper, opal, wolfram, and manganese. In central Queensland, is to be found the remarkable Mount Morgan mine. It is supposed

that this unique formation, 1,225 feet above the sea level, was once a hot spring, the water of which held in solution gold which was precipitated (thrown down) along with other mineral matter into the curious stone, which has proved to be the most wonderful gold-bearing material in the world. The capital is Brisbane, population (exclusive of South Brisbane), 30,000.

Queens'town, a seaport of Ireland, on the south side of Great island, in the harbor of Cork, 177 miles southeast of Dublin. Its original name was Cove of Cork; the present name is in memory of the visit of Queen Victoria, in 1849. The town is built in parallel streets on the slopes of a hill shaped like an amphitheatre. It is noted for

its mild and healthful climate. The splendid Roman Catholic cathedral for the Clyme diocese is the principal building. Queenstown is an important port of call, the mails from the United States being landed here and sent overland to Dublin. Population 10,000. See an article in *Harper's Magazine*, September, 1884.

Queretaro (*ka-rā'tă-rō*), one of the island states of Mexico, also a city of the same name, situated on a high plateau, 120 miles northwest of Mexico City, and 350 miles from Vera Cruz. The area of the state is 3,556 square miles, with a small population (225,000). The population of the city, its capital, is 34,576. The town was taken by the Spanish from the Chichimec Indians in 1531. Here, in 1867, Maximilian, archduke of Austria and emperor of Mexico, made his last stand, and here he was shot. The town is an important manufacturing center, and near it are some rich mines of silver, lead, iron, and copper. The chief product of the region, however, is maize, fruit, and cotton. There are some fine public buildings, and a church (that of Santa Clara) noted for its beautiful wood-carvings.

Quern (*kwĕrn*), a mill used in early times for grinding corn, the stone of which was turned by hand. It is a contrivance of great antiquity, and so well adapted to the wants of a primitive people, that we find it at the present day in remote districts of Ireland, and in some parts of the Hebrides and Shetlands. The remains of querns have been dug up in Britain, Ireland, and continental Europe, wherever the traces of ancient population are found. The most usual form of quern consists of two circular flat stones, the upper one pierced in the center with a narrow funnel, and revolving on a wooden or metal pin inserted in the lower. The upper stone is occasionally ornamented with various devices; in the Roman period, it is sometimes funnel-shaped, with grooves radiating from the center. In using the quern, the grain was dropped with one hand into the central opening, while with the other the upper stone was revolved by means of a stick inserted in a small opening near the edge.

Quick'sand (quick, *i. e.* "living" or "moving" sand), a tract of sand which, without differing much in appearance from the shore of which it forms a part, remains permanently saturated with water to such an extent that it cannot support any weight. Quicksands are most often found near the mouths of large rivers. They appear to be formed only on flat shores, the layer of earth under the sand being stiff clay, which water cannot pass through. Also in narrow channels through which the adjoining shore, from its shape, causes strong tidal currents to run, the sand may be kept so constantly stirred up by the moving water that a quicksand results. Quicksands are not commonly of great extent, and their danger has probably been exaggerated in the popular mind by sensational descriptions in works of fiction, as in the *Bride of Lammermoor*, and in *Moonstone*.

Quick'silver. See MERCURY.

Quin, James, a celebrated actor, was born at London, of Irish descent, in 1693, and made his first appearance on the stage at Dublin in 1714. Shortly after, he was engaged at Drury Lane, London, but for quite inferior parts. In 1716, however, the sudden illness of a leading actor led to Quin's being called on to take the character of "Bajazet," in the once-famous play of *Tamerlane*. His success was marked. Next year he went to Rich's Theatre at Lincoln's Inn Fields, where he remained as a principal actor for seventeen years. The only really fine parts which he seemed to have played were "Captain McHeath," in the *Beggar's Opera*, and "Falstaff," in the *Merry Wives of Windsor*. In 1734, he returned to Drury Lane Theatre, "on such terms," says Cibber, "as no hired actor had before received;" and from this date until the appearance of Garrick, in 1741, he was by universal consent the first actor in England. He died at Bath, Jan. 21, 1766.

Quince, the fruit of a species of *Pirus* (*P. cydonia*), a member of the rose family. The species is sometimes regarded as entitled to separate generic rank, and is then called *Cydonia vulgaris*. It is said to be a native of northern Persia, but is naturalized throughout the northern hemisphere. There are only

three principal varieties of quince in cultivation, namely, those in which the fruit is apple-shaped, those in which it is pear-shaped, and the so-called Portugal quince, which has very large fruit.

QUINCE.

Quin'cy, the third city in Illinois and county seat of Adams county, is on the Mississippi river near the fortieth parallel of latitude, and was founded in 1822 by John Wood. It has steadily grown into a manufacturing city of considerable importance. Among the many manufactured articles are stoves, farm implements, incubators, metallic wheels, stationary engines and engine supplies, furniture, clothing, carriages, paving and building brick, lumber and lime. In addition to several railroad lines, the city has advantage of the river transportation. The public institutions include a free library of 22,000 volumes, a fine courthouse, soldiers' and sailors' home, hospitals, churches, government building and many beautiful parks. The city has thirteen public school buildings with an enrollment of 5,000, twelve parochial schools with an enrollment of 2,500, two large business colleges and several private schools. The city is noted for its beautiful shade trees, paved streets and healthful situation on a bluff above the river. Population 36,252.

Quin'cy, Josiah, an American lawyer, was born at Boston, Feb. 23, 1744, and died at sea, off Gloucester, Mass., April 26, 1775. After graduating at Harvard, in 1763, he studied law. He took a strong stand against the oppressions of the parliament of the mother country and its violations of the rights of the colonists, and his name is associated with those of James Otis and Joseph Warren as men who had most influence in bringing about the Revolution. Although Quincy had a slender frame and ill-health, his gift of oratory, heightened by a voice of rare beauty and compass, and an impassioned and graceful delivery, had great weight in public assemblies. When Captain Prescott and the soldiers who fired on the people in the Boston massacre of March 5, 1770, were arrested, Josiah Quincy and John Adams were applied to in their behalf to act as their counsel, and, although they earned great reproach by doing so, the acquittal of the prisoners on trial the next autumn justified their course. In May, 1774, he published his chief political work, *Observations on the Boston Port Bill, with Thoughts on Civil Government and Standing Armies.* In September, 1774, he went to England on a private mission for the popular cause, as well as for his health. This visit excited much notice in London. He had interviews with Lords North and Dartmouth at their own request, had intercourse with Dr. Franklin and other friends constantly, and received the most bitter personal abuse from Lord Hillsborough. He returned early in the spring, against the advice of his physician, and died just before arriving. Almost his last words were that he could die content if he had an hour's talk with Samuel Adams or Joseph Warren. See his *Life*, by his son, Josiah Quincy (1820).

Quin'cy, Mass., an historic town and seaport of Norfolk county, on the Quincy river and bay, 8 miles south of the city of Boston. It is notable for its extensive shoe manufactories, and its large granite quarries in the neighborhood. It has a number of fine parks, some excellent schools and academies, public library (The Thomas Crane library), together with other civic and social institutions. It is served by the N. Y., N. H., and Hartford railroad. Quincy was the birthplace of the three early American statesmen, John Hancock, John Adams, and John Quincy Adams. Population 23,899.

Quinine (*kwī-nēn*, or *kwī-nīn*), is an alkaloid present in the bark of numerous species of cinchona and in one species of remigia, its yield varying from 1½ to 8 per cent. Quinine is obtained from the powdered bark by treating it with lime, and then extracting the mixture with alcohol, neutralizing with an acid so as to obtain a salt of quinine, and finally purifying the product. Preparations of quinine, especially the sulphate, are largely used in medicine.

Quinoa (*kwī-nō'a*), a valuable food-plant, a native of Chile and the high tableland of Mexico. In these countries it is much cultivated for its seed, which forms a principal food of the inhabitants. The meal made from some varieties of the seed has a somewhat peculiar flavor, but it is very nutritious, and is made into porridge and cakes.

Quintil'ian, M. Fabius Quintilianus, was born about 35 A. D., at Calagurris, in Spain, and attended the lectures of Dimitius Afer in Rome. After 59 A. D., however, he revisited Spain, whence he returned to Rome in the train of Galba and began to practice as a pleader in courts, gaining there a considerable reputation. He was more distinguished as a teacher of oratory, however, and his instructions were eagerly sought after, his pupils, including the younger Pliny and the two grand-nephews of Domitian, who conferred on him the title and insignia of consul. After twenty years of labor as advocate and teacher, he retired to private life and died about 95 A. D. His reputation rests securely on his great, but mutilated, work, entitled *Institutions of Oratory*, a complete system of rhetoric. It was written after he had ceased to be a teacher, and was the fruit of two

years' labor, as he says in his preface. The best edition of Quintilian's work is that of Burmann; of the *Institutione Oratoria*, those by Spalding, completed by Zumpt and Bonnel.

Quipu (*kē'pō*), the language of "knotted cords" which was used by the Incas of Peru previous to the conquest of their country by the Spaniards. A series of knotted strings was fastened at one end to a stout cord; the other end hung free. This was used for the purpose of conveying commands to officers in the provinces, and even for recording historic events.

Quito (*kē'tō*), the capital of Ecuador, lies in 0° 14′ south latitude, on the east side of the great plateau of Quito, at the foot of the volcano of Pichincha, at an elevation of 9,351 feet above the sea. Its site, cut up with numerous ravines, is very uneven; but the streets are laid out regularly at right angles, plunging into and scaling the sides of the valleys which come into their course. The city is well paved, but the sidewalks are very narrow; and the streets are lighted only with candles or kerosene lamps — oftenest those placed before shrines at the street corners. The appearance of Quito is very picturesque, with its beautiful mountains on every side. This, together with its clear, healthy, and temperate climate, maintaining a perpetual spring, makes it one of the most charming cities of South America; yet the abrupt changes from the hot sun of midday to the chills of evening make pneumonia and diseases of the chest very common. The principal houses are built of stone, the others of adobé, or sun-dried bricks, covered with tiles. In the great square stand the quaint cathedral, with its green-tiled dome, the archbishop's palace, the municipal building, and the capitol, built of brick and stucco, with the two halls of congress on the third floor. Other public buildings include the university, a seminary, an institute of science, an observatory, a museum, a library of 20,000 volumes, a penitentiary, a hospital, a lunatic asylum, a retreat for lepers, a score of churches, and three times as many monasteries. Most of these last are in a dilapidated condition, for which it is hard to find any reason but laziness; for they still retain their lands and revenues, and the offerings of the faithful, who are nearly all Indians, are as constant as ever. Indeed, Quito is the paradise of priests, of whom there are more than 400 in the city, and the bells are jangling all day long; for Ecuador is the most faithful province of the pope, and the one state in the world which still refuses to recognize the unity of Italy, and the condition of affairs which resulted from the occupation of Rome. There are only two or three good stores and no hotels; the daily market in the square before the monastery of San Francisco is the general purchasing place, and the religious houses serve for hotels. Quito was founded in 1534, and has suffered frequently from earthquakes. Population about 80,000, mainly Indians and Mestizoes (half-Spanish or Creole and half-Indian).

R

Rabat (*rȧ-bȧ'*), also called New Sallee, a seaport city of Morocco, Africa, is situated on the south side of the Bu-Regreg, where it empties into the Atlantic ocean. The most conspicuous object in the town is the tower of Beni-Hassan (180 feet high); and near it is the ruined mosque of Almanzor, originally intended to be the largest in the world. Formerly Rabat was the center of the European trade with Morocco; but owing to the silting up of the mouth of the river, its commerce has greatly declined. Its chief exports are goat and sheep skins, hides, wool, almonds, wax, and gum. Population 26,000.

Rab'bi, an honorary title applied to teachers and masters of the Jewish law, being in common use in the time of Christ, who was frequently addressed as such by his disciples. Other forms of the same title are *Rab*, "master," *Rabbān*, "our master," and *Rabboni*, "my master."

Rab'bit, a rodent with long ears, belonging to the same genus as the hares. The distinction between the rabbit and the hare is indefinite and shadowy. The smaller burrowing varieties are usually called rabbits, and the larger ones, and those that do not construct a burrow, are called hares. They feed on grass, herbs, and tender bark. Those kept in captivity will eat nearly all kinds of vegetables and at times should be given dry food, like shelled corn. The tame rabbits have been modified and varied by selection and breeding. They multiply rapidly, having from four to eight litters a year. The young rabbits are naked and blind at birth, and are cared for in the burrows. They were introduced into Australia about the middle of the 19th century, and into New Zealand in 1860. They multiplied till they were a great menace to the crops of the farmers and to vegetation in general. The government offered a bounty for their skins, and in a single year more than twenty-five millions were killed in New South Wales alone. Their skin is of little value, but their hair has been used in making the body for felt hats. See HARE.

Rabelais (*rȧ-blȧ'*), **Francois,** the greatest of French humorists, was born, according to the general statements of biographers, in 1493, but more probably a few years later, near Chinon, a small town in Touraine. At the request of his father, he became a brother of the order of St. Francis in the convent of Fontenay-le-Comte about the year 1519, and at once devoted himself with the utmost ardor to his hitherto neglected studies. To medicine in particular he seems to have been strongly attracted, and, in addition to the Latin and Greek languages, he is said to have mastered Italian, Spanish, German, Hebrew, and Arabic. Charged with heresy on account of his devotion to learning, he left the convent, and later was in turn a monk of the order of St. Benedict, lecturer in the university at Montpellier, and canon of Cardinal Bellay's abbey near Paris. He died at Paris, April 9, 1553. Rabelais' great romance, in which are narrated the adventures of Gargantua and Pantagruel, continues to held its rank as a masterpiece of humor and grotesque invention. In the form of a sportive and extravagant fiction, it is a pointed criticism of the corrupt society of the period, the follies and vices of which are pictured with marked ingenuity and effect; but, at the same time, on account of its free tone and plainness of speech, few books are less suitable for general perusal.

Raccoon (*rȧk-koon'*), a tree-climbing, nocturnal animal, belonging to the bear family and restricted to North and South America. The common "coon" of the United States is widely distributed. It has a stout clumsy body, about two feet long without the tail, which is about a foot in length. The long coarse hair of the body is grayish brown and the tail is ringed with black and white. It has a broad head and a pointed muzzle, and the face is crossed by a dark band which includes the eyes. The home of the animal is usually high up in the hollow of a large tree; here it rests by day and hibernates through the severe winter weather. It is active at night, and, during the season of young corn, is often very destructive to the green ears. Besides corn, in season, its usual food is fish, crayfish, and various mollusks, though it also eats mice, insects, fruits, small birds, eggs, etc. It has the curious habit of washing or dousing its food repeatedly in the water, and by the Germans is called the "wash-bear." The common raccoon of South America is called the crab-eating raccoon. A coon hunt on a moonlight night, with torches and dogs, is a common form of sport in the United States.

COMMON RACCOON.

Ra'ces of the World. The most general division of the human family is into five great races: the Caucasian, the Mongolian, the Malay, the Ethiopian, and the American. The Caucasian race is the most numerous and the most widely spread over the earth of all the races. It is distinguished by a fair complexion, a high forehead and straight hair,

and beard varying in color. This race is dispersed over nearly the whole of Europe and North America, Northern Africa, and large areas in Asia, Australia, and southern Africa. It leads the other races in literature, commerce, and all the arts of civilization. The Mongolian race has a yellowish complexion, small eyes, prominent cheekbones, and rather coarse black hair. It comprises the Chinese, the Japanese, the Turks, and many other nations in Asia, together with the Magyars of Hungary and the Esquimaux of North America. The Malay race has a dark-brown complexion, with a skull like the Caucasian; a flat face like the Ethiopian; and straight dark hair like the Mongolian. This race is found in Madagascar, Australia, the islands of the Pacific, and in the Malay peninsula in Asia. The Ethiopian, or African, race has a black complexion, a rather low forehead, a broad, flat nose, thick lips, thin beard, and woolly hair. It inhabits the greater part of Africa, although it has several million representatives in North America. The American race (Indians) has a red or copper-colored skin, high cheek bones, coarse, black hair, and scanty beard. It is found in certain portions of North America and South America. The population of the world may be estimated in round numbers at 1,500,000,000, of which more than 1,000,000,000 belong to the Caucasian and Mongolian races. Various divisions and sub-divisions of these races have been made by ethnologists during the last twenty-five years.

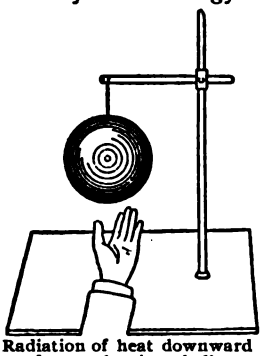
Ra'chel, properly **Elisa Rachel Felix,** the great French tragic actress, was born of Jewish parents at Mumpf, in the Swiss canton of Aargau, March 24, 1820. She had her first lessons in singing at Paris about the year 1830, when her parents took up their residence in that city, and in 1838 appeared as "Camille" in *Les Horaces* in the Théâtre Français. From this time forward she shone without a rival; and the furore excited in Paris in 1848 by her recitation of the *Marseillaise* will continue to connect her name with the revolution of that year. In 1849, she made the tour of the French provinces, and afterward visited London, St. Petersburg, Berlin, and other great cities of Europe, everywhere meeting enthusiastic admiration and applause. In 1855, while on a professional visit to America her health gave way, and she returned home utterly prostrated, her death taking place at Cannes, near Toulon, Jan. 3, 1858. As an artist, within the limits prescribed by her genius, Rachel has never been surpassed. No language can give an idea of the force and intensity which characterized her rendering of passion. Her *Phèdre*, by common consent her masterpiece, was the very incarnation of agony, not to be forgotten by anyone who ever heard it. "She does not act — she suffers," a fine critic has observed of her. But in spite of her great genius she was never tenderly loved, being grasping and avaricious. She left a large fortune, besides the amounts lavished upon her family during her life.

Racine', Wis., is a prosperous manufacturing city, having a population of 29,102, situated at the mouth of Root river, 23 miles south of Milwaukee. Being situated on a bluff, fifty feet above the waters of Lake Michigan, gives the city of Racine an excellent drainage, as well as a beautiful view of the lake.

Racine is noted for the manufacture of wagons, thrashing machines, boots and shoes, boilers, engines, boats, and malleable iron. There are three banks, a public library, and an excellent system of public schools.

Racine (*rä-sēn'*), **Jean Baptiste,** the greatest dramatic poet of France, was born at La-Ferté-Milon, in the modern department of Aisne, in December, 1639. His parents dying when he was very young, he was cared for by his maternal grandfather, being sent first to the college Beauvais and afterward to Port Royal, at which latter place he studied diligently under such masters as Claude Lancelot, Nicole, and La Maitre. At the age of nineteen he left Port Royal to pursue a course of philosophy at the collège d'Harcourt, where he appears to have first felt the attractions of a life devoted to letters, and to have become intimately acquainted with various actors and actresses. Racine's earliest play was acted by Molière's company at the Palais Royal théâtre, in June, 1664, and in the same year he received from the king a pension of 600 francs for a congratulatory ode. The next fifteen years Racine devoted to writing plays and produced a number of works, all of which bore the stamp of very high, if not the highest, genius. His last production, *Phèdre*, which appeared in 1677, was the one in which Rachel's genius, in the 19th century, reached its highest manifestation. After this Racine professed conversion and married a noble woman, who bore him two sons and five daughters. Besides the income derived from his works, he filled a number of profitable offices under the king, and divided his time between the duties of these offices and the practice of various religious exercises. In his later years he wrote a memoir on the miseries of the people at which the king is said to have expressed his displeasure in words that broke the heart of the courtier-poet, and doubtless hastened his death. He wrote a long letter to Madame de Maintenon to clear himself of the charge of Jansenism; but in recounting the miseries of the French people he had committed an offense which such a monarch as Louis XIV. could not forgive, and he never recovered the royal favor that appeared so very dear to him. His chief writings are *Esther*, *Athalie*, *Phèdre*, *Bajazet*, and *Iphigénie*. He died at Paris, April 21, 1699, and was buried according to his own request at Port Royal.

Radia'tion, one of the fundamental processes by which energy is transmitted from one point to another. The word is sometimes used also to denote the quantity of energy transmitted as well as the process. If one considers the incandescent carbon filiment of an ordinary electric lamp and holds his hand under either at the side of or underneath it, the sensation of heat is distinctly recognized. The same is true when the hand is placed some inches underneath a heated ball which is not emitting any light at all. The query arises as to how the heat gets from the ball down to the hand. It is certainly not by conduction, for air is one of the very poorest of conductors. Nor can it be by convection, for convection currents heat only the regions above the lamp or ball. Now it has been proved by elaborate series of experiments, extending over the entire 19th century, and performed by Herschel, Prevost, Carnot, Melloni, Balfour Stewart, Kirchhoff, Hertz, and others, that this "something" which passes from the ball to the hand behaves exactly as light waves behave in nearly all particulars. It travels with the same speed as light, can be polarized as light, can be reflected and refracted as light, etc. The unavoidable inference is, therefore, that that which we call heat in the ball and heat after it is received by the hand is *not* heat while traveling from the ball to the hand, but is a wave motion in the ether just as light is, the principal difference being that the heat waves are longer than the light waves. This is a process known as *radiation*, and the energy thus transmitted, whether in the form of long heat rays, or luminous rays, or so-called actinic rays, or electrical vibrations, is all grouped under the head of *radiant energy*. The student should distinguish carefully between *heat*, which is the energy of motion resident in atoms and molecules of ponderable matter, and radiant energy as defined above. See Balfour Stewart's *Treatise on Heat*.



Radiation of heat downward from a hot iron ball.

Radiometer (*rā-dĭ-ŏm'ĕ-tĕr*), an interesting device discovered by Sir William Crookes in 1873, while determining the atomic weight of the then recently found element, *thallium*. In the form in which Crookes left it, the essential features are a windmill of four light mica vanes placed in a glass bulb B from which the air has been very completely, but not too completely, exhausted. The proper degree of exhaustion is that in which the mean free path of the molecules is a little greater than the perpendicular distance from one of the vanes to the wall of the glass bulb. As shown in the figure, the vanes are blackened on one side, and when sunlight or even lamplight is allowed to fall on the instrument the vanes showing the blackened sides are more heated than the others, and hence the molecules between the blackened vanes and the glass wall bombard the vanes away, giving rise to the rotation indicated by the arrow in the figure.

RADIOMETER.

Only recently the radiometer has been made an instrument of precision, principally through the labors of Prof. E. F. Nichols of Dartmouth college. For a description of this instrument, see *Astrophysical Journal*, March, 1901, pp. 101–41.

Radiomicrometer (*rā'dĭ-ō-mī-krŏm'ĕ-tĕr*), an instrument of marvelous sensibility for detecting radiation. It consists essentially of a thermoelectric couple suspended between the poles of a strong permanent magnet. The thermoelectric couple is a part of a short electric circuit, all of which is freely suspended. When one junction in this circuit is exposed to radiation, an electric current is produced and the suspended coil rotates exactly as does the coil in an ordinary D'Arsonval galvanometer. (See article *Galvanometer*.) To the suspended coil is attached a mirror by which this rotation may be measured. The instrument in its present form was suggested by D'Arsonval, and perfected by C. V. Boys, in whose hands it has been made so sensitive as to detect the radiation of a single candle at a distance of two miles. For its use as an instrument of precision, see article by E. P. Lewis in *Astrophysical Journal*, June, 1895, pp. 1–25.

Rad'ish, a name applied to species of *Raphanus*, a genus of the mustard family, and especially to *R. sativus*, long cultivated, principally for its fleshy roots. It is native to the Old World and many garden varieties have been developed, which may be classed in general as long-rooted and turnip-rooted varieties.

Rae (*rā*), **John,** Arctic traveler, was born at Orkney, in 1813, and, after studying medicine at Edinburgh, went to Hudson bay as physician of the company's ships. In 1845, he undertook an exploring expedition, and in 1846–47 a more extensive one, wintering in Repulse bay. He was second in command, under Richardson, on a Franklin search voyage in 1848; and five years later commanded an expedition that proved King William's Land to be an island. In his journeys, he

traveled more than 1,800 miles over regions that had never before been explored. He died at London, July 24, 1893.

Rag'lan, Lord (**Fitzroy James Henry Somerset**), a British general, was born Sept. 30, 1788. He entered the army in his sixteenth year, and after serving on the staff of the Duke of Wellington in the Copenhagen expedition and the Peninsular war became his secretary in 1812. He lost his right arm in the battle of Waterloo; and for his brilliant services in that campaign he was made a K. C. B. In September, 1852, he was made master-general of the ordnance, and a month later was called to the house of peers as Baron Raglan. When war was declared against Russia, in 1854, Lord Raglan was appointed commander of the English forces in the Crimea, and at the desperate battle of Inkerman, he won the baton of a field-marshal. The siege of Sebastopol continued until June 18, 1855, when a general assault was ordered, at which both English and French troops suffered terrible losses. Raglan had a slight attack of cholera, and this disaster weighed so heavily on his mind that he died a few days later, June 28, 1855. See Kinglake's *Invasion of the Crimea.*

Rag-stone, an impure limestone, consisting chiefly of lime and silica, much used for whetstones and building material.

Ragusa (*rȧ-gōō'sȧ*), a decayed city of Dalmatia, Austria-Hungary, stands on the east shore of the Adriatic, opposite the gulf of Manfredonia in Italy. For several centuries Ragusa was a Roman outpost on the edge of the Slav states, and flourished greatly under the protection of the Byzantine empire. Toward the end of the 12th century, she was made to acknowledge the supremacy of Venice, although allowed many of the privileges of a separate state. At the beginning of the 15th century, she became an independent republic, and at the same period began to take a prominent place among the trading powers of the Mediterranean. In 1806, Napoleon declared the republic of Ragusa at an end; and since 1814 it has belonged to Austria and is fortified by her. Population 12,000.

Raikes, Robert. See SUNDAY SCHOOLS.

Rail, any one of a group of shore birds found in marshes. They have the habit of skulking, instead of taking to wing when pursued, and, therefore, are more frequently heard than seen. They are birds with slender bills, and long powerful legs. They are united with the coots into one family, but the toes of the rails are completely divided, those of the coots are lobed. The Carolina rail, or sora, is the most common one in the United States. It is found in the whole of temperate North America, but is more abundant east during migration, as it breeds chiefly in the northern part of its range. It is about eight and one-half inches long, with the upper parts olive brown, streaked with black; the breast is slaty and the belly white. The Virginia rail is also common. The king-rail, or fresh water mud-hen, is the largest and finest of the American true rails, being about seventeen

RAIL.

inches long. It is common in some sections of the United States. The yellow and the black rails are less common. The common water rail of Europe is found in marshy districts of the British Isles and many parts of Europe. Like the American rails, it nests in the grass.

Rail'roads. The origin of these mighty agents of commerce and civilization may be traced to a contrivance for carrying coal from the mines in Northumberland and Durham, England, to the places of shipment on the Tyne and Wear, which consisted of two parallel lines of wooden beams or trams fixed to the ground and furnished with flanges to prevent the wheels of vehicles from slipping aside. The date of the invention of these tramways is not certain, but it may be safely referred to the first half of the 17th century. The first step in improvement, which was covering the wooden beams with long strips of iron, was taken about the year 1700; and a second and more important improvement which followed some years afterward was the substitution of cast-iron rails fixed on wooden sleepers laid crosswise. This species of railway became pretty general in mining districts during the 18th century; but on account of the opening of canals, and other causes, was not considered practicable as a general means of travel and transportation. After the introduction of cast-iron rails, instead of a single wagon, the plan of linking together several smaller wagons was adopted — the germ of the modern railway train. The next improvement consisted in putting flanges on the wheels instead of the rails, which secured much greater facility of transit. But as no more rapid or powerful means of locomotion had been invented than horse-power, many persons labored to devise some sort of steam apparatus for the purpose. The merit of inventing a self-acting steam carriage is due to Richard Trevethick, who, in the year 1802, took out a patent for a steam locomotive which successfully performed the duty of drawing wagons on rails. Trevethick's in-

vention, however, was too imperfect to come into general use, and for a few years little or no improvement was made upon it, chiefly on account of the mistaken notion among engineers that the steam locomotive could not be made to draw a heavy load or acquire great speed unless it were provided with cogged wheels to work on a corresponding rack along the rails. That locomotives with smooth wheels running on smooth rails could draw heavy loads even up a moderate incline was established as a fact by Mr. Blackett, a coal proprietor on the Wylam railway, in the year 1811; and nothing was now lacking but the means of obtaining speed.

Locomotive power was first employed by George Stephenson, in 1814, on the Killingworth railway, and with such success that it was afterward applied on the Stockton and Darlington railway, which was the first railway in which carriages for passengers were used; but for some time its trains could not be made to move much faster than a walking horse. This difficulty was at length overcome by Stephenson after a number of experiments, by sending the waste steam up a chimney, so as to cause a powerful draught in the fire. A rapid generation of steam was the result, and from this device, in connection with the multitubular boiler, the locomotive of the present day, with its wonderful power and energy, has been derived. But it was some time before the public mind could be brought to consider the question of the general use of railways, and it was not until 1830 that the line from Liverpool to Manchester was formally opened.

The first railroad constructed in the United States was in 1826, and was for the purpose of carrying granite from the quarries near Quincy, Mass., to tidewater, a few miles distant, and in the next year the legislature of Maryland chartered the first railroad company authorized to do a general business in carrying freight and passengers. This was only a little over seventy years ago, and such has been the progress in railway enterprise in that period, especially since the close of the Civil war, that in 1900 there were 190,833 miles of railroad in the country, representing a total capital of about $12,000,000,000. The total railroad mileage of the world has been estimated at 395,000 miles, and the value of all the roads at $35,000,000,000. The mileage of the principal countries in round numbers is as follows: Austria, 20,908; France, 25,673; Germany, 30,000; Great Britain and Ireland, 22,000; Italy, 9,714; Russia, 27,000; Spain, 8,000; Switzerland, 2,260; India, 21,000; Canada, 16,684; Sweden, 6,315; Belgium, 3,667; Japan, 2,504; Mexico, 9,027; Argentine Republic, 10,595; Brazil, 8,718; Chile, 2,841; United States, 190,833.

The longest continuous railway line on the American continent is that of the Canadian Pacific railroad; its main line, from Montreal to Victoria, B. C. is 2,990 miles. The new located Russian Siberian line will have a mileage of 4,775 miles, and with its feeders and branches through Manchuria to Port Arthur will have an estimated length of 6,000 miles.

Rain is caused by whatever lowers the temperature of the air, and causes a part of the watery vapor, with which it is saturated, to assume the liquid state. Various causes may conspire to effect this object, but the most important of these originate in winds and other movements of the atmosphere. The more important principles regulating the relation of the winds to the rainfall are: (1) When the winds have traversed a considerable extent of the ocean before reaching land, the rainfall is large; (2) when the winds on arriving at the land advance into higher latitudes or into colder regions, the rainfall is greatly increased because the air is brought below the point of saturation more rapidly; (3) if the winds, on arriving at the land, at once advance into warmer regions, the rainfall is small; (4) if the winds travel across a range of mountains, the rainfall is largely increased on the side facing the winds, but reduced on the other side. There are certain places on the earth where the rain rarely or never falls, such as the coast of Peru in South America, the great valley of the river Colorado in North America, the desert of Sahara in Africa, and the desert of Cobi in Asia; while, on the other hand, in such regions as Patagonia it rains nearly every day. In all places within the tropics where the trade winds are blowing regularly and constantly, rain is of very rare occurrence, the reason being that as these winds come from a higher latitude their temperature is increasing, and consequently they take up moisture rather than part with it; and the return trade winds, which blow above them in an opposite direction, having previously parted with their moisture, are dry and cloudless. When, however, these winds are forced up mountain ranges, as is the case on the east of Hindustan, they bring rain, which falls chiefly during the night, when the earth is coolest. In respect to the rainfall Europe may be divided into two distinct regions — western Europe and the countries bordering on the Mediterranean. As the southwest winds, which are the return trades, descend to the earth and blow over the surface of Europe, it follows that the western parts, especially where mountain ranges stretch north and south, are rainy districts. Hence the rainiest regions of Europe are Norway, Ireland, the west of England and France, and Spain and Portugal. On the coasts of the Mediterranean it rarely rains in summer, but frequently in winter. In Italy the quantity diminishes as we approach the south; and south of the Alps six times more rain falls with the northeast than with the southwest winds, the exact reverse of the case in England.

The manner of the distribution of rain in the United States is very different from what it is in Europe. The Rocky mountains in Central America are so high as to present an effectual barrier to the passage of the trade winds which blow over the gulf of Mexico, by which means they are turned northward and spread themselves over the country, especially the low basin of the Mississippi. When they have blown for some time vast accumulations of heat and moisture take place, and sometimes great storms arise in consequence, sweeping eastward across the land, and in many cases crossing the Atlantic and descending with violence on western Europe. It appears, in short, that the south winds from the gulf of Mexico spread the moisture over the country, and the northwest winds separate this moisture from them by getting below them and forcing them into the higher regions of the atmosphere. As a consequence of this the heaviest rainfalls are in the valleys and the lightest on higher grounds. Thus the greatest amount of rain falls in Florida, the low flats of the Mississippi, and along its valley, and the least quantity on the Alleghanies, especially on their higher parts, and on the high grounds of the Missouri river. In the northern states the quantity diminishes considerably, and the mode of its distribution is more similar to that of Europe.

Rain'bow, an optical phenomenon of great beauty appearing in the sky when rain is falling from clouds opposite the sun. It consists of a number of concentric arcs whose successive colors are arranged in the same order as the colors of the solar spectrum. There are usually two bows, an upper and a lower. The lower one is always the brighter and is called the *primary* bow; the upper is often very faint, and is called the *secondary* bow. In the primary the colors begin with red at the top and end up with violet at the bottom; in the secondary the order is just reversed.

The explanation of the rainbow was first given by Antonio de Dominis, archbishop of Spalatro, about 1600 A. D., who showed that a glass sphere filled with water would reflect a parallel incident beam of light in such a way as to produce a complete rainbow on a screen surrounding the source of light; but this explanation was, of course, incomplete until Newton proved that color is not produced at the refracting surface, but is due to the decomposition of white light. This experiment of De Dominis can be repeated by going into the "Cave of the Winds" at Niagara Falls where on a bright day the parallel incident beam and the complete rainbow of 360° are easily obtained, the particles of spray replacing the glass bulb filled with water. The primary bow is produced by rays which have undergone *one* internal reflection; the secondary by rays which have suffered *two* internal reflections. The angular width of the primary bow is twice 42° 2′ for the red rays; and twice 40° 17′ for the violet rays. The corresponding angle for the red rays of the secondary bow is 50° 57′; and for the violet rays 54° 07′. For the details of the reflections and refractions here occurring, see any good textbook of physics, such as that of Watson (Longmans & Co., 1899).

Rain-Gauge, an instrument employed by meteorologists to measure the depth of water deposited by rain during any assigned period. In its ordinary form it consists of a funnel, with a mouth of known area, for collecting the rain water in a graduated glass vessel where its mass can be easily determined. Knowing the mass of water precipitated and the area over which it was distributed, the depth may be easily calculated. Several forms of self-registering rain-gauges have been devised, for which see any good treatise on meteorology.

Rain'y Lake, a lake forming part of the boundary line between the Canadian Dominion (province of Ontario) and the United States. It lies 100 miles west of Lake Superior, and is about 55 miles in length. It discharges its waters through Rainy river into Lake of the Woods.

Rai'sins, dried grapes of various kinds and well known in the market. The raisin industry has been long developed in the Old World, but has recently become an important industry in California.

Raleigh (*raw'lĭ*), the capital of North Carolina, named after Sir Walter Raleigh. It is situated on the Neuse river, a little less than 200 miles from Richmond. It is built on an elevated site, with a central Union Square, from which four principal streets radiate, each 100 feet wide. In the square stands the state capitol, a large granite building, costing over $500,000. The city also contains other state institutions and various manufactories. Population 13,643.

Ra'leigh, Sir Walter, was born at Hayes, Devonshire, England, in 1552. He entered Oriel college, Oxford, in 1566, but left in 1569, without taking a degree, to serve in the Huguenot cause in France. In 1580, he distinguished himself in the suppression of the Irish rebellion in Cork, and two or three years afterward was introduced to court and became a favorite of Queen Elizabeth. Raleigh's tall and handsome figure, his dark hair, lofty forehead, resolute bearing, alert expression, and spirited wit, combined to form an imposing personality, and all the advantages that nature had given him were heightened by a gorgeous splendor in dress and jewels. But as he was proud, haughty, and impatient, he made for himself a host of enemies, and was never fully admitted to the queen's counsels in reference to matters of state. The playful name of "Water," which she applied to him,

would indicate that she appreciated that instability of character which was his great fault, and which in the end worked his ruin. She, however, lavished numerous favors upon him throughout her reign, permitting him to send out and command various expeditions to the New World. His vessels scoured the seas in privateering enterprises, which at once gratified his inborn hatred of Spain and helped to provide the means for his various ventures in Virginia. Raleigh was in Ireland when the Invincible Armada appeared in English waters; but he hastened to the south of England to superintend the coast defense, and was present with the fleet throughout that week of toil and triumph. In June, 1596, he sailed in the expedition under Howard and Essex to Cadiz, and it was his counsels that governed the whole plan of action that for a second time shattered the naval power of Spain. Raleigh continued to enjoy the favor of Elizabeth until her death, in 1603; but James I. came to the throne with deep-seated prejudices against the gallant courtier, and in a short time stripped him of his various offices. Raleigh was also arrested and tried for taking part in a conspiracy against the king's life, the only witness against him being the miserable Lord Cobham, who made and unmade his eight different charges with such facility as to make them of no value at all. "But one thing," says Kingsley, "comes out of the infinite confusion and mystery of this dark Cobham plot, and that is Raleigh's innocence." He was, however, condemned to death, and only on the scaffold was his sentence commuted to imprisonment for life. After remaining in prison for thirteen years, Raleigh was released for the purpose of leading an expedition to the Orinoco river, in search of a gold mine, which he said existed there. He pledged himself not to come into collision with Spain; but some of his men, while he was sick aboard his ship, attacked a Spanish village and burned it to the ground. Raleigh returned to England without finding the mine, and was rearrested and executed under the sentence which had never been revoked. The speech he made on the scaffold was a masterpiece of eloquence. "As he stood there in the cold morning air," says Mr. Gosse, "he foiled James and Philip at one thrust, and conquered the esteem of all posterity." He asked to see the axe, and touching the edge, said: "This is a sharp medicine, but it is a sure cure for all diseases." He was executed at London, Oct. 29, 1618.

Ram, an ironclad ship, with a heavily-armored stem, projecting in the form of a beak below the water-line, intended to run into and sink an enemy's vessels. In action, the ram is propelled at full speed against her antagonist, and if she succeeds in striking her fairly, the blow is supposed to be sufficient to crush in her side and sink her immediately. The ram was first employed during the late Civil war in the action at Norfolk roads, in 1862, when the Federal frigate *Cumberland* was sunk by the Confederate ram *Virginia.*

Rama (*rä'mä*) is, in Hindu mythology, the name common to three incarnations of Vishnu, of Parasurama, Rama-chandra, and Balarama. See VISHNU.

Ramadan', the ninth month of the Mohammedan year. It was in this month that Mohammed received his first revelation, and every believer is therefore enjoined to keep a strict fast throughout its entire course from dawn to sunset. Eating, drinking, and all bodily pleasures are forbidden during the day, and even when obliged to take medicine the Moslem must make some amends for the privilege, such as spending a certain sum of money upon the poor; but during the night the most necessary wants may be supplied. The principal passages of the Koran relating to the fast of Ramadan are treated of in the second book, called *The Cow.*

Ramayana (*rä-mä'ya-na*) is the name of one of the two great epic poems of India, the name of the other being *Mahdbhdrata.* Its subject-matter is the history of Ráma, and its reputed author is Valmiki, who is said to have taught his poem to the two sons of Ráma. Although the statement is doubtful, it is certain that Valmiki was a real personage, and that the *Rámáyana* was not, like the *Mdhdbhdrata,* the creation of different minds at various epochs. As a poetical composition, the *Rámáyana* may safely be called the great poem of India.

Rameses (*răm'e-sēz*), the name of several Egyptian monarchs, of whom two, the first and the second, were especially famous. It is usual to identify the warrior-king Rameses II. with the Pharaoh who oppressed the children of Israel so sorely, and Rameses III. with the Pharaoh of the Exodus, although there is considerable difficulty in the identification. The mummy of Rameses II. was found in 1881, and that of Rameses III. in 1886.

Ramillies (*rā-mē-yē'*), a village of Brabant, Belgium, is memorable as the place near which, on May 23, 1706, the French forces under Villeroy and the elector of Bavaria, were defeated by Marlborough. This victory compelled the French to give up the whole of the Spanish Netherlands.

Ram'say, David, an American physician and historian, was born in Lancaster county, Pa., April 2, 1749, and, after graduating at Princeton college, studied medicine, and entered upon the practice of that profession at Charleston, S. C., two or three years before the Revolutionary war. After the capture of Charleston by the British, he was kept by them as a hostage at St. Augustine for nearly a year; and at the close of the war was chosen

a member of the Continental congress. Besides a number of medical essays and other works, he published a *History of South Carolina*, and a *History of the American Revolution*. Dr. Ramsay was a member of the South Carolina legislature for several years before his death, which took place at Charleston, S. C., May 8, 1815.

Ram'say, Nathaniel, a soldier of the Revolution, was born in Pennsylvania, May 1, 1771, and after graduating at Princeton college, was admitted to the bar and practiced law in Cecil county, Md. He entered the army early in the Revolutionary war, and was in command of a Maryland regiment at the battle of Monmouth, when General Lee's retreat seemed so likely to result in the rout of Washington's entire command; and when Washington arrived upon the field and proceeded to reform the troops, Ramsay rendered important service in holding the British in check, although at the loss of nearly all his command, a service for which he was highly commended and gratefully remembered by Washington. He died at Baltimore, Oct. 23, 1817.

Ramsey (*răm'zi*), **Alexander,** ex-United States senator, and ex-governor of Minnesota,

ALEXANDER RAMSEY.

was born near Harrisburg, Pa., Sept. 8, 1815, where, after studying law, he began to practice in 1839, and took part in the following year in the Harrison and Tyler campaign. In 1843, he was elected to congress in the Whig interest; from 1849 to 1853, he was governor of Minnesota territory, and again served Minnesota from 1859 to 1863, when it had become a state. He was at one time also mayor of St. Paul, and from 1863 to 1875 United States senator. In 1879, he became secretary of war in the Hayes administration. He has since acted as a member of the Utah and other commissions.

Ranch'ing, the business of cattle-raising in the unsettled regions of the west. The name is derived from the Spanish *rancho*, "mess," or "messroom." The special feature of ranching is that cattle are kept in a half-wild state, being allowed to range over a great deal of ground, such pasture as they can find being their only food. The life of ranchmen, or "cowboys," as they are generally called, is not as wild and free as it once was, but still has great charms for many different classes of young men.

Ran'dall, Samuel J., American statesman, was born at Philadelphia, Pa., Oct. 10, 1828, and after spending a number of years in mercantile business in his native city, was elected to congress as a Democrat in October, 1862. He held this position — being re-elected every two years — up to the time of his death, which took place at Washington, D. C., April 13, 1890. After the death of Speaker Kerr, in 1876, Randall was elected speaker of the house of representatives to fill the unexpired term. He was also chosen speaker of the house in 1877 and again in 1879. Throughout his congressional career, Mr. Randall's ability and integrity were conceded by men of all parties, and he was held in the highest esteem by his fellow-congressmen. He was a Democrat of the Protectionist stripe.

Ran'dolph, Edmund J., an American statesman, was born at Williamsburg, Va., Aug. 10, 1753, and after a course of legal study was admitted to the Virginia bar. In 1776, he helped to frame the constitution of Virginia, and became the first attorney-general of that state. He filled the office of governor of Virginia from 1786 to 1788, and was a member of the convention which framed the constitution of the United States. In 1789, he entered Washington's cabinet as attorney-general, and in 1794 was appointed secretary of state, to succeed Jefferson, which office he resigned in the following year on account of some misunderstanding with the President and his colleagues in reference to the Jay treaty. He died in Virginia, Sept. 13, 1813.

Ran'dolph, John, "of Roanoke," was born at Cawsons, Va., June 2, 1773. He was a second cousin of Edmund Randolph, and boasted the Indian Princess Pocahontas among his ancestors. In 1799, being only twenty-six years of age, he entered congress and continued a member of that body, with the exception of two terms, until 1825, when he was chosen United States senator, and occupied a seat in that body for two years, during which period he fought a duel with Henry Clay. In 1830, he was appointed minister to Russia, but returned home in the next year, and in 1832 was once more elected to congress. Before taking his seat, however, he died of consumption at Philadelphia, June 24, 1833, having provided in his will for the freedom of his slaves, some three hundred in number. During Randolph's long public career, he was distinguished alike for wit, eloquence, and eccentricity, and was more talked and written about than any public man of his time; many of his sallies and pungent utterances are still quoted in Virginia and throughout the country.

Ran'dolph, Peyton, was born in Virginia in the year 1723, and after studying law in the city of London, was appointed attorney-general of Virginia by the king in 1748. He was president of the continental congress when it first met at Philadelphia in 1774, but

resigned the position on account of his health. He again took his seat as a member of that body when it reassembled on the 10th of May, 1775, but died at Philadelphia, of apoplexy, in October following.

Rangoon', capital of Lower Burma, is situated on the Rangoon river, about 20 miles from its entrance into the gulf of Martaban. The present city is mostly of modern construction, having been built since the English took possession, in 1852. The town extends along the left bank of the river, the docks being opposite to it at the suburb of Da-la, on the other side of the river. A town has existed on the site of Rangoon since the 6th century B. C., but it was called Dagon till it was taken by the Burmese sovereign, Alombra, toward the end of the 18th century. That prince rebuilt the place, and called it Rangoon. The annual foreign trade of the city exceeds twelve million rupees. Population 190,000.

Ran'jit Singh, founder of the Sikh kingdom in the Punjab of India, was born Nov. 2, 1780, his father being a Singh chief, and the head of one of the twelve military organizations of the Singhs or Sikhs. When he was six years old, his father died; and at an early age he began to show both a desire and capacity to rule. After the Shah of Afghanistan had given him the province of Lahore, he directed all his energies to founding a kingdom which should unite all the Singh provinces under his personal rule. This object, after many severe conflicts, he accomplished, thus becoming the ruler of an extensive territory, with a well-trained army of 70,000 men. In 1836, his army was totally defeated by the Afghans, but this result did not affect his power over any of the territory he had acquired, and his long reign was not disturbed by a single revolt. He died June 27, 1839. He could neither read nor write, yet his signal ability and energy, united with a rare moderation, are without a parallel in Asiatic history.

Ranke (*räng'ke*), **Leopold von,** one of the greatest of German historians, was born at Wiehe, about half-way between Gotha and Halle, Dec. 21, 1795. Although he studied philology and theology at Berlin and Halle, his chief thoughts were directed to history, for the study and writing of which he possessed a rare genius. His historical works, nearly fifty in number, show remarkable skill in grouping events in proper order and placing them before the reader in a clear and vivid manner, so that he can readily see them in connection with all their causes and relations. Although Ranke was over ninety when he died, he could not have accomplished what he did, had he not been a man of such great industry and application, with a marvelous memory and excellent judgment as to the value of historical material. While his style is not brilliant, it is yet sufficiently clear and interesting. Perhaps the most popular of his works is his *History of the Popes*, so brilliantly reviewed by Macaulay, in the *Edinburgh Review* of September, 1840. Ranke continued to lecture in the University of Berlin until 1872, and died there fourteen years later, May 23, 1886.

Ran'som, Matthew Whitaker, United States senator from 1872 to 1895, and United States minister to Mexico (1895–97), was born in Warren county, N. C., Oct. 8, 1826, and educated at the University of North Carolina. In 1852, he was elected attorney-general of his state, and from 1858 to 1862 was a member of its legislature. In the Civil war, he ranged himself on the Southern side, and from lieutenant-colonel he rose to be major-general, and was one of those who surrendered at Appomattox. After this, he served for twenty-four years in the United States senate.

Raphael (*räf'ā-el*) or **Raffaello Santi** or **Sanzio,** called by his countrymen *Il Divino*, "the divine," is ranked by universal opinion among the greatest of painters. He was born at Urbino, Italy, March 28, 1483, and after the death of his father, who was his first instructor, he was placed under Perugino, the most distinguished painter of the period, who was then engaged on important works in the city of Perugia. In 1504, Raphael visited Florence, where he remained until 1508, and then went to Rome on the invitation of Pope Julius II. His celebrated frescoes in the Vatican and numerous important works were then commenced. The works of Raphael are generally divided into three classes: his first style, when under the influence of Perugino's manner; his second when he painted at Florence from 1504 to 1508; and his third style, shown in the works executed by him after he settled in Rome. Each of these styles has its peculiar features and devoted admirers. Those who incline to art employed in the service of religion prefer the first manner, as embodying purity and religious feeling. His last manner, perfected when the taste for classical art and learning was excited by the discovery of numerous works of the classic period, is held by many as correctly embodying the highest art; while his Florentine style is especially admired by some as showing his powers freed from the imitation of Perugino and as yet unaffected by the conventionalism of classic art. In each of these different styles, he has left works of great excellence. He died at Rome, April 6, 1520.

RAPHAEL SANZIO.

Rappahan'nock, a river of Virginia, rises in the Blue Ridge of the Alleghany mountains, and flows in a southeasterly course into Chesapeake bay — its total length being about 250 miles. The chief branch of the Rappahannock is the Rapidan; these two rivers were the scenes of several desperate battles during the Civil war, the most noted being Burnside's repulse at Fredericksburg, in the winter of 1862–63.

Raspberry (*rdz'bĕr-rĭ*), the name of certain species of *Rubus*, the bramble genus and a member of the rose family. Associated in the genus with raspberries are blackberries and dewberries. The original garden raspberries are *R. idæus*, a native of Europe, but it is now said to be almost out of cultivation in the United States. The parent of the black raspberries of the gardens is *R. occidentalis*, common to this country; while the parent of some of the red raspberries is *R. strigosus*, common in the United States, especially northward. Numerous garden varieties have been cultivated from these and other wild species, chiefly by hybridizing. Certain of the wild raspberries are exceedingly ornamental in cultivation, having large showy flowers, chief among which is *R. odoratus*, with purple flowers one to two inches in diameter.

Rat, a gnawing animal related to the mouse, and of similar form, but larger. Like mice, they are quick, burrowing, and nocturnal in their habits. The brown rat is about eight or nine inches long without the tail. It has spread over the civilized world, having originally come from western Asia. It appeared in Europe during the 18th century and has been transported by ships to other countries. It is commonly called the Norway rat, but the name is ill-advised, because Norway was not its original home. The black rat is smaller, being about six or seven inches long. Its original home is believed to have been Persia. It, likewise, by migration and transportation, spread around the world, but it is less fierce than the brown rat, and is driven before the latter.

Rat'tlesnake', a deadly poisonous snake, with horny rattles on the tail. The rattles are horny rings made of modified scales, so loosely constructed that they rattle when the tail is vibrated. There are about fifteen species, exclusively American. These snakes have grooved fangs that are erected when they strike. There are several reserve fangs on each side to replace those that may be broken. The common rattlesnake of the eastern United States extends from Maine to Texas. It attains a length of four feet, and, exceptionally, may have as many as twenty-three rings in the rattle. Their color is yellowish brown of various shades, with three rows of irregular brown blotches; the tail is black. They are naturally sluggish, and do not attack unprovoked. Their food is rabbits, rats, squirrels, and other small animals. The prairie rattlesnake, or massasauga, is smaller and darker colored. It is common in grassy meadows where not exterminated. Several other kinds are found west of the Mississippi and in South America.

Raubes (*row'bĕs*) **Haus** ("the Rough House") is the name of an institution founded and managed by Johann Heinrich Wichern, at Horn, near Hamburg, in connection with the German Home Mission. It is partly a refuge for neglected children; partly a boarding school for the moral and intellectual education of the children of the higher classes; and partly a training school for those who wish to become teachers or officials in houses of correction, etc. It was opened in 1831 by Wichern; and has since almost grown into a large community. The children live in families of twelve, each family being under the superintendency of an artisan, who employs the children in indoor and outdoor labor, according to their capability.

Ra'ven, a large crow-like bird, found in both the Old and New Worlds. The American raven is about two feet long, or even a little longer; the plumage is glossy black with a purple luster on some parts. It has a wide range but is local in its occurrence and rather rare. Its note is harsh, except during the breeding season, nevertheless, it can be taught to imitate sounds. It makes a rather bulky nest on cliffs or trees. The European bird has a shorter and deeper bill. They feed on rats and other small animals and, in some places, even attack lambs.

Raven'na, a city of central Italy, situated in the midst of a well-watered, fertile, and finely wooded plain. Ravenna is an ancient city, rich in monuments of art. Besides a library of nearly 100,000 volumes, it has an archæological museum and a number of educational institutions. The city was probably of Umbrian origin; at least it was an Umbrian city when it passed into the hands of the Romans. Augustus made it a first-class seaport and naval station, and 400 years later the Emperor Honorius took refuge there and made it the capital of the Roman empire. It attained its greatest glory under Theodoric the Ostrogoth, whose mausoleum is outside the walls. It contains the tomb of Galla Placidia, a Roman princess, who lived from 388 to 450 A. D., and was the daughter of Theodosius the Great. It became a republic in the early part of the 13th century, but was subject to Venice from 1440 to 1509, at which latter date it passed into the hands of the popes and continued under their dominion until 1860. Byron resided at Ravenna from June, 1819, to October, 1821. Population 68,065.

Raw'lins, John A., American soldier, was born at Galena, Ill., Feb. 13, 1831, and although his early educational opportunities

were very limited, he was admitted to the bar and commenced the practice of law at Galena in the year 1855, where he became acquainted with General Grant some years before the war. When the latter was appointed brigadier-general, in 1861, he offered Rawlins the position of assistant adjutant-general on his staff, which was at once accepted, and with scarcely any interruption he was with Grant in all his battles, marches, and campaigns, from Belmont to Lee's surrender at Appomattox Court House, rising from the rank of captain to that of major-general. When Grant became President, in 1869, he showed his gratitude for Rawlins' services by giving him a seat in the cabinet as secretary of war, a position in which he would no doubt have won additional honor and fame, but for his death, which took place at Washington, D. C., Sept. 9, 1869.

Raw'linson, George, brother of Henry Rawlinson, was born at Chadlington, Oxfordshire, in 1815, and after graduating at Oxford was elected a fellow and tutor in Exeter college. In 1860, he published his notable Bampton lectures on the *Historic Evidence for the Truth of the Christian Records.* His historical works cover nearly the entire history of the ancient Orient, commencing with an edition of Herodotus, in which many of his brother's discoveries are incorporated. This was followed by *The Five Great Monarchies of the Ancient Eastern World, The Sixth, and also the Seventh, Great Oriental Monarchy, A Manual of Ancient History, A History of Ancient Egypt,* and others.

Raw'linson, Sir **Henry,** K. C. B., Oriental scholar and diplomatist, was born at Chadlington, Oxfordshire, England, April 11, 1810, and was educated in Ealing, Middlesex. He entered the East India military service in 1827 and served in the Bombay presidency until 1833, when he was appointed to assist in reorganizing the army of the shah of Persia. During the six years he spent in that country, he began to study the cuneiform or wedge-shaped inscriptions, and made a translation of the famous Behistun inscription of Darius, which he published in the *Journal of the Asiatic Society.* After he left Persia he held command of Kandahar during the troublous times of 1840–42, and in 1844 was appointed political agent at Bagdad, and consul-general there in 1851. He then returned to England, but in 1858 was sent back to Persia as British minister. In 1871, he became president of the Royal Geographical society, an office which he retained till June, 1873, and in 1891 he was made a baronet. He died at London, March 5, 1895. He has written a number of books, among which are *England and Russia in the East, The Cuneiform Inscriptions of Western Asia, Outline History of Assyria,* etc.

Ray'leigh, Baron (**John Strutt**), one of the most eminent of English physicists, was born Nov. 12, 1842. He was educated at Trinity college, Cambridge, where he graduated senior wrangler and Smith prizeman in 1865. In 1879, he succeeded Clerk-Maxwell as professor of experimental physics at the University of Cambridge, a position from which he resigned in 1884, retiring to his country seat in Essex. Later he succeeded Tyndall as professor of physics at the Royal Institution in London. His profound scholarship is well illustrated by his *Theory of Sound,* 2 vols., which has remained a standard ever since its publication, nearly a quarter of a century ago. His prodigious activity is illustrated by the two large volumes of his *Scientific Papers,* published in 1901.

Raymond, Henry J., editor of the New York *Times,* and author of *The Life and Public Services of Abraham Lincoln,* was born at Lima, N. Y., Jan. 24, 1820, and graduated at the University of Vermont in 1840. After serving for a number of years on the staff of the New York *Tribune* and other papers, in 1851 he founded the New York *Times,* which speedily took rank among the leading journals of the country. Mr. Raymond was elected lieutenant-governor of New York in 1854, and was active in support of Fremont for President in 1856 and of Lincoln in 1860. In 1864, he was elected a member of congress from one of the districts of New York city, but declined a re-election two years later, preferring to devote himself to the duties of journalism; but in the month of June, 1869, he suffered an attack of apoplexy, which resulted in his death.

Ra'zor-shell, a long bivalve shell, shaped like a razor case, and belonging to the razor-clam. The shell gaps at each end, and from one the siphons or water tubes of the animal protrude. This animal makes vertical burrows in the sand, two or three feet deep, and ascends and descends by means of its foot. They are used both for food and bait.

Read, Opie, American novelist and journalist, was born at Nashville, Tenn., Dec. 22, 1852, and educated at Gallatin, Tenn. He began newspaper work first at Franklin, Ky., but proceeding west he made Little Rock, Ark., for about ten years his home, where he founded and edited a humorous weekly, *The Arkansaw Traveler.* He subsequently removed to his present home, in Chicago, where he has published a number of successful stories dealing with Southern life. His more important novels are *A Kentucky Colonel, A Tennessee Judge, An Arkansas Planter, Len Gansett, Emmet Bonlore, A Yankee from the West, The Wives of the Prophet, Old Ebenezer, The Jucklins, On the Suwanee River, Bolanyo,* and *My Young Master.*

Read, Thomas Buchanan, American poet and painter, was born in Chester county, Pa., March 12, 1822, and after spending a year or

two in the studio of a sculptor in Cincinnati, O., he gave his attention to painting, entering on the practice of that art in Boston at the age of twenty. In 1850, he went to Florence, Italy, where he continued to live, visiting America occasionally until his death, at New York, May 11, 1872. He won considerable fame as a portrait painter, and took an active interest in the cause of his native land during the great Civil war, his most popular poem, *Sheridan's Ride*, being written during that conflict, which he afterward illustrated. His *Wagoner of the Alleghanies* was written in 1862, and read publicly throughout the country by James E. Murdock for the benefit of the sanitary commission.

Reade, Charles, a distinguished English novelist, was born at Ipsden House, Oxfordshire, June 8, 1814. He received his education at Oxford, where he so distinguished himself as to secure a fellowship in 1835. It was not until 1850, however, that he commenced his career as a writer. "I studied," he himself tells us, "the great art of fiction for fifteen years before I presumed to write a line of it, writing first for the stage—about thirteen dramas, which nobody would play." Apart from his numerous quarrels and lawsuits, his life after 1852 is a record of the production of plays and novels, by the former of which he generally lost money, and by the latter secured both money and fame; for in spite of all his peculiarities and defects, he showed himself a story-teller of rare gifts and powers. Among his novels are *Griffith Gaunt*, *Hard Cash*, *Never Too Late to Mend*, *Put Yourself in His Place*, *The Cloister and the Hearth*, *Foul Play*, *A Terrible Temptation*, etc. He died at Shepherd's Bush, London, April 11, 1884, his last years being clouded by sorrow and ill-health.

Reading (*red'ing*), a city of Pennsylvania, on the left bank of the Schuylkill river, 60 miles from Philadelphia. It is pleasantly situated on an ascending plain, and draws its water supply from the neighboring hills. The principal manufactures of Reading are its iron and steel works, which include many rolling mills, forges, foundries, furnaces, etc. Many of the inhabitants are of German descent, and half the newspapers of the city are published in that language. Population 78,961.

Reaumur (*rā-ō-mür'*), **Rene Antoine Ferchault de,** a prominent man of science in France during the first half of the 18th century, was born in 1683, and died in 1757. He was educated by the Jesuits at Poitiers and at Paris; was elected a member of the Academy of Sciences at the age of twenty-four. To-day he is principally remembered as having devised the thermometric scale which goes by his name, namely, that in which the temperature interval between melting ice and boiling water is divided into 80 degrees. His other work relates mo ly to chemistry and natural history.

Recamier (*rā-kä-myā'*), Madame, *nee* **Jean Francoise Julie Adelaide Bernard,** was born at Lyons, Dec. 4, 1777. She grew up a girl of remarkable grace and beauty, and at the age of fifteen was married to M. Jacques Récamier, a rich banker of Paris, three times as old as herself, and immediately entered upon a career of social triumph almost without a parallel even in France. Her *salon* was soon filled with the brightest wits of the literary and political circles of the day, and, fortunately for herself, she was possessed of a temperament that saved her from temptation, and almost from scandal. She had a warm affection for Madame de Staël, and when the latter was banished by Napoleon, Madame Récamier did not fail to give the exile her warmest friendship and sympathy. In 1806, the ruin of her husband's fortune caused her to visit Mme. de Staël at Coppet, in Switzerland, and while there she met Prince August of Prussia, who is said to have been the only one of all her admirers that ever touched her heart. A marriage was arranged between them, provided a divorce could be secured. M. Récamier gave his consent to this; but his mild remonstrance so affected the wife that she declared she could not leave him in his adversity. When her devoted friend Châteaubriand became a widower, in 1848, he proposed marriage to her, her husband having died some years previously, but she declined the offer, although her friendship continued uninterrupted until his death, July 4, 1848. Madame Récamier died at Paris of cholera, a disease of which she always had a special dread, May 11, 1849.

Recep'tacle (in plants), that part of a stem axis upon which the floral organs are inserted. Usually the receptacle becomes much broader or more prominent in some way than the ordinary axis. "Torus" is an equivalent word. See FLOWER.

Reciprocity (*rē's'i-prŏs'i-tĭ*), an arrangement between two countries charging tariff duties against other countries, to admit such articles as may be agreed upon into each other's ports free from duty. When the present tariff law of the United States, known as the "McKinley bill," was passed in the year 1890, a provision giving the President discretionary power to enter into reciprocity treaties or arrangements with other nations, was made one of its leading features.

Red'breast, a bird belonging to the family of the Old World warblers. It is well known in the British Isles, and is called robin redbreast; but, it should be noted, that this is not the American robin, which is a thrush. It is about 5¾ inches long, olive-brown above, with the throat and upper breast a red-dish-orange. The abdomen is dull white. It occurs solitary or in pairs, and rears two or

three broods a season. Its song is sweet but plaintive.

Red Cross, The, is the badge and flag adopted by the societies of all nations organized for the care of the sick and wounded in time of war. The international conference, which assembled at Geneva, Oct. 26, 1863, and included among its members delegates from fourteen governments and six voluntary associations, may be taken as the starting-point of the Red Cross. At this conference, a proposed code of international enactments was discussed, and the main recommendations agreed to were: (1) The formation of a committee or society in each country to co-operate with the army sanitary service, in time of war, in the proper care of the sick and wounded, and in time of peace to occupy itself in preparing hospital stores, training nurses, etc.; (2) the declaration of the neutrality of hospitals, of the officials of the sanitary service, of the inhabitants of the country aiding the wounded, and even of the wounded themselves. The conference suggested the adoption of the same distinctive and uniform badge — the red cross on a white ground — for all hospitals and sanitary officials, as well as for the voluntary relief agents. A treaty embodying these recommendations was signed at a second conference in Geneva, in 1864, and has since been acceded to by nearly every civilized nation; and although other conferences have been held at Paris and Berlin, the resolutions passed at Geneva have undergone little change or modification.

Red Jacket, a chief of the Seneca Indians, was born near Seneca lake, N. Y., in 1752, his original name being Sagoyewatha, and the name of Red Jacket being given to him on account of a scarlet jacket presented to him by a British officer during the Revolutionary war. He was an active ally of the British in that contest; but in the War of 1812 he rendered valuable service to the United States in the operations on the Canadian frontier. During his last years, he lost much of his prestige and influence by his intemperate habits. He died on the Seneca reservation, near Buffalo, in 1830.

Red River, the lowest western branch of the Mississippi river, rises in the northern part of Texas, near the New Mexico border, and flows eastward as the boundary line between Texas and the Indian territory, thence southeast through Arkansas and Louisiana, entering the Mississippi, a little over 300 miles from its mouth. It receives its name of *red* from the color of the sediment with which it is loaded during high water. Its total length, on account of its winding course, is from 1,500 to 1,600 miles; and it receives numerous branches, the Washita, the Negro, and the Little Wichita, being the most important. It is navigable during seven or eight months of the year to Shreveport, La., 300 miles from its mouth.

Red River of the North rises in a cluster of lakes in western Minnesota, and flows northward, separating Minnesota from North Dakota, into British America, and emptying into Lake Winnipeg, about 600 miles from its source.

Red Sea or **Arabian Gulf,** is an inlet of the Indian ocean, stretching northwest from the strait of Bab-el-Mandeb (by which it communicates with the gulf of Aden) to the isthmus of Suez, by which it is separated from the Mediterranean. Its length is from 1,200 to 1,400 miles, its breadth varying from about 20 miles next the strait of Bab-el-Mandeb to about 200 miles in the central portion, the northern portion being divided by the Sinai peninsula into the gulf of Suez and the gulf of Akabah. The former of these gulfs is 180 miles in length by about 30 in breadth; the latter about 100 miles in length and from 10 to 15 miles in breadth. From the earliest times the Red Sea has been a great highway of commerce between India and the countries bordering on the Mediterranean, being traversed successively by Egyptians, Phœnicians, Hebrews, and Arabs. It is first mentioned in the book of Exodus on the occasion of the passage of the Israelites, which is supposed to have taken place a little south of the present town of Suez. The discovery of the route around the Cape of Good Hope turned the traffic with India into a different channel; but since the opening of the Suez canal, in 1870, the Red Sea has more than regained its former importance as the highway of commerce between Europe and the east.

Red'start, the name given to a small bird common in the United States, and, also, to a similar bird common in Europe, but belonging to a different family. The American redstart belongs to the family of New World warblers. It is nearly five and one-half inches long, with a black plumage and orange-red blotches or bands on the wings, the base of the tail, and sides of the breast. The abdomen is white. This bird perches on trees, from which it is continually flitting to catch insects on the wing. It is very abundant. The European redstart belongs to the family of Old World warblers. It is slightly smaller than the American bird, being about five and one-quarter inches long. It is dark-gray, with black throat, white forehead, and the breast, sides, and tail a rusty-red. In some parts of England it is called the fire-tail.

Reed, in music, the mouthpiece of a hautboy, bassoon, or clarionet. Also a piece of metal with a brass spring or tongue attached to it in such a way that the admission of a current of wind causes it to vibrate and produce a musical note. The reed is of two kinds, the *beating* reed, and the *free* reed. The former is used in the pipes of an organ,

and must be placed within a tube to produce a musical sound. The invention of the free reed has been ascribed to M. Grenié, a Frenchman, who brought it into use, but it has long been known to the Chinese. Its note is smoother and more mellow than that of the beating reed, and it has the advantage of not requiring a pipe, which is a necessary appendage to the latter.

Reed, Thomas B., an American Republican politician, was born at Portland, Me., Oct. 18, 1839, and graduated from Bowdoin college in 1860. After serving a short time as assistant paymaster in the navy, he studied law, and commenced legal practice in 1865. After serving successively as a member of the Maine legislature, as attorney-general of the state, and as city solicitor of Portland, he was elected a representative in the 45th congress in 1876. His commanding ability was so clearly recognized that he soon became the acknowledged leader of the Republican party on the floor; and when his party secured a majority of the house of representatives in the 51st congress, Mr. Reed was chosen speaker.

THOMAS B. REED.

He served continually in Congress until 1899, and was elected speaker of the 54th and 55th Congress. He was re-elected in 1899, but resigned his seat and took up the practice of law in New York City. He published *Reed's Rules* in 1894, and edited *Modern Eloquence* (10 vols.) 1901.

Reeves, John Sims, one of England's greatest singers, was born at Shooter's Hill, Kent, Oct. 21, 1822. At fourteen, he was counted a clever performer on various instruments, and was appointed organist and director of the choir in the church of North Cray, in Kent. He went to Paris, in 1843, in order to perfect his voice and style, and on his return to England, in 1847, he was recognized as the first tenor in that country, a position which he maintained for a number of years, his voice being one of wide range, and of great natural sweetness and purity. He died at Worthing, Sussex, Oct. 25, 1900.

Reforma'tion, the name given to the great religious revolution of the 16th century. With the reformation began what is known as *Modern Europe*, while the epoch that preceded it bears the equally distinctive name of *Middle Ages*. From the year 800, when Charlemagne was crowned emperor of the Romans by Pope Leo III., western Europe had been under complete subjection to the church, and many abuses had arisen. The revival of learning and the discovery of the New World had also awakened a spirit of independence in men's minds, so that it only required a spark to kindle the slumbering agitation into a definite flame, and this was supplied by the sale of indulgences under Pope Leo X. Once started, the Reformation made such rapid progress that the national churches of Britain, of Sweden, of Norway, of Holland, and of many parts of Germany and Switzerland, were separated from Rome, while in other countries, such as Hungary and France, the same movement detached large portions of the people from the Catholic faith, without separating the church itself from the papacy. By the middle of the 16th century, it seemed as if the revolution would carry everything before it. At the beginning of the Reformation, the authorities of the Catholic church did not realize the extent of the danger which threatened it, regarding the movement merely one of the many discussions and schisms to which the church had always been more or less subject; but when they saw the revolt spreading into country after country, and taking such a firm hold on the minds of both rulers and people, their eyes were opened, and they proceeded to the repair of the breaches that had been made with all the zeal and energy of which they were capable. The Society of Jesus, founded by Ignatius Loyola, in 1540, supplied an army of enthusiasts whose policy and devotion saved Rome from dissolution. By the decrees of the council of Trent the church reaffirmed its ancient doctrines and traditions; and a succession of popes during the latter half of the 16th century, carried out with zeal the policy marked out for them by the Jesuits. To quote the language of Lord Macaulay: "Two reformations were pushed on at once with equal energy and effect — a reformation of doctrine in the north, and a reformation of manners and discipline in the south. . . . In the order of Jesus was concentrated the quintessence of the Catholic spirit; and the history of the order of Jesus is the history of the great Catholic reaction." Thus the middle of the 16th century saw the tide of the revolution checked; and by the close of the same century Europe was divided between the two religions by almost the same lines as exist at the present day. To quote again from Macaulay: "As Protestantism had driven Catholicism to the Alps and Pyrenees, so Catholicism rallied and drove back Protestantism, even to the German ocean; nor has Protestantism in the course of 200 years been able to reconquer any portion of what was then lost." See Seebohm's *Era of the Protestant Revolution.*

Regillus (*re-jil'us*), anciently a lake in Latium, to the southeast of Rome, probably in the extinct volcanic crater of Corunfelle, which was drained in the 17th century. It is

celebrated in the semi-legendary history of Rome as the scene of a great battle in the year 496 B. C., between the Romans and the Latins, in which the Latins were totally defeated.

Regnault (*re-nō'*), **Henri Victor,** a French chemist and physicist distinguished especially for his accurate measurements of a large number of physical constants. He was born July 21, 1811, at Aix-la-Chapelle, and died at Paris, Jan. 19, 1878. He was educated at the Polytechnic school and at the School of Mines in Paris. After a few years spent in teaching chemistry at Lyons, he was called (1840) to the Polytechnic school as professor of chemistry, a position which he resigned a year later to accept the chair of physics at the Collège de France. It was here that he carried on his magnificent series of determinations of specific heat of various elements and compounds, and of the coefficient of expansion of various gases and liquids.

In 1854, he was appointed to the directorship of the national porcelain factory at Sèvres. The destruction of his laboratory by German shells, the loss of his son (already a distinguished painter) in battle, in 1871, and the outcome of the Franco-Prussian war combined against him, and left him a broken-hearted man for the remaining seven years of his life.

Regulus (*reg'ū-lus*), **Marcus Atilius,** a distinguished Roman, who was consul for the first time in 267 B. C. Chosen consul a second time, in 256 B. C., he was sent in connection with his colleague, Manlius, at the head of a navy of 330 ships, against the Carthaginians, whom he totally defeated off Heraclea Minor. The Romans then landed at Clypea, and for some time Regulus was victorious in every encounter, but at last suffered defeat and was taken prisoner. He was kept in captivity for a number of years, but when fresh reverses caused the Carthaginians to sue for peace they sent Regulus to Rome, on parole, in company with their own envoys. It is related that when Regulus came before the Roman senate he urged that body to reject all the proposals of the Carthaginians, even to an exchange of prisoners, but to prosecute the war against that country with the utmost vigor until it was utterly subdued. After persuading the senate to adopt this course, Regulus refused to break his parole, and, without even waiting to see his family, returned to Carthage, where he was put to death (? 250 B. C.) with the most terrible torture.

Reichs'an'stalt, the great national physical laboratory of Germany, established in 1888, and situated at Charlottenburg, a suburb of Berlin. The object of this institution is twofold; its first aim being to carry out investigation of a purely scientific character, such problems, for instance, as the change of density in water which accompanies a change of temperature, the laws of radiation, etc., while its second aim is to act as a standardizing bureau, to which makers can send thermometers, resistance coils, standard cells, etc., to be tested and certified. The two functions are performed in different buildings. The first president of the Reichsanstalt, and the controlling spirit in its establishment, was Von Helmholtz, who conducted the affairs of the institution from 1888 until his death in 1894. The present (1901) director is Professor F. Kohlrausch, who succeeded Helmholtz in 1894.

Reid, Captain **Mayne,** British novelist and writer of boys' stories, was born in County Down, Ireland, in 1818, and at twenty years of age emigrated to America, where he led a roving and adventurous life, serving in the United States army during the Mexican war. He then went to Europe, intending to take part in the Hungarian struggle, but as it was concluded before he reached that country, he settled down to a literary life in England. His vigorous style and the profusion of hair-breadth escapes he furnished, delighted his breathless readers, who did not stop to notice the truthfulness of his scenery or the occasional excellence of his narrative style. He died at London, Oct. 22, 1883. See *Memoir*, by his widow.

Reid, Thomas, an eminent Scottish philosopher, was born April 26, 1710, at Strachan, a country parish in Kincardineshire, where his father was minister. He took his degree of M.A. at Aberdeen college in 1726, and continued to act as librarian there for a number of years. In 1737, he was appointed minister to the parish church of New Machar, in which position he labored with zeal and success until 1752, when he was appointed one of the professors of philosophy in King's college, Aberdeen. In 1763, he was chosen to succeed Adam Smith as professor of moral philosophy in the University of Glasgow, and henceforth devoted himself to mental and metaphysical speculation. In 1764, he published his *Inquiry into the Human Mind;* in 1785, his *Philosophy of the Intellectual Powers;* and in 1788, his *Active Powers of the Human Mind.* These treatises must always be looked upon as constituting the first complete and systematic work on the constitution of the human mind. He died at Glasgow, Scotland, Oct. 7, 1796. See his *Life*, by Dugald Stewart, and McCosh's *Scottish Philosophy.*

Reid, Whitelaw, editor of the New York *Tribune*, was born near Xenia, O., Oct. 27, 1837, and graduated at Miami university, Oxford, O., in 1856, soon after which he commenced his literary and journalistic career by becoming editor and proprietor of the Xenia *News.* When the Civil war broke out, Mr. Reid accepted a position on the staff of the Cincinnati *Gazette*, and as its war correspondent won a national reputation by his remarkable clearness of description and accuracy of statement. In 1868, Mr. Reid severed

his connection with the Cincinnati *Gazette* to accept a position on the staff of the New York *Tribune*, then edited by the famous Horace Greeley; and when Mr. Greeley resigned the editorship of the paper, in 1872, Mr. Reid was chosen to fill his place. This position Mr. Reid still holds, having also become principal proprietor, and advanced the paper to the plane of highest prosperity. When Benjamin Harrison became president, in 1889, Mr. Reid was appointed United States minister to France, and during the two years he held that office, discharged its functions in such a manner as to reflect high honor upon himself. At the Republican national convention which met at Minneapolis, Minn., in June, 1892, Mr. Reid was placed in nomination for Vice-president, but was defeated at the election held in the following November. In 1897, he was special ambassador of the United States to England on the occasion of the jubilee of the late Queen Victoria.

Rein'deer or **Car'ibou,** a kind of deer found in the northern parts of Europe, Asia, and America. It can be distinguished from all its allies by the fact that both sexes have antlers. These are very large in comparison with the size of the animal, which is heavily built, with short limbs. The antlers have a browtine extending forward. In the American form the browtine of one side is aborted and the other is largely developed. The antlers, as well as the hoofs, are used in removing snow from their food, which, in the winter, is a sort of lichen called reindeer-moss. These animals have long been domesticated in Scandinavia and Lapland. They yield good milk, and supply material for clothing, and in the cold countries fill the place of horse, cow, goat, and sheep. They are able to draw about three hundred pounds, over the frozen snow, at the rate of nine or ten miles an hour. The United States government maintain at present (1901), stations in Alaska to promote the propagation of the reindeer and to instruct the natives in their care and breeding.

REINDEER.

Rembrandt (*rem'brant*), **Hermanzoon,** commonly called "Rembrandt van Rhyn," was born at Leyden, July 15, 1607. After attending the Latin school at Leyden and studying art under Peter Lastman at Amsterdam and Jacob Pinas at Haarlem, he returned home, and devoted himself to the study of nature. About the year 1630 he was encouraged to establish himself at Amsterdam, where he soon entered on a most successful career, and executed numerous works, including those wondrous etchings, between three and four hundred in number, which have done almost as much as his paintings to give him so high and extended a reputation. Rembrandt's power and originality are exemplified in almost every branch of art, and as examples of composition, expression, color, light, and shade, his works rank with those of the greatest artists. He died at Amsterdam, Oct. 8, 1669.

REMBRANDT VAN RHYN.

Remen'yi, Edouard, a distinguished Hungarian violinist, was born in 1830 at Heves, Hungary. Being obliged to flee from his native land because he took part in the revolution of 1848, he came to America, but returned to Europe shortly after, and earned great fame by his skill as a performer on the violin.

Rem'ington, Frederick, American artist, illustrator, sculptor, and author, was born in St. Lawrence county, N. Y., Oct. 4, 1861. He early studied at Yale Art school, and at the Art Students' league of New York, after which he led the life of a cowboy and stockman on a ranch in Montana and Wyoming, where he became notable as an animal painter and illustrator of Western scenes and modes of life on the plains. He subsequently came into note as an illustrator for magazines, treating of military subjects and of ranching life, and after the Spanish-American war of Cuban scenes and characteristics. His chief canvases and best known paintings are *A Dash for the Timber*, *The Last Stand*, *Past all Surgery*, *The Last Lull in the Fight*, and *Conjuring the Buffalo Back*. Among his leading works in sculpture are *The Broncho Buster* and *The Wounded Bunkie*. He is the author of the following works: *Pony Tracks*, *Crooked Trails*, and *Frontier Sketches*.

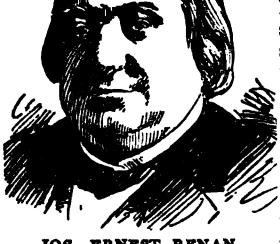
Remora (*rĕm'ō-ra*), a sucking fish with an oval suctional disc on the upper surface of the head. By means of the sucker they attach themselves to sharks, turtles, and even ships. They are found in warm seas and along the Atlantic coast north to New York. They are commonly exhibited in salt water aquaria.

Rem'sen, Ira, distinguished American chemist and educator, and successor to Dr. D. C. Gilman as president of Johns Hopkins

university, was born at New York, Feb. 10, 1846. After graduating in 1865 from the college of the city of New York, and in 1867 from the College of Physicians and Surgeons, he attended the universities of Munich and Göttingen and was for a time (1870–72) assistant in chemistry at Tübingen. On his return to the United States, he was professor of chemistry at Williams college, and in 1876 accepted the same post at Johns Hopkins. Besides his educational and administrative work and his researches in chemistry he has written a number of treatises on this his special topic, both on theoretical and on organic chemistry. On the resignation by Dr. Gilman, of the presidency of Johns Hopkins, Dr. Remsen was prevailed upon to accept this responsible executive office, in addition to his own lectureship, and to pursuing his own special lines of scientific work.

Remusat (*rā-mü-sa'*), **Charles Francois,** a French politician and philosopher, was born at Paris, March 14, 1797, and studied with brilliant success at the Lycée Napoleon. He made his first appearance in politics as a journalist in 1818, allying himself closely with Guizot, but subsequently withdrew from this connection, becoming more independent, although he was always prudent and temperate in his views. On the establishment of the *Globe*, in 1824, Remusat became one of its contributors. He was exiled after the *coup d'état* of Napoleon III., in 1851, but afterward received permission to return to France. He devoted himself to literary and scientific pursuits till 1871, when President Thiers called him to the portfolio of foreign affairs, a position which he held until 1873. He died at Paris, June 6, 1875. See translations of his mother's *Memoires*.

Renan (*rā-non'*), **J. Ernest,** one of the most eminent authors of the 19th century, was born at Tréguier, France, Feb. 27, 1823. He remained in his native village, a pupil in its school, until his sixteenth year, after which he was taken by the Abbé Dupanloup to his seminary at Paris, to be educated for the Catholic priesthood. After a three years' course at this seminary, he was entered as a student at St. Sulpice, the great seminary of the diocese of Paris. At St. Sulpice his attention was mainly turned to the study of Hebrew, and to this study, of his own accord, he added that of German. The result of these studies was to destroy his faith in the supernatural or miraculous element in Christianity, and he therefore abandoned all idea of the priesthood and resolved to devote himself to literature. In 1860, Renan was appointed by Louis Napoleon a member of the commission to study the remains of Phœnician civilization. While absent on this mission, he visited Syria and Palestine and obtained acquaintance with the latter country, which enabled him to give such a vivid local coloring to his *Life of Jesus*, published two or three years after his return. In 1861, he was chosen professor of Hebrew at the Collège de France, in Paris, but on account of his religious views was not fully established in that position until after the fall of the empire in 1870. Renan's published works are quite numerous, but the one by which he is most widely known is his *Life of Jesus*, which has been translated into the languages of all civilized nations. Renan died at Paris, Oct. 2, 1892.



JOS. ERNEST RENAN.

Reproduc'tion (in plants). In addition to the work of nutrition the plant must organize for reproduction. Two general types of reproduction are recognized. The first is vegetative multiplication, in which no such specialized bodies as spores are formed, but the ordinary vegetative body is used for this purpose. Among the lowest plants vegetative multiplication takes place by means of ordinary cell-division, and is the only method of reproduction used. In the more complex plants, various outgrowths or portions of the body, as gemmæ, bulbs, buds, tubers, various modifications of branches, etc., furnish means of propagation. The second kind of reproduction is by means of spores. Spores are specially organized to reproduce, and are not at all concerned in the nutritive work of the plant. There are two general types of spores, which differ from one another not in their power, but in the method of their origin. The "asexual spore" is ordinarily produced by cell-division; the "sexual spore" is produced by the union of two sexual cells known as "gametes." The general name of the sexually formed spore among plants is "oospore," or frequently "fertilized egg." The process by which spores form new plants is known as "germination." See SPORES.

Reptiles (*rĕp'tilz*), a class of vertebrates, embracing four natural orders of living forms as follows: I. *Chelonia*, the tortoises and turtles; II. *Lacertilia*, the lizards; III. *Ophidia*, the snakes and serpents; IV. *Crocodilia*, the crocodiles, alligators, etc. The Hatteria, of New Zealand, is related to the lizards, but stands in a group by itself. In the evolution of life the reptiles were the forms that first became independent of the water, and began to live entirely on land. Reptiles and birds, although so different in form and habits, are united by many peculiarities of structure. Huxley proposed for them a common name (*Sauropsida*) uniting the two classes. In addition to the living forms, there are many extinct forms of this class

which extend the classification, and also show best the resemblances between birds and reptiles. The plesiosaurs were enormous water animals with extremely long necks. Fossils are found indicating their length to have been about forty feet. The ichthyosaurs were long water animals, attaining thirty or forty feet in length. The dinosaurs show many bird-like peculiarities. They lacked the power of flight and lived both on land and in the water. Some forms reached a length of sixty feet. The pterodactyls were flying reptiles with membranous wings, which in some cases had an expanse of twenty-five feet.

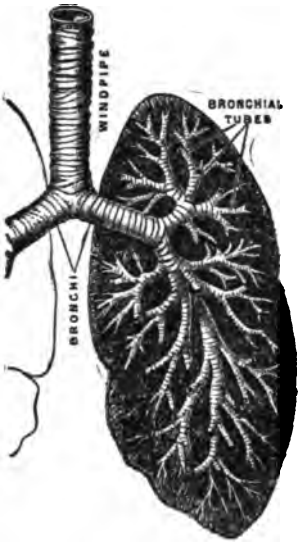
Repub'lic, Grand Army of the. The Grand Army of the Republic is an organization composed of those who were soldiers and sailors in the Federal army and navy during the Civil war — the men in blue who upheld the flag and saved the Union. Its object is to preserve the spirit of comradeship among those who stood side by side amid the hardships and perils of war; to care for sick and disabled soldiers; to provide for the widows and orphans of those who fell in field or hospital, or who have since died; to stand by each other while living, and to bury those who answer the final call as the years go by. The organization was first suggested and planned by Dr. B. F. Stephenson of Springfield, Ill. The first post was organized early in 1866, and on July 12th of that year a meeting of representative soldiers from all parts of the state was held at Springfield, where they were mustered in and given authority to organize posts throughout the state. The organization grew rapidly and extended to other states. The posts in each state constitute a department, and the organization has now reached a total of 6,905 posts, with a membership of 287,981. The motto of the order is, Fraternity, Charity, and Loyalty. The badge of the Grand Army consists of an eagle and a star, connected by a ribbon representing the flag. A bronze button is also worn as an every-day insignia of the order. The order is strictly non-political, and none but honorably discharged soldiers can become members. There are frequent campfires, reunions, and banquets, and once each year a grand national encampment is held. At these meetings greetings are exchanged, memories are revived, the old songs of the war are sung again, and the unwritten history of the war is recalled. Under the auspices of the order, large sums are every year expended in charity. Hundreds of soldiers' and sailors' monuments have been erected, orphans' homes have been built and endowed in many states, and a helping hand has been given to thousands of old soldiers, and soldiers' widows and orphans.

Res'ins, a class of natural vegetable products, closely allied to the essential oils, and in most cases obtained from the plants which yield them mixed with oil. Resins are divided into hard resins, soft resins, and gum resins. The hard resins are solid and brittle and contain little or no oil, such as copal, lac, mastic, jalap, etc. The soft resins can be molded by the hand, and some of them are sticky and semi-fluid, in which case they are called balsams. They are the solutions of hard resins in essential oils, or admixtures of the two. Turpentine, storax, and the balsams of Tolu, Peru, and Canada are examples. The gum resins are the milky juices of certain plants made solid by exposure to the air. Resins are widely diffused throughout the vegetable kingdom and are much used in medicine and in the mechanic arts. They are generally obtained by making incisions in the wood from which they are obtained, although it is sometimes necessary to use boiling alcohol to extract them from the wood. The common resin, or rosin, of commerce, exudes from several species of pine, and is used in the preparation of ointments and plasters and for various other purposes.

Resonance (*rĕz'ō-nans*), a term used in physics to denote the process by which one body sets in vibration another body having the same period of vibration. When one attempts to ring a large church bell, he soon learns that he must pull the rope at certain definite intervals if he wishes to ring the bell with ease. A rowboat moored in quiet water can, without difficulty, be set rocking if one throw his weight, first on one side then on the other, at correct intervals. If two pendulums of the same period be mounted upon one common frame, and then one pendulum be set in vibration while the second one is at rest, it will be observed that the second pendulum soon "picks up" a vibration of considerable amplitude from the first pendulum. These are all instances of resonance, taken from mechanics. In acoustics and electricity, there are also many illustrations. A tuning fork held over a tall jar partially filled with water will have its sound very much reinforced when the column of air in the jar above the water is capable of vibrating in the same period as the tuning fork. The sounding box of the guitar and violin are in resonance with the strings and enable them to give out energy at a more rapid rate. Electrical resonance is frequently employed in wireless telegraphy. For a complete theory of resonance, see Donkin's *Acoustics* (Oxford, 1884).

Respira'tion, Organs of. The respiratory organs are of two kinds, gills and lungs. The former are adapted for respiration in water, the latter for action in free air. Gills are found in clams, crayfish, squids, and other invertebrates, as well as in all fishes. The essence of respiration consists in an exchange of oxygen and carbon dioxide (CO_2) between the blood and the air. Special organs of respiration are not necessary to accomplish this end. The earthworm, for example, breathes

through the skin, that is, the blood comes close to the surface in thin-walled vessels, and the exchange between it,and the air is accomplished. In the simplest animals, like the amœba, where there is no blood, the breathing is done by the protoplasm of the body, but the exchange of carbon dioxide for oxygen is essentially the same as in higher animals. It must also be understood that respiration in plants is of the same nature as in animals. The old statement, that plants breathe carbon dioxide(carbonic acid gas) in the sunlight, giving off oxygen, and, in darkness, reverse the process is not true. In breathing they take in oxygen and give up carbon dioxide at all times, and the process is more active in sunlight than in darkness. It is easy to point out how the erroneous idea in reference to their breathing arose. Plants use carbon dioxide in their process of nourishment, and they return free oxygen to the air as a left-over product. This comes mainly from the process of starch formation, and, as that process takes place in the sunlight, it was at first supposed that the oxygen was set free in daylight from the process of respiration.



WINDPIPE, BRONCHI, AND ONE LUNG.

Fishes possess gills throughout life; the amphibia have them in larval stages, and, in some forms, both gills and lungs exist in the same individual. Lungs make their first appearance in the dipnoi fishes (which see) and occur in all animals of a higher grade. Lungs are developed in all animals as sac-like expansions of the walls of the pharynx, blood vessels are spread over them, and air is introduced into the inside. In the human body the lungs become very complicated. The windpipe divides into two main branches — the bronchi. These enter the lungs, and are sub-divided again and again into the bronchial tubes, which branch like the twigs of a tree. The smallest divisions enter into air-sacs, which are lobulated and have very thin walls. A network of capillaries is spread over the thin walls of the air-sacs, and it is in these capillaries that the exchanges between air and blood go on. The blood does not anywhere come into actual contact with the air, but the exchange of gases is made (by osmosis), through the thin membranes of the air-sacs and the capillaries. The substance of the lungs is spongy, and considerable elastic tissue enters into their structure, which allows them to expand and contract. It is not possible in an illustration to give a true picture of the complexity of the lungs. Not only do bronchial tubes branch through their substance, but blood vessels which carry blood to be aërated, others which carry arterial blood to nourish the lungs, besides lymphatics and nerves. The oxygen received by the lungs is carried to the minutest parts of the tissues, and is there given up in exchange for carbon dioxide. It is therefore clear, that there is an *external* respiration taking place in the lungs, and an *internal* respiration taking place in the tissues throughout the body. The latter is the more important part of the process of respiration. The air is renewed in the lungs through the action of the diaphragm and other muscles. For the amount of air breathed and other details, see Huxley's *Lessons in Elementary Physiology* (new edition, 1900), or any other good textbook of physiology.

Respira'tion (in plants), the process by which most plants set free in their bodies the energy required for doing the work necessary to maintain life and to form new parts. It is essentially identical with the respiration of animals. It consists of several separate but related processes: (1) the absorption of oxygen and its union with the protoplasm or with foods by the action of the protoplasm; (2) the decomposition of this unstable substance, resulting finally in the formation of carbon dioxide and water; (3) ridding the body of these waste products. The oxygen is absorbed directly from the water or air by smaller plants, but in the larger it is distributed to the internal tissues by a system of air passages (see AËRATION). Through a reverse process the carbon dioxide is got rid of. The chemical details of respiration are not known. It is even uncertain whether it is the living protoplasm or the foods that are oxidized. Neither is it known how the energy is used, nor in what form it is set free. Some of it appears as heat, making the body warmer than the surrounding air. But this heat is so quickly lost that it can only be observed when its dissipation is hindered. In this the plant is like a cold-blooded animal. On account of the carbon dioxide excreted, the plant loses weight, unless supplied with food; thus, if a seed germinate in darkness, after a few weeks the plantlet may have less than half the dry weight of the seed from which it grew.

Retort', a vessel employed by chemists for the purpose of distilling or effecting decomposition by means of heat. It may be made of glass, of earthenware, or metal, according to the purpose for which it is to be used. Glass

retorts are the most common, but in cases requiring a higher degree of heat than glass can bear, earthen retorts are used, and iron retorts are necessary in the laboratory for many processes.

Reuter (*roi'ter*), **Fritz,** a novelist and poet who wrote in the Low-German dialect, was born at Mecklenburg-Schwerin, Nov. 7, 1810. While studying law at Jena in 1833, he became involved in some of the revolutionary schemes of the students' association, and was arrested and sentenced to thirty years' imprisonment. He was released after seven years' confinement in various Prussian fortresses; and a few years later began to write the books which spread his name throughout all Germany. His tales have the flavor of real life, and prove their author a born story-teller. He died at Eisenach in Thuringia, July 12, 1874. See M'Callum's *Studies in Low-German Literature.*

Revere', Paul, a Revolutionary soldier, famous for his midnight ride from Boston to Lexington, to warn the militia of the approach of the British soldiers, was born at Boston, Jan. 1, 1735. Revere was one of the party that destroyed the tea in Boston harbor, and was at the head of a volunteer committee to watch the British. When it was known that the latter intended to move to Concord, Revere crossed over to Charlestown, and on the night of April 18, 1775, rode to Lexington, rousing the minute-men on his way. He was stopped at Lexington, but a companion succeeded in reaching Concord. Revere rose to the rank of lieutenant-colonel of artillery during the war, and after independence was secured established the Revere Copper company at Canton, Mass. He died May 10, 1818. His ride has been made the subject of a fine poem by Longfellow.

Revolv'er, a small fire arm, an improved form of pistol, which by means of a revolving breech or revolving barrels, can be made to discharge more than once without reloading. The invention is far from being new, specimens being still in existence which were manufactured during the 17th century; but in 1835, Colonel Samuel Colt patented "Colt's revolver," which was a great advance on all previous experiments, and is substantially still in use. It consists of one rifled barrel and a revolving cylinder with six or seven chambers, which are successively brought into line with the barrel by the action of the trigger. Each chamber has its nipple for a cap, which is brought under the hammer by the motion which brings the chambers around to the barrel. In addition to this, by withdrawing a bolt the breech-piece may be taken out and replaced by another of the same kind with chambers ready loaded. Revolving firearms of larger size are used in wars, the best known of which is the French *mitrailleuse*, of which so much was heard during the Franco-Prussian war of 1870.

Rey'nard the Fox, is the title of a celebrated fable of the middle ages, being the last of a series of poems in which wild beasts are the speakers and actors. It was written in Low German, professedly by one Hinrik van Alkmer in 1498; but most German critics say the real author is one Hermann Barkhausen, who published his book under a pseudonym.

An outline of the story may be briefly given as follows: When Nobel the lion, king of beasts, was holding his court one eastertide, all the animals, great and small, came to him and paid him homage, except Reynard the fox; and for his various misdeeds Reynard was summoned to appear before the Lion, Bruin the bear being sent to summon him. Reynard, however, told the bear of some honey hid in a split tree, in which Bruin got himself fast and nearly beaten to death by some peasants before he got back to court. Tibert the cat was the next messenger; but Reynard persuaded him to go and catch some mice in a place where there was a noose, in which the cat was caught and suffered a beating before he got away. At last, Grimbart the badger went to summon Reynard and persuaded him to appear at court, where he was tried and condemned to death. But just before he was to be hung on the gallows he asked leave to make a speech, in the course of which he told the Lion that old Reynard his father, in connection with Isengrim the wolf, and Bruin the bear, had formed a conspiracy to kill the Lion and make Bruin king in his place; but he (Reynard) had stolen their treasure and hidden it, as he could not bear to see the noble Lion killed and the wicked Bear made king in his place. After hearing this story, the Lion pardoned Reynard and put the Wolf and the Bear in prison. But when the Lion asked Reynard to show him where the treasure was he excused himself because he was under an oath to make a pilgrimage to Rome. The Lion then let him go; and Reynard immediately set out on his pilgrimage, taking with him Cuwært the hare and Belin the ram. On his way he passed his own house, and induced Cuwært to go with him, and there killed him. And putting the Hare's head in a satchel, he gave it to the Ram, telling him to carry it back to the Lion, as it contained valuable letters. When the Lion saw the Hare's head he was very angry, and at once released the Wolf and Bear from prison, and declared the Fox an outlaw. Another version of the fable adds an account of a fight between the Wolf and the Fox, in which the latter by his trickery won the victory, and finally returned to his own home, honored with the favor and protection of the Lion.

Reyn'olds, John Fulton, an American soldier and major-general of volunteers, was born at Lancaster, Pa., Sept. 20, 1820, and killed at the battle of Gettysburg, July 1, 1863. He graduated at West Point in 1841

and got a lieutenancy in 1846, after which he served in the Mexican war, was engaged against the Rogue River Indians, in the Utah expedition and in 1859 became commandant of West Point. In 1861, he was appointed brigadier-general of volunteers and took part in the campaigns of the army of the Potomac. After serving with distinction in the Peninsular campaign and saving the Union army at the second battle of Bull Run from a disastrous rout, he gained the rank of major-general and succeeded Hooker in the command of the First Army Corps. On the first day of the battle at Gettysburg he was struck by a rifle ball, which unhappily ended his promising career.

Reyn'olds, Sir **Joshua,** a highly distinguished English portrait painter, was born near Plymouth, July 16, 1723. His father designed him for the medical profession, but as he early manifested a desire to be a painter, he was placed under the instruction of Thomas Hudson, the principal portrait painter of the day, at the age of seventeen. In 1746, he went to London, and set up a studio there, but being invited to accompany Commodore Keppel on a cruise to the Mediterranean, in 1849, he made his way to Rome, and remained about three years in Italy, studying the works of Raphael and Michael Angelo, and visiting the places where the chief art collections are to be found. On returning to London, in 1752, his works attracted great attention, and when the Royal academy was instituted, in 1769, he was elected its first president. He was knighted by George III., and when Ramsay died, in 1784, he succeeded him as painter to the king. He died at his house in Leicester Square, London, Feb. 23, 1792, and after lying in state at the Royal academy, was interred in the crypt of St. Paul's cathedral. Reynolds' fame lies in the superior beauty and excellence of his portraits. He was at home alike in portraying the strength of manhood and the grace of womanhood; and his pictures of children have an especial tenderness and beauty. He was a man of fine and varied culture, and lived on terms of friendly intercourse with Johnson, Burke, Goldsmith, and other literary men of his day. He was also distinguished for an amiable disposition, and the most pleasing manners, fully justifying the eulogium of Goldsmith, which says of him:—

> Still born to improve us in every part,
> His pencil our faces, his manners our heart.

Rhad'aman'thus, in Greek mythology, a son of Zeus and Europa; one of the three judges of the dead on their descent into the nether world. The other two were Æacus and Minos (brother of Rhadamanthus), king and lawgiver of Crete. Before these three, according to the fable, all the dead appeared when they reached the lower world (hell), to give account of their stewardship and receive the reward of their deeds.

Rhea, Mademoiselle (Hortense Barbe-Loret), Belgian actress, was born at Brussels, Sept. 4, 1845, and died at Montmorency, France, May 8, 1899. She was educated at the Ursuline convent, Paris, and soon after leaving school she began to study for the stage. Her *début* was made in Brussels, and she afterward acted with acceptance at Rouen and in Paris, and in the early seventies she made a professional tour in Russia. At St. Petersburg, she became leading actress at the Imperial theatre. After this, she appeared in London, returned to France, and then paid a successful visit to the United States. Her repertory consisted of *Adrienne Lecouvreur*, *Camille*, *Pygmalion*, *Galatea*, *The School for Scandal*, *Frou-Frou*, *Nell Gwynn*, and *The Lady of Lyons*. She was very successful in a play on the subject of Napoleon adapted for her and first presented by Rhea at Buffalo in 1882. In this play she took the part of Empress Josephine.

Rhea (*rē'ā*) or **Nan'du,** the ostrich of the New World. The rheas are running birds, living in herds on the grassy plains of South America, and feeding on grasses, seeds of herbs, and some varieties of berries. Their wings are better developed than in other running birds, but do not suffice for flight. The larger varieties reach a height of about six feet. The female lays from ten to twenty-three eggs, in a depression in the ground made by the male. Their feathers are of coarser quality than those of the African ostrich, and are used mainly for rugs, dusters, and brooms. There are three species. The more common one is brownish gray above and nearly white on the belly. It ranges from southern Brazil to the straits of Magellan. Another smaller form, with some feathers having white tips, inhabits Patagonia, and a third, dark-colored form lives in northeastern Brazil.

Rheims (*rēmz*) or **Reims,** a city in the French department of Marne, about 100 miles from Paris by rail. In the 8th century it became the seat of an archbishop, and from 1179, when Philip Augustus was solemnly crowned here, it became the place for the coronation of the kings of France. Joan of Arc, after her great victories, brought the dauphin here to be crowned, and the only sovereigns down to 1825 who were not crowned here were Henry IV., Napoleon I., and Louis XVIII. In 1793, the cathedral was attacked by the populace, and in 1830 the ceremony of crowning at Rheims was abolished. The hills which surround the town are planted with vineyards, and Rheims is one of the great centers of woolen manufacture in France. Population 107,963.

Rheot'ropism, the sensitiveness of a plant to the direction of a current of water, to which it responds by changing the rate of growth, which results in a curvature with or against the current. When roots of corn or vetch are

grown in moving water, the rate of growth is hastened on the side not struck by the current and slowed on the other side; consequently the tip is turned up-stream. A very slow current will produce the reaction. The exact nature of the stimulus has not yet been determined. See IRRITABILITY.

Rhett (*ret*), **Robert Barnwall,** an American editor, politician, and prominent "secessionist," was born at Beaufort, S. C., Dec. 24, 1800, and died in St. James Parish, La., Sept. 14, 1876. Early in life he adopted the name of Rhett, his real name being Smith. In 1826, he was elected to the legislature of his native state and in 1832 became attorney-general of South Carolina. He subsequently served a number of terms in congress and in 1851–52 was United States' senator. He was an ardent advocate of extreme state-rights views, which he openly expressed both in congress and in the Charleston *Mercury*, which he owned and advocated. During the secession agitation in South Carolina, he advocated the dissolving the Union and voiced the sentiments of the nullifiers and ultra-secessionists. He took a prominent part in the organization of the Confederate government and helped to pass the ordinance of secession. At the close of the war he retired from public life.

Rhine, the most important river in Germany, and one of the most noted in Europe, takes its rise in Switzerland, and, after a northerly course of about 850 miles, empties into the German ocean. The area of the Rhine and its various feeders is estimated at nearly 100,000 square miles. It is divided into the Upper, Middle, and Lower Rhine, the first of these terms being applied to the river from its source to Basel, the second to its course from Basel to Cologne, and the third to its course from Cologne through the Netherlands to the sea, into which it empties by several mouths, forming an extensive delta. Several canals connect the Rhine with the Rhône, the Danube, and other rivers, thus opening a line of communication with France and Belgium on one side, and with the Netherlands and every part of Germany on the other. The delta of the Rhine, most of which is below the sea level, has to be protected by strong embankments or dikes, the principal ones of which are 25 or 30 feet above the lowest level of the river.

Rhinoceros (*ri-nŏs'e-rŏs*), a thick-skinned animal, with a horned snout, confined to tropical Africa and Asia. There are two species in Africa and three in Asia. The African species embrace a two-horned and a one-horned variety. The latter is the wide-mouthed rhinoceros, sometimes called "white," although its skin is of a slaty color. It is the largest of the family, a full-grown male, according to Selous the celebrated hunter, standing six and one-half feet high at the shoulders. The largest of the Asiatic species has also a single horn. It is ten feet long and five feet high at the shoulders. There are enormous folds in the skin which appear like huge plates of armor. Another form, inhabiting Sumatra, has two horns on the snout. The horn is a powerful weapon. Besides being used in attack, it is strong enough to root up small trees, which the animal sometimes does, for the sake of the fruit and foliage. They are shot with iron and tin bullets, as the hide is so tough that leaden bullets will not penetrate it.

INDIAN RHINOCEROS.

Rhizoids (*ri'zoids*). Usually hair-like outgrowths from plant bodies which act as holdfasts, and often as absorbing organs. The name means "root-like," but the similarity is by no means one of structure, but rather one of general function in relation to the outside world. Rhizoids are mostly developed by the lower plants, as for example, in connection with the anchoring of sea weeds, on the underside of the thallus bodies of liverworts, from the base of the erect moss plants, from the under side of the prothallium of ferns, etc.

Rhizome (*ri-zōm'*). See ROOT'STOCK.

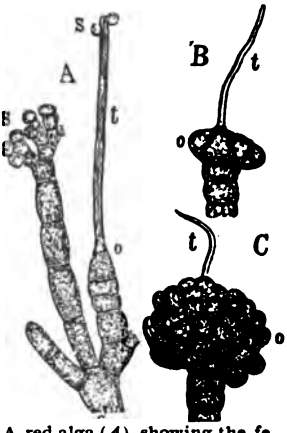
Rhode Island, one of the original thirteen states and the smallest state in area in the American Union. Its greatest length from north to south is between forty and fifty miles, and its width is less than forty miles, its land area being but little over 1,050 square miles. It is bounded on the north and east by Massachusetts, on the south by the Atlantic ocean, and on the west by Connecticut. The state is divided into five counties, its principal cities being Providence (the capital), Newport, Central Falls, Pawtucket, and Woonsocket. Narragansett bay, which occupies the southeastern quarter of the state, contains a number of beautiful islands, on the largest of which, named Rhode Island, is the city of Newport, a famous summer resort, and formerly one of the capitals of the state. The country is hilly, and the soil rough and stony, being chiefly devoted to pasturage and orchards. The inhabitants are principally engaged in trade and manufactures, there being a very large number of cotton and woolen factories in the state. Educationally the state does well for its size and resources; it has a school population of 80,000, with an average attendance of 50,000. It also maintains 18

high schools, with 170 teachers, and about 3,500 pupils. At Providence, there is the Brown university. Rhode Island was settled in 1636 by Roger Williams and his Baptist companions, who were expelled from the Puritan colony in Massachusetts on account of their religious opinions. It is also believed to have been the Vinland of the Norsemen, who explored its coast in the 10th century. Population 428,556.

Rhodes (*rōdz*), an island in the Mediterranean, belonging to Turkey, formerly an independent state of ancient Greece. It is about 50 miles long and 20 miles broad, and is traversed by a chain of mountains, the highest peak of which, Mt. Artemira, reaches a height of 4,070 feet. The island, whose ancient name was Rhodos, was inhabited at a very early period, and is said to have sent nine ships to the Trojan war. In the year 404 B. C., the city of Rhodes was founded at the northern extremity of the island, and after that the history of the island is comprised in that of the new city. The city of Rhodes was girt about by strong walls surmounted by towers, and was furnished with two good harbors. At the entrance to one of its ports stood a brazen statue of Helios, 70 cubits in height, and called the Colossus of Rhodes. Besides this statue, which was one of the seven wonders of the ancient world, there were 3,000 others in the city, of which 100 were colossal. The arts were cultivated in Rhodes, and intellectual activity showed itself long after it had declined in other parts of Greece. Like the remainder of Greece, the Rhodians submitted to the victorious Alexander the Great and received a Macedonian garrison, but on the death of Alexander, 323 B. C., they revolted and expelled the intruders. From this time until the overthrow of the Macedonian empire, was the most prosperous period in the history of Rhodes. After the death of Julius Cæsar, whose side the Rhodians had taken in his contest with Pompey, they were defeated in a naval engagement by Cassius, who entered the city by force, seized the public property, and rifled the temples. During several centuries Rhodes remained under the power of the Byzantine emperors. In 1309, it fell into the hands of the Knights of St. John of Jerusalem, who retained possession of it until 1523, when they were besieged by the Turks and compelled to sail away to Crete; and the island has remained a Turkish possession ever since.

Rhodes (*rōdz*), Rt. Hon. **Cecil John,** P. C., English South African statesman, railway projector and mining operator, was born at Bishop Stortford, England, where his father was rector of the parish, July 5, 1853. After graduating at Oxford, he went to the Cape of Good Hope in 1871 for his health, and settled at Kimberley, engaged in diamond mining, and began to dream of a united British South Africa, and of a railway project that would connect the Cape with Zambesi, and ultimately through the Egyptian Sudan to Cairo. Cape politics for a time attracted him, and he entered the local legislature and became prime minister, but resigned in consequence of the Jameson raid. In 1893, in alliance with the Dutch Afrikander party at the Cape, he took the field against the warlike Metabeles and subdued them; after which he obtained mining rights over what is now Rhodesia, which he has done much to develop. By this time, while working out his schemes of British expansion in the country, he formed the great De Beers mine consolidation, where he amassed great wealth. When war in the Transvaal broke out, he went to Kimberley, and remained there during the investment of the great diamond mining town by the Boers, raising and equipping at his own expense a town guard of 400 men, at a cost of $75,000. He died Mar. 28, 1902.

Rho'dophy'ceæ, plants commonly known as the red algæ. The red color is due to the presence of a pigment in addition to the ordinary chlorophyll which belongs to all algæ. They are mostly marine forms and are anchored by holdfasts, belonging to the deepest waters in which algæ grow. Their bodies are much more delicate than those of the brown algæ, or "kelps," their graceful forms, delicate texture, and brightly tinted bodies (shades of red, violet, dark purple, and reddish brown), making them very attractive. They show the greatest variety of forms, branching filaments, ribbons and filmy plates prevailing, sometimes branching very profusely and delicately and resembling mosses of fine texture. They are among the most prized souvenirs of a visit to the seashore. Red algæ are very peculiar in both their asexual and sexual reproduction. Every sporangium contains just four asexual spores, and contrary to the usual alga habit these spores have no cilia or power of motion. Since they are always produced in fours they are called "tetraspores." The female sex organ is also very peculiar. In the ordinary algæ the oögonium consists of a single large spherical cell. Among the red algæ, however, this spherical cell is transformed into a flask-like body, with bulbous base and an elongated almost hair-like neck. This female organ on account of its peculiar-



A red alga (*A*), showing the female organ (*o*) with its trichogyne (*t*), the male cells (*s*), and the resulting spore case (*B, C*).

ities is often called by a special name, "carpogonium," the tubular hair-like process being called the "trichogyne." The male cells come in contact with the trichogyne in the process of fertilization.

Rhone (*rōn*), the only important French river which falls into the Mediterranean, takes rise in the Swiss Alps, not far from the sources of the Rhine, its entire length being about 500 miles. There is sufficient water in the Rhône for good-sized vessels from Lyons southward, but on account of the rapidity of the current and the shifting of sand-bars, navigation is difficult and at times impossible. On account of these obstructions, which are greatest near the mouths of the river, communication with the Mediterranean is in great part dependent upon the canals which connect the Rhône with the Rhine, the Seine, and other rivers.

Rhu'barb, species of *Rheum*, a genus of the buckwheat family. Common garden rhubarb or "pie-plant" is *R. rhaponticum*, native to the Old World. The genus is very closely related to the common docks, many of which resemble the rhubarb in habit.

Rib'bon, a narrow band or strip of woven silk. Ribbons have been made an important article of commerce only during the last two centuries, the chief seats of their manufacture being Etienne, France; Basel, Switzerland; and Coventry, England. Of the names which indicate the kind of groundwork, grosgrain is a ribbed silk, plush a velvety or piled surface, satin a smooth, polished surface, etc.; and there are various mixtures of these, making an almost infinite variety of decorative effects, both in color and weaving.

Ricardo (*re-kär'dō*), **David,** an eminent political economist, was born of Jewish parentage, at London, April 19, 1772. At an early age he became a partner with his father as a stock-broker, but when he married outside the Jewish race, a misunderstanding arose between them and the partnership was dissolved. Young Ricardo then set up in the same business himself, and in a few years realized a large fortune, while preserving an honorable reputation throughout his business career. In 1809, he published a pamphlet entitled, *The High Price of Bullion a Proof of the Depreciation of Bank-notes*, which was a very clear and able argument in favor of a metallic basis for the currency of a country. After publishing a number of other successful pamphlets, Ricardo brought out his greatest work, and the one on which his fame chiefly rests, *On the Principles of Political Economy and Taxation.* This work, while not a complete treatise on political economy, may be regarded as a very able discussion of some of its principal factors, such as value, wages, rent, etc. Ricardo entered parliament in 1819, and retained his seat in that body until his death, which took place at Gatcomb Park, Gloucestershire, Sept. 11, 1823.

Rice, the well-known grain of *Oryza sativa*, extensively cultivated in Asia, where it is also native. The genus belongs to the grass family and contains about 20 described species, and perhaps these may all be considered as varieties of *O. sativa.* Rice supplies food for more human beings than does the product of any other plant. It is the principal, and often the only, food of millions in China, India, and the Malayan islands.

Rich'ard I., king of England, surnamed the "Lionhearted," was born at Oxford, Sept. 8, 1157, and by the death of his father, Henry II., became king July 6, 1189. Being a born soldier and thirsting for military glory, soon after his coronation Richard raised a large force of soldiers with which he joined the third crusade, then about to leave Europe for the Holy Land. He united his forces with those of Philip, king of France, at Vezelai; but at Lyons the two armies, numbering in all about 100,000 men, separated and proceeded by different routes to Sicily, where they again met. Here Richard betrothed his nephew Arthur to the infant daughter of Tancred, king of Sicily, with whom he formed a close alliance. On June 4, 1191, Richard reached the camp of the crusaders, then assembled near Acre, and shortly afterward that stronghold surrendered, the siege having lasted two years. Richard's march to Joppa along the seashore, his advance upon Jerusalem at Christmas, his capture of the fortresses in the south of Palestine, his second advance upon Jerusalem (the city he never beheld), his relief of Joppa — these and other deeds gave him a great name for heroism and valor, but brought no decisive advantage to the crusade. On Richard's way home, in 1193, he was shipwrecked in the Adriatic, and wandering in disguise through the dominions of his enemy, the archduke of Austria, he was recognized, seized, and handed over to the Emperor Henry VI. Being ransomed by his loyal subjects, Richard returned home the next year, and almost immediately afterward engaged in war with Philip of France, in which contest he was killed by an arrow shot from the castle of Chaluz, near Limoges, April 6, 1199.

Rich'ard II., king of England, and second son of the Black Prince and Joanna of Kent, was born at Bordeaux, April 13, 1366, and succeeded to the throne on the death of his grandfather, Edward III., June 28, 1377. The reign of Richard is a very interesting epoch of English history, as the newly-established house of commons was eager to claim a share of political power, and the laboring classes were seeking to be freed from the bondage under which they had so long suffered. During the first years of Richard's reign — he being only eleven years of age when he came to the throne — the government was in-

trusted to a council of twelve, and although the king's uncle, John of Gaunt, was nominally excluded from this council, he was generally regarded as the real head of the government, and was held responsible for the heavy taxation and other abuses of which the nation complained. In the midst of the conflicts of contending factions, and after several impeachments and executions had taken place, in the year 1389 Richard declared himself of age and took the government into his own hands, and for several years the country enjoyed peace and a fair degree of prosperity, until the king became involved in a number of quarrels with the earls of Warwick, Arundel, and others. Warwick was banished and Arundel beheaded, and after having triumphed over his enemies Richard now began to quarrel with his friends. A misunderstanding having arisen between the duke of Norfolk and Henry, duke of Lancaster, Richard sent the former into banishment for life and the latter for ten years. But on Richard's return from an expedition into Ireland, in 1399, he found that Lancaster had landed in England and raised a large army during his absence, with which he was then marching to London; and in addition to this, the army which Richard had taken with him into Ireland no sooner landed in England than it almost entirely deserted him and passed over to the invader. Richard met Lancaster at Flint castle, where he formally resigned his crown and was carried captive to London and placed in the Tower. A month later, Lancaster was proclaimed king as Henry IV., and Richard was condemned to imprisonment for life. In the following February, Richard's body, or what was supposed to be his body, was brought from Pontefract castle and shown to the public. According to some accounts, he was murdered in the castle, in February, 1400; while, according to others, he escaped to Scotland and died there a lunatic.

Rich'ard III., king of England, was the youngest son of Richard, duke of York, and the great-grandson of Edmund, duke of York, the fifth son of Edward III. He was born at Fotheringay, Oct. 2, 1452. On the defeat and death of their father in 1460, he and his brother George, afterward duke of Clarence, were sent by their mother to Utrecht, where they remained until the crown was won from Henry VI. by their eldest brother, Edward IV. In 1471, Richard led the van of his brother's army at Barnet, and also took an active part in the decisive victory at Tewkesbury. It is claimed that after the battle he and Clarence murdered Prince Edward, son of Henry VI., and in some quarters it is believed that he was concerned in the murder of Henry himself in the Tower. Edward IV. died April 9, 1483, leaving Richard guardian of his son Edward V., then only thirteen years of age; but instead of faithfully fulfilling this trust, Richard placed the boy and his younger brother in the Tower, and had himself proclaimed king. And not content with thus depriving young Edward of his crown, Richard caused him and his brother to be murdered while they were in the Tower, hoping thereby to make his own power the more secure. But Richard's numerous crimes made him so unpopular, that when Henry Tudor, earl of Richmond, arrived in England with an invading force, in 1485, he soon raised such an army that, at the battle of Bosworth, Richard lost both his crown and his life (August 22), and was succeeded by his antagonist as Henry VII.

Rich'ardson, Samuel, a famous English novelist, was born in Derbyshire, in 1689, and died at London, July 4, 1761. He says of himself that he had only "common school learning," and at the age of sixteen he was bound to John Wilde, a printer, with whom he served the usual period of apprenticeship. After working as a journeyman printer for a number of years, in 1719 he set up an establishment of his own, in which he attained a fair degree of prosperity. In November, 1740, when Richardson was over fifty years of age, he published his first novel, *Pamela, or Virtue Rewarded.* So popular was this book that a second edition was published in February following, a third edition in March, and a fourth in May. Eight years later, appeared the work which is generally considered Richardson's masterpiece, *The History of Clarissa Harlowe.* Dr. Johnson declared this book to be the first in the world for its knowledge of the human heart; and Fielding says of it: "Such simplicity, such manners, such deep penetration into nature, such power to raise and alarm the passions, few writers, either ancient or modern, have been possessed of." Having drawn the ideal woman in "Clarissa," Richardson proceeded a few years afterward to portray in "Sir Charles Grandison" the perfect man, "the man of true honor." This is considered a work of great ability, but not equal to *Clarissa.* Perhaps the most striking proof of Richardson's native genius is found in the fact that his method of telling a story by correspondence, and his extreme diffuseness, either of which would be fatal to most writers, seem to give him only a firmer hold upon his readers and to increase and intensify the reality of his creations. See the essay of Mrs. Oliphant (*Blackwood's Magazine*, March, 1869).

Richelieu (*rēsh'e-lō*), **Armand Jean du Plessis,** Cardinal Duc de, was born at Paris, Sept. 5, 1585, and was educated for the military profession at the Collège de Navarre. In 1607, he was consecrated bishop of Luçon, and for some time devoted himself to the duties of his diocese; but when a rupture occurred between the king and the queen-mother some years later, Richelieu was very active in securing a reconciliation between them, thereby laying the foundation of the

great influence he afterward exercised. In 1622, Richelieu was made cardinal, and in 1624, became minister of state, a position which, in spite of all opposition, he held until the end of his life. At one time the king had determined on dismissing him, but in an interview at Versailles, Richelieu so worked upon the weakness and fear of the monarch, that his supremacy was fully established from that day. Several important results attended Richelieu's administration of French affairs, of which the most important was the establishment of the absolute authority of the king, which during the feudal period was much abridged by the power of the nobility. By vigorous, and often cruel and unscrupulous measures, Richelieu succeeded in breaking down all the great nobles who opposed him, some of whom he brought to the scaffold, and sentenced others to lifelong imprisonment; so that, when he died, there was scarcely any check upon the exercise of the king's prerogative. Another of his great enterprises was the overthrow of the Huguenot party as a political power, which he completely effected by the siege and capture of Rochelle in 1628. At the same time he secured for the Huguenots a certain measure of toleration; and, on the whole, it is conceded that he used his success in this conflict with great moderation. In his foreign policy, the chief object of which was to humble the power of Austria, he was equally successful. With this great end in view he allied himself with the German Protestants and even with the great champion of the Protestant cause, Gustavus Adolphus, of Sweden. He died at Paris, while at the height of his power and authority, Dec. 4, 1642. See *Le Cardinal Richelieu*, by Dussieux.

Rich'mond, capital of Virginia, is situated on the left bank of the James river, about 150 miles from its mouth, and a little over 100 miles from Washington. The James river here supplies immense water-power; and the city contains nearly 1,000 manufacturing establishments, with a capital amounting to several million dollars. The chief of these are tobacco factories, rolling mills, iron foundries, etc. In 1861, Richmond was selected as the capital of the "Southern Confederacy," and throughout the war was the "objective point" for all the aggressive movements of the eastern army of the Union, until the seizure of its lines of supply by General Grant compelled its evacuation by General Lee, on the night of April 2, 1865. A portion of the city was burned by the retreating Confederates; but in the years that have followed the war the city has more than recovered her former beauty and prosperity. Her population in 1860 was 37,910; in 1900, 85,050.

Rich'mond, a city of Indiana, on the east fork of Whitewater river, 70 miles by rail from Cincinnati, and about the same distance from Indianapolis. It was founded by the Society of Friends, who established a college for both sexes in the place in the year 1859. Population 18,226.

Rich'mond, Leigh, English clergyman, author of *The Dairyman's Daughter*, was born at Liverpool, Jan. 29, 1772, and while a child was lamed for life by leaping from a wall. He studied at Trinity college, Cambridge, and after filling the joint curacies of Brading and Yaverland, in the Isle of Wight, for a number of years, in 1805, he was appointed to the rectory of Turvey, in Bedfordshire, where he died May 8, 1827. Besides *The Dairyman's Daughter*, he wrote the *Negro Servant* and *Young Cottager*, which three tracts have carried his name over the civilized world. Collected, they form the *Annals of the Poor*.

Richter (*rich'ter*), **Jean Paul Friedrich** (usually known by his pseudonym "Jean Paul"), was born March 21, 1763, at Wunsiedel, in North Bavaria, and after attending school in the town of Hof for a number of years, was sent to Leipsic to study theology. But Rousseau, Voltaire, and other authors had much greater attractions for him than theology, and he, too, resolved to write books. His first literary efforts were satires, but he could get no publisher for them, and for several years he carried on a desperate struggle against poverty, continuing to read and study with actual hunger as his daily companion. In 1785, he left Leipsic to avoid imprisonment for debt, and took refuge with his widowed mother at Hof. Here his circumstances were made a little easier, and he spent a number of years as private tutor in wealthy families. For a long time Richter seemed destined to failure as a writer, but in 1793 there was a turning point in his fortune, his work entitled *The Invisible Lodge* proving unexpectedly successful. It was followed by other works which brought him a liberal pecuniary reward and gave him high rank among the literary men of his age. In 1801, Richter married and settled down at Bayreuth, where he spent the remainder of his days writing his books, tending his pet animals, playing with his children, and taking short summer journeys to different towns in Germany. The principal works written during his married life were *Titan* and *Wild Oats*, the former accounted by himself and most German critics his masterpiece. His last years were clouded by total blindness and the death of his only son, a promising student, in 1821. Jean Paul is perhaps the most unique character in German literature, the chief of humorists, and in the language of Carlyle, "a colossal spirit, a lofty and original thinker, a genuine poet [in prose], a high-minded, true, and most amiable man." He died at Bayreuth, Nov. 14, 1825. See *Life of Jean Paul F. Richter*, by De Quincey.

Rick'etts, General, **James B.,** an American general, was born at New York in 1816, and

graduated at West Point in 1839. He served in various kinds of frontier duty, and in the Mexican war until the Civil war broke out, in 1861, when he was made brigadier-general of volunteers, and continued in active service with the army of the Potomac until the close of the struggle. Among other battles in which he participated, were Bull Run, South Mountain, Antietam, Monocacy, Cedar Creek, the Wilderness, Siege of Petersburg, etc. He retired from the army with the rank of major-general, Jan. 3, 1867, and died at Washington, D. C., Sept. 22, 1887.

Rid'dles may be defined as questions or propositions containing a more or less hidden meaning, which is to be discovered by guessing. At the present day, the propounding and solving of riddles is a mere pastime, but in ancient times they were put to more important purposes, being used to some extent for purposes of practical instruction and intellectual discipline. Homer is said to have died of chagrin because he could not solve a riddle, and every reader of the Old Testament is familiar with the riddles which Samson proposed to the Philistines. They first came into use in Greece about the time of the "Seven Wise Men," one of whom was celebrated for the composition of metrical riddles. The riddle was much cultivated in Europe during the middle ages, although it was a means of amusement rather than an intellectual exercise. The Abbé Cotin published a collection of his own riddles and those of his contemporaries, in which he styled himself *Le Père de l'Enigme* ("the father of the riddle"), but his claim has not been recognized by posterity.

Rid'ley, Nicholas, Protestant martyr, was born at Wilmontswick, Northumberland, about the year 1500, and after graduating at Pembroke Hall, Cambridge, in 1522, was ordained priest in 1524. He next went to Paris and to Louvain, and having met some of the most active reformers while abroad, after a three years' absence, he returned to England an ardent believer in the doctrines of the Reformation, quickly making himself one of the foremost leaders of the church. In 1547, he was made bishop of Rochester, and when Bonner was deposed from his position as bishop of London, Ridley was appointed his successor. He assisted Cranmer in the preparation of the forty-one articles, afterward reduced to thirty-nine, and in 1552 visited the Princess Mary at Hunsdon, but failed to convert her from the Catholic faith. After the death of Edward VI., Ridley espoused the cause of Lady Jane Grey, even going so far as to preach a sermon in which he declared both Mary and Elizabeth illegitimate. For this offense he was stripped of his office and dignities and committed to the Tower. In March, 1554, he was taken to Oxford to be tried by a commission, named by Cardinal Pole, for heresy, and after being kept in prison for eighteen months, and resisting all influences to make him recant his views, he was burned at the stake in front of Baliol college, Oct. 16, 1555. See his *Life*, by Dr. Gloucester Ridley.

Rid'path, John Clark, American historian and educator, was born in Putnam county, Ind., April 26, 1841, and died at New York city, July 31, 1900. After graduating in 1863, at Asbury (now De Pauw) university, he entered upon the profession of teaching. In 1869, he was appointed professor of literature at Asbury, and ten years later became vice-president of that university. To his alma mater he was instrumental in procuring its handsome endowment from Mr. De Pauw, when the university took that gentleman's name. Subsequently he gave himself entirely to literature, accepting the editorship, for a couple of years (1897–98), of *The Arena*. From his industrious pen came histories and cyclopædias and biographies. Among the latter are lives of Alexander Hamilton, Garfield, W. E. Gladstone, together with a history of Texas; an academic history and a popular history of the United States; *A Cyclopædia of Universal History*, and a compendious treatise on *The Great Races of Mankind*.

Rienzi (*rē-en'zē*), **Nicolas Gabrini,** generally called Cola di Rienzi, was born at Rome in 1313. His advantages of education were excellent, and nature had bestowed upon him a marvelous gift of eloquence. The assassination of his younger brother, by a Roman noble whom he found it impossible to bring to punishment, aroused his feelings against the aristocratic families of the city, and he determined, if possible, to destroy their power and overthrow them. In 1343, in company with Petrarch and others, he visited the papal court at Avignon to induce Clement VI. to return to Rome to protect the citizens from their oppressors. The pope received Rienzi with favor and appointed him notary to the civic chamber. Rienzi returned to Rome in 1344, and for three years loudly and openly threatened the nobles with revolution. At last he summoned the citizens together, and surrounded by the pope's legate and a number of trusted confederates, and followed by one hundred horsemen, he proceeded to the capitol, where he assumed the title of tribune and was invested with complete dictatorial power. The pope confirmed Rienzi in his authority; all Italy rejoiced in his success; and many predicted a revival of the power and majesty of the Eternal City. But the nobles were still bitterly hostile, and, although Rienzi won a great victory over them when they attempted to rise against him, the pomp and luxury which he sought to maintain involved him in such expense that he was compelled to levy heavy taxes for the support of his government. These taxes aroused so much opposition that, after a short reign

of seven months, he left the city and fled to Naples. After a two years' residence among the Franciscans in the Apennines, he went to Prague to secure the support of the Emperor Charles IV. in another effort to deliver Rome from the power of the nobles. Charles, however, was so amazed at his schemes of revolution and ambition that he sent him as a prisoner to the pope at Avignon, but by the mediation of Petrarch he was released. Innocent VI., the successor of Clement, now resolved to use Rienzi as a means of crushing the Roman nobles, and accordingly sent him to Rome in the train of Cardinal Albornoz. Their object was speedily accomplished, and Rienzi, having borrowed money and raised a body of soldiers, made a triumphal entry into Rome and was received with universal acclamation. But, alas, adversity had soured Rienzi's temper without teaching him wisdom and moderation. The same defects of character that had characterized his former administration again revealed themselves, and in two short months the opposition to him became so great that he was assassinated at the foot of the capitol stairs, his head being cut off and his body subjected to the greatest indignities (Oct. 8, 1354). The history of Rienzi has been made the basis of a very thrilling romance by Bulwer. See the histories of mediæval Rome, by Gregorovius and by Reumont.

Ri'fles were invented for the purpose of securing more accurate firing of bullets than was possible with the smoothbore gun. As the ball never fitted tightly in the smoothbore, its center was always below the center of the bore; and in consequence of this, a part of the explosive force of the powder escaped over the top of the ball, and was not only wasted, but exercised a downward pressure on the ball in its passage through the barrel. So great was this downward pressure that in guns of soft metal, as brass, a perceptible dent was produced on the under side of the barrel after a few rounds. Another more important consequence of the looseness of the ball was that in its irregular motion along the barrel, it was pressed now against one side and now against the other, and therefore its direction after discharge was not determined by the line of the barrel, but by the particular point of the muzzle with which it happened to be in contact at the instant of discharge. As early as 1498 the citizens of Leipsic possessed the germ of the present rifle, except that the grooves in their guns were straight; and in the year 1520 Augustus Kutter (or Koster), of Nuremberg, invented a spiral-grooved rifle, which was at least the starting point in all the improvements in rifled guns that have been made down to the present day. The spiral groove, when the bullet fits into the grooves, causes the bullet to revolve on its axis with a rapidity in proportion to the force of the explosion and the sharpness of the twist in the spiral. This revolution of the bullet on its axis causes it to move in the line of the barrel, subject only to the force of gravity, which eventually brings it to the ground. But for nearly three centuries after this the cost of rifled guns and the difficulties connected with their manufacture limited their use to the purposes of the chase. The 95th regiment of the British army was armed with "Baker's rifles" in the year 1800; and the revolutionary government of France issued rifles to a portion of their troops soon after. During the War of 1812, the American army demonstrated the value of rifles in war; but many years were yet to elapse before they were generally placed in the hands of soldiers.

In the year 1837 a rifle invented by Captain Delvigne was issued to a few regiments in the French army, and four years afterward the Prussians equipped their entire army with the celebrated needle gun, which proved its superiority over all rifles previously invented. The next step in advance was the rifle invented in 1849 by Captain Minié of the French army, in which the spherical bullet was discarded and its place supplied by one in the form of a cylinder with a conical point. The base of the bullet was hollow, so made to contain an iron cup which was driven by the force of the explosion into the bullet, causing the lead to expand into the grooves of the barrel. Notwithstanding all the advantages of the minie gun, it was found too heavy for effective service; and in 1853 the British Enfield rifle was invented, in which, besides other improvements, the diameter of the bore was reduced about one-eighth of an inch. This diminished the weight of the gun very materially without impairing its force or accuracy in any manner. From 1853 to 1865 this was the weapon of the British army, and in the last-named year the Enfield was converted into a breechloader by attaching to it the Snider breech-loading mechanism. This arrangement was, however, only temporary, and after numerous trials and experiments the Henry barrel, in connection with the Martin breech, was adopted in 1871, the first issue to troops being made in 1874. In the year 1855, the United States adopted what was known as the Springfield rifle, of which the caliber was .58 inches, the bullet, which was cylindro-conical in form, weighing 500 grains and the powder charge 60 grains. During the Civil war, it became necessary to issue Enfield and other rifles to the various regiments called into service, but the Springfield, with its various improvements, continued to be the standard arm of the United States up to 1893, the rifle issued to the regular army and the militia being the Springfield breechloader, caliber .45. This was displaced, however, in 1893, by the Kragg-Jorgensen .30 caliber magazine rifle, model 1892, which was adopted after competitive test, and is now the standard arm of the United States. See

Treatise on Small Arms and Ammunition, by Lieutenant-colonel Bond, R. A.

Riga (*rē'ga*), capital of Livonia, and the third seaport of Russia, lies on the Dwina river, seven miles from its mouth, and 350 miles from St. Petersburg. The old town has narrow streets and mediæval houses and stores; but the suburbs are laid out in broad streets with handsome buildings. Its manufactures are numerous and varied and give employment to several thousand people. Riga was founded in 1201 by Albert, bishop of Livonia, and soon became a first-rate commercial town and a member of the Hanseatic league. It belonged to Poland from 1561 till it was taken by Gustavus Adolphus in 1621, and in 1710 it was finally annexed to Russia. Population 256,197.

Riggs, Elias, D.D., LL.D., was born at New Providence, N. J., Nov. 10, 1810, and after graduating at Amherst college in 1829, and Andover Theological seminary in 1832, became a missionary of the American Board at Athens, Greece, subsequently removing to Constantinople, at which places he acquired a knowledge of modern Greek, Turkish, Bulgarian, and several other languages. In addition to other work, he has translated the Bible into Bulgarian, and assisted in revising the Turkish version. He has published *A Manual of the Chaldee Language*, *Brief Grammar of the Modern Armenian Language*, and other learned works.

Riggs, Stephen R., was many years a missionary of the American Board among the Dakota Indians, and in connection with Dr. Williamson, furnished them a translation of a greater portion of the Bible. He also published a *Grammar and Dictionary of the Dakota Language*, which is considered a very important contribution to American philology. The degree of D.D. was conferred upon him by Beloit college in the year 1873. During the Sioux war of 1862 he was obliged to flee with his family from the mission near Fort Snelling. When the expedition went against the hostile Indians he was its chaplain. He was born at Steubenville, O., March 23, 1812, and died at Beloit, Wis., Aug. 24, 1883.

Ri'ley, James Whitcomb, American author, familiarly known as "the Hoosier poet," was born at Greenfield, Ind., in 1853. After a desultory education, he began contributing verse to the newspapers of a dialect character, not a little of which, though simple and at times prosaic, is tender and touching. The success of his work led to his reciting his poems in public, chiefly those in the Hoosier dialect, caught and utilized as a remembrance of his early life on a farm in the Hoosier (Indiana) state. His best-known productions are, *The Old Swimmin' Hole, and 'Leven other Poems*, *The Boss Girl, Character Sketches and Poems*, *Afterwhiles*, *Green Fields and Running Brooks*, *Old Fashioned Roses*, *A Child-World*, *Pipes o' Pan at Zekesbury*, *Flying Islands of the Night*, *Rhymes of Childhood*, *Armazindy*, *Poems Here at Home*, *An Old Sweetheart of Mine*, *Neighborly Poems*, and *Rubaiyat of Doc Sifers*.

J. WHITCOMB RILEY.

Rimini (*rē'mē-nē*), a city of Italy, on the shore of the Adriatic, seventy miles from Bologna; it is still surrounded by walls, and contains many mediæval buildings. The spot where Cæsar stood to address his soldiers, after crossing the Rubicon (about ten miles northwest of Rimini), is marked on one of the squares by a monumental pillar, and beside one of the gates stands the triumphal arch, forty-six feet high, erected in honor of Augustus. Population 13,000.

Rine'hart, William H., an American sculptor, was born in Frederick county, Md., Sept. 13, 1825. He received only a common school education, and at the age of twenty-one years apprenticed himself to a marble worker in Baltimore. So great was his interest in his trade, and so close his attention to his duties, that in two years he was put at the head of the ornamental work in his establishment. In 1855, when thirty years old, he went to Italy with the determination to be a sculptor; and after a two years' course of instruction and practice in Florence, he brought back two bas-reliefs of such unquestioned merit, that no critic could fail to recognize his artistic talent. After remaining in Baltimore about a year, he went to Rome, where he continued to work until his death, his orders for portrait busts becoming so numerous that he generally had one or two years' work ahead. A bronze statue of the late Chief-justice Taney, made by Rinehart under a commission from the state of Maryland, was unveiled in Annapolis in 1872. Among his greatest works are the *Angel of the Resurrection*, *Woman of Samaria*, and *Clytie*. This last work was on exhibition in the Peabody institute of Baltimore. He died at Rome, Oct. 28, 1874, leaving the sum of $45,000 as a fund for the aid of indigent students of art.

Rio Gran'de, a large river of North America, rises in the San Juan mountains in Colorado, and flows southeastward, forming the boundary between Texas and Mexico, its length being about 1,800 miles. It is for the most part a shallow stream, but small steamboats can ascend it for nearly 500 miles. Its chief tributary is the Rio Pecos.

Rio de Janeiro (*rē'ō de ja-nā'rō*), capital of Brazil, stands on the west side of one of the finest natural harbors in the world. The city and its suburbs stretch nearly ten miles along the shore, while great mountain ranges shut in the background. About three miles southwest of the city stands the precipitous cone of Corcovado, up which a cog railway carries 100,000 visitors every year to enjoy the magnificent view of land and sea, which the point affords. The city is the commercial, as well as the political, capital of the Brazilian republic, sending out more than half of the exports

of the country and bringing in 45 per cent. of the imports. The exports of Brazil amount to about $125,000,000 yearly, the greater portion of this amount being derived from coffee. In the month of January, 1531, Alphonso de Sanza, a Portuguese captain, entered the bay, and thinking it the mouth of a large river, named it Rio de Janeiro—that is, January river; but the city was not founded until 1536. Its present population, including many foreigners, is 780,000. The state of Rio de Janeiro has an area of 26,630 square miles, and an estimated population of about 900,000.

Rio Negro (*rē'ō nā'grō*), one of the principal affluents of the Amazon river, rises as the Guiana in southeastern Columbia, and flows east into Venezuela, then south into the Amazonas in Brazil, and again east and southeast until it joins the Amazon at Manaos, after a course estimated at 1,350 miles. It is over a mile broad when its clean inky-black stream enters the yellow, muddy Amazon.

Rip'ley, George, was born at Greenfield, Mass., Oct. 3, 1802, and after graduating at Harvard college, in 1823, studied theology there and was ordained to the pastorate of a Unitarian church at Boston. This he held until 1841. In the meantime he had become one of the leading spirits in the Transcendental movement, the first meeting of the club being held at his house in 1836; and on leaving the pulpit he started the Brook Farm experiment. This came to an end in 1847, when Ripley removed to New York and engaged in literary and journalistic work. He died July 4, 1880. See *Life*, by O. B. Frothingham, in "American Men of Letters."

Rip Van Win'kle, the hero of Washington Irving's delightful sketch, first published in 1820, is an idle, good-natured, henpecked scapegrace, who, with his gun and dog, seeks a refuge from the scolding of his sorely tried and ill-tempered wife in the forests of the Catskill mountains. There he falls in with Hendrick Hudson and his crew of the *Half Moon*, who are playing at ninepins in a secluded hollow, the balls sounding like peals of thunder along the sides of the mountain. Rip is directed to wait on them, and while in this service drinks of their liquor until his senses forsake him and he falls asleep. He wakens on a bright summer morning twenty years afterward, to find his dog gone and a rusty firelock by his side, and when he returns to his native village he sees new buildings and new faces on the street. His own house has fallen into decay; his wife is dead, and he who went away a subject of George III. has returned to find himself a citizen of the United States. This story has been dramatized, but no version has held the stage except the one with which the name of Joseph Jefferson has been identified.

Ristori (*rēs-tō'rē*), **Adelaide,** an Italian tragedienne, was born Jan. 29, 1821, at Cividale, in Friuli. Her parents were strolling players, so that she may almost be said to have begun life in the theatre. At the age of fourteen she took a part in *Francesca da Rimini*, and in a few years became the leading actress of Italy. After acting in her own country for a number of years, she presented herself before a French audience, in 1855, and won a complete triumph, and thereafter gained additional laurels in nearly every country in Europe, as well as in the United States and South America. The *rôles* in which she especially shone were "Mary Stuart," "Medea," "Marie Antoinette," and "Lady Macbeth."

Ritsch'l, Albrecht, a German Protestant theologian, was born at Berlin, March 25, 1822, and died at Göttingen, March 20, 1889. Studying at Bonn and at Halle, he became professor of theology at the former, but subsequently accepted the same chair at Göttingen, where he became a well known exegete and the head of a school of theology bearing his name. Though he held that Christianity is a divine revelation, and that men are saved only as they are members of the Christian church, he held free views regarding inspiration, and was no believer in the supernatural. He rejected the doctrine of the trinity, incarnation, original sin, and other orthodox

religious beliefs, holding that the religious sense is the essential and ultimate fact in religion. Only a few of his published works are translated from the German. Of his works the chief are: *The Christian Doctrine of Justification and Reconciliation*, *Theology and Metaphysics*, *History of Pietism*, *Instruction in Christian Religion*, and *Origin of the Ancient Catholic Church*.

Rit'ter, Karl, an illustrious geographer, was born at Quedlinburg, in Prussia, Aug. 7, 1779, and after studying at Halle, was nominated professor of geography at Berlin in 1820, and afterward became member of the academy and director of studies of the military school. With Ritter as the founder of comparative geography began a new epoch in the history of geographical science. His chief work, *Geography in Its Relation to Nature and the History of Men*, was divided into four parts: (1) Central Asia, Siberia, China, and India; (2) West Asia; (3) Arabia; (4) Sinai Peninsula, Palestine, and Syria. His lectures were published in three volumes —*History of Geography*, 1851; *General Geography*, 1862; *Europe*, 1863. He died at Berlin, Sept. 28, 1859, and his name is perpetuated in two geographical institutions at Berlin and at Leipsic.

Rives (*rēvz*), **Amelia** (known also as Mrs. J. Armstrong Chanler, and as the Princess Amélie Troubetzkoy), American novelist, was born at Richmond, Va., Aug. 23, 1863, and early manifested a taste and strong predilection for literature. Her earliest production was a series of stories entitled *A Brother to Dragons*, which showed imagination and a certain strength. This was followed by a rather sensational and passionate work called *The Quick and the Dead*, which met, however, with considerable popularity. Her later work embraces *Virginia of Virginia*, *Herod and Mariamne*, *According to St. John*, *Barbara Dering*, *Athelwold*, *Tanis*, and a number of magazine articles. In 1896, the authoress, after being divorced from her first husband, Mr. J. A. Chanler, married a Russian prince. She nevertheless continues to make Virginia her home, her residence being at Cobham, Va.

Riviera (*rē-vē-ā'rȧ*), ("seashore"), a term applied to the narrow strip of coastland, bordering the gulf of Genoa. West of Genoa it is called the Riviera di Ponente, or western coast, and beyond Genoa the Riviera di Levante, or eastern coast. The western section is the most frequented, as it abounds in the most striking and beautiful scenery, and has numerous health and fashion resorts.

Roach, John, was born in 1815 at Mitchellstown, Ireland, and came to America in 1829. He worked for a time as machinist and then founded the Ætna iron works. During the Civil war he built many large engines, then engaged in the construction of iron vessels. In 1871, he established the Delaware River Iron Shipbuilding and Engine works at Chester, Pa., which covered 120 acres and were worth $2,000,000. He built here sixty-three large vessels. In 1885, when the navy department would not accept the dispatch boat *Dolphin*, because it was too slow, Roach made an assignment. He died at New York, Jan. 10, 1887. The *Dolphin* was afterward accepted, and the works which Roach had shut down in 1885 were reopened.

Roanoke (*rō'a-nōk'*), a river of Virginia and North Carolina, formed by the junction of the Dan and Staunton rivers, a mile above Clarksville, Va., flows southeast through North Carolina and empties into Albemarle sound. Its length is a little over 200 miles, and it is navigable for steamboats from its mouth to Weldon, a distance of 130 miles.

Roanoke', a city of Virginia on the Roanoke river, 250 miles west of Norfolk, at the junction of the Shenandoah Valley and Norfolk and Western railways. At the close of the Civil war and for some years after, Roanoke was a secluded hamlet, but by the census of 1900 it contained a population of 21,495.

Rob'ert I. (Robert the Bruce). See BRUCE, ROBERT.

Rob'ert II., king of Scotland, 1371–90, was born March 2, 1316, two years after the battle of Bannockburn. He lost both his parents in infancy, and throughout the disastrous reign of his uncle, David II., he was one of the most prominent nobles of Scotland, twice acting as regent during his exile and captivity. On David's death he obtained the crown, and became the founder of the Stuart dynasty. The wars which Robert waged with England were conducted by his barons, who shaped the policy of the kingdom according to their pleasure. The most noted features of Robert's reign were the invasions of Scotland by the duke of Lancaster ("old John of Gaunt") in 1384, and by Richard II. in 1385, and the retaliatory expedition of the Scotch in 1388, which culminated in the battle of Otterburn. King Robert died in his castle of Dundoland, in Ayrshire, April 19, 1390.

Rob'ert III., king of Scotland, was born about 1340 and came to the throne on the death of his father, Robert II., in 1390. His weakness and imbecility as a ruler virtually placed the government in the hands of his brother, the Earl of Menteith. The chief events of Robert's reign were the invasion of Scotland by Henry IV. of England, in 1400, and the retaliatory expedition of Archibald Douglas, which resulted in the terrible disaster at Homildon Hill in Northumberland two years later. Robert died of grief April 4, 1406, on learning that his son James had been taken prisoner by an English cruiser, while crossing the Channel on his way to France.

Rob'erts, Frederick Sleigh Roberts, Baron of Kandahar and Waterford, a distinguished British general, was born at Cawnpore, India, the son of Sir Abraham Roberts, Sept. 30, 1832, and was educated at Eton college and at Addiscombe and at Sandwich. At the age of nineteen he joined the Bengal artillery and served through the Indian mutiny; was present at the siege and capture of Delhi, where he was wounded; was at the relief of Lucknow, and in the battle of Cawnpore and other actions of the period. For his heroism he received the Victoria Cross. In 1868, he took part in the Abyssinian war, and also in the Lushai expedition of 1871–72, and was made a C. B. In the Afghan war of 1878 he commanded the Kuran field force, and in this affair he made his famous march from Kabul to Kandahar, effecting the relief of the latter place. For his great military feat in this war he was created a baronet, and earned from his soldiers the familiar sobriquet of "Little Bobs" or Bobs Bahadur. In 1892, he was raised to the peerage, having meanwhile served in South Africa and being given command of the British forces in India. He also received the thanks of both houses of the British parliament. In 1895, he was made field-marshal and commander of the forces in Ireland. In December, 1899, he proceeded to South Africa to take supreme command during the Boer war, where he invaded the Orange Free State and the Transvaal and turned the fortunes of that struggle in favor of the British. In the autumn of 1900, he returned to England to succeed Lord Wolseley as commander-in-chief of the army. He has published two books, one on the *Rise of Wellington*, the other *Forty-one Years in India.*

LORD ROBERTS.

Rob'ertson, Frederick William, a celebrated minister of the Church of England, was born at London, Feb. 3, 1816, his father being a captain of artillery. Robertson's early years were marked by a singular purity and uprightness and an ever-active sense of duty. For a long time he hesitated between his desire to enter the army and the call to the ministry which pressed upon his conscience, but finally decided in favor of the latter. He matriculated at Brasenose college, Oxford, in 1837, and while there ardently devoted himself to the study of the Scriptures and the standard literary works of the day. He was ordained by the bishop of Winchester in 1840, and for nearly a year thereafter held a curacy at Winchester. In the summer of 1842, he became curate to the incumbent of Christ church, Cheltenham, and here for nearly five years he labored with steady devotion, passing through the great struggle of his life, and fighting his way through many doubts and misgivings, to the realities of the Christian faith. In 1847, Robertson was called to Trinity chapel, Brighton, where in a ministry of six years he arrested the public attention by his originality, the beauty and freshness of his thought, his wide human sympathy, his knowledge of the human heart, and his interest in everything pertaining to human welfare. He showed his friendship for the working classes by establishing the Workingmen's institute at Brighton and preaching to its members the duty of culture and self-control. During Robertson's last years he suffered from a disease of the brain, which was aggravated by his nervous temperament and the misrepresentations to which he was subject on account of his liberal theological views and his sympathy for the laboring classes. His last words were: "I must die; let God do His work!" He died at Brighton, Aug. 15, 1853. See the *Life and Letters* and *Sermons.*

Robespierre (*rō'bes-pēr'*), **Maximilien Marie Isidore,** was born at Arras, May 6, 1758, and after pursuing a course of study at the college of his native town, was sent to complete his education at the College of Louis le Grand at Paris. After passing some years in diligent study, he returned to Arras and entered on the practice of the law, in which he won considerable distinction. On the convocation of the states-general, in 1789, he was elected one of the deputies and repaired to Versailles in that capacity; and it was not long until close observers noted in him a peculiar force and earnestness that gave promise of a distinguished career. "This man," said Mirabeau, "will go far, for he believes every word he says." After the death of Mirabeau, Robespierre's importance seemed to increase, and from this time forward his biography is a history of the French Revolution. In May, 1791, he proposed and carried the decree by which members of the assembly were excluded from a place in the assembly which followed, a measure calculated to insure the power of the Jacobins, of whom he had become the leader and idol. Robespierre was one of the deputies to the national convention, which was formed in 1792, and as chief of the extreme party, called "the Mountain," he was one of the main agents in procuring the execution of the king, which took place in December of that year. In the following year occurred his final struggle with the Girondists, so many of whom he sent to the scaffold during the "Reign of Terror" that lasted for several months. Marie Antoinette and the Duke of Orleans were the first victims; Danton, Camille, and others

followed, and under the so-called committee of public safety, Paris became the scene of an indiscriminate slaughter, in which thousands of lives were sacrificed. "Robespierre will follow me; I drag down Robespierre," said Danton on the scaffold. The end of the "tyrant"—such was the name given to him—drew rapidly near. A conspiracy was organized against him, and after a fierce tumult in the convention he was arrested. The next day (July 28, 1794), in company with Couthon, Saint-Just, and nineteen others, he closed his career on the scaffold. See the histories of the Revolution by Lamartine and by Taine.

Rob'in, the commonest of the American thrushes, ranging in summer from Mexico to Labrador, and Alaska. In winter, it is found from Virginia south. It is among the first migratory birds to arrive north of its winter limit. This bird is a near relative of the English blackbird. It is about ten inches long with head and tail blackish, and the rest of the upper parts olive gray. The color of the under parts is chestnut brown, except the throat, which is white with black streaks. The breast of the young robin is spotted. Its habits are too well known to require description. The robin of England and Europe is an entirely different bird, belonging to the family of warblers. See REDBREAST.

Rob Roy, the popular name for Robert McGregor, a celebrated Scottish outlaw, whose singular adventures entitle him to be considered the Robin Hood of Scotland. Rob Roy borrowed money from the Duke of Montrose to engage in cattle speculation; but as he met with heavy losses, his estates were seized by the duke on account of the debt. Being rendered desperate by his misfortunes, he collected a band of about twenty followers, and made open war on the duke, robbing him of his cattle and preventing him from receiving the rents of his tenants. Many stories are still current in the neighborhood of Loch Lomond and Loch Katrine of his narrow escapes from capture by the troops that were sent after him. Many instances have also been recorded of his kindness and liberality to the poor, whose wants he often supplied at the expense of the rich. He died in his own house Dec. 28, 1738, his funeral being attended by all the people of the district, except the partisans of the Duke of Montrose. Rob Roy's exploits have been immortalized in Sir Walter Scott's novel which bears his name.

Rochambeau (*rō-shŏn-bō'*), **Jean Baptiste Donatien, de Vimeure,** Comte de, a French marshal, was born at Vendome, July 1, 1725, and entered the army in 1742. In 1780, he was sent to America in command of 6,000 men to assist the colonies in their war for independence, and rendered effective assistance to Washington at the siege of Yorktown, the surrender of which place, by Cornwallis, brought the war to a close. During the French Revolution he was imprisoned, and was saved from the scaffold only by the death of Robespierre. He became a marshal in 1791, and three years later Napoleon made him a grand officer of the Legion of Honor. He was imprisoned during the Reign of Terror, and died May 10, 1807.

Rochefort (*rōsh-for'*), **Victor Henri,** Comte, French journalist, playwright, and Radical politician, was born at Paris, Jan. 30, 1830, a descendant of the old French nobility. At an early age he began to write boldly and humorously, but with caustic satire, in the Paris *Charivari* and in *Le Figaro*, and later on, in his journal *La Lanterne*, appeared his violent attacks on the French empire and the imperial family, which compelled him to take flight into Belgium. Here he continued his lampoons, which found their way across the frontier, and led to his election to the French legislature. Being permitted, in 1869, to return to Paris, he took his seat and at this time founded the *Marseillaise.* In this sheet he continued his attacks on Louis Napoleon, which led to a duel between his collaborator, Victor Noir, and Prince Pierre Bonaparte, in which Noir was killed. Rochefort was at the same time fined and imprisoned. In 1870, when the empire fell, he was set at liberty and for a time was a member of the government of national defense. In 1871, he founded *Le Mot d'Ordre*, and instigated many of the worst excesses of the Commune. For assailing M. Thiers and the government of Versailles, he was taken, tried, and sentenced to imprisonment for life. Subsequently he was transported to New Caledonia, from which he escaped, however, and reached Geneva. Here he remained until the amnesty of 1880, when he returned once more to Paris and established *L'Intransgeant*, only to get once more into trouble, when he fled to London until 1895, when he was again permitted to return to Paris.

Rochelle (*rō-shel'*), **La,** a seaport of France. Its harbor is still sheltered by the remains of Richelieu's famous dike, and is surrounded by fine quays, close to which lie the principal streets and squares. Many of the latter are regular and well built, and present a handsome appearance from the number of houses which are adorned with porticoes and balconies. Rochelle, which was known until the 12th century under its Latin name of *Rupella*, "Little Rock," of which its present name is a mere translation, was settled by a colony of serfs of Lower Poitou, who, fleeing from the persecutions of their lord settled on the rocky promontory between the ocean and the neighboring marshes. A stronghold of the Huguenots, it was unsuccessfully besieged in 1573, and in 1627–28 it offered a fourteen months' resistance to the forces sent against it by Cardinal Richelieu, but was at length compelled to surrender. To-day it is a fortress of France of the second class. Population 30,000.

Roch'ester, N. Y., the third city in size and commercial importance in the Empire state, is located in the Genesee river basin, seven miles from Lake Ontario. Its elevation above the lake ensures a system of perfect drainage, which, with an inexhaustible water supply, enables it to rank, in point of healthfulness, first among the cities of the state. It was settled in the year 1812; incorporated as a village in 1817 and created a city in 1834, and now contains 162,608 population. It contains 125 churches (67,000 communicants), 38 public schools (24,000 pupils), 23 parochial schools (9,000 pupils), two colleges, four seminaries, private classical and preparatory institutions, and three public libraries.

There is located here the Western New York Industrial school, a state reformatory, containing about 1,000 pupils of both sexes. Principal industries embrace the manufacture of shoes, leather products, clothing, flour, optical instruments, buttons, kodaks, photographic materials, sewer pipes, beer, tobacco, furniture, candy, canned goods, time locks, and typewriting machines. These industries have an invested capital of $52,000,000, and produce $300,000,000 worth of goods annually. The largest nurseries in the world are located at Rochester and the production of flowers and flower seeds comprises an important industry. As a shipping point the city has the advantages of nine railways, the Erie canal, and a fine harbor on Lake Ontario—the Port of Genesee. The nineteen surrounding townships, comprising Monroe county, are fertile and very productive, having a valuation of $37,000,000. The city is noted for its fine parks (700 acres), wide streets, beautiful drives, and surrounding pleasure resorts.

Rock Island, a city of Illinois, on the Mississippi river, opposite Davenport, Ia.—the two towns being connected by a wrought iron bridge which cost over $1,000,000—180 miles from Chicago. The island in the Mississippi, from which the town is named, belongs to the United States government and is used as a public park. The channel east of the island has been dammed so as to furnish immense water-power, and the city has flour and sawmills, besides foundries, machine shops, glass works, etc. Population 19,493.

Rock River rises in the southeastern portion of Wisconsin, and flows south and southwest into Illinois, emptying into the Mississippi three miles below Rock Island. Its course of nearly 400 miles is through a region much noted for beauty and fertility.

Rock'efeller, John Davidson, American capitalist and president of the Standard Oil company, was born at Richford, N. Y., July 8, 1839, and at an early age removed with his parents to Cleveland, O., where he was educated in the public schools of that city. His business career began in the office of a commission merchant in Cleveland, and in the sixties, when he showed great aptitude for commerce, he engaged in the oil business, which in its gigantic developments has yielded him an immense fortune. In the seventies and eighties, various oil-operating firms were consolidated into the giant trust, known now as the Standard Oil company, of which Mr. Rockefeller is the head. His wealth has been well and beneficently utilized, much of it (over $6,000,000) being given to the University of Chicago. He has been a princely almoner of the American Baptist church and its missionary organizations, and of Vassar college, Barnard college, and other educational and civic institutions.

Rock'et. See FIREWORKS.

Rock'ford, a thriving city of Illinois, on both sides of Rock river, about 100 miles west of Chicago. It has four bridges crossing the river, three of which are railroad bridges, four railroads, flouring, paper, woolen, and cotton mills; factories of agricultural implements, furniture, cutlery, pumps, carriages, watches, silver-plated ware, boots and shoes, wood engravings, and other products. The city is well built, and is noted for the intelligence and enterprise of its citizens. Population 31,051.

Rock'ing Stones, or **Logans,** are large masses of rock so finely poised as to move backward and forward with the slightest impulse. Some rocking stones occur near to remains of ancient fortifications, which seems to confirm the statement in one of the poems of Ossian, that the bards walked round the stone singing, and made it move as an oracle of the fate of battle. In Greece, rocking stones occur as funeral monuments, and are generally found on conspicuous places near the sea. The rocking stone of Tandil, in the Argentine Republic, 250 miles south of Buenos Ayres, weighs 700 tons, and yet is so nicely poised that it rocks in the wind, and may be made to crack a walnut.

Rocks. See GEOLOGY.

Rock'y Mountain Goat, an antelope inhabiting the Rocky mountains and mountains of Northern California from the forests to the snow line. It is a true antelope, but having a tuft of hair on the throat is commonly called a goat. It is about the size of a large sheep, and is provided with long snow-white hair. The black shining horns are six or eight inches long and project slightly backward. It is rather rare and at all times shy and difficult to approach. As the flesh is not sought for food, the animal is hunted mainly to supply museums. See Edwords' *Camp-fires of a Naturalist*, and ANTELOPE.

Rock'y Mountains, a vast system of mountain ranges lying in the western portion of the United States and the British possessions. They are a continuation of the Cordilleras of Mexico. The greatest breadth of

this mountain system in the United States is 1,000 miles and their total area is nearly 1,000,000 square miles. From latitude 32° to 40° the ranges bear nearly north and south; between latitude 40° and 45° their course is northwest; then after a more northerly bend, they keep a course nearly parallel with the Pacific coast, with many detached ranges and peaks. One of these, Mt. St. Elias, is 17,800 feet high, and marks the boundary line of longitude between Alaska and the British possessions. Mount Shasta, in the coast range in northern California, is 14,000 feet high; Fremont's Peak, near the western boundary of Wyoming, is 13,570 feet high. In British Columbia, Mt. Brown is 16,000 feet and Mt. Hooker 15,700 feet. The central range of the Rocky mountains forms the ridge which divides the rivers falling into the Pacific from those falling into the Arctic ocean, Hudson bay, and the gulf of Mexico; but between the eastern and western ranges lie the territory of Utah and territory of Nevada, in which are rivers having no outlets but such lakes as Great Salt lake in Utah and Humboldt's lake in Nevada.

Rodg'ers, John, an American naval officer, was born in Maryland, Aug. 8, 1812, his father being the Capt. John Rodgers who distinguished himself by firing the first gun on the British during the War of 1812. He entered the navy in 1828, and was commissioned captain in 1862. The next year, while in command of the monitor *Weehawken*, he captured the Confederate *Atlanta*, and was promoted to be commodore. He became rear-admiral in 1869, and was superintendent of the United States Naval observatory at Washington from 1877 until his death, May 5, 1882.

Rod'man, Thomas J., was born at Salem, Ind., in 1816, and after graduating at the United States Military academy was commissioned lieutenant of ordnance in 1841. To him belongs the honor of inventing a method of casting large guns about a hollow core and cooling the metal from the inside. He died at Rock Island, Ill., June 7, 1871.

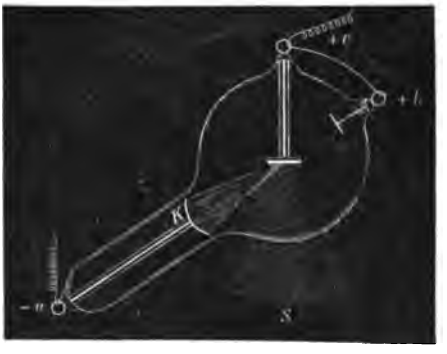
Roe, Edward Payson, American novelist, was born at New Windsor, N. Y., March 7, 1838, and, on the completion of his theological studies, became a chaplain in the volunteer service during the Civil war, and then pastor of a Presbyterian church at Highland Falls, N. Y. The great Chicago fire of 1871 furnished him a subject for his first novel, *Barriers Burned Away*, which proved very successful. In 1874, he resigned his pastorate and settled at Cornwall-on-the-Hudson, where he devoted himself to the pursuit of literature and the cultivation of small fruits. Although not a literary genius of the highest order, his stories, some twelve or fifteen in number, were all very popular, and are still widely read both in America and Europe. Among his works are *From Jest to Earnest*, *Near to Nature's Heart*, *He Fell in Love with His Wife*, *Opening a Chestnut Burr*, etc. He died at Cornwall, N. Y., July 19, 1888.

Roem'er, Ole, a Danish astronomer known principally as the man who first discovered that light travels with a finite speed; born 1644, died 1710. He was educated at the University of Copenhagen. The years from 1672 to 1681 he spent in the Paris observatory, at the end of which period he returned to Copenhagen as professor of astronomy, a position which he held until the end of his life. It was during his Paris residence that he made a study of the motion of Jupiter's satellites and showed from certain inequalities in the motion of the first satellite that the speed of light across the orbit of the earth is approximately 309,000,000 meters per second, a result which is not so very far — perhaps three per cent. — from the best modern measures.

Roemer devised the transit instrument, the meridian circle and the alt-azimuth instrument; but he was in advance of his times and their adoption was, therefore, delayed until many years after his death. See Grant's *History of Physical Astronomy*.

Roentgen (*rĕnt'gen*), **Rays.** About the beginning of 1896, Roentgen, a German physicist, long and favorably known to the scientific world, discovered that rays which are *in many respects* similar to Lenard's rays, can be observed through a very large region outside of an ordinary Crooke's tube. These are the so-called X-rays. Among the most important properties of these rays are the following: —

1. They take their origin at those points where cathode rays strike upon matter. Thus, in the accompanying figure, the cone of rays



ROENTGEN RAY TUBE.

leaving the curved cathode K, are cathode rays, while the sheaf of rays S, leaving the flat plate are X-rays.

2. Unlike cathode rays, they pass through glass, air, and various materials with little absorption.

3. Unlike ordinary light, they are not reflected or refracted, but pass straight through ordinary material without deviation.

4. They excite fluorescence in many substances, especially in platinum-barium-cyanide and some similar salts. Hence, a plate covered with these salts is widely used for observing shadows cast by X-rays. In this manner the bones of the hands, arms, etc., are easily "seen." Such a device is called a *fluoroscope.*

5. They are not deflected by a magnet as are cathode rays.

6. They produce electrolysis in air and other gases through which they pass. Such gases are made conductors by the passage of X-rays, and are said to be "ionized" or "Roentgenized." They behave in a similar way toward paraffine and some other solid insulators.

See articles BECQUEREL RAYS, CATHODE RAYS, FLUORESCENCE.

Roentgen (*rent'gen*), **Wilhelm Konrad,** eminent German scientist, distinguished investigator of physical problems, and discoverer of the "X" or Roentgen rays, was born in the province of Dusseldorf, Prussia, in 1844. Educated at Zurich and Utrecht, he became professor of physics and director of the laboratory at the University of Wurzburg, Bavaria. He also taught at Strasburg, and at Giessen. In December, 1895, he communicated to the Wurzburg Physico-Medical society his remarkable discovery of the new and powerful "X-rays," since known by his name, and in the following month he described his discovery at the celebration of the semi-centennial of the founding of the Berlin Physical society. Later, he demonstrated the rays in the presence of the Emperor of Germany, who decorated him, and Prince Ludwig of Bavaria created him a baron. The application of the "X-rays" in surgery has been fraught with wonderful and beneficent results. By the X-ray picture, pulmonary tuberculosis is better detected, and heart disease can be more accurately learned from it than by percussion of the chest.

PROFESSOR ROENTGEN.

Rog'ers, Henry Wade, LL.D., American educator and legal authority, was born at Holland Patent, N. Y., Oct. 10, 1853, and educated at the University of Michigan, Ann Arbor. He studied law and, in 1877, was admitted to the bar, and later on became professor of law and dean of the law faculty in his alma mater. In 1890 he was appointed president of Northwestern university, resigning this position in 1900, and in 1901 accepting the chair of constitutional law at Yale. He has been chairman of many important bodies, especially those which have a bearing on legal education, jurisprudence, law reform, and on the foreign policy of the United States. He is the author of a work on *Expert Testimony*, on *Illinois Citations*, and for some years edited *The American Law Register.*

Rog'ers, John, American sculptor and modeler, was born at Salem, Mass., Oct. 30, 1829, and was educated at the Boston public schools. Early in life he became interested in clay-modeling, and in 1858 went to study art in Europe. Returning to the United States in 1859, he modeled a group, *The Checker-Players*, which attracted favorable attention; after this, he took scenes occurring in the Civil war as themes of his compositions; these were soon known as "Rogers' Groups," and well merited their popularity. The best known of these, some of which were reproduced in terra cotta, are the *Picket Guard*, and *One More Shot*, besides those of a social character, such as *The Favorite Scholar*, *Coming to the Parson*, *Going for the Cows*, *The Slave Auction*, etc. He has also produced a large equestrian statue of General Reynolds, which fronts the city hall, Philadelphia.

Rog'ers, Randolph, American sculptor, was born at Waterloo, N. Y., July 6, 1825, and after following mercantile pursuits for a number of years in early life, went to Rome to study the sculptor's art. Among the works for which he is distinguished are the designs for the Washington monument at Richmond, Va., a statue of John Adams in Mt. Auburn cemetery, a memorial monument for the state of Rhode Island at Providence, and a still larger one for the state of Michigan at Detroit, and the bronze statue of Abraham Lincoln at Philadelphia. He died at Rome, Jan. 15, 1892.

Rog'ers, Samuel, English poet, was born at the suburban village of Stoke-Newington, July 30, 1763. After obtaining a private education, he entered his father's bank in London at the age of seventeen, and in 1793 became the head of the firm. In 1792, appeared the poem on which his fame was chiefly based, *The Pleasures of Memory*, which in 1816 had reached a nineteenth edition. Then followed *An Epistle to a Friend* in 1798, *Voyage of Columbus* in 1812, *Jacqueline* in 1814, and *Italy* in 1822. Rogers was very rich; but his poetry, whatever may be its merits, is wholly a thing of the past—it is now but little read or quoted. He died at London, Dec. 18, 1855.

Ro'land, the hero of one of the most popular epic poems of Frankish literature, was, according to tradition, the nephew and favorite captain of the Emperor Charlemagne. All

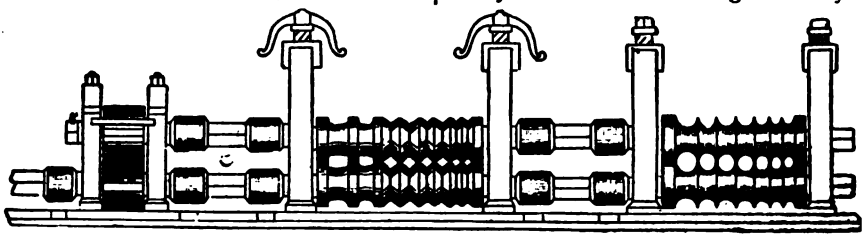
that history tells of him is, that when Charlemagne, in the year 778, was at Paderborn organizing the government of the Saxons, whom he had conquered, and attending to their formal admission into the Christian church, he was visited by a Saracen chief who offered to put the Frankish sovereign in possession of several towns south of the Pyrenees. Charlemagne at once accepted the offer and marched with a large army through Gascony, compelling its duke to do him homage, and took Pampelona and Saragossa. But on the return to France, Roland, who commanded the rear guard of the Christian army, was suddenly attacked by a large body of Gascons lying in ambush in the woods, and slain while fighting gallantly at the head of his troops. Throughout the middle ages the *Song of Roland* was the most popular of the many poems current; and William of Normandy, when on his way to conquer England, had it sung at the head of his troops to encourage them on their march. Even at the present day, the memory of Roland is still held in honor by the hardy mountaineers of the Pyrenees, among whose defiles the scene of his exploits is laid.

Roland (*rō-lon'*), **Madame Marie** (or Manon) **Jeanne Philipon,** was born at Paris, March 18, 1754. Her father had ruined himself by speculation, and her mother, an admirable woman, died shortly afterward; so her childhood was spent in poverty and loneliness, made the harder by her father's misconduct. At eleven, she spent a year at a convent and the next year with her grandmother. From a child she was a great reader, devouring all that came in her way, and the reading of Plutarch made her a republican. On her return to her father's house, she read Bossuet, Buffon, and Helvetius, and at length found her gospel in Rousseau. In February, 1780, she married Roland, who afterward became the leader of the Girondists. In 1791, in Paris, Madame Roland, with her masculine intellect and woman's heart, became the queen of a coterie of young and eloquent enthusiasts that included all the famous and ill-fated leaders of the Gironde, Brissot, Buzot, Petion, and at first even Robespierre and Danton. Her noble beauty, dark, expressive eyes, sweet voice, and eloquent words added a charm to patriotism that was irresistible. In March, 1792, Roland became minister of the interior, and three months later he was dismissed because he remonstrated with the king, who had refused to banish the priests. After the king's removal to the temple, Roland was recalled, but made himself hateful to the Jacobins by his protests against the September massacres, and took his part in the last ineffectual struggle of the Girondists to form a moderate party. On May 31, the sound of the tocsin announced the proscription of the twenty-two. Roland had been arrested, and while his wife went to protest against his imprisonment, he escaped, and fled to Rouen. She was seized, set at liberty two days later, and again arrested and taken to Sainte-Pélagie. She had five months of prison before death closed her tragedy of life, and during this time she wrote her unfinished *Mémoires*, furtively, with a swiftly flowing pen, on sheets of coarse, gray paper given her by a kind turnkey, often blotted by the falling tears. Her character, made perfect through suffering, took on a new refinement; she carried with her to death some of the sanctity of the martyr, and still, in Carlyle's phrase, like a white Grecian statue, serenely complete, she shines in that black wreck of things. She bore herself in prison with a gracious and queenly dignity, buried in her books, Thomson, Shaftesbury, Plutarch, and Tacitus. On Nov. 1, the morning of the execution of the twenty-two, she was transferred to the Conciergerie and lay there for eight days. She went to the tribunal dressed all in white, her long black hair hanging down to the girdle, and Nov. 8 (1793) she was carried to the guillotine along with a trembling printer, whom she asked the executioner to take first, to save the printer the horror of seeing her head fall. As she looked up at the statue of liberty, she exclaimed, "O Liberty, what crimes are committed in thy name!" A week later, her husband died by his own hand near Rouen, not willing to live longer in a world of crime. See Sainte-Beuve, in *Portraits of Women.*

Roll'ing Mills are machines which are rotated by steam-power and are used for manufacturing rods, bars, plates, beams, etc., of metal. The rolls are usually of cast iron, and are made in various forms according to the shape of the product. The cut shows rolls used for making square bars and round rods. Those used for making plates and sheets of metal are perfectly smooth, and are gradually brought together, as the metal is passed through, by means of the screws at the top. The picture shows a "train" of two rolls where the piece has to be brought back to the same side for each passage through the rolls, unless the machinery is reversed in direction each time. Trains of three rolls are frequently employed, so that the rolling takes place back and forth, first between the lower two, then between the upper two rolls. Steel, wrought iron, copper, and brass, as well as other metals and alloys, are frequently rolled. Usually the metal is rolled while hot, but certain products are finished by cold rolling in order that they may be harder and stiffer. All the steel and iron rails used for steam and electric roads, as well as the beams and bars used for buildings and bridges, are produced by rolling.

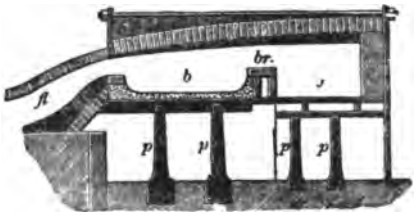
PUDDLING. Pig iron, the crude form of iron which is produced from iron ore by the process of smelting (see BLAST FURNACE), is changed to wrought iron, a metal that can be hammered,

rolled, and welded, by the process of puddling. This is an operation by which the carbon, silicon, sulphur, and other impurities are removed from the iron. The puddling furnace in which the process is conducted is shown in the figure, where *f* is the fireplace, *br* the bridge, *b* the bed, *fl* the flue, and *p p p p* the iron pillars supporting the furnace. When the fire is burning, the flame goes over the bridge, strikes the arched roof and reverberates down upon the iron, which is placed in the bed. When the roof, walls, and bed of



ROLLING MILL.

the furnace are moderately heated, the puddler "fettles" his furnace by plastering the bed and sides with a fettling composition, which consists of ground oxide of iron made into a paste with water. The crude iron is now thrown in, the fire is made up and the charge is heated. During the melting the puddlers stir the mass with a long iron rod. Presently the heated mass thickens, and solid granules are formed amid the liquid. These solid granules are squeezed together into a spongy mass or ball and rapidly carried to the hammer, where it is struck lightly at first and



PUDDLING FURNACE.

compressed into shape. During this beating or "shingling," liquid cinders are squeezed from the mass like water from a sponge. The puddled iron is then passed through rollers, by which further impurities are squeezed out, and the iron is formed into bars, plates, or thin sheets, as is desired for different purposes of manufacture. The puddling and rolling of iron was first practically introduced by Henry Cort, in England, in 1784, and since then many improvements have been introduced. Puddling has lost much of its importance since the introduction of mild steel, made by the Bessemer and open-hearth processes, which has largely taken the place of wrought iron.

Romagna (*ro-män'yä*), formerly the name of a region of Italy, forming the northern portion of the states of the church, and comprising the *delegations* of Bologna, Ravenna, Ferrara, and Forli. In 1861, these delegations became distinct provinces of the kingdom of Italy.

Ro'man Empire. To give an adequate history of this mighty nation from the founding of the city of Rome by Romulus, in the year 753 B. C., to the taking of Constantinople, in the year 1453 A. D., would require many volumes. Concerning the early settlement of Italy, it is impossible to form very definite conclusions; but we are at least warranted in affirming that at a very remote period a race emigrated from the east, embracing the ancestors of both Greeks and Italians, and Mommsen, the historian's statement that "the Italians, like the Indians, entered their peninsula from the north," may be regarded as certain. But in addition to the so-called Italian races, there settled in Italy in prehistoric times the Iapygians, the Etruscans, the Greeks, and the Gauls, and from the mingling of all these came the people of Rome. Recent investigations have shown the story of Romulus and Remus to be a mere myth; but it is probable the city was founded about the time when it is alleged they were suckled by a she-wolf. Perhaps the most rational view of the city's origin is that suggested by a consideration of its site. It was probably first built as a defense against the Etruscans, and as an emporium for the river traffic of the country; but whether it was founded by the Latin confederacy, or by the enterprise of an individual chief, is beyond our present knowledge or even conjecture. The motives which led to the founding of Rome also caused its rapid development, so that the beginnings of Roman history — if the ancient legend may be called history — are mainly records of the city's expansion and growth. An accurate history of the early Roman state is out of the question, as the traditions concerning the first four kings are too mythical to form the basis of sober narrative; but with the fifth king, Tarquinius Priscus, a marked change takes place, and we can at least feel that we are leaving the field of tradition, and approaching that of history. The expulsion of the younger Tarquin, about the year 509 B. C., in revenge for the outrage on Lucretia, marks the overthrow of the monarchy, and the establishment

of the republic, which continued during the next 500 years.

The history of Rome from the establishment of the republic to the abolition of the decemvirate, 449 B. C., was chiefly military, as the Romans were engaged in constant wars with their neighbors, especially the Etruscans. These conflicts continued down to the year 295 B. C., when the final victory over the Semnites and Etruscans ended the struggle and brought all Italy under Roman dominion. Having thus extended her power over Italy, it was but natural that Rome should become involved in wars with foreign nations; and in the year 264 B. C. began the terrible contest with Carthage, which comprised three separate wars, known as the three Punic wars, and which was closed only with the complete destruction of the latter city more than a century later. In connection with the Punic wars began the Macedonian wars — also three in number — which ended with the battle of Pydna, 168 B. C., in which the Macedonian empire was completely broken up. According to Polybius, the full establishment of the Roman empire was achieved at the battle of Pydna, as it was the last battle in which she was confronted by a civilized nation; all her subsequent wars were against rebellions of her own provinces or in contests with barbarians, as they were called. The subsequent history of the republic — the war with Jugurtha, the Servile wars, the civil wars of Marius and Sulla, the campaigns of Julius Cæsar, the civil wars between Cæsar and Pompey, and the final assumption of power by Octavius Cæsar, under the title of Augustus, has been given under appropriate heads, and need not be repeated here. When Augustus died, 14 A. D., the Roman empire was separated in the north from Germany by the Rhine; in the east the boundary line was the Euphrates; in the south Egypt, Libya, in fact, the whole of northern Africa as far west as Morocco, and as far inland as Fezzan and Sahara, acknowledged the Roman authority. The subsequent reigns of Tiberius, Caligula, Claudius, and Nero are little more than the record of conspiracies, assassinations, and acts of tyranny; but with the reign of Vespasian, 69 A. D., a better era commenced, which, if we except the reign of Domitian, continued for the next hundred years, and comprised the reigns of Titus, Nerva, Trajan, Hadrian, and Marcus Aurelius, the latter of whom, especially, was one of the wisest and most beneficent rulers the world has known. Nothing is clearer than the fact that after the time of Vespasian the worst days of Rome were over. Never again did she give way to the immorality and corruption of the first century.

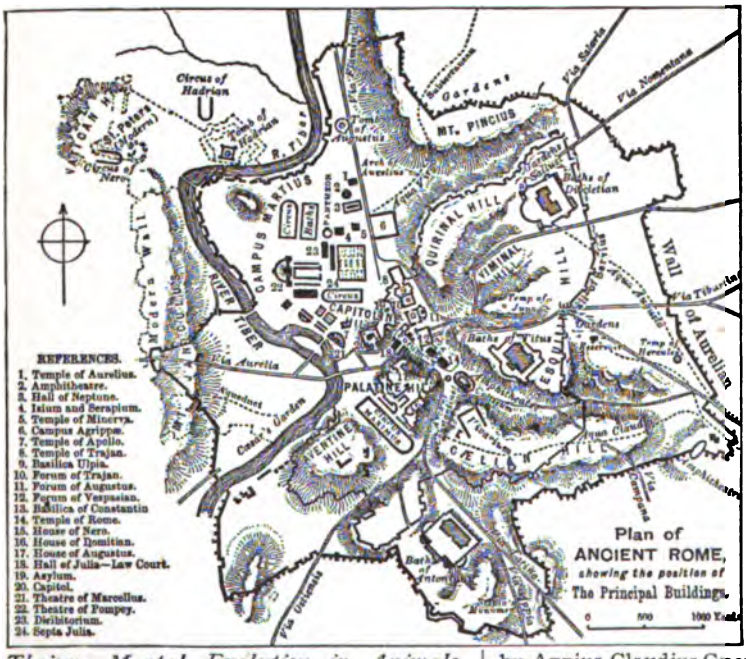
During the rule of Valerian, Gallienus, and the so-called Thirty Tyrants, the empire is a wild chaos, subject to inroads and invasions from barbarians; but with Claudius Gothicus its fortunes begin to brighten. By him and his successors Aurelian, Probus, and Carus, the barbarians of both the north and east were severely chastised, and when Diocletian became emperor, 284 A. D., it seemed as if the worst was over; but his division of the empire into east and west led to those civil wars, which were brought to a close by the commanding genius of Constantine. Under Constantine who reigned from 324 to 337 A. D., Christianity, which had hitherto been despised and persecuted, was established as the religion of the state and taken under the protection of the emperor. Constantine also transferred the seat of government from Rome to Byzantium, on the Bosporus, where he founded the city of Constantinople, naming it after himself. From the time of Constantine the political fortunes of Rome possess only a secondary interest, as it is the struggles of the Christian sects and the rise of the Catholic church that mainly occupy the attention of the historian. Christianity did not save Rome from destruction, but it enabled it to endure three centuries of barbarism. Julian's attempts to revive paganism were an utter failure, in spite of his abilities as a general, and the virtues of his personal character; and the year after his death, Valentinian was acknowledged as emperor by the army at Nicæa. In obedience to the wish of his soldiers, he conferred the title of Augustus upon his brother Valens, and the complete division of the empire was at last effected, Valentinian becoming emperor of the west, and Valens of the east. Valentinian, Gratian, and Theodosius the Great, were rulers worthy of better times; but they struggled against destiny, and their efforts were vain. Theodosius, indeed, subdued and even disarmed the Huns, by whom Rome was invaded; but immediately after his death they rose again under Alaric against Honorius, emperor of the west. Rome was saved for the time by the bravery and skill of Stilicho, the imperial general; but after his assassination the barbarians returned, sacked the city, and ravaged the entire peninsula.

The murder of Valentinian III. occurred in 455 A. D., and his widow Eudoxia, to be revenged on his murderer and successor Petronius Maximus, invited Genseric, "the scourge of God," over from Africa, thus exposing Rome to the horrors of pillage for several days. Ricimer, a Sueve, next figures as a sort of governor over the city, and the few relics of empire it still possessed; for Gaul, Britain, Spain, and Western Africa had all been wrested from it. Of the four emperors whom Ricimer placed on the throne, Majorian was the only one who had any of the qualifications of a ruler. Ricimer died in 472, and was succeeded in his functions by Orestes, the Pannonian, when Odoacer, in the year 476 A. D,, placing himself at the head of the barbarian mercenaries, overthrew the last emperor of the western empire, who,

by a curious coincidence, bore the same name as the mythical founder of the city — Romulus. This was the end of the western empire; but for nearly a thousand years thereafter the eastern empire, whose capital was at Constantinople, maintained its existence, in spite of all the enemies by which it was surrounded, until Constantinople was taken by Mohammed II., in the year 1453.

Romanes (*rō-măn'ēz*), Prof. **George John,** British biologist, author and lecturer, was born at Kingston, Ont., Canada, May 20, 1848, and died at Oxford, May 23, 1894. Educated at Cambridge, England, his taste for natural science led him to study, investigate, and write upon that branch of knowledge, and to lecture at the Royal institution, London, and later on at Oxford, on natural history, physiology, animal and plant life, etc. Making acquaintance with Darwin, he devoted much of his talent to the scientific exposition of evolution, taking ground adverse at first to the accepted Christian view of that doctrine, though finally expressing belief in the theistic position, and in opposition to the mechanical theories of the origin of things. His publications include, besides a number of articles on instinct, hybridism, and animal intelligence, *A Candid Examination of Theism*, *Mental Evolution in Animals*, *Mental Evolution in Man*, *Organic Evolution*, *Origin of the Human Faculty and the Philosophy of Natural History before and after Darwin*, a work on *Jelly-Fish, Star-Fish, and Sea-Urchins*, and an *Examination of Weismannism*, *Thoughts on Religion*, *Poems*, etc. See *Life and Letters of Romanes*, edited by his wife.

Rome. Modern Rome occupies the plain on each side of the Tiber (about fifteen miles from the mouth) and the slopes of the seven hills, the central one of which was the Palatine hill, whose summit is about 160 feet above the level of the sea. Romulus is said to have founded the city upon this hill, and upon its northwestern slope grew the sacred fig tree, under which he and his brother Remus were found sucking the she-wolf. Upon this hill were the temple of Jupiter Stator and other sacred buildings, besides many of the finest houses in Rome. Recent excavations have brought to light numerous remains of the palatial and other structures with which the Palatine hill was once covered, and these are now among the most interesting remains of the Eternal city. The settlement on the Palatine attributed to Romulus was fortified at a very early period, and in the time of the later or Etruscan kings at least five of the settlements on the seven hills had been surrounded by separate defenses. These fortified hills with the marshy hollows between them were then inclosed by a huge rampart or agger of earth. This agger formed the only defense of the city until the reign of Aurelian, a period of 800 years, and the great wall which bears the name of Aurelian is to a great extent identical with the present walls. To the period of the kings belongs the huge arched sewer which drains the marshy hollow between the Capitoline, Palatine, and Esquiline hills. In this valley was situated the Roman Forum, containing about two and one-half acres, which became at once the market and the place of political meeting for the various tribes who occupied the surrounding hills.



In the great aqueducts we have the most notable remains of the period of the republic. The oldest was that constructed by Appius Claudius Cæcus, in 312 B. C., which brought water from springs more than seven miles from the city. Other aqueducts were constructed during the imperial period. These aqueducts, fourteen in number, have an aggregate length of over 300 miles, and are among the most striking features of modern

Rome. Of the numerous temples in Rome, of which there are said to have been as many as three hundred, the names and sites of about one-half are known, the preservation of the few which remain being due to the fact of their having been converted into churches.

The Thermæ of Agrippa, of which the Pantheon is the only portion that remains, were the earliest of the great public baths for which imperial Rome was noted. On the low grounds at the south of the Cœlian hill were the baths of Caracalla, which were built to accommodate 1,600 bathers. The outer walls inclosed a space of nearly 27 acres, the baths themselves occupied nearly one-fourth of this space.

A large marshy plain, which now forms the most densely populated part of Rome, extended from the foot of the Capitoline and Quirinal hills to the Tiber, which, on account of its being used for military exercises, was called the Campus Martius. Here was erected the theatre of Pompey, which is said to have contained seats for 40,000 persons. Near by the capitol was the theatre of Marcellus, of which a considerable portion yet remains. This theatre was begun by Julius Cæsar and finished by Augustus in 11 B.C., who named it after his nephew Marcellus. The Flavian amphitheatre, known as the Colosseum, which was built for gladiatorial exhibitions and for the combats of wild beasts, was in the form of an ellipse, the longer diameter measuring a little over 600 feet, and the shorter a little over 500 feet. It rises to a height of 160 feet, and covers five acres of ground. The oldest circus was the Circus Maximus, in the valley between the Palatine and the Aventine hills, which was about three furlongs in length and one in breadth, and is said to have seated 250,000 persons. The arrangements of a Roman circus can best be studied in the well-preserved circus on the Appian Way, which usually bears the name of the Emperor Maxentius, but is more correctly assigned to his son Romulus. Of the twelve bridges over the Tiber, three are survivals of the eight or nine bridges of ancient times, the oldest being the *Pons Fabricius*, leading from the city to the island in the Tiber.

The population of the city in the time of Vespasian has been estimated at 2,000,000, while that of modern Rome, notwithstanding the great increase since it became the capital of Italy in 1870, is to-day (1901) only a little over 512,000. The walls, which inclose nearly 4,000 acres, are 14 miles in circumference, with 15 gates, two of which are closed. The largest palaces in Rome are the Vatican, the residence of the pope, and the Quirinal, now the residence of the king, but formerly a papal palace, in which were held the conclaves of cardinals for the election of popes. The chief papal collections are contained in the galleries attached to the Vatican, probably the largest palace in the world. In addition to the private gardens and apartments of the pope, the Vatican palace comprises large reception halls, with chapels, libraries, picture galleries, and vast museums of sculptures, ancient inscriptions, etc. The famous Vatican library, with its priceless manuscripts and its collections of early printed books, is contained in two immense halls.

The churches, said to be upward of 300 in number, are among the most conspicuous features of modern Rome. St. Peter's, the largest cathedral in the world, begun in 1506 and completed in 1626, covers 5 acres and cost $10,000,000. There are also the churches of the great religious orders, twenty-eight parish churches, and the titular churches of the cardinals. Before Rome became the capital of Italy in 1870, the greater part of the Pincian, Quirinal, and Esquiline hills was occupied by villas of nobles; but these have mostly been destroyed, and their sites covered with modern houses, and in many cases with blocks of buildings many stories in height, let out in tenements. The ancient city is assuming the aspect of a modern capital, broad, straight thoroughfares running through many quarters formerly occupied by narrow streets and mean, crowded houses. One of the greatest of improvements is the embankment of the Tiber and the straightening and deepening of its channel, which has put a stop to the disastrous floods, to which the lower parts of the city were formerly subject. All the necessaries of life have to be imported from a distance, as Rome is surrounded by the Campagna di Roma, a marshy plain which includes the greater part of ancient Latium, and which is, for the most part, an untilled and uninhabited waste, about 90 miles in length and from 20 to 40 miles in width. Corn and wine are brought from Tuscany and from the fertile Terra di Lavoro, near Naples. There are practically no manufactures in Rome; and the prosperity of the city depends mainly on the courts of the king and the pope, and on the foreign visitors who crowd the hotels during the winter months. The railways from all parts of Italy converge outside the city, which they enter near the Porta Maggiore on the Esquiline, and have a common terminus on the summit of the Quirinal.

Rome, the county seat of Floyd county, Ga., on the Coosa river, 61 miles northwest of Atlanta. It has iron foundries, manufactories of plows, nails, etc., and ships cotton. It is the seat of Shorter college. Population 7,291.

Rome, a city of New York, on the Mohawk river, 100 miles west of Albany, at the junction of the Erie and Black river canals. It contains a number of mills and manufactories of iron, brass, copper, and other goods. Here is Fort Stanwix, which was successfully defended against St. Leger, and six miles to the southeast the battle of Oriskany was fought during the Revolution. Population 15,343.

Rom'ulus, legendary founder and first king of Rome, son of Mars by Rhea Silvia, daughter of King Numitor of Alba Longa, was, so runs the myth, exposed along with his twin brother Remus at the foot of the Palatine hill, where he was suckled by a she-wolf, and afterward brought up by the shepherd Faustulus and his wife, Acca Laurentia. In 753 B. C., he founded his city on the Tiber, to which he invited all homeless fugitives in the surrounding country, who carried off Sabine maidens for their wives. After Romulus had firmly established his city, and secured peace between the Romans and Sabines, he was carried up to the heavens in a chariot of fire, and was later worshiped as Quirinus.

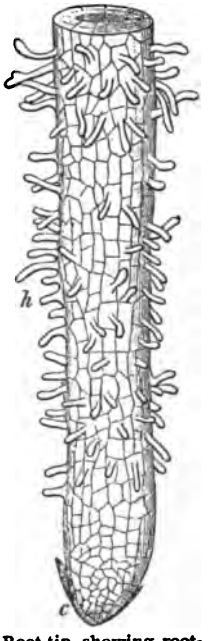
Rook, an Old World bird belonging to the crow family. It is slightly smaller than the common crow. Its plumage is purplish black with gray on the forehead and throat. The adults lose the feathers on the face, leaving a bare spot about the bill. These birds live in noisy flocks and nest near habitations. They are common in many parts of Europe and Asia, and in late autumn migrate to the east shore of Great Britain and return in the spring.

Roosevelt (*rō'ze-vĕlt*), **Theodore,** twenty-fifth President of the United States, was born at New York city, Oct. 27, 1858, and graduated from Harvard university in 1880. In 1882, he entered the New York state legislature, and at once rose to a commanding position as a Republican and reformer. In 1895, he was made president of the police commission of New York city and made his service notable by important reforms instituted. On the outbreak of the Spanish-American war, he was appointed assistant-secretary of the United States navy, but resigned after a few months' service, and organized the 1st United States cavalry volunteers, popularly known as Roosevelt's "Rough Riders," which he commanded, and with this body rendered distinguished service in Cuba, especially at the battle of Las Guasimas and at El Caney and San Juan hill. In 1898, he was elected governor of New York, and made his period of service notable for the personal integrity and political soundness which characterized his administration. In 1900, he was elected Vice-president of the United States, on the ticket with Mr. McKinley. In the campaign preceding the election he took a conspicuous part, discussing the important questions on which the election turned with marked ability and force. On the death of President McKinley, Mr. Roosevelt, who is a picturesque figure in American public life, became President of the United States, taking the oath of office at Buffalo, N. Y., Sept. 14th, 1901. Aside from his career as a public man, Mr. Roosevelt has made a mark as an author and man of letters; indeed, he at one time expected to make literature his life-work. His chief writings include *The Winning of the West*, *American Ideals*, *The Rough Riders*, *Life of Gouverneur Morris*, *Life of T. H. Benton*, *History of the Naval War of 1812*, *Life of Oliver Cromwell*, *The Wilderness Hunter*, and several books on ranch life and the hunting trail—*Hunting the Grizzly*, and *Hunting Trips of a Ranchman*.

THEODORE ROOSEVELT.

Root, George Frederick, an American musical composer, was born at Sheffield, Mass., Aug. 30, 1820, and after studying music a year in Paris, returned to write numerous popular songs, among which are *Music in the Air; Battle Cry of Freedom; Just before the Battle, Mother; Tramp, Tramp, Tramp, the Boys are Marching*. He has also produced a *Te Deum*, and other more pretentious pieces. He received the degree of a doctorate from Chicago university in 1872. He died Aug. 6, 1895.

Root. True roots are developed only by vascular plants, that is, by Pteridophytes (fern plants) and Spermatophytes (seed plants). They act either as holdfasts or as absorbing organs, or as both. The ordinary soil roots serve both for anchorage and for absorbing. In structure roots are all alike in general plan, whether they belong to ferns or pines, or to the true flowering plants. Each root consists of an epidermis, a more or less thick cortex, and a central, solid woody cylinder or axis. In the soil roots a peculiar cap of dead cells covers the delicate growing tip, known as the root-cap. This cap protects the delicate tip-cells as the root burrows through the soil, and it is renewed from beneath as fast as it is worn off on the outside. To aid roots in absorbing, the epidermal cells just behind the root-cap send out long hair-like processes known as "root-hairs," which immensely increase the absorbing surface. These root-hairs are very ephemeral, being present only near growing tips and rapidly disappearing from older parts. It is only the youngest roots which have this typical root-structure



Root-tip, showing root-cap (*c*) and young root-hairs (*h*).

and which do the work of absorption. As a root increases in age it becomes very much modified in its structure, and ceases to absorb, being then merely a channel through which the absorbed material passes to the stem and leaves. JOHN M. COULTER.

Root-cap. See ROOT.

Root-hair. See ROOT.

Root-pressure. When plants have their roots in a warm soil and the parts in air are not losing much water (whether because the leaves are not yet formed or because the moisture or coolness of the air do not permit evaporation), the roots may absorb water so rapidly (see ABSORPTION) that it distends the cells and escapes into the conducting tissues under the elastic pressure of the stretched cell walls. (See TURGOR.) By this pressure it may be driven through the conducting tissues to some distance above the ground, and may well out at a wound. Late-pruned grape vines "bleed" in this way, and much of the so-called dew on a lawn is water which has exuded from the leaves on account of root-pressure. Many leaves have special openings (water pores) which permit the escape of water at times. But when evaporation is rapid, root-pressure falls to zero or becomes negative; therefore while it may assist in supplying water to leaves, it fails when the need is the greatest, and cannot be an important agent in the ascent of water. See WATER, ASCENT OF.

Root'stock, an underground stem, usually horizontal and much thickened by the storage of reserve food. That the structure is a stem may be recognized by the fact that it often bears reduced leaves. It is really the primary shoot of the plant, and sends out its branches or leaves above ground. An equivalent word is "rhizome."

Root-tubercles (*tū'bĕr-k'ls*). On the roots of many leguminous plants, as the clovers, little wart-like outgrowths frequently occur, and are known as "root-tubercles." It is evident that these tubercles are occupied by certain bacteria, which swarm in them and which are doubtless obtaining food from the roots of the host. These bacteria have the peculiar power of laying hold of the free nitrogen of the air circulating in the soil, and of supplying it to the plant in some usable form. This habit of clover and its allies explains why they are useful in what is called "restoring soil." After ordinary crops have exhausted the soil of its usable nitrogen salts, and it has become relatively sterile, clover is able to grow by obtaining nitrogen from the air by the root-tubercles. If the crop of clover be plowed under, the nitrogenous material thus organized is contributed to the soil, which is thus restored to a condition which will support the ordinary crops again.

Ropes are usually made of vegetable fibers, and differ from twine only in their greater thickness. The fiber in most constant use is hemp, although ropes are also made of manilla or wild plantain, and of wire. Coir fiber from the husk of the cocoanut is another important rope-making material, which has the advantage of being lighter than either hemp or manilla. Sisal hemp from South America is also used to a considerable extent, especially for ropes of small size, and for many purposes cotton ropes are also employed. Notwithstanding the extensive use of machinery in the manufacture of ropes the old process of rope-walk spinning is still practiced on a considerable scale. The successive stages in this process are: (1) hackling the fiber; (2) spinning the yarn; (3) tarring in "hauls," consisting of about 300 yarns; (4) winding the yarn on bobbins and mounting these on bobbin frames; (5) forming the strands; (6) laying the strands into a rope. As life and property depend to so great an extent on the efficiency of ropes great care and ingenuity have been exercised in their manufacture, causing many improvements to be devised for increasing their strength. Among these is the introduction of wire ropes, which are now extensively used in rigging ships and for other purposes. These are generally made of iron wire, sometimes but not always galvanized. The twisting is done in the same way in which the strands of a hempen rope are laid together.

Rose. The well-known name of the genus *Rosa* and the type of a great family of plants. It is one of the most prized of the cultivated

ROSE.

ornamental forms, and is distributed over the whole temperate and sub-alpine region of the northern hemisphere. Over 200 species have been described, only about 15 or 20 of which occur native to North America. The varieties in cultivation are almost innumerable, both those which are hardy and those adapted for culture under glass.

Rose'bery, Archibald Philip Primrose (Earl of), was born at London, May 7, 1847,

and after being educated at Oxford, succeeded his grandfather as fifth earl in 1868. In 1874, he was chosen president of the Social Science congress, and in 1880 was elected lord rector of Edinburgh university. On public platforms throughout the country Lord Rosebery is welcomed as an effective and entertaining speaker, and, although a peer of the realm, enjoys in an unusual measure the good-will of the whole of the democracy. In 1886, Lord Rosebery became secretary for foreign affairs in Mr. Gladstone's cabinet. In 1894–95, he was prime minister. He is a strong imperialist, though a Liberal in politics. He has published an interesting study of *Napoleon Bonaparte.*

Rosecrans (*rō'ze-krănz*), **William Starke,** an American general, was born at Kingston, Delaware county, O., Sept. 6, 1819, and after graduating at West Point, in 1842, served in the army as an engineer until 1854, when he resigned and afterward engaged in coal mining and the manufacture of kerosene. Being commissioned brigadier-general of volunteers, in 1861, he rendered efficient service in McClellan's West Virginia campaign of that year, and when the latter was appointed commander of the army of the Potomac, Rosecrans was left in command in West Virginia. After the evacuation of Corinth by the Confederates, in 1862, he was placed in command of the army of the Mississippi; and in this capacity defeated Gen. Sterling Price at Iuka on the 19th of September, and a few days later successfully defended Corinth against Price and Van Dorn. He was then made commander of the army of the Cumberland; and on the first and second days of January, 1863, fought the battle of Stone River, Tennessee, in which his army won a substantial victory, although it was with great loss; but at Chickamauga, in the following September, he was defeated by Bragg, with a loss of over 16,000 men, the army being saved from complete destruction by the heroic valor of Gen. George H. Thomas. Rosecrans was superseded by General Grant a short time after this battle, but in 1864 was placed over the department of Missouri, and repelled Price's invasion of that state. He resigned his position in the army in 1867, and was appointed minister to Mexico by President Johnson in 1868, and was a member of congress from California from 1881 to 1885. In the latter year he was appointed registrar of the United States treasury by President Cleveland. He died near Los Angeles, Cal., March 11, 1898.

Ro'ses, Wars of the, a struggle between the houses of York (White Rose) and Lancaster (Red Rose), which desolated England from the first battle of St. Albans, in 1455, to the battle of Bosworth in 1485. The house of Lancaster first came to the throne when Henry IV., son of John of Gaunt, compelled his cousin, Richard II., to resign the crown in his favor in 1399. Henry IV. was succeeded by his son Henry V., in 1413, and he by his son Henry VI., in 1422; but during the reign of the latter, Richard, duke of York, and son of John of Gaunt, began to advance his claim to the throne. In 1454, Richard was appointed protector of the realm during Henry's insanity, and on the king's recovery soon after took up arms against his rival Somerset, and defeated and crushed him at the battle of St. Albans. But such was the weakness of Henry's administration and such the unpopularity of his queen (Margaret of Anjou), that the earls of Salisbury, Warwick, and March rose against him, defeating and capturing him at Northampton in 1460. The active and ambitious queen now passed swiftly to the north, and in the battle of Wakefield the duke of York was defeated and slain; but his son Edward gained decisive victories over the queen's forces at Mortimer's Cross and Towton (1461), after which he was crowned king at Westminster as Edward IV. A few years after Edward became king, the earl of Warwick, who had been one of his most active adherents, took offense at his marriage with Elizabeth Woodville and formed an alliance with Queen Margaret, on account of which Edward was compelled to leave England for a time, and Henry VI. was once more invested with the royal authority. But Edward returned in 1471, defeated and slew Warwick at Barnet, and defeated the queen at Tewkesbury. The murder of Prince Edward, Henry's son, after the battle, and the death of Henry himself in the Tower (1471) left Edward to reign in peace until 1483, when he died and was succeeded by his son Edward V., the unfortunate prince who, with his brother Arthur, was murdered in the Tower by order of his uncle Richard III. Richard's reign, however, was a short one, as he was defeated and slain at the battle of Bosworth, in 1485, by the earl of Richmond, who then became King Henry VII.

Roset'ta Stone, a slab of black basalt (now in the British museum), found by some French engineers, in 1799, near Rosetta, a town on the delta of the Nile, and famous as having furnished the first key for the interpretation of Egyptian hieroglyphics. Despite its present mutilated appearance, it has been judged that the slab was erected in honor of one of the Ptolemies, in 196 B. C. On it are carved three equivalent inscriptions—the first in hieroglyphics (or picture writing of a sacred character), the second in demotic (enchorial or epistolographic) characters, and the third in uncial Greek letters. The mutilations have destroyed a considerable portion of the inscriptions. In its present broken condition, the stone measures three feet nine inches in height, two feet four and one-half inches in width, and eleven inches in thickness.

Ros'lin, a Midlothian Scottish village, near the wooded glen of the North Esk, seven miles south of Edinburgh. Its castle was the seat of the St. Clairs, earls of Orkney from 1379 to 1471, and afterward of Caithness, and hereditary grandmaster masons of Scotland from 1471 to 1736. The exquisite "chapel," built about 1446, was much damaged by an Edinburgh mob in 1688, but was restored by the third earl of Rosslyn at a cost of $25,000, and since 1862 it has been used as an Episcopal church. On Roslin Moor, the Scots are said to have twice defeated the English in one day — Feb. 24, 1303.

Ross, Sir **James Clark,** British navigator, and nephew of Sir John Ross, Arctic explorer, was born at London, April 15, 1800, and died near Aylesbury, England, April 3, 1862. Entering the navy in 1812, he accompanied his uncle on his first voyage in search of a northwest passage; he also accompanied Captain Parry in similar expeditions during the years 1819 and 1827. In the latter he was appointed commander, when he once more traversed the Arctic seas under his uncle, and in June, 1831, has the credit of discovering the position of the north magnetic pole. In the thirties and forties, we find him in command of the *Erebus*, which, with the *Terror*, roamed the Antarctic seas, and reached the furthest southern latitude hitherto explored (78° 10′ S.). On this voyage the Erebus was discovered and named, the volcano having a height of 13,000 feet. Subsequently he was honored with a knighthood, and published *A Narrative of a Voyage in Southern and Antarctic Regions*, 1839–47.

Ross, Sir **John,** British navigator and Arctic explorer, was born in Scotland June 24, 1777, the son of the minister of Inch, Wigtownshire, Scotland, and was little more than nine years old when he entered the navy, serving with distinction in the French wars. His most important services were rendered in the Arctic regions, in 1818, as second in command under Commander Parry, the object of the expedition being to explore Baffin bay and attempt a northwest passage. In 1829, he commanded an expedition to the Arctic regions, fitted out by Sir Felix Booth, and discovered the peninsula of Boothia Felix. In 1850, he made yet another voyage to the polar regions — an unsuccessful attempt to find Sir John Franklin. He died at London, Aug. 30, 1856.

Rossetti (*ros-sĕt'tē*), **Christina Georgina,** a prominent modern English poetess, sister of Dante Gabriel Rossetti, was born at London, Dec. 5, 1830, and died Dec. 29, 1894. She was of Italian origin, daughter of Gabriele Rossetti, a well-known commentator on Dante, and began early to write verse. Her mood was religious and reflective, though inclined somewhat to mysticism, and she had a woman's soulfulness, insight, and grace. Her chief productions are, *The Prince's Progress, Goblin Market and Other Poems*, with a volume of children's stories, entitled *Speaking Likenesses*, and a collection of nursery rhymes, entitled *Sing-Song*, etc. See *Memoir*, by Ellen A. Proctor, edited by W. M. Rossetti.

Rossetti (*ros-set'ē*), **Gabriele,** a celebrated Italian author, was born at Vasto, in the kingdom of Naples, Feb. 28, 1783, and at an early age was placed by the Marchese del Vasto to study in the University of Naples. The boyhood and youth of Rossetti were passed in a time of great political commotion; and in 1824 he went to London as a political refugee. In that city he lived a quiet and studious life. Among his works was a commentary on Dante, in which he tried to show that the works of that great poet were antipapal in their hidden meaning, and that Beatrice was a symbolic personage, not a real woman. Rossetti's views in reference to Dante excited a great deal of controversy, which has not yet entirely ceased. His memory is much revered in Italy, especially in his native town, where the house of his birth has been purchased as public property, and a theatre and the chief public square have been named after him. He died at London, April 26, 1854. His son Dante Gabriel and his daughter Christina also won wide fame, the former as a painter and poet, and the latter as an author.

Rossini (*ros-sē'nē*), **Gioacchino,** a great Italian operatic composer, was born at Pesaro, on the Adriatic, Feb. 29, 1792. At the age of fifteen he was sent to study at the Lyceum of Bologna. Passing over a number of juvenile efforts, his first important opera was *Tancredi*, which was brought out in 1813, and immediately raised him to the summit of honor and fame. In 1823, he produced *Semiramide*, the most gorgeous of his operas, in Venice, after which he visited Paris and London, at both of which places he was received with the greatest enthusiasm. Being appointed director of the Italian opera in Paris, in the year 1829 he produced his greatest work, *William Tell*, which was conceived and written in a style very different from his Italian operas, and more conformable to modern dramatic ideas. With the exception of his well-known *Stabat Mater*, he may be said to have closed his career with *William Tell*, large offers from the managers of opera houses failing to draw him from his retirement. He died at Paris, Nov. 13, 1868. See biography, by H. S. Edwards, and *Life*, in the "Great Musician" series, by the same author.

Rossiter (*ros'i-ter*), **Thomas P.,** American painter, was born at New Haven, Conn., Sept. 29, 1817, and began the practice of his art in that city in 1838. In 1840, he sailed for Europe, and after spending a year or more at Paris, he opened a studio in Rome, where he worked for several years. He returned to

America in 1846, and opened a studio at New York, where he painted a number of large scriptural pictures. He attended the Paris exposition in 1856, at which he won a gold medal; and after his return to the United States, spent three or four more years in New York city, and then removed to Cold Spring, N. Y., where he died May 17, 1871, his later years being employed on a series of paintings representing various scenes in the life of Christ.

Rothschilds (*roths'childs*), the well-known family of bankers, take their name from the sign of the house ("Zum rothen Schilde," or "Red Shield"), in the Jews' quarter of Frankfort, in which their ancestors lived. The founder of the great banking-house was Mayer Anselm Rothschild, who was born in 1743, and died in 1812. Although educated for a Jewish rabbi, he began his career in the banking business at Frankfort, and so won the confidence of the landgrave of Hesse, that he was intrusted with the management of that prince's finances. The story is current that he hid the treasures of the landgrave, amounting to more than $5,000,000, from the French invaders of 1806, and was allowed the free use of the money for several years, thereby laying the foundations of his great fortune. Whether this be true or not, his business soon immensely prospered, and the house became a financial power that was felt by all the governments of Europe. Previous to the senior Rothschild's death, he saw his five sons established as financial kings in the principal capitals of Europe — Anselm in Frankfort, Nathan in London, Solomon in Vienna, James in Paris, and Charles in Naples. Nathan is said to have known the result of the battle of Waterloo several hours before the English government, and the knowledge was worth $1,000,000 to him. He was succeeded by his son Lionel, who distinguished himself by his efforts to secure the removal of the civil disabilities to which the Jews were formerly subject in England. See *The Rothschilds*, by Reeves.

Rotifers (*rō'ti-fērs*), a class of minute worms abundant in fresh water. They are also found in damp moss and in the sea. They are often called wheel-animalcules, on account of the wheel-like appearance presented by the rapid movement of cilia on the front part of their bodies. The movement of these cilia produces a minute whirlpool in the water, in which the particles of food are conveyed to the animal's mouth. Although so minute, and presenting a general resemblance to Infusoria (which see), they are, nevertheless, many-celled animals of complicated construction. They have a nervous system and other sets of organs distinctly developed. They are favorite objects with amateur microscopists. See Gosse's *Evenings with the Microscope*.

Rotterdam (*rot'er-dam*), the busiest port of Holland, stands on both sides of the Maas river, twenty miles from its mouth, and forty-five miles from Amsterdam. The trade of Rotterdam has grown very rapidly, ever since Holland was separated from Belgium, especially since the middle of the century. In 1888, the quays measured fifteen miles in length, and the docks covered an area of nearly 200 acres, and since then two new docks have been constructed, and the wharves have been extended. More than fifty per cent. of the vessels that enter the various ports of Holland (estimated by their tonnage) enter at Rotterdam. The total tonnage of vessels entering Rotterdam yearly amounts to over 9,000,000 tons. From this port from 5,000 to 15,000 emigrants sail yearly to the United States and other countries. Rotterdam counts among her famous sons Erasmus, the poet Tollens, and James, duke of Monmouth. Population 319,866.

Rouen (*rōon'*), formerly the capital of Normandy, and after Lyons the chief manufacturing city of France, is situated on the right bank of the Seine, 90 miles from Paris by rail. The modern streets are well and regularly built; but a considerable part of old Rouen still remains. The Seine river makes Rouen, although 80 miles from the sea, the fourth shipping port of France, and extensive improvements in the way of deepening the river and building wharves are yearly adding to its capacity and importance. William the Conqueror died at Rouen in 1087. During the wars of Henry V. and Henry VI. of England, it was subject to the English from 1419 to 1449, when it was retaken by the French under Charles VI. It was during its occupation by the English that Joan of Arc was burned alive in the square of the city in which stands her statue. Population 113,219.

Rouma'nia or **Ruma'nia**, an independent kingdom of southeastern Europe, composed of the two former principalities of Wallachia and Moldavia, situated between 22° and 30° east longitude and 43° and 49° north latitude. It is bounded on the west and north by Austria, on the east by Russia and the Black sea, and on the south by Bulgaria, from which it is separated by the Danube river. Its area is about 50,700 square miles, and its population 5,912,000. The capital of Rumania is Bucharest, in Wallachia (population 282,071), and the chief town of Moldavia is Jassy (population 78,067), not far from the river Pruth. A remarkable feature in the agricultural system of Rumania is the ownership of lands by the peasantry, which was introduced about the year 1864. The peasants had been robbed of their lands during long ages of feudal oppression, and at this time it was determined to restore a portion by permitting them to purchase small tracts by means of a loan from the government. The result was that in 1880

there were in Rumania nearly 500,000 holdings, averaging 10½ acres each, with the greater part of the debt discharged by the owners. In 1859, the two principalities elected Prince Conza as their ruler until 1866, when he was deposed and was succeeded by Prince Charles of Hohenzollern. In 1881, Prince Charles was invested with the kingly dignity with the consent of the European powers, and since that time the Rumanians have practically freed themselves from both Russian and Turkish interference, and have taken their place among the independent nations of Europe. See *Rumania, Past and Present*, by Samuelson.

Roume'lia or **Rume'lia** (Turkish *Rum Ili*, meaning "land of the Romans"), a name used to denote an important portion of European Turkey, differing widely in area in different times, but most generally applied to the region between the Balkan mountains and the Ægean sea, corresponding to the ancient Thrace and part of Macedonia.

Round Table, The, a table, according to Arthurian tradition, designed by Merlin, a Welsh sage and enchanter of the 5th century, for Uther Pendragon, a British king, to seat fifty knights at feasts. According to the legend, these knights were to be distinguished for piety, courage, and fidelity; they formed originally a military order, known as "the Knights of the Round Table," but the organization became also a theocratic one. As they gathered round the table, the seat was reserved (styled the seat perilous) for the knight of their number, or who was afterward to appear, whose achievement of the Holy Grail was certain. In due time the vacant seat was filled by the Arthur of romance, a brave, virtuous, and accomplished knight, whose exploits fill all the poetry of the middle ages. He was the son of Uther Pendragon by Igerna, and was educated and instructed by Merlin, who figures in Spenser's *Faërie Queen*, in the tales and romances of mediæval chivalry, and in Tennyson's *Idylls of the King*. Arthur woos and weds Guinevere and makes her his queen; he has, however, to wage war for her with Sir Lancelot (son of the king of Brittany, and one of the knights of the Round Table). Much of the legend of this knight (who was father of Sir Galahad by Elaine) has to do with his (Lancelot's) guilty love for Guinevere, and with the exploits he performed in her service. The Round Table is fabled to have been constructed in imitation of the one which Joseph of Arimathea established in imitation of that used at the Last Supper. According to another tradition, Arthur himself established the Round Table at York, and founded at Winchester his order of knighthood.

Rousseau (*rō-sō'*), **Jean Baptiste,** a great lyric poet of France, was born at Paris, April 16, 1670, the son of a shoemaker. When quite young he began writing pieces for the theatre which were unsuccessful. In 1712, he was banished from France for failing to make good a charge of libel brought against a fellow writer, and spent the remainder of his life abroad, a part of the time in Switzerland. At Brussels, he became acquainted with Voltaire, who was first his friend and then his enemy. His sacred odes and songs, and especially his epigrams, took high rank. Rousseau died at Brussels, March 17, 1741.

Rousseau', Jean Jacques, a noted Swiss-French philosopher, was born at Geneva, June 28, 1712. His mother died at his birth, and in 1722 his father fled from the city to escape imprisonment for engaging in a brawl. His uncle then apprenticed him to a notary. After being sent home as a fool, he was apprenticed to an engraver, but having rambled one night outside the city walls till the gates were closed, he was afraid to face his master and set out to seek his fortune. For a while he stayed with a priest of Savoy who tried to make him a Catholic — he was of an old French Protestant family — and was prevailed upon to be baptized by Madame de Warens of Annecy, to whose home he returned after serving for a time as footman, lackey, and private secretary. For nearly nine years Rousseau was her friend and pupil, calling her his "maman," reading to her, and helping her to manage her estate.

In 1741, he set out to make his fortune at Paris. Here he lived in a dirty, shabby inn, earning a livelihood copying music. Here he met Thérèse le Vasseur, who lived with him the remainder of his life. He wrote for Diderot's *Encyclopedia*, but first came into notice through his *Discourse on Arts and Sciences*, which won him a prize. His independence of thought and the freshness of his brilliant style made him celebrated and welcome in society. In 1753, he brought out a successful opera, full of sparkling airs, one of which is the well-known hymn tune, *Rousseau's Dream*. In 1760, his romance, *The New Hélöise*, was at once received with applause. Two years later, came out the *Social Contract* and *Émile*. The first of these three works raised Rousseau to the first rank as a writer of romance; the second, as a political socialist; the third, as a writer on education. His *New Hélöise*, by its passion, influenced the society and literature of France, Italy, and Germany, and by its idyllic pictures and fine descriptions touched the fashionable world with a love for country life and simple ways; while the whole book was a lesson on the rights of the poor and the duties of the rich. The *Social Contract* taught that no laws are binding unless agreed upon by all the people, and Rousseau's "liberty, equality, and fraternity" became a war-cry of the French revolution. His ideas on children's training, set forth in *Émile*, were used by great teachers like Froebel and Pestalozzi, but in a part of the book he showed himself a deist in religion,

and horrified the church, as much as he disgusted such men as Voltaire and D'Alembert. The state did not like his views on kings and government any more than the church did his views on religion. So he was denounced by the archbishop of Paris, his book burned, and himself ordered under arrest. He fled the country, living for a while in Neuchatel, where he made lace, went botanizing, and wrote his *Letters from the Mountain*. For a while he was given a home by the historian Hume in England, where he wrote his famous *Confessions*. His trials and broken health had made him senselessly suspicious. He distrusted his best friends, was sure the English government sought his life, and that he was everywhere dogged by spies. So he soon went back to France, living in various places provided by his friends, and wrote his *Reveries*. His delusions increased, so that he even asked for shelter in a hospital; everywhere he felt that he was watched by spies, and hated even by the children on the streets. He died near Paris, July 2, 1778. See Morley's *Memoir*.

Rousseau', Lovell Harrison, American soldier, was born in Kentucky, Aug. 4, 1818. He fought in the Mexican war under General Taylor, and on his return practiced law in Louisville. In the Kentucky senate, during 1860, he opposed the idea of secession and later raised two regiments of Union men. In 1861, as brigadier-general, he fought in Buell's army at the battle of Shiloh, April 7, 1862. He was in the battle of Perryville, Ky., Oct. 8, and at Murfreesboro Dec. 31, of the same year, and for gallantry was promoted to the rank of major-general. In November, 1863, he was appointed to command the district of Tennessee, which position he resigned two years later. When Alaska was purchased, in 1867, he was assigned there as brigadier-general in the regular army, and in the year following was transferred to the command of the department of Louisiana. He died at New Orleans, Jan. 7, 1869.

Rousseau', (*rō-sō'*) **Pierre Etienne T.,** a prominent landscape painter of France, was born at Paris, April 15, 1812, the son of a tailor. A kinsman, who was himself a painter, saw a landscape the boy had painted when fourteen years old, and persuaded his parents to have him study art instead of engineering, as they had intended. However his best teachers were not the artists to whom he was sent, but the old masters in the Louvre, while his happiest hours were spent in sketching from nature in the country around Paris. Some of his best pictures were rejected by the Salon, and for many years he struggled against neglect and discouragement. But later his worth was acknowledged, and he was made an officer of the legion of honor. Among his best landscapes are, *The Alley of Chestnut Trees* and *Early Summer Morning*. He died near Fontainebleau, Dec. 22, 1867. See D. C. Thompson's *The Barbizon School*.

Rowan Tree (*rō'an*). See MOUNTAIN ASH.

Row'land, Henry Augustus, easily first among American physicists, was born at Honesdale, Pa., on Nov. 27, 1848, and died at Baltimore, Md., April 16, 1901. He received his education — if we may speak of such a genius as having "received" anything at all in the way of education, other than what he worked out for himself — at the Rensselaer Polytechnic institute in Troy, where he graduated with the degree of civil engineer in 1870. During a short while, 1871–72, he "taught science" at Wooster college in Ohio. From 1872–75, he taught physics at his alma mater in Troy. During these three years he prepared a very important paper on some problems in magnetism which at once gave him a reputation in Europe. In 1872, he was selected by President Gilman as one of the original staff of Johns Hopkins university. He was immediately given a year's leave of absence, however, and in 1876 at Helmholtz's laboratory in Berlin, he made one of the most important electrical discoveries of modern times, namely, that electric charges when put into rapid motion exert magnetic forces just as do the equivalent electric currents. The story of his work during the next quarter century at Johns Hopkins university is too long for recital here. Suffice it to say that within a few years his researches on the mechanical equivalent of heat, on the value of the absolute unit of electrical resistance, on the diffraction grating, on the spectra of the elements, and on the solar spectrum won distinction and honor for him from all the more important learned societies of the world. Among his greatest discoveries must be mentioned the curved rating which is the essential part of the most powerful form of spectroscope known, and one which does not involve in its construction any lenses. His printing multiplex telegraph, on which he was at work at the time of his death, formed one of the most interesting exhibits at the Paris exposition and has recently been adopted by the German government.

President Gilman says of him: "He knew how to ask a difficult and far-reaching question, and he knew how to seek the answer. Extraneous considerations were excluded when he saw the point of an inquiry, and on that point he concentrated all his powers. For example, when he began the brilliant series of experiments in spectrography, which made him peerless in this domain, he saw that the spectrum depended on the accuracy of the gratings, and the gratings on the dividing engine, and the dividing engine on the screw, so he began the study of light by devising and making a screw more exact than any screw that has ever been produced by the most accomplished makers of instruments of precision." For details of his work, see sketch

by Professor Ames, in *Astrophysical Journal*, May, 1901; and also one by Prof. H. F. Reid, in *American Journal of Science*, June, 1901.

Ru'bens, Peter Paul, a celebrated painter of the Flemish school, was born at Siegen, in Westphalia, June 29, 1577. In 1579, his father, who was a lawyer, died, and his mother went back to her native city of Antwerp, where young Rubens was taught at a Jesuit school. For a while he served as a page, but at thirteen began to study art. In 1600, he went to Italy, studied the works of Titian and Paul Veronese, and became court painter to the Duke of Mantua. In 1605, he was sent on a mission to Philip III. of Spain and proved a good diplomat. While at Madrid he painted the portraits of many of the nobility. He settled at Antwerp in 1609, and became court painter to the Archduke Albert. The same year he married his first wife, Isabella Brant, whose likeness he so often painted. Between 1611 and 1614, he painted his *Descent from the Cross*, which is usually thought to be his masterpiece. At Paris, he painted over a score of pictures for the queen mother, Marie de Medici, illustrating her marriage with Henry IV. Sent on a mission to Philip IV. of Spain, he stayed nine months in Madrid, became acquainted with Velasquez, and painted some forty pictures, among them five portraits of the king. He was also sent as envoy to Charles I. of England, to treat for peace. He accomplished his mission with great tact, and painted the portraits of the king and queen, as well as other English pictures. He was knighted by both Charles I. and Philip IV. In 1630, Rubens married his second wife, Helena Fourment, a beautiful girl of sixteen. The main features of Rubens' work were power, spirit, and life. Reynolds said: "Rubens was perhaps the greatest master in the mechanical part of the art; the best workman with his tools that ever used a pencil." In all, Rubens painted several thousand pictures. He died at Antwerp, May 30, 1640. See C. W. Kett's *Great Artists*.

Rubicon (*rō'bi-kon*), a stream of central Italy, falling into the Adriatic, became famous from Cæsar's passage of it in the middle of January, 49 B. C., on his march on Rome. It formed the southern boundary of his province, so that by crossing it he really declared war on the republic. It is said that Cæsar hesitated awhile on the bank and then crossed with the words, *Jacta est alea* (the die is cast). So "crossing the Rubicon" has come to be a proverb with reference to any decisive step.

Rubinstein (*rō'bin-stīn*), **Anton Gregor,** Russian composer and pianist, was born near Jassy, Rumania, Nov. 30, 1829, and died near St. Petersburg, Nov. 20, 1894. Early in life he became a pupil of Abbé Liszt at Paris, after which he gave a number of notable concert tours, and by his compositions and playing created a sensation. In 1858, he became director of the Russian imperial concert and later founded the St. Petersburg Conservatory of Music. He visited England and France a number of times, as well as the United States. His compositions have a lyric melodiousness and are characterized by much feeling and sweetness. He held deserved high rank as a pianist, having a mastery of technique and manifesting great musical sensibility. He wrote about 20 operas, besides a number of overtures, sonatos, concertos, symphonies, and vocal pieces. In 1887, he was awarded the French decoration of the Legion of Honor, and in 1889 received a grand jubilee *fête* at St. Petersburg. In 1890, appeared an *Autobiography* of the great pianist, and later on a *Conversation on Music* came from his pen.

Rou'ble or **Ru'ble,** a Russian coin, weighing in silver about 20 grams, and equivalent to 100 kopecks. It is the legal unit of money throughout Russia, and is worth about 50 cents, or 2 shillings English. Officially 9.47 roubles are equivalent to $5 gold or to the pound sterling. In the Czar's dominions, gold is coined into 10 and 5 rouble pieces equal to $5.30 (£1. 1.4*d*. and $2.65 (10*s*. 8*d*. sterling). Besides the silver and gold roubles, credit notes (paper money) are legal tender of the denomination of 100, 25, 10, 5, 3, and 1 rouble.

Ru'by, a much prized gem, is a pure, transparent, red-colored variety of the mineral corundum, sapphire being a blue variety of the same mineral. Corundum, which is aluminum oxide, forms the hardest of all gems except the diamond. Although usually red, yet pink, purple, and violet rubies are found, but the most valuable are those of the color called pigeon's blood. The finest eastern rubies are more highly prized than diamonds of like size and quality. Those over a carat in weight are worth from $100 to $1,000 a carat, and no stone increases so much in value as it increases in size. But rubies perfect in color, transparency, and freedom from flaw are much rarer than good diamonds. Rubies seldom weigh more that eight or ten carats, but Gustavus III., of Sweden, presented one to Catharine of Russia as big as a pigeon's egg. One owned by the king of Ceylon was, according to Marco Polo, a span long, as thick as a man's arm, and without a flaw; Kublai Khan vainly offered a city for it. The finest rubies come from Upper Burma. Dark-red rubies are found in Siam and purplish rubies in Ceylon. Rubies are also found in the mountain region of Yunnan in China, in Afghanistan, and in the basin of the Oxus river. They have also been found in New Guinea, Victoria, and New South Wales. Many of the so-called rubies of jewelers are varieties of spinel, a mineral softer than corundum, and mostly made up of

alumina and magnesia. Artificial rubies are now made which are used in watches, and for this purpose are equal to natural rubies. Although they are identical in composition and hardness with the natural stones, their use as gems is considered fraudulent. They may usually be detected by microscopic examination, since they generally contain minute bubbles.

Ruff, a bird allied to the sandpiper. It breeds in the north of Asia and Europe, and migrates southward as far as the Cape of Good Hope. It is found as a straggler in Iceland, in Canada, and in some of the eastern states, and is sometimes shot on Long Island. The male bird, the ruff, is about a foot long. In the spring it sheds the feathers of the face; curled tufts of feathers appear on the sides of the head, and an erectile ruff grows which lasts two months. The ruff, as well as the feathers of the back, show every variation of color in different birds, but each bird yearly regains its own peculiar color. The female, the reeve, is about one-fourth smaller. The males fight for the possession of the females, and in battle the ruff serves for defense. The nest is made among the coarse grass of a hummock, in a moist, swampy place. The four eggs are grayish green, marked with reddish brown. The birds eat insects, worms, seeds, rice, etc. Ruffs are often captured and fattened for the table.

Ruffini (*rö-fē'nē*), **Giovanni,** one of the foremost Italian novelists, was born at Genoa about 1809. He was a fellow-student of the Italian patriot Mazzini, and helped him to organize his famous association, called "Young Italy." When the invasion of Savoy, planned by Mazzini, failed, his brother was put to death, but he escaped to England. In 1848, Ruffini was for a short time Sardinian ambassador at Paris, but the next year he made his home in England. His novel, *Lorenzo Benoni*, is based on his own life. The most famous of his books is *Doctor Antonio*. He died on the Riviera in 1881.

Rug'by, a town of Warwickshire, England, 30 miles southeast of Birmingham. The gunpowder plot was hatched near here, and the battlefield of Naseby is not far off. The famous Rugby school was founded in 1567 by Lawrence Sheriff, a grocer and staunch supporter of Queen Elizabeth. Under the famous teacher, Dr. Arnold, the school gained a national reputation. This school is now, by all odds, the best school in England. Among the many well known students of Rugby were Landor, Clough, Matthew Arnold, Dean Stanley, Lord Derby, Mr. Goschen, and Thomas Hughes, whose *Tom Brown's School Days* is read by boys the world over. See Stanley's *Life of Arnold.* Population about 13,000.

Rum, a kind of spirit made by fermenting and distilling the skimmings from the sugar pans, when sugar is made from cane juice. Enough water is added to the skimmings to produce one gallon of rum to every ten gallons of the mixture. Molasses is sometimes mixed with the skimmings, and a poorer quality of rum is made from molasses alone. The color of rum is given it after distillation by adding caramel or charred sugar. Rum improves with age, and a quantity of rum, known to be 140 years old, was sold in 1865 for $15 a bottle. The best rum comes from Jamaica.

Rum'ford, Count. See THOMPSON, SIR BENJAMIN.

Ru'minant, the name for any cud-chewing animal. The animals belonging to this class are grass and herb-eating forms, as the cow, camel, deer, giraff, sheep, etc. Those living in a wild state are the favorite prey of large flesh-eating animals. In order to crop their food, they must go into open, exposed places, and as the process of mastication is a long, tedious one, they retire to the shelter of concealed positions to ruminate or chew their

Stomach of sheep. (*a*) Œsophagus; (*c*) rumen or paunch; (*f*) abomasum or reed; (*b*) beginning of duodenum.

food properly. The process of chewing the cud cannot be understood without considering the complex stomach of these animals. It consists of four compartments, the paunch, the reticulum or honeycomb bag, the manyplies, and the true stomach. The food when first swallowed is in the form of a coarse pellet which pushes aside a fold in the wall of the œsophagus and goes into the paunch. There it is softened and passed into the reticulum, where it is moulded into pellets of convenient size, which are passed up the œsophagus into the mouth by a process the opposite of swallowing. Here it is carefully masticated and mixed with saliva and then swallowed again. The pellet is now smooth and fine; instead of pushing aside the fold in the wall of the œsophagus, it is guided by it into the third stomach or manyplies. This acts partly as a strainer through which the food passes into the fourth compartment or true stomach. Glands in the walls of this part secrete gastric juice and digestion is carried forward. The camels differ from other ruminants in having no third stomach.

Runeberg (*rö'ne-berg*), **Johann Ludvig,** the greatest poet who has written in Swedish, and the national poet of Finland, was born at Jacobstad, Finland, Jan. 5, 1804. His father,

a retired sea captain, gave him a good schooling. In 1830, Runeberg became reader in eloquence (Latin literature) in the University of Åbo, and also taught in the Lyceum. His beautiful epic idyll, *The Elk-Hunters*, appeared in 1832, followed soon by two others, *Christmas Eve*, and *Hanna*. In this year, Runeberg became editor of a newspaper, and a few years later reader of Roman literature in the College of Borga. Others of his best works are *King Fjalar*, and *Ensign Stals' Stories*, the opening poem of which, *Our Land, Our Land*, has been chosen as the national song of Finland. His poems embody the deepest feelings of the dual people of Finland, of the Finns no less than of the descendants of the Swedish immigrants. Runeberg died at Borga, May 6, 1877. See E. W. Gosse's *Northern Studies*.

Run'ner, a general name given to leafless branches sent out from the main body of the plant, which take root at the tip and produce new plants. The runners of the strawberry and of the eel-grass are well known.

Ru'pert, Prince, third son of the elector Palatine, Frederick V. and Elizabeth, daughter of James I. of England, was born at Prague, Dec. 18, 1619. He studied at Leyden and served in 1637–38 in the Thirty Years' war till at Lemgo he was captured and held prisoner for three years, at Lintz. In 1642, he went to England in time to take part in the civil war. For the next three years the "Mad Cavalier" was the life and soul of the Royalist cause, winning battles by his resistless charges, only to lose them by a too headlong pursuit. After fighting at Worcester, Edgehill, Bolton, Marston Moor, Naseby, and other battles, he surrendered Bristol in 1645, after a three weeks' siege. This so angered Charles, who the year before had made him Duke of Cumberland, that he sent him his passport to leave the kingdom. A court-martial, however, cleared him of all blame and he became again general of his uncle's forces only to surrender at Oxford to Fairfax the following June. In 1648, he became admiral of the part of the English fleet that remained true to the king, and acquitted himself with all his old daring and with a newborn caution. For three years he kept his ships afloat; most of his vessels were burned or sunk in a battle with Admiral Blake. With what were left Rupert escaped to the West Indies, where, with his brother Maurice, he led a buccaneering life, seizing English and other merchant ships. In 1653, he went back to Europe, and, after the restoration, served under the duke of York against the Dutch. The last ten years he spent in study. He improved the art of mezzotint, discovered an improved gunpowder, invented the composition known as Prince's metal, and perhaps the curious glass bubbles, called Prince Rupert's drops. He died, Nov. 29, 1682. See Lord Ronald Gower's *Rupert of the Rhine*.

Ru'pert's Land. See HUDSON BAY COMPANY.

Ru'rik, a Scandinavian adventurer, who became in 862 A. D. ruler or over-lord of a part of Russia, with his court at Novogorod. He is sometimes styled the founder of the Russian monarchy: the Rurik dynasty gave 67 rulers to Russia, and lasted for 736 years, viz., from 862 to 1598 A. D., becoming extinct in the last-named year in the person of Feodor. The seventh of the line (Vladimir I. or The Great) introduced Christianity into the empire; Ivan the Great (or John III.) unified the kingdom and first assumed the title of Czar (tsar).

Rush, Benjamin, was born near Philadelphia, Dec. 24, 1745. He graduated at Princeton in 1760, studied medicine in America and Europe, and became professor of chemistry in the Philadelphia Medical college. Dr. Rush was a member of the continental congress and a signer of the Declaration of Independence. The next year he became physician-general of the army, but resigned in 1778, because he could not prevent frauds on soldiers in the hospital stores. He was a founder of the Philadelphia dispensary, the first in America, and of the college of physicians, and was given several medical professorships besides the one he already held at Philadelphia. During the yellow-fever epidemic of 1793, he was a devoted worker and successful in his treatment. In 1799, Rush was made treasurer of the United States mint. Among his medical writings, which were honored at home and abroad, were *Medical Inquiries and Observations*, *Essays*, and *Diseases of the Mind*. Dr. Rush died at Philadelphia, April 19, 1813.

Rusk, Jeremiah M., was born June 17, 1830, in Morgan county, O. In 1862, he enlisted in the 25th Wisconsin volunteers, was made major the same year and lieutenant-colonel in 1863. He served in congress several terms, and was elected governor of Wisconsin in 1881 and twice re-elected. In 1889, the new department of agriculture having been created, he was made its first secretary, and died in Wisconsin, Nov. 21, 1893.

Rus'kin, John, the great art writer, was born at London, Feb. 8, 1819. He was the only child of a wealthy wine merchant. He took his degree at Oxford in 1842, and studied painting under Copley. The story of the earlier years of his life has been told by Ruskin himself in his *Præterita*, one of the most charming autobiographies in the language. In 1843, came out the first volume of *Modern Painters*, which treated of the principles of art in an independent and even revolutionary way, and though greatly opposed at first, Ruskin's views have largely determined the character of later English art.

In 1849, appeared *The Seven Lamps of Architecture*, and two years later *The Stones of Venice*. The titles of Ruskin's books often give no indication of the subject. *Notes on the Construction of Sheepfolds* deals with church discipline; *The Crown of Wild Olive* is four essays on work, traffic, war, and the future of England; *Sesame and Lilies*, lectures on good literature; *The Queen of the Air*, on the Greek myths of cloud and storm; *Ethics of the Dust*, lectures on crystallization. From 1869 to 1879, Ruskin was professor of art at Oxford. Ruskin is noted for his splendid style, which for eloquence, power, and richness has hardly its equal. In art he tells us that he aimed to set forth the "supremacy of five great painters, despised till he spoke of them — Turner, Tintoret, Luini, Botticelli, and Carpaccio." His *Munera Pulveris* deals with political economy, on which he has written from an independent point of view. See Cook's *Studies on Ruskin*. He died at Brantwood, in the English lake region, Jan. 20, 1900.

JOHN RUSKIN.

Rus'sell, John, Earl, English statesman, was born Aug. 18, 1792, at London, the third son of the duke of Bedford. He studied at Edinburgh, and entered parliament in 1813, where he made his first motion in favor of parliamentary reform in 1819. In 1830, the Liberals came into power and though Russell was not a member of the cabinet, he was one of four who framed the first reform bill. In 1835, he became home secretary and leader of the house of commons, and introduced most of the important bills passed at this time. In 1839, he became colonial secretary. In 1845, a letter in favor of repealing the corn laws written to his London constituents, caused the downfall of the Tory ministry, and Lord John was asked to form a new ministry, but failed, owing to jealousies between the Liberal leaders. But the next year Russell became prime minister. Famine and rebellion in Ireland, and troubles in England beset the ministry, which fell in 1852. He soon, however, became foreign secretary, but his mismanagement of the Crimean war made him unpopular, and he was out of office for four years. In 1859, he again became foreign secretary, which office he held for six years. Among the features of his management of affairs were England's unfriendly tone toward the United States in the *Trent* affair, her taking part in the Mexican expedition, the interference with Russia in favor of Poland, and the friendly feeling of England for Denmark during the Schleswig-Holstein war. In 1865, Lord John, now Earl Russell, became prime minister for the second time, but kept in power for only a year. He died May 28, 1878. See Spencer Walpole's *Life of Lord John Russell*.

Rus'sell of Killowen, Baron **Charles,** distinguished British jurist and statesman, was born at Newry, Ireland, Nov. 10, 1833, and died at London, Aug. 10, 1900. Educated at Trinity college, Dublin, he began his career as a parliamentary leader writer, and was called to the bar at Lincoln's Inn in 1859. of which he later on became a bencher. From 1880 to 1885, he represented Dundalk, and from 1885 to 1894 south Hackney in the British house of commons, and was twice attorney-general in Mr. Gladstone's administration. Though a Liberal, and an ardent Home Ruler, his political aspirations were subordinate to love of his profession, of which he became a great ornament. He was knighted in 1886. As a sound lawyer, acute cross-examiner, and persuasive advocate, Sir Charles Russell was for long without a rival at the English bar. In 1889, he increased his reputation by his masterly oration at the Parnell commission, where he was counsel for the great Irish leader. He was one of the English counsel in the Bering sea arbitration, and also served on the Venezuelan boundary arbitration tribunal. In 1896, he visited the United States and delivered an address on "International Arbitration" before the American Bar association. In 1894, he was appointed a lord of appeal in ordinary, with a life peerage, and succeeded Lord Coleridge as lord chief-justice of England.

Rus'sell, William, Lord, an English patriot, was born Sept. 29, 1639. He studied at Cambridge and then traveled for a time on the continent. In 1669, he married an heiress, Lady Rachel Wriothesley. In 1674, he spoke in the house of commons, of which he had been a silent member since the restoration, against the doings of the "Cabal," the famous advisers of Charles II. From this time he was a leader of the commons. He believed in the popish plot and carried up to the house of lords the bill to shut out the duke of York from the throne. Russell, Essex, and Sidney were arrested on suspicion of having taken part in the Rye House plot. By means of infamous witnesses and a packed jury he was found guilty. His father's offer of $500,000 for his life was refused; he would not accept a plan made for his escape; and on July 21, 1683, he was beheaded. Pity for his judicial murder, and the letters of his noble wife, who at his trial appeared at court as his secretary, have served to keep his memory fresh as a Christian hero. See the *Letters* of Lady Russell; and his *Life*, by Lord John Russell.

Rus'sell, William Clark, English novelist, was born at New York, Feb. 24, 1844. He is

the son of Henry Russell, who composed *Cheer, Boys, Cheer; There's a Good Time Coming; A Life on the Ocean Wave*, etc. Young Russell went to sea at thirteen, and served eight years. Since that time he has been an English newspaper writer and novelist. His sea tales rank with those of Marryat and Cooper, and are deservedly popular. Among them are *Jack's Courtship, My Shipmate Louise*, and *The Wreck of the Grosvenor*.

Russia (*rush'yă*), **Empire of**, covers a large part of eastern Europe, and northern and central Asia, a territory more than twice as large as Europe. Its main divisions are European Russia, with less than a fourth of the whole area, but with three-fourths of the population; Finland, Poland, Siberia, Caucasia, Turkestan, and the Transcaspian region, besides the dependent countries, Khiva and Bokhara. Not counting the dependent states, the area of Russia is 8,660,395 square miles, and the population 130,000,000. The Arctic ocean made up the whole Russian seaboard, till, at the end of the 17th century, she won the Baltic and Black sea shores. On the north, the Arctic ocean, White sea, Kara sea, Bering sea, and sea of Okhotsk, are valuable for fishing and hunting, but these coasts are frozen a great part of the year, and Nova Zembla and their other islands are uninhabited. Vladivostok, at the head of the gulf of Peter the Great on the Japanese sea, is one of the finest roadsteads in the world. The chief Russian sea is the Baltic with the gulfs of Finland, Bothnia, and Riga, on which are four out of the five chief ports of the country —St. Petersburg, Reval, Libau, and Riga. The sea of Azov is the great gulf of the Black sea, and its main ports are Odessa, Batoum, and Taganrog. The Caspain sea furnishes fish for all Russia; into it falls the largest river of Europe, the Volga.

Caucasus, Finland, Poland, Siberia, and Turkestan are described under these heads. A plain 700 miles wide crosses European Russia from southwest to northwest. The Urals, a series of ranges running southwest to northeast, are highest at Mt. Iremel—4,680 feet. The Niemen, Dwina, Neva, Onega, and North Dwina rivers have their sources in the broad central plain and flow in general northwest, while the Dnieper, Don, and Volga rise in the same plain but flow southeast. The other three large rivers are the Vistula, Dniester, and Pruth. The headwaters of some of these rivers have been connected by canals, as the Volga and Neva, so that now St. Petersburg stands not only at the mouth of the Neva, but also at the real mouth of the great Volga basin. The tundras of the Arctic shore are in the main covered with mosses and lichens. South of the tundras are forests of evergreens, and south of these, forests of oak, birch, and hornbeam. Still further south are the Russian steppes or prairies.

Of the population of Russia, it is estimated that 66 per cent. are Russian Slavs; seven per cent. Poles; five per cent. Finns; nine per cent. Turco-Tartans; three per cent. Jews. A recent partial census shows that the number of Jews in Russia exceeds 4,000,000. In 1900, the total population of all Russia was 135,000,000. The chief cities are St. Petersburg, the capital (population, with suburbs, 1,267,023), Moscow (population 988,614), Warsaw (population 638,209), and Odessa (population 405,041). The entire area of the empire is 8,660,395 square miles. This includes, besides European Russia, Poland, Finland, the Caucasus, Transcaucasia, Turkistan, Eastern and Western Siberia, the Transcaspian, the Steppes, and the Amur region.

The Russian empire is an absolute monarchy. The whole legislature, executive and judicial power, is united in the emperor, whose will alone is law. There are, however, certain rules of government which the present lines of sovereigns have recognized as binding. These provide that the law of succession to the throne shall be that of regular descent, by right of primogeniture, with preference of male over female heirs, and that every sovereign, with his consort and children, must be members of the orthodox Greek church. The administration of the empire is intrusted to four boards or councils. These are: first, the *Council of the State*, which consists of a president and an unlimited number of members appointed by the emperor, and which has advisory power in matters of legislation, but no power to change laws of the realm; second, the *Ruling Senate*, which promulgates the laws and also is the high court of justice for the empire; third, the *Holy Synod*, to which is committed the superintendence of the religious affairs of the empire; and fourth, the *Committee of Ministers*, which consists of all the ministers or heads of departments, and other functionaries, and of which the privy councilor is president.

Russia is divided into governments, each ruled by a governor; Finland alone has a representative government, which is fast disappearing. But in most parts of Russia there is at the same time considerable local self-government. Peasants make up four-fifths of the whole population. The other classes are burghers, merchants, the clergy, and the military. Among the peasants of Great Russia, the mir, made up of all the village householders, distributes in allotments the land, which is held in common, buys farm machinery, hires doctors, teachers, etc. Taxes are mainly in the hands of the zemstvos, or district assemblies, elected by nobles, clergy, town householders, peasants, and landowners, but their rights were greatly curtailed in 1890.

Though Russia has trial by jury, it does not apply to political cases, and every year from 15,000 to 20,000 prisoners are exiled to Siberia, many without any trial at all.

Russia's army has a peace footing of 1,169,000 and a war footing of 4,600,000. She has in her navy, including ships building, 24 battleships, 8 coast defense vessels, 22 cruisers, 49 gunboats, 34 destroyers, 193 torpedo boats, besides training ships, transports, etc. The land is held by the crown, by peasants' communes, and by landowners, mainly nobles and merchants. Most of the schools in the empire are under the ministry of public instruction, though many special schools are under separate ministers. The total contribution for education in 1899 was 51,062,842 roubles; of this 4,108,045 roubles were for universities. There are universities at Moscow (4,407 students), St. Petersburg (3,788), Kiev (2,604), Karhov (1,387), Yurger (1,208), Warsaw (1,114), Kasau (879), Odessa (709), Tomsk (401). There are many other institutions of higher grade. The number of middle schools in 1899 (exclusive of Finland) was 1089, with 212,440 pupils. The number of elementary schools in the empire in 1896 was 78,724, with 113,984 teachers and 3,779,818 pupils.

Gold is found in the Urals and Siberia; silver and lead in Siberia, the Kirghiz Steppes, the Caucasus, and Finland; platinum in the Urals; zinc in Poland; tin in Finland; cobalt and manganese in Caucasia; while iron is abundant in most parts of the empire. Salt is got from the southern lakes; coal from Poland and about the Don river and other parts of Russia; and petroleum in Baku. Russia did not become a manufacturing nation to any great extent until the serfs were freed. Her manufactures now amount to $1,460,000,000 yearly. In 1893, there were within the empire 22,483 manufacturing establishments, employing 1,400,000 men and women, and having a yearly monetary production of 1,759,331,000 roubles (the value of the gold rouble is about 75 cents). Wheat and flour head the list of exports, and cotton, tea, and raw metals that of imports. Inland trade is much helped by the great yearly fairs at Nijni-Novgorod, Kharkoff, and other cities. Trade is carried on in great part by means of the great network of rivers, besides which there are over 35,000 miles of railroad. The government owns more than one-half of the railroads. In November, 1901, the last rail on the trans-Siberian railway was laid, completing the line from St. Petersburg to the Pacific coast, except as intercepted by Lake Baikal, across which, a stretch of sixty miles, trains are transported on an ice-breaking ferry boat. The road with its branches is nearly six thousand miles in length, and was built in ten years at a total cost of about four hundred million dollars. There are fifty-five thousand miles of navigable rivers in the empire, besides five hundred and seven miles of canals and seven hundred and eleven miles of canalized rivers.

The Russians are Slavs and conquered Russia from the west, fighting eastward from the Baltic sea. However, the name Russes was first given to Norman warriors who yearly passed through these Slav lands on their way to enter the Byzantine emperor's service at Constantinople. These captains seem to have been asked to protect the Slavs, and one of them, Burik, with three of his brothers, settled there. Vladimir (980–1015) was baptized a Christian, and soon after his death Kieff, the "mother of the Russian towns," rivaled Constantinople in greatness. Under Yaroslav, who gained control of most of the Russian towns, and died in 1054, the first written Russian law was compiled. During the next 200 years the Russians steadily conquered eastward. Towns and colonies were founded, which were in reality free republics, the only bonds between the different cities being those of language, race, religion, and the unwritten law that the prince who was asked to defend a town should be a descendant of Yaroslav. In this period the trading cities, Novgorod, Pskov, and Smolensk, rose to importance. Slavery existed, though the workers of the soil were its owners, the slaves being either prisoners of war or those who remained in a servant's position for more than a year. In these years also the boyars, the chief warriors, began to gain power, settling the peasants on free lands, and making themselves their landlords. Andrei Bogalubskiy (1157–74) was the prince who changed the center of gravity of Russia from Kieff to the region where Moscow was afterward founded. He built the city of Vladimir, and plundered and burnt Kieff in 1169. Soon Nijni-Novgorod was founded as a rival of Novgorod, and this region, the home of the Great Russians, grew powerful.

In 1224, the Mongols and Tartars who, under Genghis Khan, had conquered Manchuria, North China, Turkestan, and Bokhara, won a decisive battle against the Russians on the Kalka river. From this time Russian princes paid tribute to the khan; their courts, which had now an eastern appearance, were surrounded by Tartars and Mongols; and it was with Mongol help and armies that the rich rulers of Moscow reduced to their rule the formerly independent principalities around them. The Mongol conquest threw Russia 200 years behind the civilization of the rest of Europe, and gave Poland, Lithuania, and Livonia a chance to rise into power.

It was in the 14th century under the leadership of Moscow that the Russians first tried to throw off the Mongol yoke. Dimitri Donskoi (1359–89) fought an indecisive battle at Kulikovo, followed the next year by the Mongols for the last time storming Moscow, burning it, and killing 24,000 of its people. Ivan III. (1462–1505) was the first prince of Moscow to call himself "Ruler of all Russia." He conquered Novgorod, and refused to pay further tribute to the khan. A Tartar-Mongol army of 150,000 men sent to punish him, met the Russians on the Oka, and after

a nine months' encampment retreated without fighting, and Russia was again free.

Ivan IV., "the cruel," was the first to take the title of tsar, and was Russia's first absolute ruler. When at three years of age he came to the throne, the boyars were all powerful, and to maintain any power as prince, a struggle was forced upon him, in which he was successful, but at the cost of thousands of lives, no less than 3,470 victims being inscribed by Ivan himself in his prayer book. Under Ivan's feeble son Feodor (1584–98) the regent Boris Godunoff forbade the peasants to leave the estates on which they worked, and thus sowed the seed which grew into the serfdom that cursed the country for the next 270 years. This regent murdered Ivan's son Dimitri. On Godunoff's death, a runaway monk, who lived for some time among the Cossacks ("free men"), who were runaway peasants banded together on the Don and Dnieper, imposed himself on Russia as the murdered Dimitri. His assassination at the end of a short reign, was followed by the conquest of the czardom by Sigismund of Poland. The country was freed by a general rising, started by Minin, a Nijni-Novgorod merchant, and aided by the Cossacks. The Poles were driven out, and Mikhael Romanoff (1612–45), whose grandmother was Ivan's first wife, was chosen ruler.

In the reign of Alexis (1645–76) Russia, chiefly by the aid of the Cossacks, at last gained the upper hand in the long struggle with the rival Slav power, Poland. Up to the reign of Peter the Great (1689–1725) the country had been in many respects Mongolian; this able ruler, who first called himself emperor and founded the new capital, St. Petersburg, made it European. He improved the army, started mining and manufactures, imported fine breeds of cattle, set up schools, and dug Russia's great system of canals. The ministers, Menschikoff, under Catharine I., and Dolgorouki, under Peter II., were the real rulers of those reigns. The power of the German party under Anne (1730–40) and Ivan (1740–41) was lost on the accession of Elizabeth (1741–62). Peter III., who by sending his army to the support of Frederick the Great against Austria saved Prussia from dismemberment, was dethroned by Catharine II. (1762–96), whose wars and the first partition of Poland widened Russia's domains in all directions. The excessive tyranny of Paul I. (1796–1801) brought about his murder. In the reign of Alexander I. (1801–25), the famous friend and enemy of Napoleon, took place the French invasion and the burning of Moscow. Under Nicholas I. (1825–55), was fought the Crimean war. Alexander II. (1855–81) freed the serfs, and initiated many other reforms, which were brought to a sudden close by the insurrection of Poland (1863) and the rise of the Nihilists, who three years after the close of the war with Turkey (1878) assassinated him, March 13, 1881. The reign of Alexander III. (1881–94) was marked by the famine of 1890–91, and the crusade against the Jews, who were ordered to leave Moscow, Warsaw, and other cities, and to go back to their native provinces, already overcrowded, and laid waste by famine. Of recent years, a more enterprising era seems now to have opened for Russia, though the national debt is a heavy burden on the empire's resources, added to the nation's large and increasing annual expenditure. The present emperor, Nicholas II., ascended the throne on the death of his father, Oct. 20, 1894. See Rambaud's *History of Russia*, and Edwards' *The Romanoffs*.

Rust. Neither wrought iron nor steel nor cast iron can be exposed to moist air without rusting. But wrought iron, being nearly pure iron, rusts more readily than either of the others, which contain carbon. When a drop of rain falls on a clean, bright-surface of iron, for a short time the drop stays clear, showing the bright surface of the iron through it. But soon a greenish appearance, which is a precipitate, is seen in the drop, and quickly becomes a reddish-brown — the peroxide of iron, or rust. The rust does not stick to the iron but is hung in the water, and becomes a coating only when the water has evaporated. Iron remains quite free from rust in an atmosphere containing water vapor so long as the water vapor does not condense as liquid water on the surface of the iron. But when rust once forms, the iron will go on rusting in an atmosphere in which a piece of clean iron will not rust, because liquid water will condense on rust when it will not on bright iron. So it is much easier to prevent the first formation of rust than to stop the process. To prevent rust oil paint is used, also a zinc coating or "galvanizing" and japanning.

Rust (in plants), a destructive disease caused by the attacks of certain parasitic fungi, as wheat rust. See ÆCIDIOMYCETES.

Ruth, a young Moabitess, who, after the death of her Hebrew husband, Mahlon, for the sake of her mother-in-law Naomi, came to settle in Bethlehem. There she became the wife of a near kinsman, Boaz, and the mother of Obed, grandfather of King David. The story is told in the book of Ruth, and is placed "in the days when the judges judged," about a century before the time of David.

Rut'land, Vt., is on Otter creek, close to the Green mountains and 67 miles southeast of Burlington. The main business is quarrying and working marble. There are also foundries and railroad shops and it has the state poorhouse. Its marble quarries are the best in the state, and yield fine white blocks equal to the statuary marble of Carrara. The town was settled in 1770, and was one of the state capitals from 1784 to 1804. Population 11,499.

Ruwenzori (*rō-wĕn-zō'rē*), a mountain in the center of Africa, just north of the equator, between lakes Albert Nyanza and Albert Edward Nyanza. It was discovered by Stanley in 1888, and is thought to be 19,000 feet high. Its top is always covered with snow. Stanley thinks this peak and some neighboring ones — Mount Gordon Bennett and Mackinnon Peak — are the mysterious Mountains of the Moon, which geographers of the middle ages put on their maps of Africa, but which modern research has been unable to discover.

Ruysdael (*rois'dal*), **Jakob,** the greatest Dutch landscape painter, was born at Haarlem about 1625. He loved to paint forest glades with oak trees, sleeping pools beneath groups of trees, with an old picturesque building, a mill or a ruined temple, or a glimpse of a distant town; a waterfall with rugged rocks, and coast scenes where earth and water meet. He died in the Haarlem almshouse March 14, 1682.

Ruyter (*ri'ter*), **Michael Adrianszoon de,** Dutch admiral, was born at Flushing, Holland, March 24, 1607, of poor parents who sent him to sea as a cabin boy when only eleven. He became captain in the navy in 1635, but between 1643 and 1652, he was in the merchant service and fought against the Barbary pirates. When war broke out between Holland and England, in 1652, a fleet was given to Ruyter. With it he beat off an attack made on him by the English, and attacked the English Admiral Blake off the mouth of the Thames, but was forced to retire. Two months later he totally defeated Blake off Dover. He took part in the naval battles of the next year, and when Tromp was killed in the battle off the Texel, was made vice-admiral. After the close of the war, in 1654, Ruyter was sent to blockade the coasts of Portugal, and then those of Sweden, where he forced the surrender of Nyborg in 1659. For this service he was ennobled by the king of Denmark. The years 1661–63 were taken up in checking the piracy of the north African states in the Mediterranean. War again broke out between Holland and England in 1664, and De Ruyter steered his fleet to the west coast of Africa, and took from the English Goree and some forts on the Guinea coast. The next year he destroyed many English merchantmen in the West Indies, ravaged the Scottish coast, and returned home to be made admiral-in-chief. The year after he fought four days against Monk and Prince Rupert, finally driving off the British fleet, but a month later was driven back to Holland by Monk. In 1667, De Ruyter threw London into a turmoil by sailing up the Medway as far as Rochester, burning English ships, and entering the Thames a second time as high as Gravesend, besides attacking Harwich. In 1672, war began against both France and England. In this war the Dutch admiral fought the French and English in Solebay, defeated Prince Rupert and D'Estrées off Schooneveldt, and again off Kijkduin and Helder. After this defeat England made peace. In 1675, DeRuyter sailed to the Mediterranean to help the Spanish. The Dutch-Spanish fleet fought the French in the bay of Catania, on the east of Sicily. Here DeRuyter was wounded, for the first time in his life of battles, and died a week later, April 29, 1676. DeRuyter was a man of piety, simple in his manners, and of unflinching courage. As a seaman he ranks with such captains as Nelson and Blake.

Rye, the well-known species of *Secale cereale*, a grass which is probably from western Asia. It closely resembles and is related to the wheat.

Rye-House Plot. In 1682–83, while a scheme was formed among the leading Whigs of England to raise the nation in arms against Charles II., another scheme was planned by a few fiercer spirits of the party to waylay and kill the king. It was to be carried out at a farm near Hertford, belonging to one of the plotters, called Rye-House. The plot failed because the house at Newmarket, where the king was staying, caught fire accidentally and caused Charles to leave eight days sooner than he had intended. Both the greater and lesser conspiracy were discovered before long, and though Monmouth, Russell, and other Whig leaders had nothing to do with the Rye-House plot, the indignation aroused by it throughout the country took in the whole party. Lord Russell, Algernon Sidney, and Walcot — the last one of the real plotters — were brought to the block. Hardly any one connected with either plot escaped.

Ryswick (*riz'wik*), **Peace of,** was signed at Ryswick, a Dutch village two miles south of The Hague, by France, England, the Netherlands, and Spain, on September 21, and by Germany on Oct. 30, 1697. It wound up the bloody contest between France and the allies, which had been carried on since 1688.

S

Sabine (*sa-bēn'*), a river of Texas, rises near the northern state boundary, and flows southeast to the border of Louisiana, and then south, forming the boundary between the two states. It empties through Sabine lake—18 miles long and 9 miles wide—in the gulf of Mexico. The Sabine is 500 miles long, is shallow, and navigable only in parts for small steamboats.

Sa'bines, an old Italian people who lived first among the central Apennines, but afterward reached down into the western plains, even to Rome itself. According to the story, a colony of Sabines occupied the Quirinal hill in Rome, but were at last joined to the Latin followers of Romulus on the Palatine hill, and so helped to make up the Roman people. It is said that Romulus, finding it hard to get wives for his followers, who were rather looked down upon as runaways and criminals, invited the Sabines to a feast and games. While the games were going on, the garrison of the Palatine seized the unsuspecting women, whom they carried off to be their wives. After several wars, the Sabines, outside of Rome, were conquered in 241 B. C.

Sa'ble. See MARTEN.

Sa'ble Island, a low-lying island in the Atlantic, 100 miles south of Cape Breton, to which it belongs. It is made up of two sand ridges, with a lagoon between them. The island has been called "the sailors' grave," from the many shipwrecks happening there. Since 1873, three lighthouses have been built, of which two have been swept away and one undermined, as the island is fast sinking. Early in the past century it was 40 miles long, but now it is not more than 20 miles in length. Near it, there are sandbanks and valuable fisheries.

Sack'ett's Har'bor, a village of New York on a bay of Lake Ontario at the mouth of Black river, 12 miles west of Watertown. The harbor is one of the best on the lake. In the War of 1812, Sackett's harbor was the headquarters of the northern division of the American fleet, and several war vessels were built here. It was twice attacked by the British, who were driven off, the last time with a loss of 150 men. Sackett's Harbor is now becoming a popular summer resort. Population 1,266.

Sack'ville, Lord, **Lionel Sackville-West,** English diplomatist, was born in Cambridgeshire, England, the fourth son of the fifth Earl De La Warr, July 19, 1827. He entered the British diplomatic service in 1847, served as an attaché to the English legations at Lisbon, Naples, Stuttgart, and Berlin until 1858, when he acted as secretary of legation at Turin, Madrid, and Berlin, and as secretary of embassy at Paris. He was then appointed envoy extraordinary to the Argentine Republic, was afterward transferred to Madrid, and in 1881 became minister plenipotentiary to the United States. While at Washington, he acted in 1887 at the conference on the affairs of Samoa, and in conjunction with Mr. (now Sir) Joseph Chamberlain and the elder Sir Charles Tupper, of the Canadian Dominion government, he negotiated the Fisheries treaty of Washington (1888). In the latter year, for having indiscreetly advised a naturalized British subject in this country to vote the Democratic ticket as being favorable to British interests, he received from the United States government his passports and returned to England. The incident occurred during the presidential canvass, when Mr. Cleveland was renominated by the Democrats, and Mr. Benjamin Harrison was the Republican candidate.

Sacramento (*sāk-ra-mĕn'tō*), capital of California, is on the east bank of the Sacramento river, at the mouth of the American river, 90 miles by rail northeast of San Francisco. The main public buildings are the capitol, which cost about $2,000,000; the courthouse, hospital, post office, a Roman Catholic cathedral, the Crocker art gallery, and the Masonic and Odd Fellows' halls. There are flour and planing mills, carriage, box, and broom factories, foundries, potteries, spice mills, and a cannery. Here also are the shops of the Southern Pacific railroad, covering twenty-five acres. Sacramento was settled in 1839 by a Swiss, who built a fort there in 1841. It was not till 1848, after the discovery of gold, that the city, at first a town of tents, was laid out. It became a state capital in 1854. Population 29,282.

Sacramen'to, the largest river of California, rises in the northeastern part of the state, and flows southwest through the Sierra Nevada to Shasta, south to Sacramento, and thence southwest into Suisun bay, through which its waters pass into San Pablo bay, and so to the Pacific ocean. It is about 500 miles long, and is navigable for small boats to Red Bluff, nearly 250 miles. Its chief branch is the San Joaquin.

Sacs and Foxes, Indian tribes which settled near Green bay, Wis. They lived and usually acted together. They both belong to the Algonquin family. Among the Sacs, the children of each family at birth are marked white or black in turn, thus dividing the tribe into two bands, the white or Kiscoquah and the black or Oshkosh. The Foxes were also in two branches, the Outagamies (foxes) and the Musquakink (men of red clay). Both tribes were daring and warlike, fighting coura-

geously the much more numerous Iroquois and Sioux. The French had no greater enemies, and the English no greater friends than the Foxes, who attacked Detroit in 1812, and were cut to pieces at Presque Isle on Lake St. Clair, to which they had retreated. The Sacs on the whole favored the English, serving under Pontiac, supporting the British in the Revolutionary war, and fighting under their renowned chief, Blackhawk, in 1832, to recover their hunting grounds from the United States. In 1857, a party of 317 Sacs and Foxes bought lands at Tama, Ia., which they have worked, becoming industrious and self-supporting. The two tribes now number about 1,000, separate bands living in Iowa, Nebraska, Kansas, and the Indian Territory.

Sadi (*sä'dē*), the assumed name of Sheikh Muslih Ad-din, one of the most celebrated of Persian poets, who was born at Shiraz about 1184. Little is known of his life. His father's name was Abdallah, and he was a descendant of Ali, Mohammed's son-in-law. He studied science and theology at Bagdad, and from here made the first of fourteen pilgrimages to Mecca. He traveled for many years in parts of Asia, Africa, and Europe. Near Jerusalem he was captured by the crusaders, but was ransomed by an Aleppo merchant, who recognized him, and gave him his daughter in marriage. He is said to have been a short, slim, and spare man, pious and quiet in his ways. Called the "nightingale of a thousand songs," he fully deserved the honors showered on him by princes and nobles, during his life and after his death. The catalogue of his works contains twenty-two different kinds of writing in prose and poetry, in Arabic and Persian. The greater part are odes and dirges. The finest of his works is *Gulistan*, or Flower-garden — a kind of moral work in prose and verse, made up of eight chapters on such subjects as kings, old age, and education, together with stories, puns, and maxims. Two others of his works are *Bustan* or Tree-garden, *Pand-Namah* or Book of Instructions. See Robinson's *Persian Poetry for English Readers*, and Sir Edwin Arnold's *With Sádi in the Garden*.

Sadowa (*sä-dō'vä*), a Bohemian village 58 miles northeast of Prague, where an important victory was gained by 240,000 Prussians under King William I. over 220,000 Austrians under General Benedik, July 3, 1866. The battle lasted from 8 A. M. to 4 P. M., and resulted in the rout of the Austrians, who lost 21,000 men, with 22,000 prisoners. The Prussian loss was 9,000 men. This battle, which is often called Königgratz, from a town eight miles distant, decided the German-Italian war of 1866.

Safe'ty Lamp. When marsh gas, which is often set free in large quantities from coal seams, is mixed with ten times its volume of air, it becomes highly explosive. Moreover this gas, the fire-damp of mines, in exploding, renders ten times its bulk of air unfit for breathing, and the choke damp thus produced is often as fatal to miners as the first explosion. To do away with these dangers, Sir Humphry Davy began his experiments on flame, which resulted in his invention of the safety lamp. He found that when two vessels filled with a gaseous explosive mixture are joined by a narrow tube, and the contents of one fired, the flame does not reach the other, provided the thickness of the tube, its length, and the conducting power for heat of its material, bear certain proportions to each other; the flame being put out by cooling, and its transmission made impossible. He found also that high conducting power and less thickness make up for less length; and to such an extent may this shortening of length be carried that metallic gauze, which may be looked upon as a series of very short square tubes arranged side by side, wholly stops the passage of flame in explosive mixtures. His lamp consists of a burner inclosed in a wire gauze. When such a lighted lamp is brought into an explosive mixture of air and fire-damp, the flame is seen slowly to enlarge as the amount of fire-damp increases, until it fills the entire gauze cylinder. Whenever this pale, enlarged flame is seen, the miners should at once get to a place of safety; for although no explosion can take place while the gauze is sound, yet at that high temperature the metal becomes rapidly burnt and might easily break, and a single opening, if large enough, would then cause a destructive explosion. Many improvements have since been made in Davy's lamp.

Saf'fron is got from the dried flowers of the saffron crocus. It is used as a coloring matter for some articles of food and medicines. It was formerly used for dyeing cloth yellow. Saffron was of much greater importance centuries ago than it is now. The early Greeks used it as a dye, and both they and the Romans, as a perfume. As late as the 15th century, persons were burned alive in Nuremburg for adulterating saffron. The plant is raised in Persia, Afghanistan, Cashmere, southern Europe, and England.

Sage, a general name for a species of *Salvia*, a genus of the mint family, containing about 500 species, and distributed throughout the temperate and tropical regions. Over 30 species are found in North America. The common garden sage is *S. officinalis* from southern Europe. The showy red flowered species which are common in gardens and parks are derived from several species, prominent among which are *S. splendens* of Brazil and *S. fulgens* of Mexico.

Sage-Cock or **Sage-Grouse,** the largest grouse found in North America. It lives on the western plains in the Rocky mountain region and feeds on wild sage, from which cir-

cumstance its name is derived. The upper parts are brown, varied with gray, black, and buff, and the under parts mostly black. A full-grown male reaches a weight of six pounds. The bird has a long pointed tail composed of twenty stiff feathers. It has also large air-sacs of yellow skin on each side of the neck. These are inflated in the spring and enable it to produce a deep, hollow tone.

Sage, Russell, American capitalist and financier, was born in Oneida county, N. Y., Aug. 4, 1816; was brought up on a farm and received his education at the public schools. In early life, he engaged in mercantile pursuits at Troy, N. Y., and was elected to congress as a Whig in 1853, serving for four years. In 1863, he removed to New York city, where he became interested in railways, especially in the New York elevated railroad system, as well as in various telegraph and cable companies. Later on he secured interest in western railroads, chiefly in the Milwaukee and St. Paul, and was associated with the Goulds in their control of other western lines. Becoming a large operator in railway and other stocks, and from buying and selling "privileges" in Wall street, he amassed large wealth, and became director in numberless New York corporations.

Saginaw (*sag'i-naw*), the third city of Michigan, stands on both sides of the Saginaw river, 108 miles northwest of Detroit. The city is the headquarters of the Saginaw bay lumber and salt trade, and its flour mills, furniture, and other factories reach for three miles along the river. It is a busy, growing place, and was until recently separated into the cities of Saginaw and East Saginaw. Saginaw was founded in 1822. Population 42,345.

Sag'inaw Bay, an arm of Lake Huron, and the largest inlet of the southern peninsula of Michigan, is 60 miles long and 30 miles wide. The river Saginaw, 30 miles long, falls into it. It has several good harbors, and under its islands and shores vessels find shelter from the fierce storms which sweep over the expanse of Lake Huron.

Sa'go, a starch obtained from the stems of certain palms. See PALM.

Saguenay (*sâg'e-nâ'*), a large river of Canada, falling into an inlet of the St. Lawrence, about 115 miles below Quebec. It drains Lake St. John, and is about 100 miles long. In its lower course it flows between cliffs, often from 500 to 1,500 feet high, and is in many places two or three miles broad. Its scenery is beautiful, and it is navigable for the largest steamers to Ha Ha bay.

Sagun'tum, a wealthy and warlike town of early Spain, stood where is now the modern town of Murviedro, near the mouth of the Pallantias river. It was a Greek trading town of prominence, but is kept in memory because of its siege and destruction by the Carthaginians under Hannibal in 219 B. C. Having held out the greater part of a year against the great captain and his army of 150,000, the half-starved Saguntines preferred death to unavoidable surrender. Heaping their valuables into one huge pile, and placing their women and children around it, the men made a last sally, and the women fired the pile, casting themselves upon it with their children, thus expiring in the flames at the same time that their husbands were dying in battle.

Sahara (*sa-hâ'ra*), the vast desert region of North Africa, stretching from the Atlantic to the Nile, and from Morocco, Algeria, Tunis, and Tripoli, south to the Sudan, is estimated to have a total area of 2,386,000 square miles. It is a link in the chain of great deserts which girdle the Old World from the Atlantic across Africa, Arabia, Persia, Turkestan, and Mongolia, to the Pacific. The old idea that the Sahara was a vast expanse of sand, and that it was once the bed of an inland sea, is hardly true. The surface is mostly above sea level, and in one place reaches a height of 8,000 feet. However, of large tracts next to nothing is known. On the northern side of this desert is a vast bow of sand hills; the middle portion is a high tableland with snow-clad mountain peaks; and in the east and west are mountain ranges. Water can almost always be found in the hollows between the sand dunes, and also a little below the surface in the deep valleys between the western mountains, these valleys being mostly dry beds of old rivers. In many parts of the Sahara are oases, islands of green in the midst of an ocean of desert. These oases are found most plentiful on the southern side of the Atlas and Algerian mountains, on the northern side of the large central tableland, and along certain lines across the desert, which mark the caravan routes between the Sudan states and the Mediterranean.

A large part of the Sahara, though not the whole, was once undoubtedly under water. The greater part of the surface seems to have been raised, and a process of drying up, similar to that which is now going on in the Turkestan desert, has gone on here from the earliest historic times. The sand is the Saharan rocks ground to dust. The great heat by day causes the rocks to expand; the great fall of the temperature by night, together with the great evaporation which then takes place, makes them split and crack, and break in pieces; and the strong, fierce winds use these pieces like files or sand blasts to grind to fragments other rocks. These desert sand storms are more feared by the traveler than lack of water. Thick deposits of sand have been found on the floor of the Atlantic, a long way west of the African coast. The thermometer falls from above 100° F. during the day, to just below freezing point at night.

On the oasis grow date palms, oranges, peaches, and other fruits, rice, millet, etc. In

the desert little grows except thorny shrubs and coarse grasses. The giraffe, antelope, wild cattle, the wild ass, jackal, ostrich, crow, viper, python, locusts, and flies are found. The camel is the great carrier across the Sahara. The people of the Sahara, numbering from 1,400,000 to 2,500,000, are Moors, and other Berbers, Negroes, Arabs, and Jews. The chief products are dates and salt. But a large trade is carried on by caravans, bringing to the Mediterranean ivory, ostrich feathers, gums, hides, gold dust, etc. To get this trade the French are building a railroad from Algiers, which is to extend across the Sahara to the Niger. Another road is projected from Tripoli to the Sudan. Different plans for flooding the Sahara and so making it an inland sea, have been proposed but have been dropped as it is now known that the greater part of it is above sea level. However, the French, since 1856, have dug many artesian wells, striking water in abundance at a depth of 10 to 300 feet. Wherever these wells have been bored, date palm groves and orchards have increased in size, and the population has become greater. See Barth's *Travels in North and Central Africa*.

Saigon (*sī-gŏn'*), capital of French Cochin China, stands on the river Saigon, 60 miles from the sea. The present town has grown up since 1861, and is one of the handsomest cities of the east. The governor's palace, cathedral, and arsenal are among its fine buildings. Chinese, Anamese, and French make up the bulk of the population of 36,213, the suburb of Cholon, really a part of the city, having a population of 39,925. Saigon is the chief port between Singapore and Hong-Kong. There are in the colony 51 miles of railroad (from Saigon to Mytho). The main export is rice.

Sail. Sails are generally made of flax and hemp, but jute, cotton, and linen are also used, while savages make them of matting and vegetable fibers. Sails are stretched by means of masts, yards, booms, gaffs, and ropes. A vessel of shallow draught or of narrow beam can bear little sail, while a vessel of deep draught and heavily ballasted, as a yacht, or a vessel of great breadth of beam, can carry large sail. A sail acts with greatest power when the wind is right astern, but it can be applied with less strength when on either beam. In the latter case the force of the wind is divided into two parts, one part tending to make the ship go forward, the other tending to make it go sideways, but from the shape of the vessel this second force causes little motion; any that it does cause is called leeway. The sails which are set square across the ship are nearly square in shape, and are called square sails. But many which are set parallel with the keel, called fore-and-aft sails, are also four-sided. Others are three-sided, as stay sails, which are suspended from the ropes which stay the masts. The larger sailing vessels usually carry both fore-and-aft and square sails. The schooner has mainly fore-and-aft sails. The brig is mainly square-rigged, and the brigantine is a cross between the brig and the schooner. The cutter is a fore-and-aft one-master. The ordinary sails are mentioned under YACHT.

St. Albans (*al'banz*), a town of Hertfordshire, England, famous for its Benedictine abbey, which was founded by Offa, king of Mercia, in 793. Cardinal Wolsey was its greatest abbot. It contains the tomb of the early traveler, Sir John Mandeville. In St. Michael's church is Lord Bacon's monument. Here were fought two battles during the War of the Roses. Population 14,000.

St. An'drews, a Scottish town, stands on St. Andrew's bay, 42 miles northeast of Edinburgh. St. Rule's tower, the Bishop's castle, noted for its "battle-dungeon," and within whose walls Cardinal Beaton was slain, and the cathedral consecrated in the presence of Robert Bruce, here, are among the interesting buildings of Scotland. The schools of St. Andrews were well known in 1120, but the university, the first in Scotland, was not founded till 1411. It is now one of the smaller universities, but it is doing much for the higher education of women. The library has over 100,000 volumes, and there is a good museum. Population 7,853.

St. Augustine (*a'gŭs-tēn*), an old Spanish town on the east coast of Florida, stands on Matanzas sound, two miles from the Atlantic and thirty-seven miles southeast of Jacksonville. It was founded by Menendez, who built a fort here in 1565, and is the oldest town in the United States. It was several times attacked by the French, English, and Indians. A sea wall; a mile long, affords a fine promenade. The post office was once the residence of the Spanish governor, and the large barracks occupy an old Franciscan monastery. The old fortress of San Marco, now Fort Marion, was built by Indian slaves, who worked on it for more than a century. Besides its quaint Spanish lanes and balconied buildings, crumbling gates, and magnolias, palms, and oleanders, it has the most costly and magnificent hotels in the world. Two of these, the Ponce de Leon and the Alcazar, are massively built of shell concrete, with towers, casinos, and courtyards; a third is the Hotel Cordova. Its attractive drives, its yachting, and, above all, its climate, bring to it thousands of northern visitors. Population 4,272.

St. Bernard (*sānt bĕr'nard*), the name of two passes in the Alps. Great St. Bernard is 8,120 feet high. Almost on its crest stands the celebrated hospice, founded in 962 by Bernard de Menthon, a neighboring nobleman, for the benefit of pilgrims journeying to Rome. Now a telephone tells the Monks

when travelers are on their way up the mountain. These dozen monks, all young and strong, with the aid of large dogs — no longer the famous St. Bernard dogs, but Newfoundlands — rescue travelers who are in danger of perishing from the snow and cold. There is a botanical garden for Alpine plants on the northern slope of the pass. It was this pass over which Napoleon marched his army. Little St. Bernard is the pass used by Hannibal when he led his troops into Italy. It also has a hospice, 7,143 feet high.

St. Ber'nard Dog. See DOG.

St. Clair', a river of North America, in the line of the Great Lakes, carrying into Lake St. Clair the waters of Lake Huron, at the rate of 225,000 cubic feet per second. It is over 40 miles long and half a mile broad. In 1891, a railroad tunnel under its bed was finished between Port Huron, Mich., and Sarnia, Ont., including approaches 11,553 feet long.

LAKE ST. CLAIR is 26 miles long and 25 wide. From its southwest end passes the volume of water it has received into Lake Erie by means of the Detroit river.

St. Cloud (*san-klō'*), a French town near the Seine, ten miles west of Paris. , St. Cloud was long famous for its fine castle, built by the brother of Louis XIV., the Duke of Orleans. It was afterward a favorite palace of Napoleon. It was destroyed during the siege of Paris, in 1870. Population 6,000.

St. Croix (*kroi*), called also the Passamaquoddy and the Schoodic, a river flowing out of Grand lake, on the eastern border of Maine, runs southeast seventy-five miles to Passamaquoddy bay. It forms part of the boundary between the United States and New Brunswick. It is navigable to St. Stephen, twenty miles from its mouth.

St. Cyr (*san sēr'*), a French town two miles west of Versailles. A school for poor girls was founded here by Louis XIV., and it was for its pupils that Racine wrote his tragedies, *Esther* and *Athalie*. In 1806, Napoleon founded in its place the military school of St. Cyr, one of the most famous in the world. Population 3,500.

St. Denis (*san dā-nē'*), a noted French city, is four miles north of Paris, within the line of forts forming the outer defenses of the capital, and was itself formerly fortified. A famous fair has been held here since 1552. The abbey of St. Denis was the burying-place of the kings of France. The finest of the tombs are those of Louis XII. and his queen, Anne of Brittany, Francis I., Henry II., and Catherine de Medici. Napoleon turned the abbey into a school for the daughters of officers of the Legion of Honor. During the French Revolution the tombs were demolished and the bodies cast into ditches. Population 54,432.

St. Ell'as, Mount, a great volcanic mountain in Alaska, near the Canadian boundary line. It was long thought to be the highest mountain on the American continent, but is now known to be surpassed by Mt. Logan, 26 miles northeast of St. Elias, by Mt. McKinley in Alaska, and Mt. Orizaton in Mexico. Its height as determined by the United States Geodetic survey is 18,100 feet. It is covered almost from base to top with never-melting snow. There are huge glaciers, precipices, and chasms, which make the peak hard to climb. It was ascended in 1897 by Prince Louis Amadeus, of Savoy, and party.

St. Etienne (*san-ta-tyen'*), a large manufacturing city of France, stands on a branch of the Loire, 36 miles southwest of Lyons. It is in the midst of the second largest coal field in France, from which are taken 3,000,000 tons of coal a year. The art gallery, school of mines, and museum are the chief institutions. There is a large national gun factory, which since the revolution has furnished nearly all the muskets, rifles, and revolvers for the army. Steel and iron plates, guns, armor, iron masts, machinery castings, locks, cutlery, ribbons, and laces are the chief manufactures. The coal mines have been worked since the 14th century. The two first French railroads were built from St. Etienne. The town was captured twice by the Huguenots, and has suffered three terrible plagues. Population 136,030.

Saint-Evremond (*san-tāvr-mōn'*), Seigneur de, a famous French writer and wit, was born at St. Denis, Normandy, April 1, 1613. He was taught by the Jesuits, became a soldier, and fought well at Rocroi, Freiburg, and Nördlingen. He supported the throne, but in 1661 had to flee to Holland and then to England, on the discovery of a witty letter he had written on the subject of a treaty. There he spent the rest of his life as a wit, courtier, and warm friend of Charles II. His writings were famous long before they were published. More a man of fashion than an earnest writer, he is yet one of the masters of French style. His works include essays, letters, comedies, etc. He died in England, Sept. 29, 1703.

Saint Gaudens (*gaw'denz*), **Augustus,** American sculptor, was born at Dublin, Ireland, March 1, 1848, and came in his infancy to New York. Here he learned the trade of a cameo cutter, and studied drawing at the Cooper institute and later at the National Academy of Design. From 1867 to 1872 he pursued his artistic studies at the École des Beaux Arts, at Paris, and at Rome, where he produced his first sculptured figure, *Hiawatha*. Returning to New York, he opened a studio and produced a number of busts, statues, and emblematic subjects. The more prominent of these are his statues of Abraham Lincoln, Admiral Farragut, William M.

Evarts, Gen. W. T. Sherman, John A. Logan, Robert R. Randall, Theodore D. Woolsey, and other memorial sculptures, portrait-busts, bas-reliefs, tablets, etc. Also notable are his figure pieces—*The Puritan*, *Diana* (on the tower of Madison Square garden, N. Y.), and the fine bas-relief in St. Thomas' church, N. Y., entitled *Adoration of the Cross by Angels*. Effective also is his *Shaw Memorial* tablet in Boston Common.

St. Germain (*sĕr-măn'*), a famous French city on the Seine, 13 miles east of Paris. A fine terrace, built in 1672, runs along the river in front, and behind it is a royal forest of 10,000 acres. The old royal castle was the favorite residence of the kings of France until Louis XIV. moved the court to Versailles. Population 15,997.

St. Gotthard (*sănt'gŏth'ärd*), a mountain knob of the Alps, 9,850 feet high. Here are the sources of the Rhine, Rhône, Ticino, and Reuss, whereby St. Gotthard sends its melted snows to the German ocean, the Mediterranean, and the Adriatic. Across its shoulder runs one of the famous passes from Switzerland to Italy, 6,936 feet high. Near the top stand two hotels and a hospice for the 12,000 travelers who use the pass every year. Now most of the traffic goes through the tunnel, finished in 1880, which is 9¼ miles long, and cost $11,350,000, while the whole cost of the St. Gotthard railroad was $45,400,000.

St. Helena (*he-lē'nä*), a lonely island in the Atlantic, 1,200 miles from the west coast of Africa, covering 47 square miles. It is a part of an old volcano; and High hill is 2,823 feet above the sea. Its shores are cliffs, from 600 to 2,000 feet high, cut by deep, narrow valleys. The people, who number 5,000, raise potatoes, and fish for whales. The Suez canal destroyed a large trade with vessels which stopped on the way to and from India, by the Cape of Good Hope. The chief trade now is the export of the produce of the whale fisheries to the United States. St. Helena was discovered by the Portuguese in 1502, and taken possession of by the British East India company in 1651. The island is chiefly noted as the place of Napoleon's imprisonment from 1815 to his death in 1821. His home was the farmhouse of Longwood, three miles inland from the capital, Jamestown. Many Boer prisoners were sent here during the war in South Africa (1899–1901). See Melliss' *St. Helena*.

Saint-Hilaire (*san-tē-lĕr'*), **Geoffroy, Etienne,** a French naturalist, noted for his work in comparative anatomy, and for his connection with the theory of evolution. He was born at Étampes, France, April 15, 1772, and died at Paris in 1844. He was educated as a priest, but developed such a passionate fondness for zoology, that he deserted the ministry and became attached to the Museum of Natural History at the Jardin des Plantes. Here he was associated with Cuvier and Lamarck. He became professor of zoology, and devoted himself mainly to the study of vertebrates. He published works on the structure of animals and on the philosophy of anatomy. In 1803, he was given the badge of the Legion of Honor, and in 1807 was elected to the Institute. He reached the conclusion that there was a unity of plan in the construction of all animals, and he accounted for the origin of different animals through the changes produced in them by the surrounding conditions. As an evolutionist he sided with Lamarck against Cuvier, who believed in the fixity of species. (See EVOLUTION.) He was, however, more nearly a follower of Buffon than of Lamarck. In 1830, just after the death of Lamarck, he engaged in a controversy with Cuvier, before the Institute, on the unity of type and the evolution of animal life. This debate was so famous that it stirred all intellectual Europe. Cuvier won by his great authority and the more skillful management of his side of the case. He was in part right, but as regards the evolution of animal life, all later evidence is against him.

St. James' Palace, a large brick building, fronting toward Pall Mall, London. At first a hospital, it was made a royal manor by Henry VIII. Here died Queen Mary, and Charles I. slept here the night before his execution. When Whitehall was burned in 1697, St. James became the regular London palace of the English sovereigns and so continued until the late Queen Victoria removed the royal household to Buckingham palace in 1837. The Court of St. James is a name often given to the British court.

St. John, a river rising in Maine, and after a course of 450 miles falling into the bay of Fundy by an inlet five miles wide. It is navigable for small craft for 155 miles to Woodstock. Through most of its upper course it forms the boundary line between Maine and Canada.

St. John, the capital and largest city of New Brunswick, is on the inlet of the St. John river, 277 miles northwest of Halifax. It has a good harbor, and steamers ply to and from Boston. Shipbuilding, timber trade, and fishing are carried on, and there are important manufactures. The greater part of the city was destroyed by fire in 1877, but has since been rebuilt. Population 40,711.

St. John of Jerusalem, Knights of, a celebrated military and religious order of the middle ages, was founded about 1048 in a hospital built by merchants of Amalfi at Jerusalem for the care of pilgrims to the Holy Sepulchre. After the conquest of Jerusalem by the Crusaders in 1099, the hospital servants were joined by many from the Christian army, who resolved to devote themselves to the service of poor and sick pilgrims. They soon

became an order, which was military as well as religious, their chief undertaking being the protection of pilgrims on their way to Jerusalem. For this purpose commanderies were set up in the Mediterranean towns, and the members of the order became known as Hospitallers. Saladin forced them to retire to Acre in 1191, the last Christian stronghold in Palestine, which they held with great bravery for a century, but then after a terrible siege were compelled to sail to Cyprus. In 1310, the knights captured Rhodes and seven neighboring islands from the Greek and Moslem pirates, and for over 200 years waged successful war against the Turks. In 1523, Sultan Solyman captured Rhodes, and after a short stay at Crete, Charles V. gave the Hospitallers the island of Malta, with Tripoli and Gozo. In 1565, the Corsair Dragut, after capturing Tripoli, laid siege to Malta, and at the end of four months was beaten off with a loss of 25,000 men. By 1798, the order was of little importance, and Malta was surrendered to the French. Certain branches are still kept up in Europe.

In the 12th century a bitter rivalry sprang up between the Hospitallers and the Knights Templar, which was fought out in 1259, the former being victorious. On the suppression of the Knights Templar, in 1312, their 9,000 manors in different parts of Europe were added to the 19,000 already possessed by the Hospitallers. The brethren were divided into three classes, knights, chaplains, and serving brothers, these last being fighting squires who accompanied the knights on their expeditions. The Hospitallers wore a red coat over their armor; their badge was a maltese cross, enameled white and edged with gold; their motto was *pro fide*, to which was afterward added *pro utilitate hominum* ("for the faith and for the service of men").

St. John's, capital of Newfoundland, is on the east coast of the island, 1,076 miles northeast of Montreal, and is the nearest port in America to Europe, being only 1,730 miles from Cork. It has a good harbor, two railroads, and a number of manufactures. Population 29,007.

St. Jo'seph, a city of Missouri on the Missouri river, 110 miles above Kansas City. Eight railroads center here, and the river is crossed by an iron railroad bridge which has five spans, one a draw span of 365 feet, and which cost $1,500,000. Here are the state insane asylum, and St. Joseph college. The stockyards cover 440 acres, and a yearly jobbing trade of $150,000,000 is done. There are also gun, carriage, stove, ironwork, clothing, and other manufactures. An Indian trader laid out the town in 1843, and it soon became famous as a starting point for the long journey in wagons across the plains. Its area is seven square miles. Population 102,979.

Saint-Just (*sän-zhüst'*), **Louis Antoine de,** French revolutionist, was born at Décize, France, Aug. 25, 1767. While studying law at Rheims he was captivated by Rousseau's writings, and, in order to become a writer, set off to Paris at nineteen, taking some of his mother's plate, and was, at her request, imprisoned for six months. His essay *The Spirit of the Revolution*, gained him some standing, and as a member of the convention he attracted notice by his fierce tirades against the king, and by his making the opening speech on the verdict at his trial. As a follower of Robespierre he began the attacks on Hébert, which sent him to his doom, quickly followed by the fall of Danton. Saint-Just fell with Robespierre, but unlike him, carried his head high on the tumbrel, and died without a word, July 28, 1794.

St. Law'rence, a great North American river, which, issuing from Lake Ontario, flows northeast for 750 miles — part of the way forming the boundary line between the United States and Canada — and falls into the gulf of St. Lawrence by a broad inlet. In reality, the St. Lawrence includes the Great Lakes and their connecting streams, with a length of 2,200 miles, these lakes being a great system of river valleys whose old outlets have been blocked. The St. Lawrence system is the largest body of fresh water on the globe. The system begins with the St. Louis, which rises in the same plain which sends forth also the Mississippi and the Red River of the North. The St. Lawrence proper has a number of expansions, as the lake of the Thousand Isles, lake of St. Francis, lake of St. Peter, etc. The channel has been deepened and widened between Quebec and Montreal. Between Montreal and Lake Ontario there are rapids, around which canals have been dug. Of its branches the Richelieu brings the waters of Lake Champlain; others are the Ottawa, St. Maurice, Saguenay, and Batiscan. The width of the St. Lawrence varies from one to four miles, while the inlet at its mouth is over 100 miles across. During the winter the river is frozen over.

St. Law'rence, The Gulf of, washes Newfoundland, Quebec, New Brunswick, and Nova Scotia. It is joined to the Atlantic by the strait of Belle Isle, between Newfoundland and Labrador; the gulf of Canso, between Cape Breton and Nova Scotia; and by a wider passage than either between Cape Breton and Newfoundland. The main islands are Anticosti, St. Paul's, and Prince Edward's. The gulf is noted for its fisheries.

St. Louis (*sānt lō'is*), **Mo.,** the chief city of the Mississippi valley, and the fourth of the United States, is in Missouri, on the west bank of the Mississippi river, 21 miles south of the mouth of the Missouri. The city stands many feet above the river, built on three terraces, the third terrace being 200 feet high. It has a river frontage of 19 miles, and covers 62½

square miles. Water is taken from the Mississippi river, the water works having a capacity of 50,000,000 gallons daily, which will soon be doubled. Only electric lighting is used; and there are cable, electric, and horse railroads. Eighteen railroads enter the new union depot, and an electric railroad is being built between St. Louis and Chicago. The Eads bridge over the Mississippi was opened in 1874, and is 1,524 feet long. The Merchants' steel bridge, opened in 1890, is 2,450 feet long, including approaches.

Among the fine public buildings are the new city hall, costing over $1,500,000, the exposition building, four courts, the merchants' exchange, courthouse, Union Trust building, Equitable building, Southern and Planters' hotel, the United States arsenal, Roman Catholic cathedral, and St. George's church (Episcopalian). The public squares and parks occupy over 3,000 acres. Forest park is the largest, containing 1,372 acres; Tower Grove park, in which is a botanical garden, is one of the finest in the country. The exposition is open every fall, and is one of the best yearly fairs in the United States.

St. Louis spends over $1,500,000 a year on its public schools, which are attended by 80,673 pupils. St. Louis university has 34 professors and 435 students; its buildings are new, and it has a library of 25,000 volumes. Washington university includes a college, polytechnic school, law school, school of botany, and school of fine arts; it has 104 professors, and 1,450 students. The museum of fine arts is housed in a handsome building. The chief libraries are the public school library (75,000 volumes) and the Mercantile library (68,000 volumes).

St. Louis' growth is due to its river trade, though now it is equally important as a railroad center. It receives over 10,000,000 tons of freight yearly, and ships over 6,000,000 tons. It manufactures more tobacco than any city in the world; its other chief manufactures are beer, and boots and shoes.

In 1764, a company of merchants headed by Pierre Ligueste Laclède, who had been given by the director-general of Louisiana the right to trade with the Indians on the Missouri, made a settlement at St. Louis. It was taken possession of by Spanish troops in 1768 and with the rest of Louisiana became a part of the United States in 1803. In 1780, it was attacked by a large body of Indians, who were driven off. For many years it was only a trading post for the fur traders. The first newspaper was started in 1808; and a year later it became a town. The city suffered from cholera in 1832, and from cholera and fire in 1849. In 1896, St. Louis was visited by a cyclone which swept through the heart of the city, causing great loss of life and destroying property to the value of from $25,000,000 to $50,000,000. Population 575,238. See Billon's *Annals of St. Louis in Its Early Days.*

St. Lou'is, capital of the French colony of Senegal in West Africa, is on a small island near the mouth of the Senegal river. Bridges join it to suburbs on either bank. A sand-bar makes the river mouth dangerous to vessels, and freight is landed at Dakar on Cape Verde, 100 miles southwest, and brought to St. Louis by rail. Still the place has a trade of $5,000,000 a year, its chief exports being gums and earth-nuts. The climate is unhealthy; water is brought to the town by an aqueduct seven and one-half miles long. Population 20,200.

St. Ma'ry's Strait or **River** connects Lake Superior and Lake Huron, and forms the boundary between Ontario and the Upper Peninsula of Michigan. The strait is sixty-three miles long. One mile below Lake Superior are the rapids called the Sault Ste. Marie, below which it spreads out into a broad lake. These rapids have a fall of 20½ feet, around which a canal has been built, most of it cut through solid rock.

St. Paul, capital of Minnesota, is on both banks of the Mississippi, near the mouth of the Minnesota. The city is built on two high plains of limestone rock; the business portion is on the lower plain, and most of the best residences are on the upper plain overlooking the Mississippi, one of the finest streets of which is Summit avenue. Its buildings compare well with those of any city in the country. Among them are the state house, city hall, chamber of commerce, Convent of the Good Shepherd, and the New York life insurance building. The manufacturing output amounts to $52,000,000 a year, and the stockyards do a business of $10,000,000. St. Paul is served by ten railroads, and electric railroads carry passengers to all parts of the city. Twenty-five thousand pupils attend the public schools which are maintained at an annual cost of $465,000; there are three colleges, Macalester college (Presbyterian), Hamline university (Methodist), and St. Thomas college (Roman Catholic). The city library has 50,000 volumes.

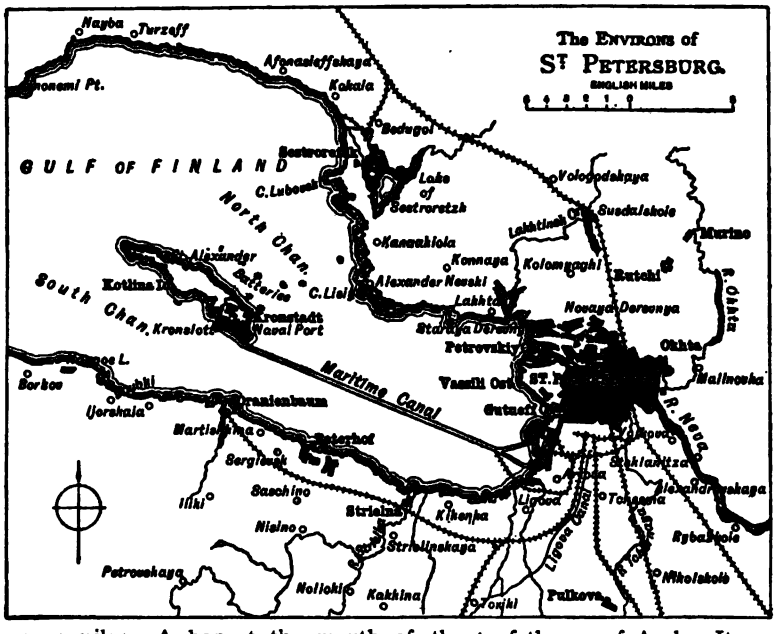
The first log huts were built in 1840 on the site of St. Paul by Canadian voyagers, who were engaged in the fur trade. In 1849, when St. Paul was made the capital of the newly organized Minnesota territory, the town had but 500 inhabitants. Its present population is 163,065, more than three-fourths of which is the growth of the last 20 years. St. Paul and Minneapolis are known as the twin cities, and have been growing steadily toward each other, so that they are now practically one city, with a combined population of 365,783.

St. Pe'tersburg, the capital of the Russian empire, stands at the head of the gulf of Finland, at the mouth of the Neva. It is built on flat and low marshy ground, from which the sea is slowly receding, the Neva dividing into many branches, thus producing 100 islands, which are all the time getting

larger. In this way nearly 600 acres have been added to St. Petersburg in the last 150 years. High winds sometimes raise the sea level and flood the poorer parts of the city. In 1777, 1824, and 1891 rises of ten or more feet covered nearly the whole city with water. St. Petersburg is surrounded by wildernesses, the nearest city being Novgorod, and is almost wholly cut off from the rest of Russia. The chief connection is by railway and by the Neva, which is joined by canals with the Volga, and so is the real mouth of Russia's greatest river. Founded by Peter the Great in 1702, the city has spread over the banks and islands of the Neva and now covers 42 square miles. A bar at the mouth of the river made Kronstadt, on an island 16 miles west, the real port, but the building of a ship canal, twenty-two feet deep, now allows ships to unload within the city itself. Most of and the finest part of the city is on the mainland, bordered by a granite quay, with a long line of palaces and mansions stretching along the Neva for 2½ miles. The old Admiralty with its gilded spire is the center of the main part of St. Petersburg. From it starts the Nevskiy Prospect, one of the finest streets in the world, not so much for its houses as for its great width and length, its crowds and carriages. To the east of the old Admiralty rises the huge and magnificent mass of the Winter Palace. On the island of Vasilievsky is the stock exchange, the university, the academy of sciences, and the academy of arts. On the Petersburgskiy island stands the old fortress of St. Peter and St. Paul, containing the mint, the cathedral, in which the members of the imperial family are buried, and a political prison. Many islands are joined by bridges and covered by beautiful parks and summer houses.

The chief manufactures are cottons, metals, leather, sugar, and guns. But St. Petersburg owes its growth chiefly to foreign trade. Thousands of boats and rafts bring 3,000,000 tons of freight down the Neva yearly, while the railroads bring 1,260,000 tons.

The St. Petersburg university, and the many medical, technical, engineering, naval, military, and other schools, as well as the Ladies' university, number several thousands of students. There are fine picture galleries in the Academy of Arts and the Hermitage. The imperial public library has 1,200,000 volumes and 40,000 manuscripts Population 1,267,023.



Saint-Pierre (*săn'pē-ĕr'*), **Jacques Henri Bernardin de,** was born at Havre, France, Jan. 19, 1737. As a boy he made a voyage to Martinique, and studied at Caen and Rouen. He worked for a while as an engineer, made voyages and journeys, was a disciple of Rousseau, and wished to found an ideal state on the shores of the sea of Aral. It was not till 1771 that his first book appeared, *Voyage to the Isle of France*, which at first was hardly noticed. He is remembered chiefly as the author of the beautiful story of *Paul and Virginia*, which was quickly scattered over Europe, in English, Italian, Spanish, Dutch, Polish, and Russian translations. Napoleon took it with him on his Italian campaign, re-read it at St. Helena, and heaped many favors on St. Pierre, which enabled him to spend his old age comfortably among his flowers at his country house at Éragny. Here he died Jan. 21, 1814.

St. Quentin (*săn kŏn-tăn'*), a French city on the Somme, ninety-five miles northeast of Paris. The church of St. Quentin and the town hall are fine Gothic buildings. There are large cotton and other mills, and vast quantities of embroidery are made. Two important battles were fought here. Spanish and English troops won a victory over the

French under Montmorency in 1557, followed by the surrender of the city to the Spaniards, though bravely defended by Coligny. On Jan. 19, 1871, the Germans under Von Goeben defeated the French under Faidherbe, capturing nearly 10,000 prisoners. Population 48,868.

Saint-Simon (*sānt-sī'mon*), **Claude Henri,** Count of, the founder of French socialism, was born at Paris, Oct. 17, 1760. He was odd and ambitious as a young man, and ordered his servant to wake him every morning with the words, "Rise, Monsieur le Comte; you have great things to do." Like other French nobles he showed his love for liberty by serving as a volunteer in the American Revolutionary war. However, he took very little part in the French Revolution, except to undergo a short imprisonment. His ancestor, Charlemagne, appeared to him in a dream and encouraged him to devote his life to philosophy, promising that his successes as a philosopher would equal those of the emperor as a warrior and statesman. His first work was *Letters of a Citizen of Geneva to His Contemporaries*. His last and most important was *New Christianity*. Both he and his writings attracted many of the brightest and ablest young men of France, including Comte and Augustin Thierry. He suffered hardships from lack of means, often being without decent clothes and food. This poverty caused him to try to shoot himself, in which attempt he lost an eye, two years before his death, May 19, 1825.

Saint-Si'mon, Louis de Rouvroy, Duke of, was born at Paris, Jan. 16, 1675. He served as a soldier in the wars of Louis XIV. and took a leading part as courtier and politician at that monarch's court. He is remembered for his *Memoirs*, which were not published in full till 1830. They are a masterpiece of art and are said not to be equaled by any work of the kind yet written. His aim, in which he succeeded, was to make his reader think "not that he is reading a history or memoirs, but rather that he is himself in the secret of all that is represented to him, and spectator of all that is related." He died at Laferté, March 2, 1755. See Henry Reeve's *Royal and Republican France*.

St. Vin'cent, Cape, forms the southwestern corner of Portugal, off which two important battles have taken place. On June 16, 1693, the French fleet defeated the English Admiral Rooke, who lost 12 men-of-war and 80 merchantmen that were sailing under his convoy. On Feb. 14, 1797, the well-known battle of Cape St. Vincent was fought, in which Earl St. Vincent, ably seconded by Lord Nelson, with 15 sail of the line and 7 frigates, defeated the Spanish with 27 sail. This victory prevented the invasion of England by France.

Sainte-Beuve (*sant'bev'*), **Charles Augustin,** the greatest literary critic of modern times, was born at Boulogne-sur-Mer, France, in 1804. His father died before his birth and his mother had a hard struggle to find means to give her son a schooling. At fourteen, Charles went to the college Charlemagne at Paris, and afterward studied medicine. In 1824, he began his career as a writer, as a regular contributor of the *Globe*, a paper started in that year by one of his college professors. A review of Victor Hugo's *Odes and Ballads* made him a lifelong friend of that poet. His best work as a critic began in 1840, in which year he was made keeper of the Mazarin library. In 1849, he began to write, for the *Constitutionel*, an article on some literary subject every Monday, and this was his work for twenty years. These *Monday Talks* fill twenty-eight volumes, and on them his fame chiefly rests. Sainte-Beuve died at Paris, Oct. 13, 1869.

Sais (*sā-is'*), an old Egyptian city, on the right bank of the Canoptic branch of the Nile. It gave its name to two Egyptian dynasties, the 24th and the 26th, founded by natives of the city. Sais was important as a religious capital, and had a famous temple of the goddess Neith and the tomb of Osiris. Toward the close of the monarchy it rose to great splendor. The 26th dynasty made it the capital of the kingdom. It was also a renowned seat of learning, and was frequently visited by Greek sages. The legend of the mysterious veiled statue in the temple at Sais formed the subject of one of Schiller's ballads.

Saki (*sä'ke*), a kind of beer which the Japanese make from rice. It is the common drink of Japan. It is clear, and tastes unpleasant to Europeans. It is usually drunk hot, out of flat cups or lacquered wood saucers.

Saladin (*säl'a-din*), the name given by western writers to Salah-ed-din Yusuf ibn Ayub, the sultan of Egypt and Syria. He was born in 1137 at the castle of Tekrit, on the Tigris, of which his father, a Kurd, was governor under the Seljuk Turks. He entered the service of the emir of Syria, and went on several expeditions to Egypt in company with his uncle, who was general of the emir's army. He rose to be grand vizier and in 1171 master of Egypt, overthrowing the reigning caliph. Three years later, the emir died and Saladin proclaimed himself sultan of Egypt and Syria, which title was confirmed to him by the caliph of Bagdad. He next conquered Mesopotamia and received the homage of the Turkish princes of Asia Minor. He then turned his attention to the Christians, utterly defeating them near Tiberias in 1187; next Jerusalem was stormed (Oct. 3), and almost every other fortified place on the Syrian coast was taken. The news of this great success aroused the Christians of western Europe, and a power-

ful body of crusaders, headed by the kings of France and England, soon appeared on the scene of strife. They captured Acre in 1191, and Richard Cœur-de-Lion defeated Saladin, took Cæsarea and Jaffa, and obtained a treaty for three years by which the coast from Jaffa to Tyre was yielded to the Christians. The next year Saladin died at Damascus, March 3, 1193. Saladin was not merely a great soldier; his wise government left traces which lasted for centuries in the citadel of Cairo, and in canals, dikes, and roads. He lives in history as the Moslem hero of the third crusade, and as the Moslem ideal of chivalry. The chivalrous side of his character is seen in Scott's *The Talisman*.

Salaman'ca, a Spanish city on the Tormes, 110 miles northwest of Madrid. From the 13th to the end of the 17th century it was the seat of one of the most renowned universities in Europe. In the 16th century there were from 6,000 to 8,000 students; now there are some 1,200. The library contains 70,500 volumes. The city, which once had a population of 50,000, is still surrounded with walls, pierced by ten gates. Its houses, convents, churches, streets, and squares preserve much of their appearance during the middle ages. The great square was used for bullfights, and can hold 20,000 spectators. The town was captured by Hannibal in 222 B. C. The Moors were driven out of it in 1055. The French captured it in 1812. Population 24,000.

Sal'amander, a tailed amphibian, with a body shaped like a lizard and often mistaken for one of those reptiles. The group includes

COMMON MUD PUPPY, WITH EXTERNAL GILLS.

mud puppies, newts, and the like. They are abundant in many places in both the Old and the New Worlds. Several kinds of *Amblystoma* are very common in the United States. The commoner forms are six to eight inches long. They have blunt noses, and are dark colored with yellow spots and blotches. They lay their eggs in quiet waters, preferring small ponds in which the water is easily warmed. The eggs are hatched into tadpoles, with external gills. These grow to a length of five or six inches before the gills are dropped and replaced entirely by lungs. The adults live on land, going into the water to lay eggs. Some salamanders, like the Mexican axolotl, and the common mud puppy (*Necturus*), live habitually in the water and retain their external feather-like gills throughout life. The salamanders are divided into those which retain and those which lose their gills. Most salamanders lay eggs, but one form (*Salamandra atra*) living on the Alps, brings forth living young. Though regarded with fear by many people, the salamanders are harmless.

Salamis (*sal'a-mis*), **Battle of.** This great naval battle was fought between the Greeks and the Persians in 480 B. C., a few days after the battle of Thermopylæ, in the narrow strait between the island of Salamis and the coast of Attica. The Greek fleet of 366 triremes was drawn up at the entrance of the bay forming the harbor of the town of New Salamis, the Athenians under Themistocles, the Corinthians under Adimantus, while the Spartan Eurybiades commanded the whole. Quarrels among the Greek leaders would probably have caused the fleet to break up, had not Themistocles by a stratagem got Xerxes, the Persian king, to bring up his fleet and give battle at once. Xerxes drew up his fleet, numbering 1,200 triremes and 3,000 smaller vessels, during the night before the battle, so as to block up both entrances to the strait. Sure of victory he took his seat on a throne set up on a lofty height on the Attic coast. Both Greeks and Persians fought with great bravery, but the latter were defeated, the Greeks being victorious in one of the most important sea-fights of history.

Sa'lem, a city in the south of India, 120 miles southwest of Madras. It stands in a valley backed by hills. It has large cotton mills, and a good general trade. Population 67,750.

Sa'lem, city, settled 1626, chief county-seat of Essex county, Mass., on the Boston and Maine railroad, Eastern Division, 17 miles by rail northeast of Boston. Its harbor, an arm of Massachusetts bay, is well sheltered and commodious, but of insufficient depth for the largest vessels. The city is a popular resort for people interested in antiquities of early American settlements, possessing, as it does, many historic localities and buildings. The Essex institute contains a large collection of relics and portraits and a library of 82,850 volumes and 285,922 pamphlets and serials, many of which treat of historic subjects. The East India Marine museum has a rare ex-

hibit of ethnological value and many other objects of varied interest. The Athenæum contains a library of 25,000 volumes, and the free public library has upward of 40,000 volumes. Besides a well-sustained system of public schools, it has three parochial schools and is the seat of a flourishing state normal school. It has twenty-one churches, a Y. M. C. A. organization, with a fine, large building, and an endowed institution for work among boys, known as the Salem Fraternity.

The city has been somewhat unjustly identified with the witchcraft delusion of 1692 from the fact that the courts sat here at which the accused were tried. The recovery from this delusion was earlier here than in other parts of this country or in England.

The city formerly enjoyed a large and extensive foreign commerce. This has become superseded by an extensive coasting trade, of which the reception of coal for distribution by rail and the shipment of ice form the chief items. Population (1901), 35,956.

Sa'lem, capital of Oregon, is on the Willamette river, 52 miles southwest of Portland. It has good water-power and some manufactures. Here are the state capitol, penitentiary, insane asylum, and schools for the blind, deaf and dumb, besides Willamette university (Methodist). Salem was settled in 1834, and became the state capital in 1860. Population 4,258.

Salerno (*sä-lĕr'no*), a city of southern Italy, on the gulf of Salerno, 33 miles southeast of Naples. An old Norman castle surmounts the hill behind the city. The beautiful Gothic cathedral of St. Matthew has in front of it a quadrangle of porphyry and granite pillars. The city was celebrated in the middle ages for its university. Population 39,239.

Sal'ic Law, a collection of the popular laws of the Salic Franks, in which the succession to what are called Salic lands was confined to males, probably from the importance of getting military service from the chief landowners. This law was afterward applied to the succession to the French crown.

Salisbury (*sawlz'ber-i*), a cathedral city of England, stands near the Avon river, 84 miles southwest of London. Its famous cathedral is built in early English style, and is 473 feet long and 111 wide; the spire is the highest in England—400 feet. In the large close which surrounds the cathedral is the bishop's palace. The Blackmore museum contains a fine collection of American antiquities. Among the bishops have been Cardinal Campeggio, Jewell, Hooker, Fuller, Barrow, Liddon, and Wordsworth. Old Sarum, a mile north of the present city, was a castle and a place of importance in Roman times. Here Canute died, and here William the Conqueror gathered the barons to renew their oath of fealty. Population 17,362.

Salis'bury, Robert A. T. Gascoyne Cecil, Marquis of, P. C., English statesman and prime minister, was born at Hatfield, Herts, Feb. 3, 1830, and educated at Eton and at Christ Church, Oxford. In 1866 he entered Lord Derby's ministry as secretary of state for India (under the title of Lord Cranbourne). On the death of his father, in 1867, he entered the house of lords and took rank as the foremost debater in the upper chamber. In 1876, he acted as joint plenipotentiary of Great Britain at the conference of Constantinople, and two years later became secretary of state for foreign affairs. When the Earl of Beaconsfield died, in 1880, Lord Salisbury became the recognized leader of the Conservative party, and when the Gladstone ministry resigned, in 1885, he became premier and secretary for foreign affairs. Owing to feeble support received by his government he resigned affairs to Mr. Gladstone, but on the latter being defeated on the second reading of the Irish Home Rule bill, he was again returned to power. In 1892, Mr. Gladstone and he once more exchanged the premiership, and in 1895, on the resignation of Lord Rosebery, Lord Salisbury formed his third administration, in coalition with Liberal-Unionists, of which he is still (1901) the head. In 1864, he was elected chancellor of the University of Oxford. In his younger days, he was a contributor to the *Quarterly Review*, but now finds relaxation from the cares of office in his laboratory, where he dabbles in chemistry and electricity.

MARQUIS OF SALISBURY.

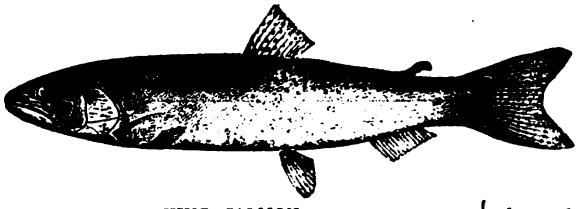
Saliva (*sa-lī'va*), one of the digestive fluids, is mainly the product of the salivary glands, of which there are three kinds, named from Greek and Latin words denoting their position—the parotid, the submaxillary, and the sublingual, with ducts or canals which carry the saliva into the mouth. Here it is mixed with mucous, from the mucous membrane lining the mouth, forming ordinary or mixed saliva. The parotid gland is the largest of the three glands, found on each side. It lies on the side of the face just in front of the ear. Its duct is about two and a half inches long and opens into the mouth opposite the second molar tooth of the upper jaw. The submaxillary gland is below the jaw bone, the sublingual gland is under the tongue on the floor of the mouth. Salivary glands are found in most of the higher animals except fishes.

Sallee', a seaport of Morocco, stands on the Atlantic, at the mouth of the Bu-Rakrak. It

was for centuries notorious as a haunt of pirates, who carried the terror of their name far and wide, and who are known to every reader of *Robinson Crusoe*. The people, 10,000 in number, allow no European to dwell within their walls, though a stop was put to their piracy at the beginning of the 19th century. Population about 10,000.

Sal'lust, a Roman historian, was born of a plebeian family at Amiternum, in the Sabine country, 86 B. C. As a follower of Cæsar, he rose to be tribune in 52, and prætor five years later. He took part in Cæsar's African campaign, came near being killed in a mutiny of some of the troops, and was made governor of Numidia. This office enriched him, and enabled him to lay out beautiful gardens on the Quirinal which bore his name for centuries, and to build the palace used afterward by the emperors Nerva, Vespasian, and Aurelian. Here he wrote his famous histories, *Catiline*, *Jugurtha*, and the *Five Books of History*, of which last only a few fragments are known. Sallust died in 34 B. C.

Salmon (*săm'ŭn*), the name for several species of fish belonging to the trout family and ascending rivers to spawn. They are, of course, found abundantly during migration in fresh water, but as they feed mainly in salt water, they may be regarded as marine fishes. They occur on the shores of both eastern and western continents. They are essentially cold-water fish, in Europe ranging north of Spain, and on the eastern coast of North America, from Maine northward, being



KING SALMON.

sometimes found as far south as the mouth of the Hudson river. The salmon of the Pacific coast, so abundant in the Columbia and Yukon rivers, belongs to another genus. This kind is more tolerant of warm water and occurs on the coast and in rivers of California. The North Atlantic salmon is brownish above, with silvery sides, spotted with black. These spots are often in the form of a letter S. Its delicate reddish-orange flesh makes it highly prized as a table fish. The average weight of an adult is about fifteen pounds. Very similar forms are found in Great Britain, Europe, Norway, Russia, Eastern Asia, and Japan. The salmon of the western Pacific coast are larger. They ascend the Yukon river to a distance of 1,500 miles. The king salmon is the largest, and is known to reach a weight of 100 pounds, although those weighing 40 or 50 pounds are considered very large. The average weight is about 22 pounds. In migrating, they are able to leap over vertical water falls six or eight feet high, when there is considerable depth just below the falls, and they ascend swift rapids of much greater height. There are four other varieties on the Pacific coast associated with the king salmon, but all of smaller size. The young fish at first live in the fresh water and are called, successively, parr, smolt, and many other local names. Going into the salt water after one to three years with a length of six inches, they develop rapidly, and, in a few months, reach a weight of several pounds. They are now called grilse and return to fresh water to spawn. On going to the sea again after their first spawning, they are called salmon and thereafter bear that name. The most extensive factories for canning salmon are on the Columbia river. The fish canned in this region are shipped all over the world. In 1888, the value of the salmon canned in the Pacific states was $3,703,833. See Buckland's *Fish Hatching;* Traherne's *The Habits of the Salmon.*

Salonica (*să-lo-nē'ka*), the most important city for trade in European Turkey after Constantinople. It stands at the head of the gulf of Salonica, and since 1889 has been joined to Belgrade and Vienna by rail. It has a fine appearance from the sea, as it is surrounded by white walls five miles long, and its houses and mosques are shaded by dark-leaved trees, while a citadel, the old Acropolis, looks down from the rocky heights above it. The main buildings are the mosques, most of them now Christian churches; among them are St. Sophia, St. George, and St. Demetrius. The old mosque was once a temple of Venus. Here is the court of the hippodrome where Theodosius ordered the massacre of 7,000 citizens of Salonica. The Via Equatia, the high-road from Rome to Byzantium passes through the city. The trade of the port is steadily growing, especially since the opening of the railroad to Servia. Cotton, flour, soap, bricks, leather, silk, and carpets are manufactured. Salonica is the early Thessalonica of the Christians, to which St. Paul wrote the two epistles to the Thessalonians. At this city Cicero lived when he withdrew from Rome after putting down Catiline's conspiracy. The town was founded by Cassander in 315 B. C., who named it after his wife, sister of Alexander the Great. It was taken by the Moslems from Africa in 904, when they carried off 22,000 of its people into slavery, and by the Normans of South Italy in 1185. Then it went to the Venetians, who surrendered it to the Turks in 1430. Population, about 105,000, of whom nearly 61,000 are Jews of Spanish descent, 25,000 are Turks, and 14,000 Greeks.

Salt. Common salt is chloride of sodium (NaCl). It occurs in nature both in beds, or strata, when it is called rock salt; and in solution in water. Aside from the sea and salt lakes, the under-ground waters of many regions contain salt. The salt of commerce is partly mined from the beds of rock salt, and partly extracted from salt waters. In the latter case, the brine may be natural, as in the case of the sea, salt lakes, and certain salt wells; or artificial. In the case of artificial brines, fresh water is allowed to flow over beds of salt, and from the resulting solution salt is extracted. In the extraction of salt from salt water, two general processes are in vogue. In the one, the water is allowed to evaporate in the open air under the influence of the sun; and in the other, the evaporation is hastened by means of artificial heat. By the former process, the *coarse salt*, and by the latter, the *fine salt* of commerce is obtained. Beds of rock salt represent deposits from solution on the bottoms of salt lakes, lagoons, etc. In some lakes, such as Great Salt lake, such deposits are being made at the present time. Similar deposits have been made in the past, and subsequently buried by other sediments, such as sand, mud, etc. Some of these beds of salt were made millions of years ago. Some of them are hundreds of feet thick. The salt in solution in under-ground waters may have been derived from salt beds over which the waters seeping in from the surface have passed, and some of the natural brines may represent sea water with which the sediment was originally filled, and which has never been drained out.

The thickest salt beds of this country, so far as now known, are on the coast of Louisiana, on Avery's island (*Petite Anse*). Other salt beds occur in New York, Pennsylvania, Ohio, Michigan, and in the province of Ontario.

The output of salt in the United States in 1898 was 17,612,634 barrels (280 lbs. per bbl.). Its production by states was as follows:—

	BARRELS.
New York	6,791,798
Michigan	5,263,564
Kansas	1,882,329
Ohio	1,682,247
California	653,009
Utah	266,250
Texas	254,284
West Virginia	247,668
Pennsylvania	154,287
Other States	417,198

In spite of this great amount, and in spite of the fact that the United States produces more salt than any other country, over 178,000,000 pounds of salt were imported in 1898, and but 17,000,000 pounds exported.

Great Britain, Russia, Germany, France, India, Spain, and Italy are great producer of salt, in the order named. The total product for the world in 1897 was more than 11,000,000 short tons.

Salt Lake City, capital of Utah, is on the Jordan river, eleven miles from Great Salt Lake, and 4,265 feet above the sea. It covers twelve square miles and the city limits embrace fifty square miles. Its streets are 137 feet wide, shaded by fine trees, many of them freshened by streams of running water from the neighboring mountains, and are lighted by electricity. The finest public buildings are the Mormon temple, which cost $10,000,000, with walls built of blocks of dressed granite, twenty feet thick at the bottom, tapering to six feet thick at the top; the tabernacle, a huge building in the shape of an ellipse with a flat dome-shaped roof—something like a tureen cover—resting on sandstone pillars, and seating 9,000; the new assembly hall of rough-hewn granite, the endowment house, the city and county building, etc. But though Mormon influence is strong, there are also Roman Catholic, Episcopalian, Presbyterian, Congregational, and Methodist churches. St. Mark's cathedral (Episcopalian) is the finest Gentile church. The city is the center of large mining industries, and has smelting works, flour, woolen, and paper mills, foundries, machine shops, breweries, tanneries, etc. It has good public schools, supported at an annual cost of $250,000, with 272 teachers and 11,630 pupils. Here is located the University of Utah, a coeducational institution, supported by the state, having about forty instructors and over 500 students. Salt Lake City was founded in 1847 by Brigham Young, who with 142 picked men had spent three months hunting for a site for the future Mormon capital. The city has grown greatly because of the inflow of Mormon emigrants. Population 53,531. See Burton's *The City of the Saints;* Bancroft's *History of Utah.*

Salt'peter, or **Ni'ter,** is potassium nitrate (KNO_3). It is generally in long, colorless, six-sided prisms. Its taste is cooling and very salty. It dissolves in water but not in alcohol. Mixtures of niter and carbon or of niter and sulphur, or of all three, explode with great energy on applying heat. If saltpeter be thrown on glowing coals it flashes briskly. Niter is found in India and Persia, as a natural product, on the soil or scattered through the upper rocks. But most saltpeter is now made from the Chilean sodium nitrate. Niter is used in making sulphuric acid, nitric acid, fireworks, and especially gunpowder. It is also a medicine.

Sodium nitrate is found abundantly on the surface of the soil in Chile and Peru in the form of cube-like crystals, and so is often called cubic niter. Besides its use in the manufacture of saltpeter, it is a valuable fertilizer. In 1889, 930,000 tons of this nitrate, or Chilean saltpeter, as it is called, were shipped from South American ports. See W. H. Russell's *Visit to Chile and the Nitrate Fields of Tarapaca.*

Salts make up a very important class of substances in chemistry, of which common or

sea salt is the most familiar example. Epsom salts, saltpeter, and Rochelle salts are other well-known salts. Common salt was known from the earliest times, and the name salt was given to other substances from the more or less likeness of these to common salt in appearance, taste, solubility, etc., but many substances, which have entirely different physical properties, are now called salts by chemists, and it is not necessary, from a chemical standpoint, that a salt should be white, soluble in water, or that it should have a salty taste. By a salt is ordinarily meant a substance that may be got from an acid by replacing part or whole of the hydrogen of the acid by a metal, or a substance capable of playing the part of a metal, as ammonium. For example, when nitric acid and oxide of lead act upon each other, the acid loses its hydrogen, the place of which is taken by the lead, thus forming lead nitrate, while the hydrogen of the acid and the oxygen of the lead oxide combine to form water. In neutral or normal salts the hydrogen of an acid has been wholly replaced by a metal; in acid salts, only partially replaced; and in basic salts, more than replaced, there being more atoms of metal in the salt than there were atoms of hydrogen in the acid.

HORACE L. WELLS.

Salvador (*săl-vă-dôr'*), the smallest but most thickly populated of the Central American republics, is 140 miles long, and on an average 60 miles wide. It covers 7,225 square miles, and is about as large as New Jersey. The bulk of Salvador is a level plain, 2,000 feet high, cut by rivers and broken by many volcanic peaks from 4,900 to 6,900 feet high. Some of these volcanoes are still active, and one, Izalco, has been in a state of eruption for over a hundred years. On the northern frontier is a portion of the Central American cordillera. The chief rivers, all of which flow to the Pacific, are the Lempa, which receives the waters of the Laguna de Cuija, a large lake on the borders of Salvador and Guatemala, and the San Miguel. The well-watered and rich soil is divided into small farms, which will yield four crops of corn a year. The main products are coffee, indigo, and balsam; the balsam grows only on one part of the seaboard, called the balsam coast. Gold, silver, coal, and iron are found, but the metal yield of the country is not great. The bulk of trade is with the United States and Great Britain.

The whites number only 20,000, most of the people being Indians or of mixed race. The Indians are Aztecs, speak Spanish, and are Roman Catholics. A president, chosen for four years, a cabinet of four secretaries, and a congress elected once a year, carry on the government. Education is free and compulsory. The army numbers 4,000 men, besides 18,000 militia. A railroad connects the capital, San Salvador (population 50,000), and the chief port, Acajutla. Another road is planned to run from La Union, the best harbor, to San Miguel, and thence to San Salvador.

Salvador's first name was Cuscatlan. Pedro de Alvarado had great trouble in conquering it in 1525–26. The country freed itself from Spain in 1821, and two years later joined the Central American Confederacy. Since 1853, it has been an independent republic; it has been without foreign wars since 1864, with the exception of the short war with Guatamala in 1890. This war put an end to the proposed treaty of union between the five Central American states. Population 803,534. See Bates' *Central America.*

Salva'tion Army, a religious body which was founded in England in 1865 by the Rev. William Booth. The Salvationists' beliefs do not differ greatly from those of other Christians, but their methods are entirely new. Mr. Booth's idea was to reach the poorer classes of London by means of a military organization, and in this work he was ably seconded by his wife. The name Salvation Army was adopted in 1878, and its head was thereafter known as General Booth. Its growth has been wonderful, there now being 4,345 corps, with 12,050 officers, in thirty-five countries in every part of the world. A country is mapped out into districts, each under the care of a major. Every large town in a district is occupied by one or more corps under a captain, with lieutenants to assist him. Their work is to carry on daily services indoors and out of doors, to care for recruits, and to work in every way for the salvation of souls, and they are supported by the army. Services are held in the streets, with processions, accompanied by banners, drums, and tamborines. All are bound to abstain from liquor and to lead unselfish lives. One who can hardly read is as welcome as the cultured, and women as well as men are enlisted and can hold any position. The army is supported by offerings, gifts, and the profits of their press, of which the *War Cry* is the best-known paper. These papers have a circulation of 804,000 weekly copies and 131,000 monthly copies. Counting books, song books, etc., their publications have a circulation of nearly 4,000,000 a month.

In 1890, a scheme for uplifting the out-of-work and homeless multitudes, set forth in General Booth's book, *In Darkest England and the Way Out*, attracted wide attention, and funds were collected to enable him to carry out his plan. By this plan outcasts are first taken into a city colony, given shelter and food, and offered work of some kind. If found willing to work and do right, they are then sent to the farm colony, and afterward shipped to the "colony over the seas" as emigrants. In 1896, Ballington Booth, son of General Booth, who had for some years been in charge of the Salvation Army in the United States, separated from the parent society, and established a new organization,

named "The Volunteers." In character, aims, and methods, this organization is similar to the Salvation Army. See General Booth's book mentioned above, and also his *Aggressive Christianity*.

Salvini (*sal-vē'nē*), **Tommaso,** was born at Milan, Italy, Jan. 1, 1830, of a family of actors. The boy had a good training and became well known as a member of Ristori's company. In 1849, he fought in the Revolutionary war, after which he went back to the stage. He played tragic parts, especially "Œdipus," "Saul," and "Othello." He was popular and successful at Paris, Madrid, Brussels, in England, and in the United States, which he visited in 1874 and 1881. In 1884, Salvini left the stage and retired to his villa near Florence. He died in 1896.

ALEXANDER SALVINI, son of the above, followed his father's profession, and gained considerable reputation, appearing successfully in the United States in the *Three Guardsmen* and other plays.

Samarcand (*săm-ăr-kănd'*), a city of western Turkestan, 130 miles southeast of Bokhara. Under its old name, Maracanda, it was taken and destroyed by Alexander the Great. Since its capture in 712 A. D. by the Arabs, it has been a sacred Moslem city. Genghis Khan took it in 1219 and killed three-fourths of its half a million people. Timur the Great made it his capital in the 14th century, when it still had a population of 150,000. Also from Timur's time date its finest buildings, as the Ulug-bed college, the tombs of the conqueror and his wives, and the great stone which he used as a throne. Samarcand had a checkered history from the decay of Timur's empire, till in 1868 it was taken by the Russians from the emirs of Bokhara. A railroad now joins Samarcand to Merv and the Caspian sea. The many gardens are irrigated; manufactures of harness, pottery, etc., are carried on, as is also a brisk trade in silk, rice, horses, etc. A garrison of 6,000 Russians holds the citadel, which is built on a steep hill. Population 54,900.

Sama'ria, the capital of the northern kingdom of Israel, after the ten tribes became independent of Judah. It was founded by Omri. It was about five miles northwest of Shechem, and thus near the middle of Palestine. It stood on the top of a hill 1,450 feet high, and was easily made a place of considerable strength. The Syrians besieged it in vain, but about 721 B. C. it fell before the attacks of the Assyrian kings, Shalmaneser and Sargon. Nearly all the Hebrews of the capital and country were carried captives into Babylonia. Their places were taken by Assyrian colonists. These settlers, though still keeping a good deal of their heathen ways of worship, adopted for the greater part the religion of the Israelites; but the refusal of the Jews to accept their help in rebuilding the temple at Jerusalem caused bitter feeling; and in 409 B. C. the Samaritans built on Mt. Gerizim a rival temple. This enmity between the Samaritans and the Jews, became so great that the "Jews had no dealings with the Samaritans," and the Samaritans none with the Jews. Alexander the Great captured Samaria, and brought there a colony of Greeks. The Jewish captain, John Hyrcanus, after a year's siege, took Samaria, and razed it to the ground, about 110 B. C. But the Samaritans clung to the spot, and after a bloody siege by the Romans saw their city a second time destroyed. Samaria was, however, rebuilt, and held by Herod the Great. The place is now but a heap of ruins, and most of the Samaritans were, like the Jews, scattered to the four winds; yet as late as 529 the few left rose in rebellion against the Eastern Empire.

Samoa (*să-mō'ă*), is the name of a group of islands in the Pacific, from 400 to 500 miles northeast of Fiji. All but one are of volcanic formation, and are mostly surrounded by coral reefs. They are mountainous, well wooded, with rich soil. Only four are of any size. The largest, Savaii, is 47 miles long and 28 miles wide. Upolu has on its northern side the bay and harbor of Apia, while on the shore of the bay is Apia, the chief town of the islands. In the spring there are disastrous hurricanes. Copra, the dried kernel of the cocoanut, is the chief export. Cotton, coffee, and tobacco are grown, and sugar cane grows wild. Steamers ply between Apia and San Francisco, Auckland, and Sydney.

The Samoans belong to the brown Polynesian race. They are a well-formed people, but lessening in numbers, the present population being about 35,000. The Frenchman Bougainville visited the islands in 1768, and called them the Navigators' islands, from the skill of the native boatmen. The natives are now Christians. By treaty in 1889 the United States, Great Britain, and Germany assumed joint control of the islands.

This arrangement continued in force till 1898, when King Malietoa Laupepa died, and disturbances arose regarding the succession. A joint commission which was appointed recommended, among other measures, the abolition of the kingship. The result was that, by the Anglo-German agreement of Nov. 14, 1899, accepted and ratified by the United States in January, 1900, Great Britain renounced all rights over the islands in favor of Germany as regards Savaii and Upolu, and in favor of the United States as regards Tutuila and other islands. In February, 1900, a naval governor was appointed for Tutuila. The island of Tutuila, 70 miles from Apia, has an area of about 54 square miles, with a population of 3,800. Manua and the other islets have a united area of about 25 square miles, with about 2,000 inhabitants. Tutuila is mountainous, luxuriantly wooded, and fertile. It is described as

the most pleasing of the Samoan islands. The harbor at Pago-Pago, which penetrates the south coast, is the only good harbor in Samoa.

Sa'mos, an island in the Ægean sea near the Asia Minor coast. It covers 180 square miles. A chain of mountains runs through the island. Between it and the mainland runs the mile-wide channel Mycale, where in 479 B. C., the Persian fleet was routed by the Greeks. The main product is wine, though olive oil, raisins, hides, etc., are also exported. Tanning is an important business. The capital is Vathy. The old city of Samos is now called Tigani. It was celebrated for its aqueduct, cut almost a mile through the heart of a mountain; a huge mole built to protect the harbor, and its temple to Hera. In early times famous red pottery was made in Samos. The Samians, like the Corinthians, were among the earliest and most daring sailors; a Samian is said to have first passed the Pillars of Hercules into the Atlantic; and Samos was the mother of colonies in Thrace, Cilicia, Crete, Italy, and Sicily. The island was mistress of the Ægean isles under its greatest ruler Polycrates (532–522 B. C.). No Greeks were more patriotic than the Samians in the war of independence in 1821, but were forced, though the rest of Greece became free, to remain in the hands of their masters, the Turks. The island is, however, governed by a Greek who is called prince of Samos. See Tozer's *Islands of the Ægean.*

Samo-Thrace is an island in the northeast corner of the Ægean sea. Mt. Saoce, 5,248 feet high, takes up nearly its whole surface, sixty-eight square miles. From this peak Poseidon watched the combats on the plain of Troy. Samo-Thrace was for many years a sacred spot, where were worshiped the strange gods known as the Cabeiri. In 1457, and again in 1821, the Turks killed nearly all its people. Population about 2,000. See Tozer's *Islands of the Ægean.*

Samp'son, William T., rear-admiral United States navy, was born at Palmyra, N. Y., in 1840. He graduated at Annapolis, first in his class, in 1861. He was on the *Patapsco* when she was destroyed by a torpedo in Charleston harbor, 1865. He was made lieutenant-commander in 1866 and commander in 1874. He served six years as instructor at Annapolis and commanded successively the *Swatara, Iowa,* and *San Francisco.* On the outbreak of the war with Spain he was appointed acting rear-admiral, March 26, 1898, and placed in command of the North Atlantic squadron operating against Spain in Cuban waters. When the Spanish fleet under Cervera took refuge in the harbor of Santiago de Cuba, Sampson established a close blockade of that port, resulting in the destruction of the Spanish fleet when it attempted to escape from the harbor, July 3, 1898. At the close of the war he was made Rear-Admiral. Died May 6, 1902.

WILLIAM T. SAMPSON.

Sam'son "judged Israel twenty years." He was a Danite, and a native of Zorah. At his birth he became a Nazarite, and in accordance with this vow his head remained unshorn and his lips never knew the taste of wine. The account of his marvelous feats of strength and his fall through his love for Delilah, a Philistine woman, forms one of the most interesting of Bible stories.

Sam'uel, the last of the judges, the first of the prophets, and next to Moses the greatest man in the early history of Israel as a nation. He was an Ephraimite; and set apart by his mother for the priesthood, he became a temple attendant under Eli, the high priest, at Shiloh. While but a child he foretold the downfall of Eli and his house. Twenty years after his master's death he gathered the people at Mizpah, routed the Philistines, and governed the nation for twenty years. On the people's wishing for a king Samuel reluctantly anointed Saul and afterward David, as kings of Israel.

San Anto'nio, the first city of Texas, is on the San Antonio river. It has a large trade in horses, mules, wool, hides, and grain, and has flour mills, breweries, tanneries, etc. There is a Roman Catholic cathedral and seminary, a United States government building, courthouse, and large park. Its broad plazas are overarched by fine old trees. In the Mexican quarters of Laredito and Chihuahua may be seen Spanish manners and customs, markets, shops, cafés, and churches. In San Antonio, as elsewhere in Texas, many Germans have settled, and have greatly helped to build up the city. Except during the war, San Antonio has been the state headquarters of the United States army since 1848, and the quartermaster's depot covers eight acres, while the arsenal covers twenty acres. Fort Alamo, just across the river, was the scene of the massacre by Santa Anna of the garrison of 188 men, including Crockett and Bowie, in 1836. The place was founded by the Spaniards in 1714, who built here a fort, and four years later some monks began the mission of the Alamo. Population 53,321.

San Diego (*dē-ā'go*), the main port of southern California, stands on the beautiful bay of the same name, 125 miles southeast of Los Angeles. The bay, six miles long, forms a good and very busy harbor. The climate is remarkably genial and thousands of tourists come here, and to Coronado Beach, a suburb across the bay, whose hotel cost $1,200,000. San Diego is the oldest city in California, and the ruins of Father Junipero's Jesuit

mission of 1768 are still preserved. A few miles back, at the mouth of a cañon, stands the famous Sweetwater dam, one of the largest in the world, with a curving wall of masonry 90 feet high and 46 feet through at the base. A large trade in wool and other products of the country is carried on. A monument to Richard A. Proctor was set up near San Diego in 1891. Population 17,700.

San (or **Santo**) **Domin'go,** capital of the Dominican Republic, is on the south coast of the island of Haiti. It was founded by Columbus as early as 1494. The main buildings are the Gothic cathedral, where the ashes of Columbus found a rest from 1536 to 1796, the hospital, arsenal, and government buildings. A wall surrounds the town, and forts and batteries defend the harbor. Population 15,000. The republic of the same name, which embraces the eastern portion of the island of Haiti, has an area of 18,045 square miles, with a population of 610,000.

San Francis'co, the chief city of California and the Pacific coast, stands on a peninsula between the sea and the bay of San Francisco. The bay stretches north and south of the city for 47 miles, with a width of six to ten miles. Joining San Francisco bay on the north are San Pablo bay, 10 miles long, in which is Mare island and the United States navy yard,

and Suisun bay, eight miles long, into which fall the San Joaquin and Sacramento rivers. The entrance to San Francisco bay is the famous Golden Gate, a strait a mile wide and five miles long. The shores of the strait are rocky cliffs, in some places nearly 2,000 feet high. The bay is a large factor in making San Francisco's site of such business importance. Near the city are three islands; Goat island, or Yerba Buena, Alcatraz, and Angel island, the two last of which are fortified.

Two hills within the city rise several hundred feet high. San Francisco has many large and fine buildings of marble, granite, terra cotta, iron and brick, yet in spite of many bad fires, it is still, because of its climate, largely a wooden city. Among the public buildings are the sub-treasury, mint, stock exchange, city hall, theatres, etc. The Palace hotel, cost over $3,000,000. Like Central Park, New York, the beautiful Golden Gate park has been reclaimed from a waste tract, in this case of sand dunes. The park runs along the seashore for about three miles and covers 1,050 acres. At Point Lobos are the Cliff House, Seal Rocks, and Sutro Heights, which are popular resorts in the summer, and there are a dozen or more public squares within the city. Among the notable church edifices are St. Mary's cathedral, St. Ignatius church and college (Roman Catholic), the Unitarian church and Grace church (Episcopalian). The public schools are maintained at an annual cost of $1,274,696. The teaching force numbers 1,015, and the number of pupils in attendance is 48,058. At San Francisco are the schools of dentistry, pharmacy, law, and medicine of the University of California. Other schools of the city are Cooper Medical college, Hahnemann Medical college, the School of Mechanic Arts founded by James Lick, the California Academy of Sciences, also endowed by Mr. Lick, and the Cogswell Polytechnic college. The free public library has 75,000 volumes; other libraries are the Mercantile, Mechanics', Odd Fellows', and law libraries.

Cable roads were first used in San Francisco and were invented as the easiest method of transit over its steep and hilly streets; there are now numerous lines of electric railway. Electric lighting and gas are used; and water is furnished by a private company, which brings the 30,000,000 gallons used daily from creeks and reservoirs twenty miles distant. San Francisco has almost the only good harbor on the Pacific from Mexico to Puget sound. Steamers ply to Hawaii, the Philippines, Alaska, Australia, China, Japan, Central and South America; there is a large coast trade as far north as Sitka, and whaling fleets start from this port for the Arctic. San Francisco is an important wheat port, exporting yearly nearly 1,000,000 tons; and the yearly imports and exports amount to $150,000,000. Some 20,000 workmen are employed in the city's mills and factories. Among the leading lines are iron, glass, woolens, and blankets, cable and wire, flour, mining machinery, cordage, and sugar.

As much or more than any American city do the people of San Francisco represent the entire globe. Newspapers in half a dozen languages are here published; 25,000 Chinese live in their quarter, while Mexicans, Maltese, and Greeks elbow the Europeans more common to others of our cities. Population 342,782.

The mission of San Francisco de Asis, often called the Mission Dolores, was founded

in 1776 by Spanish Franciscan monks. This mission became wealthy and in 1825 controlled 1,800 Indians. A few years after it was turned over to the civil officers, in 1834, nothing was left of it but the adobe buildings. In its place grew up the village of Yerba Buena, the first house of which was built in 1835. The town was taken by an American man-of-war in 1846, and the next year its name was changed to San Francisco. The discovery of gold in 1848 made it a city at one leap. In the spring of 1849 its population was 2,000, at the end of that year it was 20,000. Five great fires in 1849–51, which swept away the wooden houses thickly crowded together, did not stop the growth in the slightest. In 1851 and 1856, because of bad city government, the people organized a vigilance committee and hanged a number of criminals.

San Jacin'to, Battle of, the last battle of the Texan war of independence, took place April 21, 1836, near the town of San Jacinto, Tex. General Santa Anna, in command of the Mexican force of 2,000, was attempting to cut off the retreat of the Texans, and came up with them at the mouth of the river. Gen. Sam Houston ordered his small force of 783 men to charge, which they did to the shout of "Remember the Alamo!" (See ALAMO.) After fighting an hour and losing 630 men, the Mexicans surrendered. This decisive battle ended the war.

San Jose (*hō-sā'*), **Cal.,** is on the Gaudalupe river, 50 miles southeast of San Francisco. Besides a fine courthouse and a city hall, it contains the state normal school and a Roman Catholic college for girls. Near by is the famous Lick observatory. There are three parks, and the city is noted for its gardens and fruit. It is a center for fruit canning and wine manufacture, besides which there are flour, woolen, and other mills. Population 21,500.

San Jo'se, the capital since 1823 of Costa Rica, stands in a rich plain, 3,711 feet above the sea. There are many squares and two large parks. The notable buildings are the presidential and national palaces, and that of justice, the cathedral, and the bishop's palace, the old university buildings, two colleges, and the covered market. The chief factory is the government distillery. A railroad joins the capital to Limon, the Atlantic port. Population 25,000.

San Luis Potosi (*lō-ēs' pō-tō-sē'*), capital of the Mexican state of the same name, stands on the edge of a table-land, 7,400 feet above the sea, 362 miles northwest of Mexico City. It is well built, and contains a fine cathedral, a seminary, railroad workshops, a cotton factory, and very large smelting works. There are silver mines near by. The city was founded in 1586, and in 1863 was the seat of Juarez's government. Population 69,050.

San Marino (*mä-rē'nō*), the smallest independent state in Europe, and a republic, lies among the Apennines. It covers but 33 square miles, and contains some villages besides the town of San Marino. The town, which is built on a mountain crag, can be reached by only one road. Farming and cattle breeding are the main occupations. Its independence was recognized by the pope in 1631, when the duchy of Urbino, a part of which it had been since the 13th century, was annexed to the papal states. It is governed by a grand council, the members of which are chosen for life, one-third of whom are nobles. There are two captains-general chosen, who each hold office for six months. Population 9,500.

San Salvador (*säl'vä-dōr'*), the capital of the republic of Salvador, is built at the foot of the extinct volcano of San Salvador (8,360 feet). The houses are mostly of one story, with thick walls, on account of earthquakes. The government buildings are handsome, and a fine cathedral is not yet finished. The city was founded in 1528. In 1854 it was a fine, well-built city, with a population of over 25,000, but on the night of April 16, it was wholly destroyed by an earthquake. Violent shocks of earthquake have been felt in 1873, 1879, and 1891. Population to-day, 50,000.

Sand, a term loosely applied to incoherent mineral matter occurring in particles smaller than pebbles, and larger than particles of mud or dust. If the mineral matter is fine enough to become mud when wet, it would hardly be called sand. Between clay, the particles of which are very small, and sand, there is no sharp line of demarcation. The one grades into the other. The same is true of sand and gravel. Sand is usually made up chiefly of quartz, but it generally contains other mineral matter in small quantities, and sometimes it is largely made up of other minerals. Grains of sand are usually thought to be round, though this is rarely the case. They are, however, often roundish. As it occurs in nature, quartz sand is made up of partly rounded bits of quartz crystals. These crystals originally occurred in igneous rock, and by the decay of the other minerals of the rock, the quartz crystals were set free. They were then brought together in valleys and along shores by the wash of rain, streams, and waves. The purest varieties of quartz sand are used for the manufacture of glass. Sand is extensively used with lime for mortar, cements, etc. When cemented by natural processes, sand becomes sandstone.

Sand Dollar, the name given to a flattened sea urchin, very common on sandy shores. The soft parts are inclosed in a rounded, flattened disc, made of plates of carbonate of lime nicely fitted together. When living the discs are covered with short spines. They are dark yellow or whitish if bleached in the

sun. There are five rows of plates with minute holes, for the tube feet as in other sea urchins, and five rows without holes. In certain forms, the disc is completely perforated by a number of orifices of a key-hole pattern. See SEA URCHIN.

SAND DOLLAR.

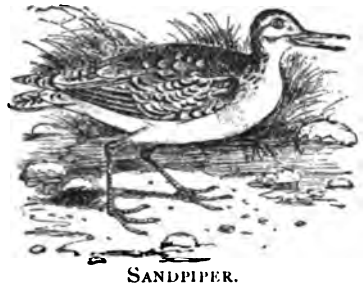
Sand, George, the assumed name of Armandine Lucile Aurore Dupin, was born at Paris, July 5, 1804. She was educated at a convent in Paris, and at eighteen married M. Dudevant. After nine years of married life she separated from her husband and went to Paris to make her living by writing. Her life was spent among authors and literary people generally, her most intimate friends being Alfred de Musset, Chopin, Lamennais, and Michel. After twenty years of this life she settled on her estate of Nohant in Berri, dividing her time between writing, at which she was very industrious, and showing hospitality to almost all French and many foreign men of letters of eminence. George Sand wrote an enormous number of novels. Among the best are *Consuelo*, *Mauprat*, *The Little Fadette*, and *The Marquis of Villemer*. Her plays did not gain the extraordinary popularity of her novels. Her *History of My Life* is interesting, but is mostly made up of her fancies and thoughts. George Sand died June 7, 1876. See *Life*, by Miss Bertha Thomas.

San'dalwood, the wood of *Santalum album*, a small genus of trees and shrubs from the East Indies, Australia, and the Pacific islands. The wood of *S. album* is white or yellowish and sweet scented when dry.

Sand'blast. See GLASS.

San'derling, a bird of the snipe family, which is widely scattered, breeding in Arctic regions and ranging from Iceland to Patagonia. It is about eight inches long and very fat. The winter plumage is ash gray; the under parts are all white, and in summer the upper feathers are reddish with black markings.

Sand'piper, a name commonly applied to several shore-birds belonging to the snipe family. These birds run over the sand uttering a piping note, which doubtless gave them their name. They are small active birds, running along the shore and feeding on the small forms of life cast up by the waves. Many of them are simply migrants in most parts of the United States. The best-known form nesting in the United States is the spotted sandpiper. This is a true snipe, about seven and one-half inches long, with upper parts brownish, gray, and black, the under parts white, spotted with



SANDPIPER.

black. It is also called Tip-up and Pee-wit. The semi-palmated sandpiper, or sand-peep, is about an inch shorter than the form just described. It is similar in coloring, but has no spots on the breast. They are abundant during migrations in flocks, which sometimes number several hundred. See SNIPE.

Sand'stone is a rock formed of compacted sand. The grains are generally quartz, though other minerals are often mixed with this; they are colorless, or of a dull white, yellow, brown, red, or green. The grains vary in size, forming a fine or coarse grained stone. Sandstones, especially when of handsome colors, are much used in building.

Sandus'ky, O., stands on the south shore of Sandusky bay, an arm of Lake Erie, 56 miles (by water) west of Cleveland. The bay, 15 miles long and five wide, forms a good harbor. The city is built on a bed of limestone, on a site rising gradually from the shore. Its business as a lake port is large, its wharves shipping quantities of fish, lime, limestone, lumber, salt, coal, ice, wool, wheat, flour, and Ohio wine. There are also machine and car works, and edge tool, wheel, and woodwork factories. Sandusky is an important import and export point for Canadian trade. The neighboring islands are a favorite summer resort. Population 19,664.

Sand'wich Islands. See HAWAIIAN ISLANDS.

San'dy Hook, a narrow sandy peninsula of New Jersey, between the Atlantic and Sandy Hook bay, 16 miles south of New York. It is about six miles long, and reaches northward toward the Lower Bay of New York. Near the north point are a fort, a life-saving station, and Sandy Hook lighthouse, with a lantern 90 feet high. The voyage across the Atlantic is considered to begin at Sandy Hook.

Sangir (*säng-gēr'*) **Islands,** a group of fifty mountainous and volcanic islands between the Philippines and Celebes, covering 323 square miles. The largest, Great Sangir, on which a fourth of the people live, contains

the volcano Abu, the eruption of which in 1856 cost more than 6,000 lives. The people, who number 50,000, are Malays, and are ruled by their own chiefs under the protection of the Dutch.

San'hedrim, the supreme national council of the Jews, established under the Maccabees. There were seventy-one members, and it was presided over by the Nasi ("prince") at whose side stood the Ab-Beth-Din ("father of the council"). The members were priests; elders, by which was meant heads of families; scribes, or doctors of the law, and men of learning. The high priest, if a man of learning, otherwise "he who excels all others in wisdom," was appointed president. This court had power over life and death, regulated admission into the priesthood, and slowly gathered to itself the whole internal government of Palestine. It usually met daily in a hall in one of the temple courts, though on extraordinary occasions it met at the house of the high priest. After the destruction of Jerusalem, the Sanhedrim found its way to Babylon. See Schürer's *History of the Jewish People in the Time of Christ.*

San'itary Commis'sion, The, was established by women of the northern states at the beginning of the Civil war, to aid and comfort the soldiers of the Union. Its inspectors endeavored to improve the ventilation, drainage, clothing, cookery, etc., in the several camps. To it was due the establishment of pavilion hospitals at the camps, and of soldiers' homes at recruiting points; it provided hospital steamers and cars for sick soldiers, and distributed the supplies given the soldiers by the women of the land. The commission was a board of twenty-five men; its president was Dr. Henry Bellows, of New York. During the war $4,924,481 were received, besides supplies worth $15,000,000.

Sansculotte (*sanz'ku-lŏt'*), that is, "without breeches," was the name given in scorn at the beginning of the French Revolution by the court party to the democratic party in Paris. The latter adopted the name with pride, and used it as a title to distinguish the "good patriot." The name was given because of the revolutionists giving up knee breeches and wearing trousers, not because of their roughness of manner or raggedness of dress, as has often been supposed.

San'ta An'na, Antonio Lopez de, president of Mexico, was born at Jalapa, Feb. 21, 1795. When fifteen he entered the Spanish army, and served against his countrymen till 1821 when he joined Iturbide, who made him brigadier-general and governor of Vera Cruz. In 1822, Santa Anna proclaimed a republic and brought about the downfall of the emperor Iturbide. In 1829, he defeated and captured a body of Spanish troops which had landed at Tampico, and in 1832 through intrigue and revolt had himself chosen president. Under Santa Anna the states became mere provinces, while all power was in the hands of the central government. This policy cost the country Texas in 1836. Santa Anna invaded this province with 6,000 men, and defeated and massacred the Texans with unbroken success, till he was routed and his army and himself taken prisoners, by Gen. Sam Houston, at the battle of San Jacinto. After eight months' imprisonment he was set free, but his influence at home was not recovered till his gallant defense of Vera Cruz against an attack of the French in 1838. In 1841, a revolution again put him in the president's chair, and in 1845 another revolution sent him into exile at Havana. But in 1846 the war with the United States, which had opened badly with the loss of Palo Alto, Resaca, and Monterey, caused the Mexicans to recall Santa Anna, and to make him president and commander-in-chief. But the loss of the battle of Buena Vista to Taylor, and that of Cerro Gordo to Scott, followed by the certainty of the fall of the capital, induced Santa Anna to leave the city by night, after resigning the presidency. In 1853, he was made president for life, but his harsh rule caused him to be driven from the country two years later. In 1867, after the death of Maximilian, he tried to land in Mexico, was captured, tried, and condemned to death, but was pardoned on condition of his leaving the country. He died at Mexico City, June 20, 1876.

San'ta Claus, a corruption of the name St. Nicholas. The term was first used by the Dutch settlers of New York, who kept a San Claus holiday. Santa Claus is held to be the patron saint of the young, and his feast held on Dec. 6 was celebrated formerly in England, and still is in Germany. Now the visits of Santa Claus bearing gifts to the children is transferred to Christmas.

Santa Fe (*săn'ta-fā'*), the capital of New Mexico, is built among the Rocky mountains, 6,840 feet above the sea, and is 1,327 miles southwest of Chicago. The site is a mountain-walled basin, 20 miles from the Rio Grande. One half of the people are Mexicans, dwelling in low adobe houses, on narrow little streets. The Plaza has shops on three sides, and on the other the old governor's palace, a long, low adobe building. The climate is very dry, so that irrigation is necessary for gardening or farming. When first seen by the Spaniards about 1542, the town was a well-peopled Indian pueblo. It has been the capital since 1640. The Indians captured it, burned the main buildings, and drove out the whites in 1680. The Indians again made an attack in 1837, but were driven off by the Mexican governor, Manuel Armijo. General Kearny occupied it with United States troops in 1846. During the Civil war the Confederates held Santa Fé for a few weeks in the spring of 1862. Population 5,603.

Santiago (*sän-tē-ä'gō*), the capital of Chile, stands on a wide and beautiful plain near the western base of the Andes, 1,700 feet above the sea level, and 115 miles southeast of Valparaiso. The town is well built, but most of the houses are only one story high, owing to earthquakes. The chief square is the Plaza Independencia, its sides formed by the government palaces, arcades, the cathedral, and archbishop's palace, and a handsome hotel. On the site of the Jesuit church, which was burned down in 1853, is a marble and bronze monument in memory of the 2,000 worshipers, mostly women, who perished in the fire. The government buildings include the capitol, mint, president's dwelling, prison, two hospitals, and a deaf and dumb asylum. The Alameda, with four rows of fine poplars, runs the whole length of the city and is adorned with many statues. Facing it are the university with 912 and the national institute with 1,148 students. There are other special schools, besides a national library of 65,000 volumes, botanical and zoological gardens, exposition buildings, theatres, and clubhouses. Santiago is surrounded by pretty suburbs dotted with villas and gardens bright with flowers. There is considerable trade, and a busy stock exchange. Cloth, ships' biscuits, beer, ice, etc., are manufactured. Santiago was founded by Pedro de Valdivia in 1541. Population 256,412.

Santiago de Cuba (*sän-tē-ä'gō dā kö'bä*), a southeastern province of Cuba, area 10,125 square miles (population 327,715); also a fortified city, seaport, and former capital of the island, situated near the mouth of the river Santiago, fronting a harbor four miles long on the southern coast. The island, after having been continuously in the possession of Spain from its discovery, was as the result of the Spanish-American war of 1898, relinquished by that Power; while the United States government (which had captured Santiago and the southeastern part of the island by its troops, and by its fleet destroyed that of Spain, on its attempting to escape seaward from the harbor of Santiago de Cuba) undertook the obligations with respect to the protection of life and property which naturally resulted from its occupation of the island, so long as that occupation should last. The American administration of the city and province was in July, 1898, intrusted to Maj.-Gen. Leonard Wood, and was by him ably conducted. He effected many reforms in this region and did much to improve the sanitary condition of Santiago and secure its good and orderly government. He also established public schools, instituted courts of law, and constructed roads inland and along the coast. The region is known to be rich in metals, including iron, copper, and manganese: it is also rich in forests of cabinet woods, such as mahogany and cedar, besides dye woods and other elements of wealth. Its chief products are, however, sugar and tobacco; while in the city there are many cigar factories, foundries, and saw-mills.

On the outbreak of the war in Cuba, the Spanish fleet under Admiral Cervera was in West Indian waters; on May 20, 1898, this squadron entered the harbor of Santiago and was at once blockaded by a United States fleet, commanded by Admiral Sampson. To "bottle up" the Spanish vessels in the harbor, a gallant feat was attempted by Naval-Constructor, Lieut. R. P. Hobson, which was to take the United States ship *Merrimac* into the narrow channel between the Morro forts, at the exit of the harbor, and there sink her with torpedoes. This gallant deed was effected on the night of June 3, and was rendered all the more hazardous, not only by the blowing up of the ship, but by the fire drawn upon her from the enemy. Hobson and his volunteer crew were all made prisoners, two only of their number having been wounded. A few days after this, a force of United States marines made a landing at Caimanera and formed Camp McCalla; while General Shafter landed a division at Baiquiri and General Wheeler landed another at Siboney, the landing of the troops being covered by the guns of the United States fleet. These forces, proceeding toward Santiago, were met near Sevilla, six miles inland from Baiquiri, by a Spanish force, when the battle of Las Guasimas was fought. Following upon this (July 1st), occurred the two bloody engagements at San Juan and El Caney, in which the Spanish forces were defeated and driven within the fortifications of Santiago. Then came the fatal dash of Cervera's squadron out of the harbor of Santiago and its speedy annihilation by the United States fleet, July 3,—a splendid naval achievement. Operations against the city were now pressed by General Shafter, resulting in the surrender, July 14, of the city and province of Santiago de Cuba, together with over 20,000 Spanish troops under General Toral. Population of the town, 43,090.

Sao Francisco (*sän frän-sēs'ko*), a large river of Brazil, rises in the southwest part of the province of Minas Geraes, in its lower course separates the provinces of Bahia and Sergipe from Pernambuco and Alagoas, and after a course of 1,800 miles falls into the Atlantic. It is navigable as far as the mouth of the Paraopeba, except at three points, one of which is the falls of Paulo Affonso (275 feet), around which traffic is carried by rail.

Sao Paulo (*sän pou'lō*), capital of the Brazilian state of the same name, stands on a wide plain, four miles from the Rio Tiete and 310 southwest of Rio de Janeiro. There is a handsome public garden, and there are beautiful suburbs. The main buildings are the government palace, formerly a Jesuit college, the bishop's palace, and a celebrated law school. Sao Paulo is the headquarters of the

coffee trade, and four railroads join it to the coffee districts. There are a number of factories. Population 64,934, including 12,000 Italians and 1,500 Germans.

Sap, Ascent of. See WATER, ASCENT OF.

Sapphire (*saf'ir*), the most precious of gems except the diamond and ruby is, like the latter, a variety of corundum. The name sapphire is commonly given to the beautiful blue variety of corundum, but stones of other shades, such as colorless or pink, sometimes receive the name. Purplish or greenish colors are undesirable, while clouds, milky spots, flakes, or stripes show flaws. It is found crystalized, usually in si sided prisms, ending in six-sided pyramids. It is sometimes found imbedded in gneiss, but more often in clay soils. The finest sapphires are found in Ceylon; Cashmere and Burma also produce beautiful specimens; and sapphires are found in the United States, particularly in Montana, Victoria, and New South Wales. The value depends on quality rather than size and does not increase with the size as does that of the ruby. A sapphire of 165 carats was sold in 1867 for $40,000. In early times a dark-hued or indigo sapphire was called a "male sapphire," a pale blue, a "female sapphire."

Sappho (*saf'ō*), one of the great poetesses of the world, was born on the island of Lesbos in Greece. She was only six years old when she lost her father, and she must have lived about the end of the 7th century B. C., as she flourished at the same time as the poets Alcæus and Stesichorus. But little is known of her life except that she had a daughter named Cleis, and was acquainted with Alcæus. It is said that she fled from Mitylene to Sicily for refuge about 596, but a few years later came back to Mitylene, where she was the center of a group of girls with a passion for poetry. But two of her odes, one to Aphrodite, with a number of short fragments have survived the wear and tear of centuries, but they are enough to assure her genius. For sincerity, deep feeling, passion, and exquisite grace, her lyrics stand alone. There is a story that she fell in love with a beautiful youth, and because he did not return her love, she plunged from a precipice, called the Leucadian rock, into the sea.

Saprophytes (*saf'ro-fits*), plants which are not able to make their own food, and which do not attack living plants or animals, but obtain their food supply from decaying bodies or organic products. These plants are not able to make their own food because they do not contain chlorophyll. They attack dead bodies or body products and sooner or later all organic matter is attacked and decomposed by them. Were it not for them it is said that "the whole surface of the earth would be covered with a thick deposit of the animal and plant remains of the past thousands of years." Saprophytes are mostly fungi, but some of the higher plants also adopt this method of obtaining food. See FUNGI.

Sap Suck'er, a name loosely applied to several small black and white woodpeckers, and also to the white-bellied nuthatch. The only true sap sucker is the yellow-bellied woodpecker, a permanent resident in some parts of the United States, and a winter resident in other parts. The bird is about eight and one-quarter inches long, black and white above, with dusky sides, black on the breast, and the belly yellowish. The crown is reddish in the adult. These birds perforate the bark to the sapwood and devour the same. They have done extensive damages to orchards and shade trees in the west.

Sap'wood. As the trunks of trees increase in diameter each year new layers of wood are laid down. The ascending sap moves through the newer wood, gradually abandoning the older. This newer wood, therefore, is known as "sapwood," in distinction from the abandoned wood, known as the "heart-wood," which see.

Saracens (*sar'a-sens*), the name formerly given by western writers to the Mohammedans of Syria and Palestine, the Arabs generally, or the Arab-Berber races of North Africa, who conquered Spain and Sicily, and invaded France. Later it was used to mean all nations against which crusades were preached, and was thus applied to the Seljuks of Iconium, the Turks, the Gypsies, and even the pagan Prussians. Whether the word comes from Sarah, the wife of Abraham, from an Arab word meaning "to steal," from another meaning "desert," from a Hebrew word meaning "poor," or from an Arab word meaning "eastern people," has been disputed, but the last guess is the most likely. See ARABIA, CRUSADES, MOORS.

Saragossa (*să-ra-gŏs'ă*), a city of Spain, formerly capital of the kingdom of Aragon, stands on the Ebro, 212 miles northeast of Madrid. A seven-arched bridge, built in 1437, crosses the Ebro within the city. The low, brick houses and narrow, winding streets contrast strangely with the many tall and slender towers and spires. There are two cathedrals, one a Gothic building of the 13th century. The citadel Aljaferia was once the palace of the kings of Aragon, and later the headquarters of the Inquisition. The university, founded in 1474, has 800 students and a library of 18,000 volumes. The leaning tower, Torre Nueva, built in 1504, has been declared unsafe and ordered taken down. Cloth, silk, and leather are among the town's manufactures. The name Saragossa is a corruption of Cæsarea Augusta, by which name it was called in 25 B. C. It was an important Roman town, and it was one of the first Spanish cities to accept Christianity. Saragossa was taken by the Goths in

the 5th and by the Moors in the 8th century, and recaptured in 1118 by Alphonso of Aragon, after a five years' siege, during which most of the people died of hunger. In was twice besieged by the French in 1808, 60,000 people perishing in its defense. It was at this siege that the famous "Maid of Saragossa," whose exploit has been sung by Byron and Southey, fought by the side of her artilleryman lover. Population 98,188.

Saratoff (*să-ră'tŏf*), a city of Russia on the Volga, 500 miles southeast of Moscow, stands on terraces rising from the river. There are nearly 30 churches, two cathedrals, and a museum containing a fine art gallery and library. Brandy, liquors, oil, flour, and tobacco are manufactured. There is also a large trade. Saratoff was pillaged in 1774 by the Cossack pretender to the czardom, Pugatcheff. Population 137,109.

Saratoga (*sar-a-tō'gă*) **Springs, N. Y.,** one of the chief watering places in the United States, is in New York state, 38 miles north of Albany. It has twenty or more mineral springs, whose waters are bottled and exported. There are a large number of huge hotels, some having rooms for over 1,000 guests. There is a race track, and regattas are held on Saratoga lake, four miles away. Population 12,409.

Sarato'ga, Battle of, was fought Oct. 7, 1777, near Saratoga Springs, N. Y. The British under Burgoyne and the Americans under Gates had faced each other since Sept. 14. Burgoyne advanced against the Americans, who charged in turn, headed by Arnold, who had rushed without orders to head off the attacking column, and had assumed command. After a stubborn fight the British abandoned their guns, and retreated to their camp, followed by the Continentals, who charged and carried a part of the camp, when darkness put an end to the battle. On the 9th, Burgoyne retreated to Saratoga, where he was hemmed in by Gates, and forced to surrender on the 17th. At the time of the surrender, the American force numbered 10,817; the British surrendered 5,804 men, 4,647 muskets, and 42 guns. This victory was in some respects the most decisive of the whole war. Twelve miles to the east of Saratoga Springs, a handsome obelisk, 155 feet high, on a bluff 350 feet above the Hudson, overlooks the scene of this surrender, which it commemorates.

Sardanapalus (*sar-da-na-pā'lus*), according to Greek tradition, a king of Assyria, whose reign was ended by a revolt. The rebels were defeated several times, but at last shut up Sardanapalus in his capital, Nineveh, and besieged him for two years. When the city could hold out no longer, the monarch gathered all his vast treasures, and, setting them on fire, leaped with his wives into the flames. It is not certain what, if any, real king of Assyria is referred to under the Greek name, Sardanapalus. He was, perhaps, Asurbanipal, who began his reign in 668 B. C.

Sar'dine, a small fish of the herring family. It received its name from being taken abundantly off the coast of Sardinia. The true sardine is a tunny. They are abundant in the Mediterranean, and off the coasts of Spain and Portugal. They are salted, boiled in oil and packed in flat tin boxes containing oil. In this form they are exported as a delicacy to all countries. The supply of true sardines is now considerably reduced and is not sufficient to supply the market. As a result, sprats, pilchards, and other small herring have been preserved in oil, and sold under the name of sardines.

Sardinia (*sär-din'i-ă*), an island of Italy, after Sicily the largest in the Mediterranean, is 135 miles west of the mouth of the Tiber and just south of Corsica, from which it is separated by the strait of Bonifacio, seven and one-half miles wide. In the south is the gulf of Cagliari, a deep, wide bay, and in the north the gulf of Porto Torres. The island is 170 miles long, 75 miles wide, and covers 9,294 square miles. The country is generally mountainous, the highest peak being Gennargentu (6,233 feet). The grotto of Neptune on the west coast is one of the finest in Europe. Sardinia was in early times the granary of Rome, and was renowned for its mines. It has a rich soil, valuable mines, large forests and important fisheries, but these resources are only partially used. The main produce is wheat, barley, beans, potatoes, wine, olive-oil, oranges, lemons, tobacco, and flax. Large numbers of horses, cattle, sheep, swine, and goats are bred. Lead and zinc are the chief metals mined; granite, marble, and clay for pottery are quarried; and convicts manufacture salt from sea-water. The fisheries yield tunny, sardines, anchovy, and coral. There are a number of good ports — Cagliari (the capital), Porto Torres, Terranova, Tortoli, and others. The people are mostly of mixed races, Spanish and Italian. Italian is spoken by the educated, but the common language is a mixture of Latin, Italian, and Spanish. Eighty-three per cent. of the population cannot read or write; there are universities at Cagliari and Sassari. The practice of the vendetta and brigandage, once common, is now almost wholly stopped.

The first people of Sardinia seem to have been Iberians. These were conquered by the Phœnicians, but little is known of them before the conquest by the Carthaginians in 512 B. C., who ruled tyrannically till displaced by the Romans in the 3d century B. C. After the fall of the Roman empire, Sardinia was overrun by Vandal, Goth, Saracen, Byzantine, and Papal soldiers. After a twenty years' struggle the Pisans and Genoese drove out the Saracens and in 1299 divided the island between them. Its later masters were

the Aragonese, Spaniards, Austrians, and in 1720 it was exchanged for Sicily, and with Savoy and Piedmont became the kingdom of Sardinia, under the rule of the house of Savoy. Except for the short time it was annexed to France, under Napoleon, this family continued in power. After the French Revolution, Sardinia became of great importance among the smaller European states and took part in the Crimean war. Victor Emmanuel II. became king of United Italy and its later history is Italian. Population 775,986. See C. Edwardes' *Sardinia and the Sardes.*

Sar'dis, the capital of ancient Lydia, in Asia Minor, stood at the foot of Mount Tmolus (5,906 feet). Its people were rich. They wove luxurious woolen stuffs and carpets and carried on a large trade between the highlands and the coast. It was, moreover, the capital of the fabulously wealthy Crœsus. Its wealth was tempting; it was destroyed by the Cimmerian Gauls in the 7th century B. C., by the Athenians in the 6th, by Antiochus the Great in 215 B. C., and by Timur in 1402; besides this it was overwhelmed by an earthquake in the reign of Tiberius. Both Xerxes and Cyrus the Great lived here before setting out on their famous expeditions. Sardis lost its trade as Byzantium grew, and now only a small village, called Sart, stands on the ancient site.

Sardonyx (*sär'do-niks*), a variety of onyx, or stratified chalcedony, exhibiting white layers alternating with those of a red or brown color. It has always been a favorite stone with the cameo engraver, and hence the stone has been imitated artificially by spurious fabrications. The sardonyx, usually, is composed of two strata, viz., a thin layer of white chalcedony resting upon a ground of either carnelian or sard; though more rarely it presents three layers — a superficial stratum of red, an intermediate band of white, and a base of dark brown chalcedony. The stone is to be distinguished from jasper, which is an opaque variety of chalcedony, and from the Mexican onyx,—a form of aragonite, or carbonate of lime. The sardonyx derives its name from Sardis, reputed to be its original locality.

Sardou (*sär-dō̃*), **Victorien,** French dramatist, was born at Paris, Sept. 7, 1831. In his early student days, he desired to become a doctor, but abandoned medicine for literature and the writing of plays and comedies. His first production was a failure, but in 1860 he met with success in his next works — *Monsieur Garat* and *Les prés Saint-Gervais.* Even better received was his comedy *Les pattes de Mouche,* as were his numberless dramatic compositions which he wrote for Madame Berkhardt and others—*Fédora, Théodora, La Tosca, Gismonda,* etc. In 1891 he produced *Thermidor,* based on the French Revolution, but which was prohibited by the French government in the interest of public order. Other of his notable productions are *Nos Intimes, La famille Benoîton, Divorçons, Belle-Maman, Pamela, Cléopâtra,* and *La Marquise.* He also wrote a satire on American society, *L'Oncle Sam,* and many of his plays were produced with success in this country by Fanny Davenport, among which, especially, was his *Madame Sans-Gêne.* The plots of his comedies, as a rule, are slight, and rather improbable, but they are amusing and rapid in their action. Some of them are full of witty dialogue, with amusing hits at contemporary men of letters.

Sargas'sum, a genus ot brown seaweeds whose species are often observed floating in great masses in the large eddies formed by oceanic currents. These regions of comparatively stagnant water covered by the seaweeds are known as Sargasso seas, the prevailing type being a species of Sargassum. See PHÆOPHYCEÆ.

Sar'gon. See ASSYR'IA.

Sarma'tians, a race who spoke the same language as the Scythians. They were nomads, wild and savage in looks, good horsemen and bowmen, and dressed in leather armor. Their young women went into battle on horseback, which custom may have caused the Greek stories about the Amazons. They were made up of several tribes that roamed over the wide plains which stretch from the Vistula and the Danube to the Volga and the Caucasus. In the second half of the 4th century B. C., they conquered the Scythians. Their empire lasted till the 4th century A. D., when it was overthrown by the Goths.

Sarsaparil'la is the dried root of the smilax, a native plant of Central America. It is a twining shrub, which grows only where water is plenty. The brownish root is many feet long and about as thick as a goose quill. A liquid extract is used as a flavoring and a medicine.

Sar'to, Andrea del, a painter of Florence, where he was born in 1487 or 1486. His family name was Vannucchi, but he was nicknamed Del Sarto — "the tailor's son" — from his father's business. He painted two series of frescos in Florence, the best of the first series being *Nativity of the Virgin* and *Journey of the Three Kings.* He spent a year in Paris at the invitation of Francis I., and was very popular among the French. The most celebrated of his single pictures are the *Last Supper,* the *Madonna with the Harpies,* and *Fathers of the Church Disputing.* Del Sarto was a rapid worker, and excelled in accurate drawing. He died at Florence in 1531. See Crowe's and Cavalcasselle's *Painting in Italy.*

Saskatchewan (*sas-kach'ē-wan*), a large river of Canada, draws its waters from the Rocky mountains, and is formed by two head-

waters called the south and north branches. The north branch rises among the glaciers near Mt. Hooker, the south branch from a group of springs near the same locality, but a short distance to the south. The former has a course of 770 miles, the latter of 810 miles, before they meet. The river then flows east 282 miles to Lake Winnipeg, from which its waters are carried to Hudson bay by the Nelson river. Including the Nelson, its whole length is 1,514 miles. Steamers now run from Lake Winnipeg to Edmonton (700 miles); the Nelson is spoiled for navigation by rapids.

Saskatch'ewan, a western territorial district of Canada, lying to the north of Assiniboia, from the 52d parallel to about 53.30°. It is flanked by Alberta, Keewatin, and northern Manitoba. Both branches of the Saskatchewan river traverse the territory. The chief settlements are Prince Albert and Battleford. The district was organized in 1882, and has an area of 114,000 square miles, and a population of 13,000.

Sas'safras, the popular name and also the technical name of a genus which contains but a single species, native to eastern North America. The trees are usually small, but occasionally become 125 feet in height. The root is largely used for the aromatic oil.

Satellite (*sāt'ĕl-līt*), a small planet or moon. The term is generally employed in astronomy to denote one planet revolving about another; and hence satellites are sometimes called *secondary* planets, to distinguish them from the *primary*, or larger planets. One of the chief points of interest in connection with satellites is the fact that a satellite enables one to determine the mass of the primary as soon as the radius of its orbit, r, and its period, T, are known. For then, if we denote the mass of the primary by M and the mass of the secondary by m, we have

$$M + m = \left(\frac{2\pi}{T}\right)^2 r^3$$

and since m is practically always negligible in comparison with M. we have

$$M = \left(\frac{2\pi}{T}\right)^2 r^3$$

For a list of the known satellites see Webster's *Unabridged Dictionary*, article *Solar System*. On the evolution of satellites, see *Time and Tide*, by Sir Robert Ball ("Romance of Science" series).

Sat'inwood, the wood of *Chloroxylon Swietenia* from India. The wood is deep yellow and remarkably close grained, heavy, and durable.

Sato'lli, Cardinal **Francis,** a Roman Catholic prelate and diplomat of the papal see, was born at Perugia, Italy, July 21, 1831. He early in life distinguished himself as an orator and linguist, and on the accession of Pope Leo XIII. he was selected for the work of promoting theological studies at the college of the Propaganda at Rome. In 1888, he was created archbishop of Lepanto, and in the following year represented His Holiness the Pope at Baltimore, Md., on the occasion of the centenary of the Catholic hierarchy and on the inauguration of the Roman Catholic university at Washington, D. C. In 1893, he came again to this country as apostolic delegate with plenary powers, and in 1896 received the cardinal's hat. In the latter year he returned to Rome, leaving behind him as papal delegate in this country Sebastian Martinelli, archbishop of Ephesus. Cardinal Satolli is the author of a *Course of Philosophy* on the *Summa* of St. Thomas, and of essays on various philosophical themes.

Sat'urn, an early Italian god who presided over farming, his name coming from the word meaning "to sow." He most resembles Demeter of the Greek deities, but was later identified or confounded with the Greek Kronos. According to the Greek myth, Kronos the son of Uranos (heaven) and Gæa (earth) is the youngest of the Titans. He married Rhea by whom he had several children, all of whom he devoured at their birth except the last, Zeus (Jupiter), whom his mother saved by a stratagem. The motive of Kronos was his hope of bringing to naught a prophecy which declared that his children would one day deprive him of his sovereignty, as he himself had done in the case of his father Uranos; but fate is stronger even than the gods, and when Zeus had grown up he began a ten years' war against Kronos and the Titans, ending in their being hurled down to Tartarus and there imprisoned. Other myths added to this that after his banishment from heaven Kronos went to Italy, where Janus gave him a share in his sovereignty. In this way Zeus' conquest of Kronos, a Greek myth, became the Roman myth of Jupiter's conquest of Saturn. Saturn thus became a divine king, who ruled with a fatherly mildness the Italian natives and taught them agriculture. Hence the whole land received from him the name of Saturnia, or "land of plenty," and his reign was that "golden age" of which later poets sang. Saturn's temple, in Rome, stood at the foot of the Capitoline hill.

Sat'urn. See PLAN'ETS.

Saturnalia (*sat-ur-nā'li-a*), **The,** was most probably an old Italian harvest festival. During the festival slaves sat down to banquets in their master's clothes, while he waited on them at table. Crowds of people filled the streets, and roamed about the city in a peculiar dress; friends sent presents to each other; all business stopped; the courts closed; schoolboys got a holiday, and no war could be begun. The length of the Saturnalia varied at different times in Roman history, but they were usually held Dec. 17, 18, and 19.

The modern Italian carnival seems to be founded on the old pagan Saturnalia.

Satyrs (*sā'tẽrs*), in Greek myth, were a race of woodland deities, half human, half animal. They are generally described as roaming the hills in the train of Dionysus (Bacchus). They looked grotesque and repulsive. They were of robust build, with broad, snub noses, large, pointed ears, bristly and shaggy hair, rough skin, little horny knobs on their foreheads, and small tails. They were fond of the woodland nymphs, of music, dancing, wine, and sleep. They were usually hostile to man. The Roman poets represented them as the same as the fauns of their own myths, and gave them larger horns, and goats' feet. Satyrs were often sculptured; for example, Praxiteles' famous *Satyr* at Athens.

Saul, the first king of Israel, was the son of Kish, a wealthy chief of the tribe of Benjamin. Gigantic in frame, noble in mien, and commanding in character, he was well fitted for the task of uniting the tribes of Israel. His deliverance of the men of Jabesh Gilead, and his victories over the Philistines, Ammonites, and Amalekites were unmistakable proofs of his ability as a soldier. But soon he became possessed of a wild madness which found vent in an insane jealousy of David, his son-in-law and the chief of his bodyguard, and in a fit of rage attempted his life with his own hand. Saul fell in a disastrous and bloody battle with the Philistines on Mt. Gilboa.

Sault (*sō*) **Ste. Marie,** a port of Michigan, on the St. Mary river, near the outlet of Lake Superior, 290 miles northwest of Detroit. A canal around the rapids or sault passes yearly nearly three times as many boats as the Suez canal. An immense iron bridge connects the railroads from St. Paul and Duluth with those of Ontario. Population in 1900, 10,538.

Savan'nah, a city and port of Georgia, stretches several miles along the Savannah river, 18 miles from its mouth and 115 miles southwest of Charleston. It is built on a sandy plain, 40 feet above the river, with broad streets shaded by beautiful trees. Forsyth Place, covering thirty acres, and thickly planted with forest pines, is almost in the center of the city. Here is a monument to the Confederate dead, and there are others in the city to Gen. Nathaniel Green and Count Pulaski, who fell here. Savannah has electric cars and electric lights. The custom-house, city exchange, cotton exchange, a Roman Catholic cathedral, and Christ church, on the site where John Wesley first preached to the colonists, are among the main buildings. The city annually spends $120,000 to maintain its public schools, that have a teaching force of 177, and an attendance of 8,697 pupils. The colored people have churches and good schools for themselves. Savannah has long been the first naval stores station and second cotton port of the continent; the yearly export of cotton is over $27,000,000. The whole business of the port amounts to $134,000,000 yearly. There are also rice, paper, flour, planing, cotton, and other mills. Savannah was founded in 1733. It was taken by the English in 1778, and by General Sherman in December, 1864. Population 54,244.

Savan'nah, a river which with its right branch forms the boundary line between Georgia and South Carolina, rises near the southern border of North Carolina and flows southeast to the Atlantic. It is 450 miles long, and is navigable from November to June for large vessels to Savannah, and for steamboats to Augusta.

Save (*sāv*), a river in South Austria, an important branch of the Danube, rises in Carniola, crosses Croatia, separates Bosnia and Servia on the south from Slavonia on the north, and falls into the Danube at Belgrade. It is 556 miles long and is navigable for 336 miles to Sissek in Croatia.

Savonarola (*sä-vō-nä-rō'lä*), **Girolamo,** an Italian reformer, was born at Ferrara, Sept. 21, 1452. He was taught at home, and in 1474 entered the Dominican order at Bologna. He first preached at the Dominican convent of San Marco in Florence in 1482, where his harsh voice, and lack of the graces of a speaker, caused his lectures to be deserted. After a seven years' absence in another convent, he appeared again before the Florentines, and this time his sterling genius and enthusiasm gained him complete success, as he preached against the sins and luxuries of Florence, then at the height of its wealth and brilliancy, under Lorenzo the Magnificent. At this time he stood well with the government and the church, the pope appointing him vicar-general to carry out a reform Savonarola had proposed of the Dominican order in Tuscany. But about 1493 he began to preach pretty plainly at the government and in one of his sermons he referred to the coming of the French under Charles VIII.; and when what he had foretold happened, Savonarola was one of the committee sent to welcome the French king as the saviour of Italy. When the French were forced to leave Florence, a republic was established, of which Savonarola became, though without holding any office, the guiding spirit, his party, who were called Piagnoni, or "Weepers" from the character of penitents which they professed, being in power. Savonarola now aimed at making Florence a model of a Christian commonwealth. Gambling and other vices were sternly punished; vanities of dress were ruled by law; and under the enthusiasm which this prophet stirred among the people women flocked in troops to the public square to fling down their costliest jewelry, and his followers made a "bonfire of vanities," including cards, dice, and carnival costumes. Mean-

while, his denunciations which did not spare even the pope himself — Alexander VI. — and his followers' claim that he was a heaven-sent prophet, arrayed the church against him. He refused to go to Rome to awswer a charge of heresy, likewise refused a cardinal's hat offered him if he would change the style of his preaching, and kept on preaching when forbidden by the pope. He was then excommunicated; the elections at Florence were carried by the party called the Arrabbiati or the "enraged," that is, against Savonarola's upright but vigorous government; and lastly, a Franciscan preacher having denounced him, an appeal was made to the ordeal of fire, a Franciscan and a Dominican monk agreeing to make a trial of this dread ordeal to prove which side in this quarrel was favored by Providence. The trial was not made, owing to difficulties and disputes, the failure destroying Savonarola's prestige among the people. No longer having the support of Florence, he was tried by the church council, tortured, and condemned as a heretic and an enemy of the state. So, on May 23, 1498, this extraordinary man and two other Dominicans, Domenico and Silvestro, were strangled and their bodies burned by the executioner. See his *Life*, by Villari (English translation); Mrs. Oliphant's *Makers of Florence*, and George Eliot's *Romola*.

Saw'fish, a cartilaginous fish related to sharks and rays, with the snout prolonged into a bony blade and sharp teeth along each edge. The body is shaped like that of a shark, and the saw sometimes reaches a length of six feet. There are from sixteen to twenty pairs of teeth in the different species. These fish are normally inhabitants of warm seas. They are abundant in the Mediterranean, and are also found about the West Indies, and off the southern coast of North America. They attack whales and large fish. With the saw they rasp off flesh which is eaten, and sometimes they rip open their prey. Their nostrils, and mouth with small teeth, are located on the under surface of the head near the base of the saw.

Saxe (*saks*), **John Godfrey,** was born at Highgate, Vt., June 2, 1816. He graduated at Middlebury college, Vermont, in 1839, became a lawyer and for seven years practiced in his native county. For six years he owned and edited a newspaper at Burlington. He also served a year as state's attorney and ran for governor of Vermont on the Democratic ticket in 1859 and 1860. Saxe's poetry was mostly satirical and soon gained great popularity, his first volume of poems going through over forty editions. Among his verses are *The Proud Miss McBride*, *The Money King*, and *New Rape of the Lock*. Saxe died at Albany, N. Y., March 31, 1887.

Saxe, Maurice, Marshal, a celebrated soldier of the 18th century, was the natural son of Augustus II., elector of Saxony, and the countess of Königsmark, and was born at Goslar, Hanover, Oct. 28, 1696. When only twelve years old he ran away from home to Flanders, joined the army of Marlborough, and took part in the capture of Lille and the siege of Tournay. With a boyish love of change he joined the Russo-Polish army in 1711 and distinguished himself under his father's own eyes. After fighting against the Turks in Hungary, he was chosen in 1726 duke of Courland, and for three years stubbornly defended the duchy against both Russians and Poles. At length, forced to give it up, he fought under the duke of Berwick, and decided the battle of Ettlingen by a desperate charge. On the breaking out of the Austrian war of succession he was given command of an army to invade Bohemia, stormed Prague, and captured Egar. In 1744, he was made a marshal of France, put in command of the French army in Flanders, and with masterly genius kept a much larger force of the enemy inactive, at the same time capturing various important fortresses. The following year was for him more glorious still; he defeated the duke of Cumberland at Fontenoy, thus winning one of the greatest French victories over the English. The next year he won against the allies the brilliant victory of Raucoux, and the year after for the third time defeated Cumberland at Laufeldt, and forced the allies to agree to the treaty of Aix-la-Chapelle. Saxe died Nov. 30, 1750. George Sand was Saxe's great-granddaughter. See Carlyle's *Frederick the Great*.

Saxe-Coburg-Gotha (*kō'burg-gotä'*), a duchy in Thuringia, one of the German states, area 755 square miles, with a population of 230,000. The principality consists chiefly of two detached portions, the duchy of Gotha in the north and the duchy of Coburg in the south, the chief towns of which are Gotha (population 31,671), and Coburg (population 18,689). The reigning family was, until 1893, represented by Duke Ernest II., who was succeeded by his nephew Prince Alfred of England, duke of Edinburgh, who died in 1900. A son of the latter, heir presumptive, having died in 1899, the duke of Connaught became heir to the ducal throne; but as he, with his son, renounced all claim to the succession, the throne fell to the present incumbent, Charles Edward, son of Prince Leopold (duke of Albany). The latter, being still a minor (he was born in 1884), the duchy is administered by a regent, the hereditary Prince Ernest of Hohenlohe. There are 173 miles of railway in the duchy, its chief products being agricultural — the crop consisting largely of rye, wheat, and barley.

Saxe-Meiningen (*saks-mī'ning-en*), a duchy in Thuringia, one of the states of the German empire. The charter of the duchy dates from 1829; its capital is Meiningen (population 12,869). The reigning duke is George II., son of Duke Bernhard I., who

succeeded on the abdication of Duke Bernhard in 1866. The area of the duchy is 953 square miles, with a population, almost entirely Protestant, of 234,005. Like the duchy of Saxe-Coburg-Gotha, its products are mainly agricultural, the chief crop being rye, oats, wheat, hay, and potatoes. It has 150 miles of railways.

Saxe-Weimar (*saks-vī'mär*), a grand-duchy of Thuringia, one of the German states, whose constitution dates from 1816. Its area (1,388 square miles, with a population of 362,018) consists of three detached districts — Weimar, Eisenach, and Neustadt. The capital is Weimar (population 26,670), and the reigning grand-duke is Wilhelm-Ernst (born 1876), son of the late Prince Karl August, who succeeded Jan. 7, 1901, on the death of his grandfather, the late Grand-Duke Karl Alexander. The government is an hereditary constitutional monarchy. The chief occupation of the people is agriculture, though there are some manufactures, mainly cotton and woolen.

Sax'horn, the name of a series of brass wind musical instruments invented by Antoine or Adolphe Sax, who was born at Dinant, Belgium, in 1814, and settled at Paris in 1842. By means of this and another family of instruments called saxophones, he has greatly influenced military music throughout the world. The saxhorn is a conical tube opening out to a wide bell, is sounded through a cupped mouthpiece, and is provided with valves or pistons like a cornet. Saxhorns are made in different sizes, the series having a very wide compass. Their number and variety supply all the different parts required by a brass band, and in many places good bands are wholly made up of them. From the fact that their fingering is all alike, a performer having mastered one can by a little practice play as well on any of the others. Their compass, richness, and flexibility of tone render them especially fit for military music, and their form makes them easy to play either on the march or on horseback.

Sax'ons, a Germanic people, whose name is thought to come from an old word meaning "knife." A "Saxon league" was formed in the 3d century of tribes living along the Elbe inlet and on the neighboring islands. The Saxons invaded Roman territory in the reigns of Julian and Valentinian, and about 450 they, together with the Angles, conquered settlements in England and founded the Anglo-Saxon kingdoms. Before the fifth century they had settled along the sea coast from the Elbe to the Loire, but these settlements soon became a part of the kingdom of the Franks. At home the Old Saxons widened their country till it embraced all the lands between the Rhine and Elbe, the North sea and the Hartz mountains. Saxons and Franks together destroyed the Thuringian kingdom in 531. The Frankish war of conquest was waged against the Saxons from 719 to 804, the Franks at last conquering under Charlemagne, in spite of the stubborn defense of the Saxons under their leader Wittekind. The Saxons gave up their pagan worship with their freedom, and accepted Christianity.

Sax'ony, a German kingdom, in area the fifth, and in population the third state of the empire; it covers 5,787 square miles, and has a population of 4,199,758. For the present state of Saxony, see GERMAN EMPIRE.

After the division of the territories ruled over by Charlemagne, the Frankish conqueror of the Saxons, that nation became a part of Austrasia. Its first duke was Otto (880–912). His son Henry made himself master of all the territories included in the present kingdom of Saxony, the Prussian province of Saxony, the smaller Saxon duchies, and more besides. The German emperors, after 1024, were Franks and their greatest enemies were the Saxon dukes, especially Henry the Proud of Bavaria, and Henry the Lion, Rudolph II. (1356–70), first took the title of Elector of Saxony. During the Thirty Years' war, the elector John George I. (1611–56) sided with the Protestants, but in 1635 made his peace with the emperor, on which account his lands were ravaged by the Swedes for the next ten years. Frederick Augustus I. (1694–1733) became a Catholic and was chosen king of Poland. After that the headship of the Protestant states of Germany passed to the elector of Brandenburg, and to this day the court of Saxony is Catholic. Saxony waged war against Charles XII. of Sweden and suffered greatly at his hands; was defeated by Prussia in the second Silesian war, and was conquered by Frederick the Great in the Seven Years' war. Frederick Augustus III. (1763–1827) proclaimed himself king of Saxony, and sent his army to support Napoleon. For this reason the congress of Vienna took from him over half his territory to form the new province of Prussian Saxony. In the Austro-Prussian war of 1866, Saxony sided with Austria, was defeated, and joined the North German confederation. In the Franco-Prussian war the Saxon army fought on the side of Prussia, and since 1871 Saxony has been a part of the German empire.

Saxophone (*saks'o-fōn*), the name of a group of musical instruments invented by Adolphe Sax. (See SAXHORN.) The saxophone is a conical brass tube, sounded by a mouthpiece furnished with a single reed like that of a clarinet, and is made in as many different keys as the saxhorn. It has twenty holes covered by keys and studs, for the first three fingers of each hand. All the different saxophones are fingered alike. They are greatly valued in military music, but are not much used in orchestras.

Sax'ton, Joseph, American inventor, was born at Huntingdon, Pa., March 22, 1799, and died at Washington, D. C., Oct. 26, 1873. At an early age he showed much mechanical ingenuity, which manifested itself later in inventions and improvements in connection with the mechanism of clocks; he constructed the clock for the tower of Independence Hall, Philadelphia, and superintended the construction of the machinery and delicate weighing balances for the Philadelphia mint. He spent some years, early in the thirties, in England, and while there constructed a magneto-electrical machine, by which the first magnetic spark was obtained; he made much of the apparatus used by Wheatstone, the physicist and inventor, and devised a locomotive differential pulley. Among his other inventions were a deep-sea thermometer, an immersed hydrometer, and a self-registering tide-gauge. He was one of the founders of the American Academy of Sciences.

Sayce (*sās*), **Archibald Henry,** one of the greatest of living philologists, was born at Shirehampton, England, Sept. 25, 1846. After attending Grosvenor college at Bath, he entered Queen's college, Oxford, in 1865, and became a fellow and tutor of his college. In 1876, he was appointed assistant to Max Müller in the chair of comparative philology at Oxford, which position he resigned in 1890. Professor Sayce was made a member of the Old Testament revision committee in 1874. The most important among his many books, which rank among the first in scholarship and value, are *The Ancient Empires of the East*, *Fresh Light from the Monuments*, *The Hittites*, and *The Races of the Old Testament*.

Scale (in plants). The word has two applications. Epidermal outgrowths, which technically are "hairs," sometimes assume the form of scales which more or less overlap one another. The more general application of the term, however, is in connection with the protecting leaves of scaly buds or the reduced leaves of underground stems. Such leaves are not green, are not much developed, and are often firmer than ordinary leaf tissue. The scales of underground stems are probably merely reduced leaves, with no function; the scales of aerial buds, however, are distinctly protective organs, and are not only firm and resistant, but are frequently covered with hairs or gummy products.

Scale Insects, the name of a large number of flat insects, with scale-like bodies. They are often injurious to fruit and shade trees, as well as to smaller plants. The cottony-cushion scale did a great amount of injury to trees in California, and was combatted by introducing a ladybird which preyed upon it. A scale insect which forms a large cottony egg-case, making it a conspicuous object on the trees, has recently done much injury to maple trees in various parts of the United States. The scale insects infesting the orange and lemon trees have done much damage. The bark-lice and the insects which furnish cochineal also belong to this group.

Scal'lop (*skŏl'lŭp*), the name of a number of widely distributed and well-known mollusks inhabiting salt water. Their shells are marked with radially arranged ridges and are often bright colored. The animal living within is somewhat like a clam, with a slender foot, orange or reddish in color. The mantle, which covers the animal and secretes the shell, is provided with many small sparkling eyes arranged around the margin. These show when the shell is open. When young, scallops swim by opening and shutting the valves of their shells, but as they grow older, they become sedentary. The larger scallop shells are often used for baking and serving shredded fish and oysters in cracker crumbs.

Scalp, the outer covering of the skull. The skin of the scalp does not differ from that of the rest of the body, except that hair grows on it more abundantly. Besides the skin, the scalp is formed of an expanded muscle or tendon and cellular tissue and blood-vessels. Scalping was a favorite practice of the American Indians in war, in which the scalp with the hair attached was partly cut and partly torn away, the victim being either alive or dead during the operation. The scalps were worn as trophies by the warriors.

Scan'derbeg (Iskander Beg or Bey), an Albanian chieftain, was born at Albania, about 1403, of Servian parents. He was called George Castriota, by the Christians. He was carried away by the Turks when seven years old, and brought up a Mohammedan. His bravery and skill made him a favorite with the sultan, who put him in command of a division of his army. In 1443, he deserted the Turkish army with 300 Albanians, and renounced Mohammedanism. In less than a month, the whole of Albania was in arms, Scanderbeg was chosen chief, and the Turkish garrisons driven out of the country. He was never defeated by the Turks but once, in all the struggles that followed, destroying an army of 40,000 Turks, with 15,000 Albanians, and defying the sultan himself with his army of 150,000, until he retired disgusted from the conflict. Pope Pius II. tried in vain to league the Christian princes together to help Scanderbeg in his conflicts with the Turks, but succeeded in inducing him to break a truce of peace, made in 1461, and renew the war alone. He again defeated every force that attacked him, even driving back Mohammed II., the conqueror of Constantinople, who conducted two campaigns against him in person. Scanderbeg died at Alessio, of malarial fever, Jan. 17, 1468.

Scandina'via, a long peninsula in the north of Europe, lying on the Arctic ocean, the Norwegian sea, the Baltic sea, and the gulf

of Bothnia. Geographically it includes Norway and Sweden, and historically Denmark and Iceland, while its literature includes the literary work of the Swedish race in Finland. See NORWAY, SWEDEN, and LITERATURE.

Scarabæus (*skăr'a-bē'ŭs*), a name commonly restricted to the tumble-bugs or dung-beetles, but properly including other members of the large family *Scarabæidæ*. The tumble-bugs form round balls of dung and roll them to considerable distances, and finally bury them in the ground. The female lays an egg in this mass, which serves as food for the larva after the egg hatches. The most famous scarab is the sacred beetle of the ancient Egyptians. These were highly venerated and placed in tombs with their dead, where four different species have been preserved. A strange symbolism grew up in reference to these insects. The ball they rolled was taken to represent the earth, the rayed head of the insect the sun, the thirty joints in their six tarsi the days of the month, etc. They became accepted as emblems of power and resurrection. They are found sculptured on monuments and tombs. Gems were also cut in the form of the scarab and worn in rings and amulets. The Greeks and Etruscans borrowed this custom of engraving the scarabæus on gems.

Scar'let Tan'ager. See TANAGER.

Schaff (*shăf*), **Philip,** an American theologian, was born at Coire, Switzerland, Jan. 1, 1819. He studied at Tübingen, Halle, and Berlin, and was a privat-docent or tutor at Berlin, when he was recommended in 1843 by Neander and Tholuck, for a professorship in the Theological Seminary of the German Reformed church at Mercersburg, Pa. In 1869, he was made a professor in Union Theological seminary, New York city. He was one of the founders of the American branch of the Evangelical Alliance, and president of the American committee for revising the Old Testament. He has written *History of the Christian Church* in five volumes, *Creeds of Christendom*, *The Person of Christ*, and many other theological works, besides editing a large number of religious and philosophical volumes. He died at New York, Oct. 20, 1893.

Schauffler (*shawf'-fler*), **William Gottlieb,** a missionary, was born at Stuttgart, Wurtemberg, in 1798. He came to the United States to study in 1827, and took a theological course at Andover seminary, where he decided to devote his life to mission work, intending to labor among the Jews. His labors in Constantinople among the Jews and Armenians lasted forty-four years, during which he translated the Bible into Turkish and also into Hebrew-Spanish. He was remarkable for his knowledge of foreign tongues, speaking ten languages and reading easily at least twenty. He died in New York in 1883.

Scheffer (*shĕf'er*), **Ary,** a painter, was born at Dordrecht, Holland, Feb. 12, 1795, and studied in Paris. His first works were inspired by Goethe's, Byron's, and Dante's works, and included *Margaret at the Well*, *Faust in His Study*, *Suliote Women*, and the well-known *Dante and Beatrice in Heaven*. After 1835, he turned to religious subjects, painting his *Christus Consolator* (Christ the Consoler), *Temptation of Christ*, *St. Augustine and Monica*, and others. Some of his best portraits are those of Lafayette, Madame Guizot, Talleyrand, Liszt, and Lamartine. He died at Argenteuil, near Paris, June 5, 1858. See *Memoir*, by Mrs. Grote.

Scheldt (*skelt*), a river of Europe, rising in France, flowing north through Belgium, past Ghent and Antwerp, enters the North sea at Flushing by two arms, going north and south of two small islands. It is 267 miles long, and navigable for 211 miles. The Dutch claimed the navigation of the lower Scheldt in the 17th and 18th centuries and demanded toll of all foreign vessels sailing on it. In 1831, the rights passed to Belgium when it was separated from Holland. In 1863, Belgium gave up the claim for the sum of $3,750,000 paid to it by foreign nations.

Schelling (*shĕl'ing*), **Friedrich Wilhelm Joseph,** a German philosopher, was born at Wurtemberg, Jan. 27, 1775. He studied theology and philosophy at Tübingen and science and mathematics at Leipsic. He succeeded Fichte as teacher of philosophy in the University of Jena in 1798. From 1803 to 1808 he was professor at Wurzburg; until 1820, secretary of the Royal Academy of Arts at Munich; professor at Erlangen until 1827, when he returned to Munich to a position in the new university there, and finally was called to Berlin by King William IV. in 1841. He died in Switzerland in 1854. He began as a follower in philosophy of Fichte and Hegel, with whom he ranks among German philosophers, but later was influenced by Spinoza and Brehme. The large number of his philosophical works include the *Inquiry into the Nature of Human Freedom*, *On the Possibility of Any Form of Philosophy*, *Philosophy of Nature*, and *The World Soul*. See *History of Philosophy*, by Morell.

Schenck (*skĕngk*), **Robert Cumming,** American soldier and diplomat, was born at Franklin, O., Oct. 4, 1809, and died at Washington, D. C., March 23, 1890. He was educated at Miami university, studied law, and for a time practiced at Dayton, O. He served some eight years in congress (1843–51) when he was appointed United States minister to Brazil. He was afterward sent on diplomatic missions to Buenos Ayres, Montevideo, and Paraguay. In the Civil war, he was appointed (May, 1861) brigadier-general of

volunteers and took part in the two battles of Bull Run, as well as in that at Cross Keys. He had his right arm shattered by a rifle ball. In September, 1862, he was promoted major-general and given command at Baltimore, which he protected during Lee's invasion of Maryland. From 1863 to 1871 he represented Ohio in congress on the Republican side and from 1871 to 1876 was United States minister to Great Britain. He subsequently practiced law at Washington, D. C.

Schenectady (*ske-nĕk'ta-dĭ*), a city of New York, is on the Mohawk river, 17 miles northwest of Albany. It is on the Erie canal and is a manufacturing town, with the works of the Westinghouse company, the General Electric company, knitting mills, stove foundries, locomotive works, and pumps, steel springs, wire railings, and wheelbarrow, and broom factories. It is the seat of Union college, founded in 1795, and forming, with the law and medical schools and Dudley observatory at Albany, Union university. Its buildings are on a hill overlooking the city. Schenectady was settled by the Dutch in 1661. In 1690, it was burned and the citizens massacred by the French and Indians. Population 31,682.

Schiller (*shĭl'er*), **Johann Christoph Friedrich,** a German poet, was born at Marbach, in Wurtemberg, Nov. 10, 1759. He studied first law and then medicine, in the school at Ludwidgsburg, established by Duke Carl Eugen of Wurtemberg, where he received three medals, though he had spent more time in reading and writing poetry than he had in studying medicine. His first play, *The Robbers*, in 1782, was produced at Mannheim. The people were so eager for it that they filled the theatre at noon, five hours before the play began, and it made a tremendous sensation, being full of the revolutionary spirit that preceded the French Revolution. Because Schiller had twice left Stuttgart without the permission of the duke, he was arrested, and forbidden to write plays or to leave Wurtemberg, which led to his flight to Mannheim under the name of Dr. Ritter. He was for a year dramatist to the theatre in Mannheim, and also published a theatrical journal, in which appeared many of his best poems, and a part of *Don Carlos*, finished later at Dresden. He kept up his philosophical and historical studies, and in 1788 was given a professorship at Jena, and a pension by the duke of Saxe-Weimar, which enabled him to marry. His historical works of this period are the *Revolt of the Netherlands*, and the *Thirty Years' War*. In 1794, began Schiller's friendship with Goethe, and under the stimulus of his intercourse with him, he began again writing poetry, especially his ballads, that have made him the popular poet of Germany. His drama of *Wallenstein*, written when every hour's writing cost him hours of suffering, was finished in 1799. Carlyle calls it "the greatest dramatic work of the 18th century." Settling at Weimar in 1799, to be near Goethe, he wrote *Mary Stuart*, *The Maid of Orleans*, *The Bride of Messina*, and *William Tell*, his last finished work. He died while still young, and in his intellectual prime, May 9, 1805. See *Life*, by Carlyle, and *Life*, by Nevinson, in the "Great Writers" series, and *Wallenstein's Death* and *Piccolomini*, by Coleridge.

Schlegel (*shlā'gel*), **August Wilhelm,** a German critic and poet, was born at Hanover, Sept. 8, 1767. He studied theology at Göttingen, but soon turned to literature, writing poems and other articles for magazines. He was made professor of literature and fine arts at the University of Jena, and lectured at Berlin on the same subjects and at Vienna in 1808. In 1818, he became professor at Bonn. He translated into German verse most of the works of Shakespeare, and many of those of Cervantes, Dante, Calderon, and Camoens. His translation of Shakespeare, revised by Tieck, is still the classic German version. Heine attended Schlegel's lectures at Bonn, and thus describes the professor lecturing to his class: "He wore kid gloves and was dressed after the latest Paris fashion, and when he spoke of the English lord of the treasury, always begun with the words 'My friend.' Beside him stood his servant, dressed in the grand livery of the house of Schlegel; his business was to snuff the wax candles in the silver candlesticks that stood, along with a glass of 'sugared water,' on the desk before him, the 'genius of the age.'" His critical writings and his lectures were published in three collections. He died at Bonn, May 12, 1845.

Schle'gel, Friedrich von, German critic and writer, was born at Hanover, March 10, 1772. He studied at Göttingen and Leipsic, and then began a literary life. He edited with his brother, August Wilhelm, the journal, *The Athenæum*, and also in connection with him, wrote a series of critical essays, which gave an impulse to good work in German literature. From 1808 until 1829, he had a government position in Austria, and wrote the proclamations of that empire against Napoleon. His best known works are *Philosophy of History*, and *History of Literature*, two series of lectures delivered at Vienna. His book on *The Language and Wisdom of India* is the pioneer in the study of Sanskrit in Europe. His works are collected in fifteen volumes. He died at Dresden, Jan. 11, 1829.

Schleiermacher (*shlī'er-mā'ker*), **Friedrich Ernst Daniel,** a great German theologian, was born at Breslau, Prussia, Nov. 21, 1768. He studied at the Moravian schools and afterward at Halle. While preaching at Berlin, he published the first of the works which made him known to the learned world.

In 1804, he became a professor at Halle. After that university was closed, in 1806 by Napoleon, he returned to Berlin and was active in founding the University of Berlin in which he became a professor in 1810. His lectures on philosophy and theology brought crowds of students, and his sermons increased his influence. His writings also continued, and besides many theological works published before his death, which placed him next to Luther as a theologian, his friends published several volumes from his manuscripts. He died Feb. 12, 1834. See *History of German Theology in the Nineteenth Century*, by Lichtenberger; and *Autobiography*.

Schley (*sli*), **Winfield Scott,** rear-admiral United States navy, was born near Frederick, Md., Oct. 9, 1839. He graduated from the Naval academy in 1860, and served during the Civil war. He was in command of the Greely relief expedition which sailed in 1884. As commodore he was placed in command of the flying squadron in the War with Spain, and for conspicuous service in the battle of Santiago, (July 3, 1898) he was made rear-admiral. In the autumn of 1901, Admiral Schley figured in a Court of Inquiry arising out of professional controversies between himself and Admiral Sampson respecting the share of honors each was entitled to in the destruction of the Spanish fleet off Santiago de Cuba.

WINFIELD S. SCHLEY.

Schliemann (*shlē'män*), **Heinrich,** a German scholar, born at Mechlenburg-Schwerin, Jan. 6, 1822. While in business in St. Petersburg he mastered Greek and the modern languages of Europe. Becoming convinced that the heaps of Hissarlik in Asia Minor covered the site of ancient Troy, when he possessed an independent fortune, he began in 1870 to excavate it at his own cost, carrying on the work for twelve years. He had to pay the Turkish government $10,000 for carrying off all the treasures he unearthed, contrary to agreement. His collection is now in the Ethnological museum at Berlin. In 1876, Schliemann began excavations on the site of the ancient city of Mycenæ, in Greece, and the treasures found there are now preserved at Athens. He wrote an account of his work in *Mycenæ and Tiryns*, *Ilios*, *Troja* (Troy), and other volumes. He died at Naples, Dec. 27, 1890, and was buried at Athens.

Schmalkald (*shmäl'käld*), **League of,** an alliance formed at Schmalkalden, a town in Hesse-Nassau, Germany, April 4, 1531, between nine Protestant princes and eleven imperial cities. Other princes and cities afterward joined the league, until it included nearly all the Protestant states from Denmark to Switzerland. The object of the league was the protection of the Protestants against Charles V. and the Catholic states. The *Articles of Smalkald*, adopted by the league, were drawn up by Luther at Wittenberg. At the battle of Mühlberg, April 24, 1547, the Protestants, weakened by the withdrawal of Duke Maurice of Saxony, were defeated and the league was broken up.

Schnitz'ler, Eduard. See EMIN PASHA.

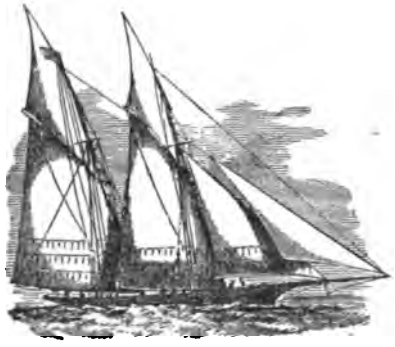
Scho'field, John McAllister, an American general, was born in New York state in 1831. A graduate of West Point, he was made a professor there in 1855. When the Civil war broke out, he entered the army as major of the 1st Missouri volunteers, and was on General Lyon's staff when the latter was killed at the battle of Wilson's creek. He was in command in Missouri until February, 1864, and then of the army of the Ohio. He shared Sherman's southern campaign, and was in most of the battles which ended with the taking of Atlanta, when he returned to Tennessee, defeating Hood at Franklin, and was with General Thomas at the battle of Nashville. Entering North Carolina, he took Wilmington, and again joined Sherman, for whom he drew up the supplementary articles of surrender of Johnston's army, which were afterward approved by the government. In 1868, he became secretary of war, and major-general in the regular army. Upon the death of General Sheridan, 1888, he succeeded to the command of the United States army. Previous to his retirement, he was, by act of congress, made lieutenant-general, Feb. 7, 1895. He is the author of a biographical narrative, entitled *Forty-six Years in the Army*.

GENERAL SCHOFIELD.

School'craft, Henry Rowe, an American writer, was born in the state of New York, March 28, 1793. After studying at Union college, he visited the mining region west of the Mississippi, and also acted as geologist in an exploring expedition to Lake Superior and the Upper Mississippi under General Cass. In 1822, he was Indian agent for the tribes about the lakes, and married in 1823 the granddaughter of an Ojibway chief who had been educated in Europe. While Indian agent he made treaties that gave the United States 16,000,000 acres. As a member of the legislature of Michigan territory, from 1828–32, he founded its historical society. An expedition which he commanded in 1832 discovered the sources of the Mississippi. After collecting

the statistics of the Six Nations, he was employed by congress in 1847 to gather all the information possible about the Indian tribes, the result being published in five volumes, costing the government $30.000 a volume. He added a sixth volume to the collection in 1857. His works include narratives of his journeys—*Notes on the Iroquois, the Red Race of America, Thirty Years with the Indian Tribes*, and *The Indian in His Wigwam*. He died at Washington, D. C., Dec. 10, 1864.

Schoon'er. See SHIP.



SCHOONER.

Schopenhauer (*shō'pen-how'er*), **Arthur,** a German philosopher, was born at Dantzic, Prussia, Feb. 22, 1788. His mother was a writer and a friend of Goethe's. His father, a banker, trained his son for a business career by study and foreign travel, but after his death, the son having a small income, decided on a literary life and studied at Göttingen, Berlin, and Jena, hearing Fichte and Schleiermacher lecture. From Weimar, where his mother resided, he went in 1814 to Dresden, and from there to Italy, afterward living at Berlin and Frankfort-on-the-Main. His chief book, *The World as Will and Idea*, gives a large part of his peculiar philosophy, which he thought was the only worthy successor to that of Socrates, though for sixty years it failed of recognition, while what he considered the ravings of Fichte, Schelling, and Hegel were praised as the highest wisdom. *On the Will in Nature, Seeing and Colors*, are among his philosophical writings, which include also many occasional papers, and his prize essay in the Norwegian academy on *Freedom of the Will*, which brought him the first public praise. His life was a solitary one, as his mother could not live with him, and, despising women, he never married, and had no intimate friends. He died Sept. 21, 1860. See *Lives*, by Zimmerman and by Wallace.

Schubert (*shō'bert*), **Franz Peter,** a celebrated musical composer, was born at Vienna, Jan. 31, 1797. Before he was eleven years old he was singing in a church choir, and was soon sent to the chorister's school of the court chapel, where he became leader of the school band. The boys of the school had very little instruction and went hungry and cold, but Schubert's desire for composition kept him at work for the five years spent in the institution. The *Erl King*, his immortal song, was composed when only eighteen, and the *Mass in F*, while teaching in his father's school at Lichtenthal. His musical friends seem to have helped him for a few years, both in giving him lodgings and in making his work known to the public. In 1819, one of his songs, *The Shepherd's Lament*, was given at a concert at Vienna, and his comic operetta, *The Twins*, was produced at the theatre there. As his songs became known, the enthusiasm with which they were received made publishers ready to accept his manuscripts, and as many as twenty songs were published in eight months. He made a tour with Vogl in 1825, delighting everyone with the performance of Schubert's seven songs from the *Lady of the Lake*, though the songs were afterward sold for only $100. He gave his first and only concert in Vienna in 1828, which was so successful as to put the needy composer, who had been selling some of his best songs at a penny, beyond want for a time. His musical productions are very numerous, as he wrote rapidly and steadily, sometimes composing six or seven songs in a morning. Everything he saw, or heard, or read, suggested a subject to him; one of his piano duets was inspired by the song which he heard sung by a Hungarian girl as he passed the kitchen door, and his *Hark! Hark! the Lark*, flashed over him in a beer-garden. His songs are among his finest work; Beethoven, who saw them only on his death-bed, saying: "Surely Schubert has the divine fire." His compositions include more than 500 songs, ten symphonies, six masses, several operas, cantatas, and a host of sonatas. He died in his thirty-second year, Nov. 19, 1828. See *Life*, by Frost.

Schumann (*shō'măn*), **Robert,** a German musician, was born at Zwickau, in Saxony, June 8, 1810. He began his musical studies in Leipsic, and in his haste, besides constant practicing, tried some mechanical means for increasing the power of his hands, which resulted in a permanent injury to the right hand, and compelled him to turn his attention to composition. For ten years he edited a musical journal, composing at the same time some of his best pianoforte works. Mendelssohns' coming to Leipsic in 1835 resulted in making it the musical center of Germany, and Schumann was at once one of his worshipers. His last years, in which he produced some of his best works, such as the *Quintette* for pianoforte and strings, *Paradise and the Peri, Genoveva*, etc., were clouded by brain trouble, ending in insanity. The two last years of his

life were spent in a private asylum near Bonn, where he died July 29, 1856. His wife, a fine pianist, labored incessantly to have his works acknowledged, performing them in the chief cities of Europe with splendid success. She lived to see him ranked among the great composers. See *Life*, by Wasielewski.

Schur'man, Jacob Gould, American educator, president of Cornell university, was born at Freetown, Prince Edward island, Canada, May 22, 1854, and was educated at Acadia college, Nova Scotia, graduated at London university, and pursued his studies at Paris and at Edinburgh, Scotland. He also took special courses at Heidelberg, Berlin, and Göttingen, and on his return to this continent he became professor of philosophy and English literature in two of the colleges of the Canadian maritime provinces. In 1886, he was appointed Sage professor of philosophy and dean of the Sage school in connection with Cornell university. In 1892, he became president of Cornell, and at the same time edited *The Philosophical Review* and *The School Review*. In January, 1899, he was nominated by President McKinley chairman of the U. S. Philippine commission, and given temporary leave of absence from Cornell. He is the author of *Kantian Ethics*, *Ethics of Evolution*, *The Ethical Import of Darwinism*, *Belief in God*, *Agnosticism and Religion*, and *The Genesis of the Critical Philosophy*.

Schuyler (*ski'ler*), **Philip John,** an American general, was born at Albany, N. Y., Nov. 22, 1733. He served in the French and Indian war, was a member of the colonial assembly from 1768, and of the continental congress of 1775, and one of the first four major-generals of the Revolutionary army. He was preparing to invade Canada as head of the northern department of New York, when his health obliged him to give up the command to General Montgomery, and in 1779 he resigned his office, though remaining one of Washington's most trusted advisers. He made treaties with the Six Nations, was state senator for thirteen years, and United States senator for two terms, and surveyor-general of the state from 1782. He was one of the leaders of the Federal party in New York, and helped to prepare the state code of laws. He died at Albany, Nov. 18, 1804. See *Life*, by Lossing; *Philip Schuyler and His Family*, by Schuyler.

Schuylkill (*sköl'kil*), a river of Pennsylvania, rising in the coal region near Pottsville, and flowing 130 miles southeast into the Delaware river at Philadelphia, to which it furnishes its water supply. Coal barges ascend the river by the help of dams and locks.

Schwatka (*shwot'kä*), **Frederick,** an American Arctic explorer, was born at Galena, Ill., Sept. 29, 1849, and died (by suicide) at Portland, Oregon, Nov. 2, 1892. In 1871, he graduated from West Point, receiving a commission as lieutenant of cavalry in the United States army, which he resigned in 1884. Early in his career he became interested in Arctic exploration and in the fate of Sir John Franklin and his party. In 1878, he obtained leave of absence and joined an expedition, on the *Eöthen*, for King William's Land. This search party returned two years after, having discovered and interred many of the skeletons of Franklin's crew, and solved, in some degree, the mystery of that explorer's fate, bringing home interesting relics at the same time of Franklin's outfit. On this expedition, the *Eöthen's* party made a sledge-journey of over 3,250 statute miles—the longest on record. Later on, Lieutenant Schwatka explored the course of the Yukon river, in Alaska, and in 1886 he commanded the New York *Times* Alaskan expedition and ascended Mt. St. Elias to a height of 7,200 feet. He also sought in Northern Mexico for remains of Aztec civilization. He published accounts of his explorations, among which are *'Along Alaska's Great River*, *A Nimrod of the North*, *The Children of the Cold*, *The Franklin Search*, etc. See Gilder's *Schwatka's Search*.

Sci'ence. To know a truth in its relations to other truths is to know it scientifically. For example, when one understands that the change of night and day depends upon the apparent daily motion of the sun, he has mastered a scientific truth which thinking-minds have known from time immemorial. By summing up every-day experiences like this, man has been led to the belief that natural events follow each other in an orderly and connected way. To investigate this orderly connection is the aim of all science. The method in use is called the scientific method, and is that of observation and experiment. In this way great laws are deduced, or thought to be deduced, for history shows that the scientific beliefs of one age are time and again overthrown by the scientific discoveries of a later age. Great principles which lie at the foundation of all science have, however, been certainly determined, and especially have great advances in scientific knowledge been made in the last century.

The different divisions of science have been grouped in different ways by Comte, Herbert Spencer, and others. The most general division is into physical sciences, which have to do with matter and force; biological sciences, which consider the laws of life; and psychical sciences, which deal with the phenomena of the mind. Religion, agriculture, politics, and art are as truly sciences as are geology and astronomy. But the word science is often used popularly to mean the physical sciences alone. See Jevons' *Principles of Science*.

Scil'ly Islands, a group of islands on the southwestern coast of England, 27 miles

southwest of Land's End. There are six large islands, and about 30 smaller ones, and many rocks and ledges. Tin is found in small quantities. Athelstan conquered the islands in 938, and put some monks on Tresco, where are still seen the ruins of their abbey. Queen Elizabeth leased the islands to Sir Francis Godolphin, in whose family they remained for 250 years. The star castle on St. Mary's island was built by him, and the village of Dolphin on Tresco owes its name to the family. In 1834, they were leased to Augustus John Smith, and in 1872 to his nephew. There are lighthouses on several of the islands, but wrecks were formerly common, one of the most noted being that of Sir Cloudesley Shovel's fleet in 1707, when 2,000 men were drowned. The principal industry of the islands is the cultivation of the narcissus and other lilies, 100 tons of flowers being shipped in a single spring. The mackerel fishing in May and June is extensive, a daily steamer carrying away a cargo of 100,000 fish. See *A Week in the Isles of Scilly*, by White.

Sciop'tican. See MAGIC LANTERN.

Scioto (*sī-ō'tō*), a river in southern Ohio. It rises in the northwestern part of the state, flowing east and south to the Ohio river, which it enters at Portsmouth. It is 300 miles long, and is a feeder of the Ohio and Erie canal.

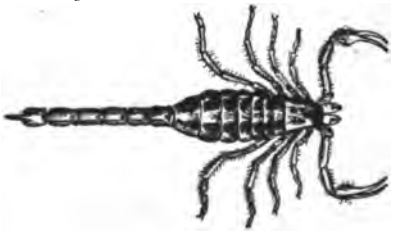
Scipio (*sip'i-o*), **Publius Cornelius,** called "Africanus Major," a Roman soldier, was born in 237 B. C. He saved his father's life at the battle of Ticinus (218) and was also in service at Cannæ. He was so popular that he was elected to the Roman office of "ædile" before he was of legal age, and was chosen a "general extraordinary" for Spain by acclamation, a choice which his victories in that country, which gave the whole state to the Romans, proved wise. He succeeded in having the war carried into Africa, thus compelling Hannibal to leave Italy, where he defeated him at Zama, Oct. 19, 202, thus ending the long struggle between Rome and Carthage. He was received in triumph at Rome, the title of Africanus given to him and the offer of the positions of consul and dictator for life, which he refused. With his brother Lucius he won the great victory of Magnesia over Antiochus, and when his brother was prosecuted for receiving bribes from Antiochus and condemned, he rescued him from prison. Later charges were brought against Scipio himself, which he did not deign to notice, but on the first day of his trial, told the story of his victories, and on the second day reminded the people that it was the anniversary of the battle of Zama, and a time to give thanks to the immortal gods. In the popular excitement that followed the prosecution was ended. His daughter was Cornelia, the mother of the Gracchi. He died at his country seat of Campania about 183 B.C.

Scip'io, Publius Cornelius, called "Africanus Minor," was born 185 B. C. He was the son of Lucius Æmilius Paulus, the conqueror of Macedon, but was adopted by Publius Scipio, a son of the great Scipio. He fought with his father at Macedon, went to Spain as military tribune, and in 149 B. C. laid siege to Carthage. He was elected consul in 147. In 146, he took Carthage by storm, and obeyed with sorrow the harsh order of the senate to level it with the ground, and plow over its site. As he gazed on the ruin, the thought of the possible destruction of Rome flashing over him, he quoted the words of the *Iliad:* "The day shall come when sacred Troy shall perish, and Priam and his people shall be slain." In 142 he was censor, in 139 an ambassador to Egypt and Asia, and in 134 he was re-elected consul. The contests in Spain tried the best skill of the Roman generals, until in 134 Scipio was sent to Spain, and after an eight months' siege of Numantia, destroyed the city. In the political troubles at Rome, Scipio made the reform party angry by interfering for the Latins whose lands were being seized, in the haste to carry out a new measure, and he was found dead in bed in 129 B. C., doubtless murdered by some member of the party.

Sclerenchyma (*skle-rn'ki-mȧ*) (in plants), a tissue whose cells have walls uniformly thickened. These cells are usually more or less elongated, and a common form is fibrous. Sclerenchyma is a mechanical supporting tissue and is generally developed wherever strength is needed. It is very commonly associated with the vessels, forming the so-called "fibers" of the fibrovascular bundles. It is also frequently developed in the cortex, either in strands or in bands.

Scone (*skōn*), a town in Scotland, two miles north of Perth, on the river Tay, celebrated as the place where the Scottish kings were crowned from 1153 to 1458. The "Stone of Destiny," on which the kings were seated, was carried off in 1296 by Edward I. See *History of Scone*, by Urquhart.

Scor'pion, the common name for any member of the natural order of jointed animals called *Scorpionida*. These animals are united



SCORPION.

into a class with the spiders. They have long slender bodies and resemble in a general way the small lobster. The head and thorax are joined into a single division, but

the long abdomen is plainly jointed. It is divided into two portions, a broad part of seven joints, and a more slender tail-like part with five joints. The latter is terminated by a sting, and is carried arched over the back of the animal. The thorax bears four pairs of walking legs. The most prominent appendages are the pedipalps, which extend forward and end in brood clams. Scorpions are restricted to warm countries. They range in length from two to eight inches. Small kinds are common in the southern portion of the United States. During the day they lie concealed under stones and in holes, but they are active at night. Their food is insects, spiders, and other small animals. They are able to inflict a severe wound with their sting, but it is rarely if ever fatal.

Scotland is one of the kingdoms forming the British empire, and is the northern part of Great Britain, surrounded by the ocean on all sides except on the south, where it touches England. It is 274 miles long and from 24 to 146 miles wide, including 30,902 square miles, which makes it about as large as the state of Indiana. The coast line of 3,000 miles is deeply indented, so that very few places are more than 40 miles from the sea, and there are 787 islands, mostly in the Hebrides, Orkney, and Shetland groups. The Solway Firth, the Liddel, and Tweed rivers, and the Cheviot hills separate Scotland from England. The rivers, flowing mostly to the sea, are not large, the Clyde of 106 miles being the longest. The Tweed, Forth, Tay, and Dee are well known, as are also the beautiful fresh-water lakes Loch Lomond, Loch Katrine, Loch Leven, etc. The division of the country into Highlands and Lowlands is rather a division of race than of country, for though the Highlands include the more mountainous parts of the country, they have rich, level tracts, while there is hardly any part of the Lowlands without mountains. The Highlands is that part of the north and northwest of Scotland where the Celtic language and customs still linger, and includes the Hebrides, but not the Orkneys and Shetlands, where the people are of Norwegian origin. There are nearly 200 mountain peaks in Scotland over 3,000 feet in height, the highest being Ben Nevis, 4,406 feet. The northern Highlands, the Grampians, and the Cheviot hills, with their beautiful glens and mountain lakes, make up the famous scenery of Scotland. The nearness of the ocean tempers the climate, so that the thermometer rarely falls to zero in winter, or rises above 80° in summer. The animals and plants resemble those of England. About half of the birds are waterbirds, and fish, especially shellfish, abound. The country is not well adapted to agriculture, because of its cool summers, late springs, and heavy rains, but it is carried on with great care and the use of the most improved methods; and in the wildest mountain regions sheep graze. The fisheries form an important industry, especially the salmon, herring, cod, and ling. The salmon is so abundant that before it was sent to England in large quantities, servants used to make a condition that they should not be fed upon it more than three times a week. The principal minerals are coal, iron, known in the United States as Scotch pig, lead, and granite, sandstone, and other fine building stones. The linen, cotton, and wool manufactures are large, and there are besides silk, hemp, hosiery, hats, leather, and soap factories, and large breweries and shipyards.

Scotland, since its union with England, sends 16 peers to the house of lords and elects 72 members to the house of commons. It has its own courts and its state religion, which is Presbyterian. Its common-school system, going back to 1695, made the Scottish people of the 18th century the best educated in Europe. There are four universities, Glasgow, Aberdeen, Edinburgh, and St. Andrews.

The early inhabitants of Scotland were the Picts, a collection of Celtic tribes, and the country was called by the Romans, Caledonia. The Scots were a tribe from Ireland, then called Scotia, who settled on the western coast of Caledonia, and the kingdom of the Picts and Scots seems to have been called Scotland first in the 10th century. There are 38 Pictish kings mentioned in early Scotch history. The Saxons settled in the lowlands in 449, and one of their leaders, Edwin, founded Edinburgh (Edwin's-burg). The introduction of Christianity into Scotland by Irish missionaries dates back to the 6th century. In the 9th century, the Scots became the leading power in the country, and the government was in the hands of their prince, Kenneth Macalpin. The first great battle of Scottish princes on English soil was fought in 937, between Constantine, their king, aided by the Danes, and the Saxon king, Athelstan. During the reign of Malcolm, the son of Constantine, Edmund, king of England, restored to that prince a part of the Cambrian kingdom, which Edmund had wrested from the Britons, and this grant was the pretext for the claim of homage from the Scottish rulers, made by the English kings for so many years. Malcolm II., Duncan, and Macbeth, the next three kings of Scotland, are well-known through Shakespeare's tragedy. Malcolm III. defeated the usurper Macbeth in 1057. His wife was Margaret, the sister of Edgar Atheling of England, and her influence and that of his own life in England led to the introduction of English customs; while the tyranny of William the Conqueror drove large numbers of the Saxons into Scotland. The three sons of Malcolm who succeeded him, Edgar, Alexander, and David, continued their father's policy; David was to Scotland what Arthur was to England. He established Norman, English, and French colonies, introduced a

system of written law, and placed the religion of the country on a new basis, providing for the support of the clergy, and the building of churches. His grandsons, Malcolm IV. and William the Lion, and Alexander II., the son of William, brings the list of Scottish kings to Alexander III., one of the ablest and best of their rulers. His sudden death, in 1286, ended the period of Scotland's prosperity that had lasted for 400 years. The struggle for the succession between Baliol and Bruce, and the ambition of Edward I. of England, who had conquered Wales, to add Scotland to his kingdom, brought in the series of conflicts under Wallace and Bruce, ending in the battle of Bannockburn.

Robert I. (Robert Bruce) was succeeded by his infant son David, and his grandson Robert, who, as Robert II., heads the list of the Stuart sovereigns of Scotland, which numbers fourteen; an unfortunate race, including Robert II., Robert III., who died of grief, with his elder son murdered, and his younger son an English captive; James I., for eighteen years a prisoner in England and finally murdered; James II., killed in battle; James III., murdered with his son in rebellion against him; James IV., killed at Flodden; James V., who died broken-hearted at the rout of Solway Moss; Mary, twice a widow, and twenty years a captive, beheaded at Fotheringay castle, and James VI. of Scotland and I. of England. The feuds of the powerful nobles of Scotland, and the struggles with England, kept the country in a state of turmoil. In 1503, James IV. married Margaret of England, which finally resulted in the union of the two kingdoms. Under James V., religious struggles added to the troubles of the country, and James VI. became king of England on the death of Elizabeth, in 1603.

The Scotch parliament met for the last time in 1706. The leading statesmen of both Scotland and England felt that nothing but a complete union of the two countries would bring about permanent peace, and though opposed by a majority of the people, the Scottish parliament passed the act of union Jan. 16, 1707. The union was unpopular in Scotland for many years, but with the evident prosperity of the country under the new arrangement, discontent gradually disappeared; though Scotland and England are still two countries, and a Scot abroad, if asked if he is an Englishman, will seldom answer "yes." The Gaelic language used in the west and north of Scotland is a Celtic dialect, while the Lowland Scotch is a form of the Saxon, being the same as the Northern English of Northumbria. The dialects are many, classed as Border Scotch, Central Scotch, and Northeastern Scotch. The chief cities of Scotland are Edinburgh, the capital, Glasgow, Dundee, Aberdeen, Leith, Paisley, and Greenock. Population 4,313,993. See BRUCE, MARY STUART, etc. See *Scotland under Early Kings*, by Robertson; *Scotland as It Was and as It Is*, by Argyll; *Scotland from the Earliest Century to the Present Time*, by Mackintosh.

Scot'tish Literature. See LITERATURE, ENGLISH.

Scott, David, a Scottish painter, was born at Edinburgh, in October, 1806. He was an apprentice of his father, who was an engraver, but turned his attention to painting, exhibiting his first picture in 1828. He studied at Rome, painting while there his *Vintager*, now in the national gallery. Among his best-known works are the illustrations of the *Ancient Mariner*, and *Pilgrim's Progress*, and the paintings, *Nimrod*, *The Traitor's Gate*, *Queen Elizabeth at the Theatre*, and *Vasco da Gama Encountering the Spirit of the Cape*. He died March 5, 1849. See *Memoir*, by his brother, W. B. Scott.

Scott, Sir Walter, the Scottish novelist, was born at Edinburgh, Aug. 15, 1771. He became lame as the result of a fever when an infant. At Edinburgh university, where he studied, he declined to learn Greek, which he regretted in his later years. He studied law, and as a lawyer's clerk superintending the removal of a family who had not paid their rent, he first entered the Highlands. His first publication in 1796 was a volume of rhymed versions of ballads by Bürger. The first two volumes of *The Border Minstrelsy*, for which he had been preparing himself by gathering legends and hunting up old ballads for nearly ten years, appeared in 1802. *The Lay of the Last Minstrel*, begun as a ballad, published in Edinburgh in 1805, made him very popular; *Marmion* followed in 1808, and in 1810 *The Lady of the Lake*. He was now offered the place of poet laureate, but declined in favor of Southey. His first novel, *Waverley*, was begun in 1805, but laid aside until 1814, when he wrote the last two volumes in three weeks. *Guy Mannering*, "the work of six weeks," and *The Antiquary* followed, all by the "author of *Waverley*," as Scott's authorship was not known. They were very popular, and in wonderfully quick succession followed *Rob Roy*, *Old Mortality*, *The Heart of Midlothian*, *Ivanhoe*, and the rest of the well-known stories. His purchase of Abbotsford and the sums spent on its improvement, and his generous hospitality and liberality, especially to poor writers, had used up his large receipts from his writings,

SIR WALTER SCOTT.

and the failure of both the firms that published his works, in one of which he had been a secret partner, all combined to place Scott heavily in debt. His friends offered help and his creditors a compromise, but he declined both, and bravely at the age of 55 undertook to pay off a debt of $700,000 by his pen. He wrote fourteen hours a day, producing among other works, his *Life of Bonaparte*, several series of his *Tales of a Grandfather*, from Scottish history, and *Woodstock*. At a public dinner in Edinburgh in 1826, he made himself known as the author of the *Waverley Novels*, which the public had already discovered, and he afterward furnished notes and prefaces for a new edition. But his excessive labors brought on symptoms of paralysis, and he sailed to Italy for rest, receiving everywhere the honors due to his literary fame. His failing strength warned him of the end, and he begged to be taken back to his beloved Tweed. He reached Abbotsford, where he died Sept. 21, 1832. In the last moments of consciousness he turned to the window for a last look at the river Tweed, then said, "To-night I shall know all." At his death over $500,000 of his debt had been paid, and soon after the copyrights of his novels brought in sufficient to pay the last dollar. His novels have been translated into almost every civilized language. He was buried at Dryburgh Abbey, and a Gothic temple was built to his memory at Edinburgh. See *Life*, by Lockhart, and *Journal*, by himself.

Scott, Winfield, an American general, was born at Petersburg, Va., June 13, 1786. He studied at William and Mary college, and

WINFIELD SCOTT.

first became a lawyer, but in 1808 entered the army as captain. In the War of 1812, he was sent to the Canadian border, where he fought at Queenston and at Lundy's Lane, being taken prisoner at Queenston, but was soon exchanged and was wounded in both the battles, having two horses shot under him at Lundy's Lane. He was made a major-general for his services, receiving also the thanks of congress. His services were helpful in preserving peace during the nullification troubles in South Carolina, where he commanded the Federal forces at Charleston harbor, and also in the disputes about the border of Maine in 1839. As commander-in-chief of the United States army, which office he held from 1841, he took command of the invasion of Mexico in 1847. He captured Vera Cruz, and defeated Santa Anna at Cerro Gordo, taking Jalapa and Puebla. The battles of Contreras and Churubusco might have been followed by the taking of the capital, but an effort was made to negotiate a treaty. The castle of Chapultepec was taken by storm, and Sept. 14, 1847, Scott's army marched into the city of Mexico, where he commanded until the treaty of peace was signed in February, 1848. He was a candidate for the presidency in 1852, but failed of election. At the beginning of the Civil war, he was in charge of the army, but soon yielded his position to younger and stronger men. He died at West Point, May 29, 1866. See *Life*, by Mansfield, and *Memoirs*, by himself.

Scran'ton, a city of Pennsylvania, on the Lackawanna river, 144 miles northwest of New York. It is a well-built city, with wide streets and many fine buildings, including a cathedral. Its prosperity is largely due to its situation in the anthracite coal region, which gives it an immense coal trade, and also a large business in mining supplies. There are also great iron and steel factories, making locomotives, boilers, machinery, tools, etc. It has a large foreign population, especially of Welsh miners. The city annually expends the sum of $383,759 on its public schools, which have a force of 337 teachers and an attendance of 15,906 pupils. Population 102,026.

Scream'er, a class of South American birds resembling most nearly ducks and geese. The horned screamer, found in Brazil and Guiana, is about as large as a turkey and blackish brown in color, with a long, slender horn on the head. It lives in swamps, eating the leaves and seeds of water plants. The crested screamer has no horn, but instead a bunch of tall feathers. The name is given because of its loud, harsh cry.

Screw, a simple mechanical device for transforming a motion of rotation into one of translation. An external, or ordinary, screw is made by cutting a spiral groove on the surface of a cylinder; an internal screw, generally called a "nut," is made by cutting a similar groove on the inside surface of a cylinder. The elevation of metal adjoining this groove is called the "thread" of the screw. When the nut is slipped over the screw and held so that it cannot rotate, and the screw is placed in bearings so that it cannot be translated, it is evident that for every turn of the screw the

nut must advance along the axis of the screw by a definite amount. The amount of this advance is called the "pitch" of the screw. The arrangement just mentioned forms the most accurate mechanical method for measuring small distances and for producing small displacements.

Ordinary screws are generally made by forcing a steel nut, called a "die," over a cylinder of metal. In like manner, nuts are made by forcing a conical screw, provided with sharp cutting edges, through a hollow cylinder of metal. This conical screw is called a "tap." Higher grades of screws are made by placing a cylinder between the centers of a lathe and then moving the cutting tool along the lathe bed on a carriage which is itself operated by another screw.

With elaborate precautions, Professor Rowland succeeded in this way in making a more perfect screw than had ever been made before, one which, when finally corrected, moved the ruling point of a dividing engine with such accuracy that no single ruling was in error by as much as $\frac{1}{100000}$ of an inch. "Wood-screws," so called, are metal cones, upon which a thread has been cut, and upon which a slotted head has been made. They have pointed ends for starting into wood, where they cut their own nuts and act rather as *clamps* than *screws*.

See article SCREW, in *Encyclopædia Britannica*, written by Rowland. See also article ROWLAND, in this work, and Rankine's *Machinery and Millwork*.

Screw-Propel'ler, a wheel with two or more radial blades in the form of a helix or spiral, used to propel a vessel. In modern ocean steamers, there are generally two propellers, one on each side of the keel. The action of the propeller is similar to that of a screw revolving in a fixed nut, the water being more or less fixed as regards the revolving propeller. The screw-propeller was suggested by several inventors about 1800, and in 1801 John Stevens, of Hoboken, N. J., made a successful experimental boat with a screw propeller. But it was not until between 1835 and 1840 that it began to come into general use. Its practical use was then demonstrated by F. P. Smith in England and by Capt. John Ericsson, first in England and later in the United States. Ericsson is generally given the credit of having made the first successful application of the screw-propeller to steam navigation. At present it is the only method of propulsion used on large steam vessels. The design of the shape and size of the propeller depends on conditions more or less peculiar to each vessel, and requires not only calculations but often experiments before the best shape is found for a given boat. Propellers are generally made of gun metal. The dimensions of the propellers and shafts on the transatlantic steamers are very large. For the *Celtic*, a "White Star" steamer of 14,259 tons displacement, the two propellers have each a diameter of 20 feet, and are carried on steel shafts of 19½ inches diameter.

Scribe, a name used among the Jews originally to indicate a military officer, whose business was recruiting soldiers and levying taxes, etc. Later the name was given to those who copied the books of the law, and as those who copied the law became its best expounders, the word "scribe" had come to mean, in the time of Christ, an expounder of the law, or a learned man. They were found all over Palestine and were reverenced by the people as public teachers and lawyers. Some of them were members of the Sanhedrim, or court, and some of them had public class rooms, where their disciples sat at their feet. Those who did not fill these higher places in the nation were engaged in copying the books of the law and of the prophets and in writing contracts, letters of divorce, etc. See *History of the Jewish People in the Time of Christ*.

Scud'der, Horace Elisha, American man of letters, was born at Boston, Mass., Oct. 16, 1838, and graduated at Williams college. After teaching school for three years in New York city, he took to the writing of stories for youth, and edited a magazine in their interest. From 1890 to 1898 he edited the *Atlantic Monthly* and became a resident of Cambridge, Mass. Here he assiduously pursued a literary life, writing, besides his successful series of *The Bodley Books* and a brief *History of the United States*, a monograph of *Noah Webster*, an historical biography of *Washington*, a collection of essays and criticisms, entitled *Men and Letters*, etc. He is the editor also of the series of volumes of the *American Commonwealths*, and author jointly with Mrs. Taylor of the *Life and Letters of Bayard Taylor*. He was one of the writers, moreover, of Bryant & Gay's *History of the United States*, and of Justin Winsor's *Memorial History of Boston*. Died 1902.

Sculpture (*skŭlp'tūr*), from a Latin word meaning to cut out or carve, is the art of representing the form of an object in a solid substance. When a figure is only partly raised from a background it is called "relief," and has different names according to the degree in which it is raised, as bas-relief, meaning low relief. Wood, marble, granite, bronze, gold, and ivory are some of the materials used in sculpture; anything that can be cut, or moulded into shape, being made use of. The Greeks and Romans worked largely in marble, especially the pure white marble brought from the island of Paros, called Parian. The art is an ancient one, beginning with the use of memorial stones and the making of images of the gods. The Egyptians are among the earliest nations to use sculpture in their religion, their temples being covered with reliefs, while innumerable

statues of gods stood upon their plains. The Sphinx was probably sculptured about 4000 B. C. The specimens of Assyrian sculpture found belong to the 9th and 8th centuries B. C. and are largely bas-reliefs, and made on a large scale, and of curious forms, such as the colossal winged bulls, with human heads, that guarded their palaces. The first monument of Greek art which has come down to the present time, is the marble statues on the temple of Athena at Ægina, by an unknown author. They are now at Munich. Phidias, the greatest of Greek sculptors, and of the world, known by his great work, the Parthenon, was followed by Praxiteles, Scopas, Lysippus, and such works as the *Venus of Milo*, *Apollo Belvedere*, *Laocoön*, etc. The best artists of Rome were Greeks, and her treasures of art were largely brought from the plundered cities of Greece. For several centuries the art of sculpture was almost lost, until the 14th and 15th centuries, when Ghiberti made his wonderful gates at Florence, and Donatello his statues of St. Mark and St. George, and Michael Angelo towered above all others. The 17th century witnessed only a falling back in the art of sculpture, with no immortal names among the artists; while the names of Houdon, Canova, Chantrey, Gibson, Thorwaldsen, and Rude, among others, adorn the 18th century. The art has many followers in the present century, such as Alfred Stevens, of England, with his magnificent monument to the duke of Wellington, and Barye Rodin, and many others in France, and Powers, Crawford, Greenough, and Rogers in the United States. See *History of Sculpture*, by Lübke; *History of Greek Sculpture*, by Murray.

Scutari (*skō-tä'rē*), a town in Turkey, on the eastern shore of the Bosporus, opposite Constantinople, of which it is a suburb. It is built on the slopes of a hill, and has several handsome mosques, bazaars, a dervish college, and factories of cotton, silk, and leather goods. It is famed for its large cemeteries adorned with great cypress trees, where many of the Turks from the city are buried, because it is the sacred soil of Asia. During the Crimean war the barracks and hospital of the English troops were at Scutari, and formed the scene of Florence Nightingale's labors. A marble obelisk marks the site of the English burial place. Population from 40,000 to 60,000.

Scylla and Charybdis (*sil'lä and ka-rib'dis*), in Greek legend, were two sea monsters who dwelt on opposite sides of a narrow sea strait. Scylla had twelve feet, six necks, and six mouths, with three rows of teeth in each, and barked like a dog. Charybdis lived on a cliff under a large fig tree, and three times a day she sucked up the waters of the sea, and three times a day threw them back again. Ulysses passed safely between the monsters, but Scylla snatched away six of his sailors. The names are now applied to a couple of rapids in the straits of Messina near Italy. From the difficulty of passing between them without falling into one or the other, rises the proverb, "To shun Charybdis and fall into Scylla."

Scythians (*sith'i-ans*), an ancient race of Asia. The name is given either to the Scythians proper, the Scolots, or to all the wandering tribes who lived on the steppes from Hungary to Turkestan. The Scythians proper were a wandering people, living in the treeless plains between the Danube and the Volga. They lived in tent-covered wagons, kept herds of horses, cattle, and sheep, fought with bows and arrows on horseback, made drinking cups of the skulls of their enemies, and worshiped without images gods like those of the Aryan Greeks. They seem to have learned some of the arts of civilized life from the Greek colonies, and a Scythian king went to Athens to study under Solon. In the 7th century they invaded Media, occupying it ten years, until Cyaxares made all their chiefs drunk at a banquet and slew them. The Scythians of Europe were nearly exterminated by the Sarmatians in the 4th century. The Scythians of Asia overran Parthia (Persia) about 128 B. C. and founded a kingdom in the eastern part of the empire, so that that part of Asia was called Indo-Scythia. In the century before and the century after Christ, they invaded northern India, where they held possession for four or five centuries. See *The Greek World under Roman Sway*, by Mahaffy.

Sea. The waters of the sea cover about 143,259,300 square miles, or about five-sevenths of the earth's surface. The ocean basins are filled with sea water up to within about 2,250 feet of the general level of the continents, the average depth of the water in these basins being 12,480 feet. Were the solid crust of the earth to be reduced to a level, the surface of the earth would then be covered by a universal ocean with a depth of about two miles. The greatest sea depth recorded is 4,655 fathoms in the North Pacific, east of Japan. The bulk of water in the whole ocean is stated to be 323,800,000 cubic miles. The temperature of the surface waters varies from 28° F. in the polar regions to 85° or 86° F. in equatorial regions. The bottom waters vary from 32.7° F. to 36.8° F. At a depth of a little over half a mile the water of the tropics has generally a temperature below 40° F. The circulation of oceanic waters is kept up by the action of the prevailing winds on the surface layers. In the southern hemisphere the warm water of the tropics is driven to the south along the eastern coasts of South America, Africa, and Australia, till, between 50° and 55° latitude, it sinks on being cooled, and spreads slowly over the ocean floor to the north and south. A similar circulation takes place in the north; the cold water which occupies the deeper parts of the Arctic basin, is largely made up

of the dense Gulf stream water which sinks to the bottom on being cooled in the Norwegian sea. The water evaporated from the sea surface is borne to the land, and condensed on the mountain slopes. Over 6,500 cubic miles of this water is yearly sent back to the sea by rivers, carrying along with it salts and earthy matters; in this way the ocean has in all probability become salt in the course of ages. The saltest waters are found where evaporation is the greatest, for example in the Red sea, Mediterranean, and trade wind regions of the ocean basins. Owing to the constant circulation in the ocean, oxygen and other gases of the air are carried down to the greatest depths; thus animals and plants may flourish throughout the whole extent of the ocean. Water is but slightly compressible, and almost any substance which will fall to the bottom of a tumbler of water will in time fall to the bottom of the ocean. Still the pressure amounts to four or five tons per square inch; hence in an ocean with a depth of five miles, were the action of gravity suddenly to stop, the ocean waters would rise 500 feet above their present level by expansion.

Pure sea water is a light shade of blue; but it is sometimes a shade of green or brown, owing to foreign matter or plants and animals floating in it. Some form of life is scattered throughout the whole ocean. A trawl at a depth of over two miles, brought up 200 specimens of living animals; a trawl in about three miles' depth yielded 50 specimens; and fishes and animals have been found at over four miles depth. The term "Beuthos," is now used for all animals and plants which live attached to, or creep over the bottom of the ocean, "Plankton" being the term for all plants and animals which live in, and are carried along by the currents of the ocean. Life is most abundant in the surface waters down to about 100 fathoms, is less abundant in the intermediate regions, and becomes more plentiful within a few hundred fathoms of the bottom. The shells and skeletons of animals and fishes fall to the bottom after death and make up a large part of the sea deposits in many regions, especially in the deeper parts of the ocean. Besides these "pelagic" deposits, there are others, mainly made up of the débris from the solid land of the globe, laid down in greater or lesser nearness to the shores of continents and islands, which are called "terriginous."

Sea Lion. See SEAL.

Sea Ur'chin, a very common sea animal grouped with the *Echinoderms*. The common sea urchin has a globular shell or test, composed of carbonate of lime, and made of six-sided plates nicely fitted together. The shell is covered with spines, which vary in length and size according to the variety of the animal. Five rows of the plates composing the shell are perforated by openings for the tube-feet, and five rows are without such openings. The animals move mainly by tube-feet, but the spines are also movable and aid in locomotion. The mouth, with a complicated masticating apparatus, is on the under side. They feed on seaweeds and organic matter found in the mud. Some forms are flattened and called sand cakes. For illustration, see ECHINODENNATA. See also SAND DOLLAR.

Seal, a carnivorous animal fitted for a life in the water. The animal famous for yielding the valuable fur, called seal skin, is not

FUR SEAL.

a true seal, but a kind of sea lion with ears and more flexible limbs. The true seals have no external ears and their hind limbs are closely united together, being useless on the land, but very effective in the water. The hind limbs of the sea lions are separated and used by the animal when on land. All kinds of seals come on the land or on ice in great numbers during the breeding season. The true seals vary from four to eight feet in length. Their fur is stiff and they lack the woolly under fur of the fur seals. They occur on both sides of the Atlantic. The common harbor seal is found on British coasts and

GREENLAND SEAL.

on those of Europe and North America. It is four or five feet long, usually yellowish gray, with darker spots. The Greenland seals are larger; they congregate on shore in immense numbers for breeding. All true seals are awkward on land, and move by means of the muscles of the trunk, assisted a little by the fore limbs. The hind limbs are entirely passive. A large number (390,174, in 1892) are killed annually for their hides and oil.

Seals feed mainly on fish, but also eat crustacea and mollusks. The harbor seals are sometimes destructive to salmon. The eared-seals, sea lions, or sea bears, vary greatly in size. The larger ones reach a length of about ten feet. Their hind limbs are flexible and they make considerable journeys inland, but return to the water for food. To this group belongs the fur seal of the north Pacific. They are of moderate size, a full-grown male being about six feet and a female about four feet in length. These animals breed on the Pribylofs, the Commander, and the Robben islands of the North Pacific and Bering sea. Since 1835, they have been in a measure protected by law. The males three years old—at which age their fur is finest—are taken for their skins, together with unusually large ones two years old, and small ones four years old. From 1871 to 1889, inclusive, about 100,000 animals were taken annually, but they began to show a decline in 1885, and, in 1890, only 21,000 skins were secured. In 1895 and 1896, the number was reduced to 16,000 and 15,000 respectively. Controversies in reference to the fur seal fisheries arose between the United States, England, and Russia. The questions were referred to arbitrators who met in Paris in 1893. In 1896, the United States government and Great Britain each appointed a commission to study the life of the seals and the causes for their decline in numbers. The members of the United States seal commission reached the conclusion that the decline in the herds is due to killing females in the open sea, where the sex cannot be readily distinguished. This form of capture should be abandoned, the hunt for skins should be confined to killing on the land, and restricted to the three-year-old males. See Allen's *Fur Seal and Other Fisheries of Alaska* (Washington 1889); Jordan's *Report of the Fur Seal Investigations* (Washington, 1898).

Sealed Orders are orders which are delivered to the commanding officer of a ship or squadron, sealed up and only to be opened when at sea. The commanding officer of a ship or squadron is sent to sea under sealed orders when sailing on any secret service, to prevent the destination and object of the expedition from becoming known. The commander, equally with all under him, is ignorant of where he is to sail or what he is to do until the seal is broken.

Seal'ing Wax. Before ordinary sealing wax was known in Europe, colored beeswax was used for sealing letters and documents. Sealing wax was probably first made in India or China. The best red sealing wax is made of shellac, Venice turpentine, and vermilion, to which is often added magnesia, chalk, or gypsum. In parcel wax, the main ingredient is common resin.

Seasons (*sē'z'nz*). The motions of the earth on which the seasons depend are explained in the article EARTH. The chief cause of the greater heat of summer and cold of winter is that the sun's rays fall more obliquely on the earth's surface in the latter season than in the former. Another cause is the greater length of the day in summer and of the night in winter. In the tropics, the sun's rays are always so nearly direct that no one part of the year is sensibly colder than another. But the zone of calms in which the rainfall is almost continuous, moves northward with the sun in the northern summer and southward in the southern summer. As the wet zone follows the sun, the regions it crosses have wet and dry seasons. In the Arctic and Antarctic regions spring and fall are very short, the year dividing itself simply into a long winter and a short summer. In temperate regions the year is naturally divided into spring, summer, fall, and winter. The almanacs assume that spring begins at the vernal equinox, March 20; summer at the summer solstice, June 21; fall at the autumnal equinox, and winter at the winter solstice. However, the greatest heat is reached sometime after the summer solstice, the time when the sun's rays are most nearly vertical and the day is longest. In like manner, the greatest cold of winter comes after the winter solstice, the time when the day is shortest and the sun's rays most oblique. The reason in the former case is that as summer comes on, the earth itself becomes more heated; in the latter, that it keeps a part of the heat which it had got in summer, just as the warmest part of the day is a little after midday, and the coldest part of the night is toward morning.

Seattle (*sē-ăt'l*), the largest city of the state of Washington, is located on Elliott bay, an arm of Puget sound, 18 miles north of Tacoma. It was founded in 1852 and was named in honor of Seattle, a noted Indian chief. The phenomenal growth of the city in recent years is shown in the fact that from a population of only 3,533 in 1880, it advanced to 80,671 in 1900. It is the center of a rich agricultural and mining region, there being important coal fields and immense deposits of iron ore within 40 miles of the city. The lumber trade has been a large factor in the growth of the city. The industries include sawmills, sash and door factories, carriage works, brickyards, machine shops, tanneries, breweries, etc. The development of gold mining in the Alaska region has of late years stimulated the growth of Seattle, there being regular lines of steamers to Alaskan ports, as also to San Francisco and to the Orient. From the east it is reached by the Northern Pacific and Great Northern railways. Here are located the Washington State university, Seattle Female college, and College of the Immaculate Conception. The public schools are of high excellence, the teaching force numbering 250, with 11,000 pupils in attendance. The cost of maintaining the schools is $290,962.

Sea'weeds. See ALGÆ.

Sebastian (*se-bast'yan*), **St.,** a martyr of the early church, was a native of Narbonne. Under Diocletian he became a captain of the prætorian guard and secretly a Christian. It coming to the ears of Diocletian how Sebastian encouraged those who were being led out to death for being Christians, the emperor had his captain tied to a stake and shot by archers. But they did not wholly kill him; a pious woman named Irene took him away and tended his wounds. As soon as he recovered, Sebastian boldly faced the tyrant and upbraided him for his cruelty. Diocletian then ordered him to be beaten to death with rods (about 288 A. D.). His first martyrdom — a young and handsome soldier bristling with arrows — was a favorite subject for the Italian religious painters, such as Mantegna, Veronese, and Domenichino.

SECRETARY BIRD.

Sebastopol (*sĕb'as'tō'pol*), a Russian seaport and fortress, is near the southwest end of the Crimea, on the southern side of one of the finest harbors in the world. The place is celebrated for its long siege by the French, Turks, and English in the Crimean war of 1854–55. The town and harbor were defended by forts of immense strength, built of limestone faced with granite, on which artillery made little impression. On the land side the earthworks and fortifications raised by General Todleben kept the armies of France and England at bay for eleven months. But the capture of the Malakoff and Redan works at length forced the Russians to evacuate the lines. The town was mined and the docks and forts blown up by the allies. The fortifications and docks have since been rebuilt. The imports of Sebastopol are mainly cotton, and coal; the exports, grain. The town was founded in 1783 under orders of the Empress Catharine II. Population 39,000, not counting a garrison of 12,000. See Leo Tolstoi's *Sebastopol.*

Sec'retary Bird, a large bird of South Africa, receiving its name from the arrangement of a number of black and gray quills over the ear, in the position of a clerk's pen. It belongs with the birds of prey, but is unlike the others and stands alone in that group. From its habit of eating snakes, it has also received the name of the serpent eater. The bird is about four feet long from bill to tip of tail, which is about two feet long. The legs and neck are both long, and the body makes up only a small part of the bird. The general color of the plumage is clear gray. They are shy in their native haunts, but have been domesticated by Cape Colony farmers. Their favorite food seems to be frogs and toads, but lizards and many snakes are devoured.

Secre'tion (in plants), in its broadest sense, the process by which substances are separated from the protoplasm; also the substances so separated. In this sense, the cell-wall and starch grains are secretions, since they are formed by the protoplasm and separated from it. The term is usually applied, however, to waste products (sometimes distinguished as excretions) or to products which have some special function, *e. g.*, enzymes (which see) and nectar. The number and variety of secretions are very great. Some of them are formed in a special cell or group of cells, constituting a gland, which may be on the surface (*e. g.*, in geranium leaves), or may adjoin an internal space into which the secretion is poured (*e. g.*, resin glands of pines). In other cases the secretion accumulates in the gland cells, which finally die, leaving a mass of the secretion occupying their room, *e. g.*, in orange rind. The methods by which the secretion is put forth from a cell are not known.

Seda'lia, a large central city of Missouri, is situated in a fine farming district and is a nest of factories. There are car works, machine shops, woolen mills, manufactories of agricultural implements, wagons, furniture, etc. It has fine railroad facilities, several roads converging here. It was founded in 1860, and has now a population of 15,231.

Sedan (*se-dŏn'*), a town and frontier fortress of France, stands on the Meuse, 64 miles northeast of Rheims. The citadel surren-

dered to the Germans in 1815; but Sedan is chiefly noted for the surrender, Sept. 2, 1870, of Napoleon III. and an army of 86,000 men to the Germans, in the Franco-Prussian war. The Germans, under the command of King William of Prussia, began the battle of Sedan September 1. By manœuvers and hard fighting, the French under Marshal MacMahon were driven from all sides to the fortress, where, defeated, surrounded, and without provisions, they were forced to surrender. The emperor was sent a prisoner to Wilhelmshöhe, and two days later Gambetta proclaimed the republic at Paris. Colbert founded at Sedan cloth mills, which now employ 10,000 men. Its Protestant Theological seminary was famous in the days of the Huguenots. Sedan chairs were named from this town, where they are said to have been invented. Population 24,000.

Sedge, the name of a family of plants, one class of which contains over two hundred kinds in North America. They are mostly found in swamps and other wet places, forming often thick tufts. The stems are solid and triangular. Sedges are most common in cold countries. They differ in some important respects from grasses, especially in being worthless as pasture or food plants.

Sedg'wick, Catherine Maria, American novelist and writer, was born at Stockbridge, Mass., Dec. 28, 1789, and died near Roxbury, Mass., July 31, 1867. She was the daughter of Theodore Sedgwick (1747–1813), the Federalist politician and jurist. She is herself noted as one of the earliest of American women of letters, a contributor to the *Annuals*, in vogue early in the literary history of the United States, and a voluminous and entertaining writer of moral tales and miscellanies. Her chief works embrace: *A New England Tale*, published anonymously in 1822; *Redwood* (1824), which was reprinted in England and appeared also in three or four European translations; *Hope Leslie* (1827); *Clarence* (1830); *Linwoods* (1835); *Letters from Abroad to Kindred at Home* (1841); *Historical Sketches of Old Painters; Live and Let Live; The Poor Rich Man and the Rich Poor Man; Morals of Manners; Means and Ends, or Self-Training; Letters to My Pupils; Wilton Harvey, and other Tales; Facts and Fancies; Married or Single*, etc.

Sedg'wick, John (Major-general), was born at Cornwall, Conn., Sept. 13, 1813. A West Point graduate, he served in Florida as second-lieutenant when the Cherokees were removed. He also served through the Mexican war, gaining promotion at the battles of Contreras, Churubusco, and Chapultepec. His record in the Civil war was brilliant. By the spring of 1862, Sedgwick was in command of a division, and in July of that year was made major-general of volunteers. Also in 1862 he was twice wounded, at Glendale and at Antietam. As commander of the 6th, or Sedgwick's corps, as it was called, he made a forced march of 35 miles to Gettysburg, and commanded there the left wing in the battle of July 2 and 3, 1863. Three days after the battle of the Wilderness, May 5 and 6, 1864, in which he had taken part, he was shot by a sharpshooter while ordering a battery to be brought into position. See *Address on General Sedgwick*, by MacMahon.

Seebeck (*sā'bĕk*), **Thomas Johann,** a German physicist, born April 9, 1770, at Reval, died Dec. 10, 1831, at Berlin. Lived as a private gentleman in Jena, Bayreuth, Nürnberg, and Berlin. Seebeck will be remembered principally for his very important discovery of thermo-electric currents, sometimes called the "Seebeck effect." This is the converse of the "Peltier effect." (See ELECTRICITY and PELTIER.) For an excellent account of these two "effects," see J. J. Thompson's *Elements of Electricity and Magnetism*, ch. 14.

Seed Disper'sal. See SEEDS.

Seed-plants. The common name of Spermatophytes, which see.

Seeds. In general a seed is a transformed ovule, and an ovule is a megasporangium (which see). The transformation is connected with the process of fertilization. The most apparent effect is the development of the hard coat or testa, which has to do with the protection of the delicate structures within. This testa is formed usually in connection with the integument of the ovule. Within the seed coat the essential thing is the embryo (which see). Around the embryo there may be deposited more or less endosperm (which see), and outside of the endosperm, in some seeds, there is the perisperm (which see). A seed is well devised for carrying a plant through an unfavorable season of drouth or cold. The length of time a seed may retain its vitality and be made to germinate is known only in the most general way. The old story of the germination of wheat derived from mummies in Egypt was contradicted almost as soon as it was started, but the contradiction has never yet overtaken the original statement. That seeds may endure for several, and often many years, and then be made to germinate is well attested, but the data are very uncertain. Seeds must be carried out of reach of rivalry with the parent plant and with each other. Various agencies have been used to effect this dispersal: (1) *Currents of air.*—The wind transports numerous seeds, which have been prepared for this agency in a variety of ways. Some have tufts of hair, others plumes, others wings. Often it is the fruit rather than the seed which bears the tuft of hairs (as thistle) or the wings (as maple), but the result is the same. (2) *Currents of water.*—Many seeds may be carried long distances by water and still be able to germinate. The

banks and flood-plains of streams are constantly receiving seeds from the regions toward the headwaters, and the more extensive the area drained by a stream the more varied is the collection of seeds on its flood-plain. The oceanic currents probably carry seeds the greatest distances, transporting them from continents to islands, and even from continent to continent. By experiment, Darwin found that numerous seeds could be soaked in sea water long enough to be carried over 1,000 miles by an oceanic current, without losing the power of germination. (3) *Animals.* —Many seeds and fruits develop grappling appendages of various kinds, by means of which they adhere to animals brushing past, as the tickseed, Spanish needle, etc. The migrating birds, especially those which visit marshy shores, are great carriers of seeds which are imbedded in the mud adhering to their feet. Fruit-eating birds also transport seeds, which may pass through the alimentary tract without losing the power of germination. (4) *Explosive fruits.*— In some cases fruits have the power of forcibly discharging their seeds, as the violet, witch hazel, touch-me-not, etc. This method is interesting, but not so effective as the others, since the distance traversed is necessarily very limited.

JOHN M. COULTER.

Seeley (*sē'li*), Sir **John Robert,** an English historian, born in 1834 and died in 1895, was the author of several notable books, historical and religious. He held a professorship at University college, London, and in 1869 was appointed professor of modern history at the University of Cambridge. His writings embrace a *Short History of Napoleon I., Lectures and Essays, Life and Times of Stein, The Expansion of England, Natural Religion,* and his most celebrated work, *Ecce Homo, a Survey of the Life and Work of Jesus Christ.*

Seidl (*zīdl*), **Anton H.,** an Austrian musical conductor, was born at Budapesth, Hungary, May 7, 1850, and died at New York, March 28, 1898. After studying at Leipsic under Richter, and at Bayreuth under Wagner, he became conductor of the Leipsic Opera house, and in 1882 made a tour of Europe as conductor of Neumann's Nibelungen Opera troupe. In 1883, he was appointed conductor of the Opera house at Bremen, and two years later came to the United States, where he was received with favor in New York and other cities, as leader of German operas, and as successor to Theodore Thomas in conducting the concerts of the New York Philharmonic society. He was the notable exponent, for many years in this country, of Wagner's music.

Seine (*sān*), one of the four chief rivers of France, rises northwest of Dijon, and flows northwestward, with many windings, past Fontainebleau, Melun, Paris, St. Denis, St. Germain, and Rouen, for 482 miles, falling into the English channel at an inlet where stands the ports of Harfleur and Havre. It is navigable 350 miles from its mouth, or to Marcilly, and the improvement of the upper Seine as a canal is one of the schemes proposed to join Paris to the Atlantic. Its main branches are the Aube, Marne, Oise, Yonne, Loing, Essonne, and Eure; and canals join it to the Somme, Scheldt, Meuse, Rhine, Sâone, and Loire. Deep dredging from Rouen, through the inlet at its mouth, has made that city a seaport, and has reclaimed 28,000 acres of land. The situation of Paris on the Seine has made this, like the Hudson and the Thames, one of the famous rivers of the world. See Vernon-Harcourt's *The River Seine.*

Seismometer (*sīs-mŏm'ē-ter*), an instrument which is used to measure the amount and direction of displacement at any point on the earth's surface during an earthquake. The name is also applied to those devices by which the slow and gradual tilting of the earth's surface is indicated.

For the first of these two purposes the one thing essential is to place a body in neutral equilibrium and without friction. To realize these two conditions perfectly is of course impossible. But they can be very nearly approximated. Thus an open gate, with a heavy mass at its outer end, and rotating about a strictly vertical axis, with very minute friction, would fairly represent a seismometer. Three instruments of this kind, one free to move east-and-west, one free to move north-and-south, and one free to move in a vertical direction, will give the three components of any motion produced by an earthquake; and by compounding these three motions we can obtain the original motion. In the modern instruments, as perfected by Prof. John Milne, these records are automatically photographed.

Seismometers which are employed to measure the tilting of the earth's crust, generally use a beam of light which has been reflected, part of it from a mirror rigidly attached to the earth, and part of it from a surface of mercury, which remains horizontal whether the earth's crust is tilted or not. The variation in angle between these two beams measures the tilting of the earth. See Milne's *Earthquakes* in the "International Scientific" series, and Darwin's *Tides,* a series of popular lectures given before the Lowell institute in Boston, in which earth-tiltings are treated.

Seja'nus. See TIBERIUS.

Selaginella (*sĕl'ă-jĭ-nĕl'lă*), the genus of plants to which the "little club mosses" belong. See LYCOPODIALES.

Selenium (*sē-lē'ni-ŭm*), is a very rare element which exists in two forms. In the glassy form at ordinary temperatures, it is a solid of a dark brown color, and a non-conductor of electricity. When it is slowly cooled from its

melted condition it does not appear vitreous or glassy, but crystalline, of a dull leaden color, and at ordinary temperatures is a conductor of electricity. It is very sensitive to light, and its electrical resistance is much less in the light than in the dark. This property led to the discovery of the photophone in 1880. Selenium is found chiefly in combination with lead, silver, copper or iron; but it has also been found in sulphur and certain iron sulphides. Selenium was discovered, in 1817, by Berzelius in the waste of a sulphuric acid factory.

Seleucia (*selū-si-ă*), the name of several early cities: —

SELEUCIA PIERIA (*pi-ē'ri-ă*), founded by Seleucus Nicator, near the mouth of the Orontes in Syria, was the seaport of Antioch. It was a city of importance during the wars between the Seleucidæ and the Ptolemies for the possession of Syria. A remarkable tunnel, 1,088 yards long, dug out of the solid rock, the only connection between the city and the sea, and the ruins of its threefold line of walls, fortress, temple, amphitheatre, etc., speak of its former splendor.

SELEUCIA-ON-THE-TIGRIS was built by Seleucus Nicator, 40 miles northeast of Babylon, as the successor of that capital, which was despoiled to furnish it with building material. It grew fast and at one time had a population of 600,000. It was partly burned by Trajan and razed to the ground by Avidius Cassius in 162 A. D.— in the reign of Marcus Aurelius and Lucius Verus.

Seleucidæ (*se-lū'si-dē*), the royal house to whom fell Syria, a large part of Asia Minor and Persia, Bactria, and the other eastern provinces of Alexander the Great. Seleucus Nicator was driven to Egypt by Antigonus. The date of his return to Babylon, 312 B. C., was the beginning of the Seleucian empire. Suriana, Media, and the provinces as far as the Oxus and the Indus, fell into his hands. Joining the confederacy headed by Ptolemy, he gained Syria, and later all Asia Minor fell to his share on the defeat of Antigonus by the allies. Planting Greek colonies, founding many cities — some of which, as Seleucia-on-the-Tigris and Antioch, became among the largest and richest in the world — were some of his plans to create a great empire. Seleucus was murdered by one of his officers in 280 B. C. Antiochus II. allowed the great Parthian kingdom to rise in the east. The two ablest of Seleucus I.'s successors were Antiochus III., the first great eastern king to come into collision with the Romans, and Antiochus IV., whose cruelties would have perhaps succeeded in supplanting the Jewish religion by the Greek worship, had it not been for the patriotic resistance of the Maccabees. Antiochus died a raving lunatic. In derision, his subjects changed his surname, Epiphanes, "the Illustrious," into Epimanes, "the Madman." Syria, the last Seleucian possession, was conquered by Ptolemy in 65 B. C.

Self-pollina'tion (in plants), the transfer of pollen from a stamen to the stigma of the same flower. The same as "close-pollination." See POLLINATION.

Se'lim I., sultan of Turkey, was born in 1467, dethroned his father, Bajazet II., by the aid of the Janizaries, in 1512, and had his father, brothers, and nephews put to death. In 1514, after massacring 40,000 Shiites, he declared war against Persia, and defeated Shah Ismail near Tabriz. Three years later, he wrested Egypt from the Mamelukes, and annexed Syria. He also forced the caliph of Cairo to yield to him the headship of the Mohammedan world, and the standard of the prophet. The sacred cities, Mecca and Medina, also fell into his hands. This able yet savage ruler, however, improved the condition of the people he had conquered, kept the Janizaries in order, and was a lover of literature. He died in 1520.

Seljuks (*sĕl-jŏks'*), a division of the Ghuzz confederacy of Turkish tribes, who were settled on the Jaxartes and beyond the Oxus in the 11th century, when they became Mohammedans. Togrul Beg, grandson of Seljuk, founder of the dynasty, crippled the empire of Ghazni (1040), conquered Persia, and ten years later, Bagdad. Togrul's nephew and successor, Alp-Arslan, wrested Syria and Palestine from the caliph of Egypt, and in 1071 captured Diogenes, the Byzantine emperor. Diogenes' ransom was the best part of Asia Minor. The grand-vizier of the next reign was the able Nizam-ul-Mulk, a schoolmate of Omar Khayyam, the poet, and of Hassan ibn Sabbah, the founder of the famous secret order of the Assassins. The empire, at the close of this reign (1092), began to break up into smaller kingdoms. Even before this, strong chieftains like Saladin had been really independent. It was the Seljuk provinces of Asia Minor and Syria that bore the brunt of the crusades. Iconium was the capital of Rum, the Seljuk name for Asia Minor. This province, or rather kingdom, became very powerful under Kaikawus (1211–34), who ruled also over parts of Mesopotamia and Persia. During his son's reign the orders of dervishes arose, and the Mongols began to gain the power which they wielded over this part of Asia till the rise of the Ottoman princes, who like the Seljuks were Turks, and had been driven westward by the Mongols. Out of their supremacy grew the Turkish empire.

Sel'kirk, Alexander. See JUAN FERNANDEZ.

Sel'kirk Mountains, an outlying range of the Rocky mountains, in British Columbia, reaching southward almost to the United States boundary line. The range contains

enormous glaciers, and is the home of bears, big-horned sheep, Rocky Mountain sheep, etc. See W. S. Green's *Among the Selkirk Glaciers.*

Semele (*sem'e-lē*), in Greek story, was beloved by Zeus, and Hera, moved by jealousy, persuaded her to ask him to appear to her clothed in all his majesty as king of gods and men. Having sworn to grant her every request, and warned her in vain not to press her wish, he unwillingly yielded and appeared as the god of the thunderbolt. Semele was consumed by the lightning, but the child to which she was about to give birth was saved by Zeus. This child was Dionysus, the god of wine.

Seminoles (*sĕm'i-nōlz*), at first a wandering branch of Creek Indians. In 1817, they joined the Creeks and some refugee negroes in ravaging the white settlements in Georgia, plundering the plantations, and carrying off slaves, whom they refused to surrender. Gen. Andrew Jackson was sent to punish them, and his expedition hastened the cession of Florida to the United States (1819). The Seminoles, numbering 4,000 in 1823, by a treaty made in that year, sold most of their lands for a yearly sum. In 1832, a treaty for the removal of the whole tribe west of the Mississippi was signed by the chiefs, but the tribe, under the leadership of Osceola, would not ratify it. This led to a war, lasting seven years, and costing hundreds of lives and millions of dollars. At length the tribe was removed to the Indian territory, where are now settled all the Seminoles, some 3,000, except about 200 still lingering in Florida, and a few in Texas. The Seminoles are steady, sober, and industrious, and in the progress they have made rank next to the Cherokees, Creeks, and the Choctaws. They receive $25,000 a year, besides money to keep up their schools and government. They work about 8,000 acres of land. They have eight churches and are under the training of Presbyterian missionaries.

Semiramis (*se-mĭr'a-mĭs*), wife of Ninus, who, according to the Greek historians, founded Nineveh. A daughter of Derceto, the fish goddess, she was exposed to death when a baby, but miraculously fed by doves and brought up by a shepherd. Omnes, one of the king's generals, charmed by her beauty, married her; but she won the heart of the king himself by her heroic capture of Bactra, whereupon her husband had the loyalty to take his own life. Ninus soon died, leaving Semiramis to reign gloriously for forty-two years, conquering in Persia, Libya, and Æthiopia, but failing in her attack on India, where her army was cut to pieces by elephants. She at last disappeared, according to some stories, in the form of a dove. The name of the mighty queen survived in the names of many great works, such as the hanging gardens of Babylon, which were attributed to her. The Semiramis of the North was the name aptly given to Catherine II. of Russia.

Semites (*sem'ites*), a name applied to a group of nations, much alike in language, religion, manners, and looks, who are mostly represented in Genesis x. as descended from Shem, a son of Noah. Their home is Abyssinia, Arabia, Palestine, Phœnicia, Syria, and the countries of the Euphrates and Tigris. It is generally believed that as early as 4000 B. C. the Semites migrated as wandering tribes, probably from Arabia, into Mesopotamia. There they found a Turanian people dwelling in cities built of brick, under a regular government of priest-kings, skilled in metals and using the cuneiform mode of writing. Accad, Shumir, and Elam, were conquered, the Semites forming the upper classes of society and ruling the Turanians. Chedorlaomer, a king of Elam, about 2200 B. C., conquered as far as Palestine. Some Semites migrated northwest and founded Tyre, Sidon, and other cities on the Mediterranean, and became known as Canaanites and Phœnicians. Later, others came from Ur and founded the nation of Israelites. Still others built cities which grew into the Assyrian empire.

The Semites as a race have finely-developed bodies, quick and clever minds, but are not inclined to change. Almost their only arts are the sculpture of Assyria, the glass, pottery, cloth, and embroidery, of the Phœnicians. They have made their mark on the world in the Phœnician commerce and colonies; in the Carthaginian empire, and the exploits of Hannibal; in the spreading of the Phœnician alphabet, which is the mother of the European and most Asiatic alphabets, though it is not the oldest alphabet; in the Babylonian and Assyrian empires; in the Hebrew Bible and Jewish religion; in the New Testament and Christian religion; in the Koran and Mohammedan religion; in the Mohammedan conquests and empire, and in the preservation of learning through the dark and middle ages.

Semmes (*sĕmz*), **Raphael,** was born in Charles county, Md., Sept. 27, 1809. He entered the navy in 1826, and became a commander in 1855. He served during the Mexican war as a naval officer and also as an aide to General Worth. As commander of the Confederate steamer *Sumter*, he ran the blockade at the mouth of the Mississippi at the beginning of the Civil war. After capturing several merchant vessels in the gulf of Mexico, he sailed to England. On leaving Southampton he was pursued by the Federal steamer *Tuscarora*, blockaded at Tangier, and forced to sell his ship. In August, 1862, he took command of the famous *Alabama*, built in England and manned by an English crew. He then commenced a successful cruise against merchant vessels. He also

sank the gunboat *Hatteras* off Galveston; but on June 19, 1864, the *Alabama* was herself sunk by the *Kearsarge* in a sea fight off the harbor of Cherbourg, France. Semmes, however, escaped in an English yacht. He opened a law office at Mobile after the war closed, but was arrested and suffered a four months' imprisonment. He afterward wrote and lectured on his adventures during the war. Semmes died at Mobile, Ala., Aug. 30, 1877.

Sempach (*sem'päk*), **Battle of.** See WINKELRIED, ARNOLD VON.

Seneca (*sen'e-kă*), whose father was a prominent writer, was a Spaniard, born at Corduba (Cordova) about 4 B. C. He studied law at Rome, where he narrowly escaped being put to death by the Emperor Caligula. Later in life he entered the Roman Curia, but in 41 A. D. lost the favor of Claudius and suffered an eight years' banishment to Corsica. After his return, he became tutor to Nero, over whom he had a strong and good influence, and was made consul, in 57 A. D., by his pupil, who was now emperor. As Nero rapidly sank into crime, Seneca's high moral character aroused in him hatred, while his teacher's wealth, heaped on him by himself, is said to have made the emperor jealous. Nero tried to poison him, but failing in this, had him drawn into the Pisonian conspiracy, for which he was tried and condemned. Left free to choose his own death, he opened his veins and bled to death, 65 A. D. Seneca was a noble and upright man, yet had many enemies. *On Foresight*, *On Shortness of Life*, and *Epistles to Lucilius*, are some of his writings, besides epigrams and eight tragedies, which show great mastery of style, but are unfitted for the stage. For a striking portrait of Seneca, see Hugh Westbury's *Acté*.

Sen'eca Lake, one of a range of narrow lakes in the western part of New York. It is 36 miles long, and averages two miles in width, and 530 feet in depth. Steamboats ply daily from end to end. It flows into Lake Ontario through the Seneca and Oswego rivers, and is joined by canal to the Erie canal.

Sen'ecas, one of the Iroquois tribes of Indians. See IROQUOIS.

Senegal (*sen'e-gal*), a river of West Africa, has two sources, the Bafing and the Bakhoy. These streams meet at Bafulabé, 700 miles from the coast, the united Senegal reaching the Atlantic ten miles below St. Louis. From July to October the river is navigable to within forty miles of Bafulabé, but the channel has in it many falls, narrows, and low, flat islands. A railroad has been built along the left bank for sixty-five miles, from Kayes to Dioubeba, which is to be carried on to Bammako on the Niger.

Senegal (*sĕn'e-gal*), a French colony on the west coast of Africa, lying between the Sahara and the river Gambia, and extending inland for about 900 miles. It covers an area of about 200,000 square miles, with a population of about 3,200,000. The whole colony is administered directly or indirectly by a civil governor. The communes of St. Louis, Dakar, Gorée, and Rufisque are directly under the governor; nine circles are under other administrators, while other districts are self-governed, under French protectorate. The colony is represented in the French parliament by one deputy. In 1900, the military force numbered 2,600 men. Dakar is fortified. In 1897, the four chief towns had nine schools, with 67 teachers and 1,986 pupils. The natives cultivate millet, corn, rice; other products are gums, castor beans, groundnuts, cocoanuts, rubber, and kola. The domestic animals are cattle, sheep, goats, and camels. Gold, silver, copper, and quicksilver are found in some localities. The native industries comprise weaving, pottery, brickmaking, and jewelry. The imports in 1899 amounted in value to 52,425,000 francs, and the exports to 23,725,000 francs. In 1898, there were in Senegal 246 miles of railway and 574 miles of telegraph. One line connects Dakar, St. Louis, and Rufisque; another from Kayes to Bafulabé is being extended to the Niger.

Sennacherib (*sĕn-nak'e-rib*), an Assyrian king, son of Sargon, reigned from 705 to 681 B. C. He built the embankment of the Tigris, made canals and water courses, built a huge palace at Nineveh, and was the founder of many other public works. The chief acts of his reign are given under ASSYRIA.

Sen'sitive Plants. All plants are more or less sensitive, that is, able to respond to stimuli. Some plants, however, respond so quickly and so evidently that they have been popularly called "sensitive plants." Conspicuous among them are species of Mimosa, Acacia, and their allies, members of the pea family. These particular plants have large compound leaves composed of numerous and very small leaflets. At a sudden touch the paired leaflets fold together, or the whole leaf may fold up and its petiole droop. In the natural surroundings of these plants this folding up of the leaves has to do with the avoidance of too intense light, or drought, etc., the surface of exposure thus being diminished in exact proportion to the need.

Seoul (*sā-ōl'*), capital of Korea, is on the river Han, 75 miles from its entrance into the Yellow sea. It is in a basin in the midst of granite hills and is surrounded by a wall. Narrow, dirty streets, wide, open squares, poorly built houses, and a royal palace covering 600 acres, make up the city. Silk, paper, tobacco, mats, and fans are produced. Population 150,000, with suburbs, 250,000.

Se'pal (in plants), one of the parts which together make up the calyx or outer set of floral leaves. See FLOWER.

(*s, s*) Sepals.

Se'poy, a native Hindu soldier, as distinguished from a gora or white soldier. Sepoys have always been volunteers. The French first employed them in the 18th century. The East India company had 10,000 Sepoys at the time of the battle of Plassy. This force had grown to 45,000 by the time the first governor-general was appointed (1773). Their discipline, faithfulness, and good services caused general belief in their loyalty until the outbreak of the great Sepoy rebellion in 1857. The army was then 300,000 strong, all Sepoys but 40,000. The rising took place among the high caste Hindus, who made up the Bengal army. The Sepoy forces of Madras, Bombay, and the Punjab took no part in it. This rebellion cost the British $200,000,000. Since 1857, the proportion of Sepoys to Europeans is less, it being now two to one instead of six to one.

Septem'ber, from the Latin word meaning seven, was the seventh month of the Roman calendar, but is the ninth according to our reckoning. The Anglo-Saxons called it gerstmonath, "barley month."

Sequoia (*sē-kwoi'a*), a genus of the Conifers, whose two species are native only in California. They are the famous "redwoods" or "big trees," and form one of the attractions to visitors in California. The species are *S. sempervirens*, the true redwood, and *S. gigantea*, the giant redwood. The former grows only in the Coast ranges, and is abundant enough to be a very important lumber tree. The recorded sizes are from 50 to 75 feet in circumference and 200 to 275 feet in height. The giant redwood occurs in patches or "groves" in a narrow strip along the western slope of the Sierra Nevada. Among the most famous groves are those of Calaveras county, and the Mariposa grove just south of the Yosemite. The latter contains one of the largest standing trees, known as the "Grizzly Giant," whose trunk at the ground is more than 93 feet in circumference. The age of the largest trees is from 2,000 to 2,500 years. In former ages, sequoias were widely distributed throughout the world.

Sera'pis, the Greek name of an Egyptian god, introduced into Egypt in the time of Ptolemy Soter. He was a combination of the Greek Hades and the Egyptian Osiris. It is said that 42 temples were built for the worship of this god, though they were only admitted into the Greek cities founded in Egypt. The best known of these temples was the magnificent Serapeum at Alexandria, to which was joined the celebrated Alexandrine library. Antoninus Pius introduced the worship of Serapis into Rome, but it was soon abolished. Many Roman coins have his image joined to that of Isis. The worship of Serapis ceased in Egypt only when his image in Alexandria was destroyed by the Christian archbishop of the city, in 398 A. D.

Serf. See SLAVERY.

Ser'pentine, a mineral made up of silica, magnesia, and water, with a little protoxide of iron. Serpentine is usually found in masses, never in crystals; is generally some shade of green, but is sometimes red or brownish-yellow, and feels smooth, but often greasy. Precious or noble serpentine is a rich, dark green, hard enough to take a good polish, translucent, and sometimes has imbedded in it garnets, which form red spots and add to its beauty. It is a rather rare mineral, and is found at Baireuth (Germany), in Corsica, and in the Shetland islands. The Romans made of it beautiful pillars, and boxes, vases, etc., are still cut from it. Marmolite is a scaly serpentine; chrysolite is a kind with delicate fibers and a silky luster. Common serpentine is a rock rather than a mineral. Its name comes from its being often marked with winding veins. Its color is usually green or red, often mottled, veined, or clouded.

Ser'pents. See SNAKES.

Ser'pent Wor'ship is one of the oldest forms of religion, and still exists among many savage peoples. Serpent worship is prominent in Indian Buddhism. We see traces of it in the great serpent which defended the citadel of Athens, fed every month with honey cakes. Among Zulus, harmless green or brown snakes which come boldly into the houses are thought to be ancestors, and are often identified by some scar or mark, such as the man bore in life. Serpents are often looked upon as the embodiment of gods, such as the rattlesnake worshiped in the Natchez temple of the Sun; the Phœnician serpent with its tail in its mouth, an emblem of eternity. Reverence for the serpent is notable among the red Indians, where its name has been given to rivers, as the Kennebec and the Antietam. Among the Dakotas, Shawnees, and Sacs, the words for spirit and snake are similar. The Algonquins think the lightning a huge snake, and the Caribs speak of the god of the thunder storm as a mighty serpent. The Ojibways dread to kill a rattlesnake, and if they find one in their path, beseech it to go away and spare them and their families. The same worship is found among the Cherokees and other tribes, as well as in the strange snake dances of the Zuñis. See Fergusson's *Tree and Serpent Worship.*

Servia (*ser'vi-a*), a kingdom of the Balkan peninsula, reaching from Hungary on the north to Turkey on the south, and from Bosnia on the west to Bulgaria and Rumania on

the east. It covers 18,455 square miles, measuring 140 miles from east to west and 110 miles from north to south. It is on the whole a mountainous country, covered with fine forests. Servia is an agricultural country. Wheat, corn, grapes, and plums are the chief crops. Cattle, sheep, and acorn-fed hogs are exported, as are also hides, wool, timber, and cordage. The foreign trade is mostly in the hands of Austria-Hungary, and its center is at Belgrade, the capital (population 60,000). Manufactures are not yet of great value, but are being fostered by government gifts of monopolies.

The Servians are a well-built, stalwart race. They cling to old customs and beliefs, and are democratic in their institutions. The farms are all of small size. There are no paupers, asylums, or "homes" in Servia. Population, 2,312,484, including 150,000 Rumanians and 34,000 gypsies. Besides these, there are 250,000 Servians in Montenegro, 1,300,000 in Herzegovina, and 2,350,000 in Austria-Hungary. The people belong to the Greek Orthodox church.

Servia is a constitutional and hereditary monarchy. The king rules through eight ministers, who are accountable to the people. There is also a national assembly and a senate. The army takes in all capable of bearing arms between the ages of twenty and fifty, divided into the standing army, in peace 22,448, in war 160,751, and the second and third classes of national militia, numbering 192,615. Thus the full average military strength is 353,366.

Elementary education in Servia is compulsory. In 1900, there were 1,105 elementary schools, with 1,921 teachers and 100,901 pupils; 16 higher schools, with 357 teachers and 5,712 students. The university at Belgrade has 62 instructors and an attendance of 463 students. Servia has 354 miles of railway and 2,526 miles of telegraph line.

The Servians came from the slopes of the Carpathians to Servia, Bosnia, and Herzegovina in the year 638, and soon accepted Christianity. Under their feudal lords, they on the whole withstood the Byzantine empire and the Bulgarians. The Rascian dynasty was founded in 1159. Its greatest prince was Stephan Dushan (1336–56), who conquered Bulgaria, Macedonia, Albania, and thought of welding Servia, Bulgaria, and Byzantium into a power strong enough to withstand the Turks. But he died before anything could be done, and left a feeble son. By the loss of two battles to the Turks, that on the Maritza in 1371, and the Field of the Blackbirds in 1389, Servia lost its independence. Then followed three hundred years of Turkish cruelty, many chief families being blotted out, 200,000 people carried off as slaves, while the boys every seven years were forced to become Moslems and Janizaries. In 1718, Austria won Servia from Turkey, but had to give it up twenty-one years later. In 1804, the people rose under Czerny George ("Black George"), a wealthy swine owner, who stormed and took Belgrade and drove the Janizaries out of the country. In 1809, and 1810, the Turks were beaten off only with the help of the Russians, who agreed by treaty that the sultan should garrison the country, but that the Servians should manage their home affairs themselves. The Turks broke the treaty, and Czerny George fled to Austria; but in 1815 a new leader Milosh Obrenovitch, a herdsman, confined the Turks to their garrisons. He had his rival, Czerny George, murdered, and by 1829 was acknowledged prince of Servia. His rule was very despotic, and in 1839 he was forced to yield the throne to his son, Milan, who was soon succeeded by his brother, Michael. Three years later, the rival faction replaced Michael by Alexander, the son of Czerny George, a weak ruler, who was driven out in 1859. The aged Milosh Obrenovitch was again made prince and was soon succeeded by his son, Michael. His rule was able, and in 1867 the last Turkish garrison was withdrawn. A year later he was assassinated. His cousin, Milan (1868–89) took part in the Russo-Turkish war, whereby Servia gained her independence, and was crowned king as Milan I. in 1882. In 1889, he gave up the throne to his son, Alexander, then thirteen years old. On April 13, 1893, King Alexander, being then in his seventeenth year, took the royal authority into his own hands. See Laveleye's *The Balkan Peninsula.*

Sesostris (*se-sos'tris*), the Greek name of a celebrated Egyptian king. According to the Greek accounts, Sesostris at the head of a large army invaded Libya, Arabia, Asia, Europe, Thrace, and Scythia, leaving a colony at Colchis on his way home. In the south he conquered Ethiopia, and by means of his fleet on the Red sea got possession of the neighboring islands, and widened his dominions to India itself. Captives in great numbers were put to work on temples, canals, and mounds. Sesostris is said to have gone blind after a reign of thirty-three years, and to have taken his own life. Just who this great conqueror was is a puzzle. The most reasonable explanation is that his doings are the confused exploits of Sethos I. and Rameses II.

Set'ter, a breed of dog employed in shooting birds. There are three varieties—the English setter, the Gordon setter, and the Irish setter. Dogs had been trained from the 16th century to scent game, but it was not until the beginning of the 19th century that a record of a distinct breed of setter was begun. The English setter is generally white with red markings, or with black spots. The Gordon setter was bred by the duke of Gordon in the year 1800, by crossing the existing setter with the collie. This setter should be a rich and glossy black, marked with tan on the

face, chest, and legs. The origin of the Irish setter with its deep chestnut-red color is unknown.

Sev'en Sleep'ers, the heroes of a celebrated tale. During the flight of the Christians from the persecution under Decius, seven Christians of Ephesus took refuge in a cave near the city, where they were discovered by their pursuers, who walled up the entrance in order to starve them to death. Instead they fell into a sleep which lasted from 250 or 251 to the reign of Theodosius (447). They imagined that their sleep had been but for a night. One of the seven went secretly into the city to buy food, and was thunderstruck to see the cross on churches and other buildings. Offering a coin of Decius at a bakery he was arrested, his startling story not being believed till he guided the citizens to the cave where he had left his comrades. The emperor heard from their lips enough to make him believe in the life beyond the grave, whereupon they sank again to sleep till the resurrection. The Roman Catholic church holds their festival on June 27. The story was adopted by Mohammed. A like story is told in Germany. See Rydberg's *Teutonic Mythology.*

Sev'en Wise Men, Greek sages, whose lives were embodied in certain maxims. Their names and characteristic sayings are as follows: Solon of Athens — "Nothing in excess"; Thales of Miletus — "Suretyship brings ruin"; Pittacus of Mitylene — "Know thine opportunity"; Bias of Priene, in Ionia — "Too many workers spoil the work"; Chilon of Sparta — "Know thyself"; Cleobulus, tyrant of Lindus, in Rhodes — "Moderation is the chief good"; and Periander, tyrant of Corinth — "Forethought in all things."

Sev'en Won'ders of the World were in early times reckoned to be the Pyramids of Egypt, the Hanging (that is, terraced) Gardens of Semiramis at Babylon, the temple of Diana at Ephesus, the Statue of Jupiter at Athens by Phidias, the Mausoleum, the Colossus at Rhodes, and the Pharos (or lighthouse) at Alexandria.

Sev'en Years' War (1756–1763). A struggle in Europe, which had far-reaching results, between Prussia under Frederick the Great, and a confederacy of European powers, consisting mainly of Austria, under the Empress Maria Theresa, Russia, Saxony, Sweden, and France. The immediate object of the war was to enable Austria to regain possession of Silesia, whose duchies, in 1740, had been seized by Frederick, and this precipitated a strife known as the Seven Years' War, or the third Silesian war. With Prussia was allied England, under George II., who sought thus to secure his Hanoverian possessions against France, and between which and the English there had been a growing ill-feeling, in consequence of rivalry in the American colonies and in India. On the part of the confederacy of Austria, Russia, and France, the feeling that led on to the war was European jealousy of the growing power of Prussia, whose prestige had been greatly raised by the genius of Frederick, and who on the outbreak of the war made himself master of Saxony by the defeat of the Austrians at Lobositz (October, 1756), temporarily invaded Bohemia, and again inflicted defeat upon the Austrians (at Prague, May, 1757), followed by victories, later in the year, over the French and Austrians at Rossbach, and over the Austrians alone at Leuthen (December, 1757). Through varying fortune, Frederick's military genius enabled him, in the two ensuing years, to wrest victories from the Russians at Zorndorf and from the French at Minden, though his capital was taken by the Russians and was subject to a three-days' plunder. In 1761, the English, owing to the death of George II., withdrew her subsidies to Prussia; but Frederick's straits were somewhat relieved in the following year, when Elizabeth of Russia died, and Peter III., her successor, in his few months' reign, made peace with Prussia. Sweden and France fell away from the alliance, and at Hubertusburg, Austria, too weak to carry on the war alone, made peace with Prussia, Feb. 15, 1763, and Silesia was confirmed as a possession of Frederick.

Aside from European complications, there was at this time, between England and France, cause enough for war, in the friction between the two nations, owing to their rivalries in India and in North America, and the desire of both to settle the question who should be master of these vast continents. In America, France, as we have seen in the French and Indian wars (*q. v.*), had colonized Canada and Louisiana, while England has established colonies along that part of the Atlantic coast which separated the French settlements. To connect the latter, and to exclude England from the great fur-trade of the interior, France, as we know, erected a series of military posts from the Niagara river to the mouth of the Mississippi. This was naturally resented by England and her New England colonies and precipitated a conflict in the Ohio valley and on the St. Lawrence, which had its fateful issue in the crowning English victory of the conquest of Quebec, and the surrender of the whole of Canada to Britain. Joy at the capture of this stronghold on the St. Lawrence was saddened by the deaths of the gallant British commander, General Wolfe, and the equally gallant French commander, General Montcalm. In India, English prowess met with like good fortune and decided the question of supremacy. There, the East India Company had founded settlements for purposes of trade, which gave promise of extending to an empire; but France, jealous of her hereditary rival, endeavored to snatch from her the prize. Dupleix, the French governor of Pondicherry,

captured Madras, and by intriguing with the native princes, attempted to make French power supreme over the country. In this ambitious scheme he was, however, checkmated by Lord Clive, who from a clerkship in the East India company rose to be one of the greatest of English generals and the saviour of India. Clive captured Arcot, and in 1757, when the sovereignty of Bengal was in peril, he won a great victory over the native insurgents at Plassey, which made Bengal a British province, saved the English residents from massacre, and, in spite of the atrocity of the Black Hole at Calcutta, laid the foundations of British rule in India. The war, which raised Prussia to the front rank among European powers, and developed England's colonial empire, was marked by sundry naval victories which fell to the English, such as the affairs at Louisburg, Lagos, and of Quiberon bay. See Carlyle's *Frederick the Great*, and Lives of *William Pitt, General Wolfe*, and *Lord Robert Clive;* also Parkman's *Montcalm and Wolfe.*

Severn (*sev'ern*), next to the largest river of England, rises in Wales and after a course of 210 miles falls into the Bristol channel. It is navigable for 180 miles; a canal has helped navigation from Gloucester, and is now being extended to Worcester. Below Gloucester, the swiftly flowing tide produces a bore or wave five or six feet high. The Severn is a beautiful as well as an important river.

Severus (*sē-vē'rus*), **Alexander,** a Roman emperor, was born about 205 A. D. He was the adopted son of the emperor Heliogabalus, who, in his jealousy of the young man's popularity, vainly tried to kill him. Severus became emperor in 222. The first nine years of his reign were peaceful, but in 231 he began a war with the Persians, in which he was successful. In 235, he began a campaign against the Germans on the Rhine, in which he lost his life, not at the hands of the enemy, but at those of his own soldiers.

Seve'rus, L. Septimius, a Roman emperor and a vigorous and courageous soldier, was born in Africa, 146 A. D. At the time of the murder of Pertinax (193) he was in command of an army in Pannonia and Illyria. At once proclaimed emperor, he marched on Rome, which was held by Julianus, who had obtained the throne of the Cæsars by bribery. Julianus and the murderers of Pertinax were punished, one rival, Clodius Albinus, won over by the gift of the title of Cæsar, the soldiers flattered by a rich largess, and a second rival conquered at Issus. A glorious campaign in the east and the three years' siege and capture of Byzantium, were followed by a hard struggle with the jealous Clodius, whom he defeated near Lyons in 197. After the usual games to the citizens of Rome and largesses to the troops, he marched on the Parthians and took and plundered their capital, Ctesiphon. By 202 he was again in Rome, pleasing the people with shows of unheard-of magnificence, and showering gold upon citizens and officers. In 208, he marched at the head of a large army to put down a rebellion in Britain, and repaired Hadrian's wall, which is often called after him. He died at York (Eboracum), Feb. 4, 211.

Sevigne (*sā-vēn-yā'*), **Madame de,** the queen of letter writers, was born at Paris, as Marie de Rabutin-Chantal, Feb. 6, 1626. Her father died fighting against the English when she was one year old; her mother also died a few years later, and Marie was brought up by an uncle who had her taught Latin, Italian, and Spanish. At eighteen she married a spendthrift marquis, whom she forgave and loved. At the death of her husband, in a duel in 1651, she was but twenty-five, brilliant in her beauty and fascination. The prince of Conti, Turenne, Rohan, and others courted her in vain. But no woman ever knew, as she did, how to change a lover into a friend, and perhaps no one ever had so many and such friends. But as to love, that was wholly bound up in her son and daughter. Especially did Madame de Sévigné's love overflow for the girl, Françoise Marguerite, whose beauty, as far as mere features went, surpassed her mother's, and whose first appearance at court, when sixteen, as "the prettiest girl in France," filled that mother's heart with joy. The marriage of Françoise to the count of Grignan, lieutenant-général of Provence, obliged her to live away from Paris. This separation from her daughter was the great grief of Madame de Sévigné's life, but it is mainly to it that we owe those letters, lasting over the twenty-five years till her death. These letters tell the inner history of the time in great detail; but are most valuable as mere letters, charming in their good sense, sparkling wit, and in the affection breathed into them. The writer died April 18, 1696. See Amelia Gere Mason's *Women of the French Salons.*

Seville (*sā-vēl'*), one of the most famous Spanish cities, is on the Guadalquivir, 62 miles northeast of Cadiz. Up to a short time ago Seville had the appearance of a picturesque Moorish town — narrow shaded streets, houses built around handsome courts and gardens, and fountain-studded squares. But now room has been made for wide, straight streets, and modern houses and shops. The great ornament of the city is its Gothic cathedral, one of the largest in Europe, containing paintings by Murillo and others, a great organ, the tombs of Ferdinand III. of Castile, and Ferdinand the son of Columbus, and fine bronze, sculptured, and wood-carving work. Close beside stands the beautiful tower called Giralda, 275 feet high. Another of the glories of Seville is the Alcazar, or Moorish royal palace, whose halls and gardens are surpassed only by those of the Alhambra. The museum and charity hospi-

tal both contain masterpieces by Murillo. The bull-ring can accommodate 18,000 spectators. The leading manufactures are cigars, iron, machinery, and pottery. Seville is also a large port of entry. The largest imports are chemicals and timber; the chief exports, lead, quicksilver, wine, copper, oranges, olives, olive oil, and corks. This city was the Roman Hispalis, a place of trade in those days. Under the name Ishbilia, from 712 to 1248 it was an important Moorish city. When Ferdinand III. of Castile captured it (1248) about 300,000 Moors abandoned the place. Population 146,205.

Sevres (*sāvr*), a small town in France, 2½ miles southwest of Paris, celebrated for its porcelain. The Sèvres vases are of great value and are known the world over. Painted glass and mosaic are also made. Porcelain has been manufactured under state control since 1756. See Garnier's *Soft Porcelain of Sevres.*

Sew'erage, a system of underground pipes or conduits for the removal of sewage or the rain water of a place. Sewerage is required for sanitary reasons in towns and cities. In the country where the population is not dense, the sewage can be disposed of without any elaborate system, though care must always be taken that the water supply is not contaminated. The construction of elaborate sewer systems is found in ancient cities, such as Babylon, Jerusalem, and Rome, but it is only within recent years that it has received the attention it deserves in modern cities. There are two systems in use, the combined and the separate system. In the combined system, the same pipes carry both the sewage and the storm water; in the separate system, called the "Waring system," there are separate pipes for the sewage and the storm water. In the latter system, the flushing is done by automatic flush tanks supplied with water from the town waterworks. The separate system is recommended by most sanitary engineers. The liquid sewage may flow due to the fall of the pipes, but in many cases pumping has to be resorted to. Among the methods of sewerage disposal are the following: (*a*) by dilution by discharge into a large mass of flowing water which is not used for a water supply, as at New York city and in towns on the lower Mississippi; (*b*) by running the liquid sewage over a large area of land and letting it oxidize in the air; (*c*) by chemical treatment so as to kill the organic life. In some cases, as at Berlin, Germany, the sewage is used to fertilize land which is cultivated. The city of Chicago has constructed a drainage canal at a cost of $33,000,000 to dispose of its sewage by dilution with a large body of water taken from Lake Michigan and emptied into the Illinois river.

Seward (*sū'ärd*), **William Henry,** was born at Florida, N. Y., May 16, 1801. He graduated at Union college in 1820, and became a lawyer. He joined the Whigs, being the party leader in the state senate from 1830 to 1834. Defeated for the governorship in 1834, he was elected in 1838 and again in 1840. He refused a nomination for a third term, and between 1843 and 1849, when he entered the United States senate, he gained an enviable reputation as a criminal and patent lawyer. While governor he had refused to surrender to the governor of Virginia three negro seamen, demanded on the charge of inciting a slave to escape. He was against the admission of Texas as a slave-holding state, and thus became marked as an opponent of slavery. His speech in defense of the negro murderer Freeman, Gladstone has called "the greatest forensic effort in the English language." Two terms as senator brought him to the front as an able and patriotic statesman, and when the Republican party was formed he became one of its first leaders. A strong candidate for the presidential nomination in 1860, Seward entered Lincoln's cabinet as its head, filling the office of secretary of state from 1861 to 1869. His moderation in the *Trent* affair, in which he advised giving up the envoys, as demanded by England, probably saved us from a war with Britain. His claim for damages from the English government, because of the *Alabama's* being fitted out in British ports, was sustained. His most important service to the country was, perhaps, his purchase of Alaska from Russia in 1867. In the spring of 1865, Mr. Seward was thrown from his carriage, breaking his jaw and an arm. While confined to bed, on the night of Lincoln's assassination, April 14, one of the conspirators made his way to the secretary's room and severely cut his face and neck. Seward died at Auburn, N. Y., Oct. 10, 1872. See *Life and Letters*, by his son.

WILLIAM HENRY SEWARD.

Sew'ing Machine, a machine which takes the place of the old-fashioned needle and thread in sewing garments. Several attempts were made in England and the United States to invent a machine for sewing, but without much success until Elias Howe, of Cambridge, Mass., patented his first machine in 1846. This machine uses the lock-stitch, which is used by most machines now, and from 1854 until the patents expired, Howe received a

"royalty" on every machine made, amounting to over $2,000,000. The lock-stitch makes use of two threads, one in the needle which pushes the thread down through the cloth, forming a loop; the other thread is wound on a bobbin and placed in a shuttle which carries the second thread through the loop made by the first one. The rotating hook is used instead of a shuttle in some machines. The loop-stitch is made by a curved needle which catches the loop made by the upper needle, and passes the thread through it. The most important improvement on Howe's original machine was made by Allan B. Wilson in his "four-motioned feed," which carries the work along, and has been adopted in all machines. There are a large variety of machines, differing slightly, and also those made for different purposes. The family sewing machine has revolutionized the work of the home; the button-hole machine cuts the hole, works it around, bars the ends, stops of itself when it is done, and makes 6,000 buttonholes in a day; the carpet-sewing machine, the cylinder machine for stitching mailbags, satchels, shoes, water-hose, and all kinds of leather work; the universal arm-feeder machine for making gloves; the basting and quilting machine; the pattern-stitching machine, are a few of the varieties in use. The largest sewing machine manufacturing company is the Singer, which has factories in Scotland, Austria, Canada, and the United States. Since 1878, when the principal patents expired, the price of sewing machines has been much reduced.

Sex'tant. See QUAD'RANT.

Sex'ual Spore (in plants), a spore which has been produced by the union of two gametes, that is, by fertilization. The general name of such a spore is "oöspore" or "fertilized egg." The name is unfortunate, since the spore is not sexual, the full phrase merely meaning a sexually formed spore. See SPORE.

Sey'mour, Hora'tio, was born at Pompey, N. Y., May 31, 1810. He studied at a military school and became a lawyer. In 1841, he entered the assembly as a Democrat, and was three times re-elected, in 1845 being chosen speaker. Defeated for governor in 1850, he was elected by a large majority two years later. The prohibition, know-nothing, and antislavery questions combined to defeat Seymour in the election of 1854. Seymour came into great prominence as one of New York's "war governors," holding this office during the draft riots in New York city. He presided over the Democratic national convention of 1868, which was held in New York. He had refused to be a candidate, but on the 22d ballot was nominated for the presidency by a sudden wave of enthusiasm, in spite of his loudly spoken protestations. He, however, received but eighty electoral votes. He died at Utica, N. Y., Feb. 12, 1886.

Sforza (*sfort'sȧ*), **Frances'co,** when twenty-three years old succeeded his father, Muzio Attendolo, the founder of the family, who was called Sforza, meaning "stormer" (of cities), in command of a famous band of *condottiere*, soldiers who sold their swords to the highest bidder. He fought at times for and against the pope, Milan, Venice, and Florence. He invented a better system of tactics than had been in use, and it soon came to be taken for granted that victory was certain for the party which had his support. So it came about naturally that the peasant chief won the hand of Bianca, the only child of the duke of Milan. Meanwhile, Sforza wrested Ancona and Pesaro from the pope. At the death of his father-in-law, in 1450, he gained the dukedom by a combination of stratagem and force. He made firm his authority over all Lombardy and several districts south of the Po, gained the favor of Louis XI., who gave him Savona and Genoa, and won the love of all his subjects. Though himself ignorant, he loved and protected letters. Sforza died March 8, 1466, at the age of sixty-five, and was followed by five dukes of the Sforza family.

Shad, an important food fish belonging to the herring family. The American shad is more valued than the European species. It ranges along the Atlantic coast from New England to the gulf of Mexico and ascends different rivers to spawn. This species has been successfully introduced on the Pacific coast. The full-grown fish is about thirty inches long. Its color is bluish, with silvery sides and usually a dark blotch behind the gill covers, and often several in a row behind this. These fish were among the first to be protected and artificially propagated by the United States Fish commission. The result of this care was to increase greatly their numbers. Statistics show that the catch of shad in 1890 was two and one-half times that of 1880.

Shad'dock, a native tree of the East Indies, which has been long grown in southern Europe. Its name is said to come from a Captain Shaddock, who introduced it into the West Indies in 1810. It has large, white flowers, and its fruit is also very large, sometimes weighing fron 10 to 14 pounds, roundish and pale yellow. The pulp is green, watery, and has a slight acid taste. Finer and smaller than the shaddock proper is the pomelo (also called pummelo, pompelmoose, and grapefruit), a variety rather larger than an orange, which bears its fruit in clusters. Both kinds are grown in Florida and sold in the north.

Shad'ow, a term in optics employed to denote the region immediately behind an opaque object which cannot be illuminated by a source of light in front of the opaque object. If the source of light is a single point, we find that the shadow is geometrically similar to

the outline of the opaque object, which is a consequence of the fact that light moves in straight lines in a homogenous medium. Such a shadow is exhibited in Fig. 1. In case the luminous source is not a single point, but an extended body, we find the shadow consists of two parts, one a central, dark area,

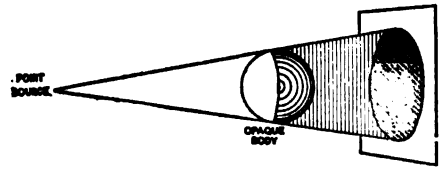


FIG. 1.

called the *umbra*, the other a partly illuminated border, called the *penumbra*. This is well illustrated in the case of the sun and earth shown in Fig. 2.

The penumbra, as will be evident from the figure, is merely that region which is illuminated by some but not by all points on the luminous source. The more nearly a source

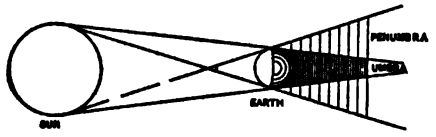

FIG. 2.

approximates a point the more nearly does the penumbra vanish. This almost complete absence of penumbra is well shown in the shadows cast by naked electric arcs.

In case a shadow is produced by a point source it is always accompanied by a series of diffraction fringes, called, after their discoverer, "Grimaldi's fringes." These are beautifully shown in the case of the naked arc light, where the first three fringes of the series are easily seen bordering the shadow of each twig on a tree, or the shadow of one's lead pencil cast on a sheet of white paper. For explanation of these fringes, see Preston's *Theory of Light* (Macmillan & Co.).

Shaf'ter, William Rufus, American general, was born at Galesburg, Mich., Oct. 16, 1835. In 1861, he entered the Union army as lieutenant in the 7th regiment of Michigan volunteers, and distinguished himself in the campaigns under McClellan in Virginia. He rose to be lieutenant-colonel and subsequently organized a regiment of colored troops, when he was brevetted brigadier-general for gallantry in action. When the volunteer army was disbanded at the close of the Civil war, he entered the regular army as lieutenant-colonel of the 41st United States infantry. After this he rose to be colonel, and then brigadier-general in 1897. On the outbreak of the war with Spain, he was put in command of an expedition setting out for Cuba, with the rank of major-general of volunteers. In May, 1898, he proceeded to Tampa, Fla., then to Cuba, where in June and July of that year he commanded the military operations which ended in the capitulation of Santiago de Cuba and the surrender of General Linares' army of over 20,000 men. He subsequently was in command of the department of California and Columbia, and was retired June 30, 1901.

Shag. See COR'MORANT.

Shagreen', a name given to the skins of sharks, rays, and other fish of the same family. These skins have a covering of small hard grains, which stand wear better than ordinary leather. Such skins when prepared like parchment, dyed and smoothed, have an attractive look, and are used for covering small caskets, cigar cases, spectacle cases, and small boxes. The name "shagreen," a Persian word meaning the back of a beast of burden, is also, and perhaps was first given to skins of horses, asses, and other animals, prepared by unhairing and scraping them. Each piece is then stretched on a frame and while still moist the seeds of a kind of chenopodium are sprinkled on the surface and forced in by the feet or a press. When the skin is dry the seeds are beaten out, leaving a pitted appearance. It is then pared down and placed in water till the pits swell and give the skin a pimpled look, like that of the shark. The covers of old Persian manuscripts are made of this shagreen, which is also used in the east for horse trappings and shoes. Wood is embossed sometimes in a like way.

Shah'jahan'pur, a city of British India, in the northwest provinces, is 100 miles northwest of Lucknow. It takes its name from Shah-Jehan, in whose reign it was founded in 1647. It was a hotbed of rebellion during the mutiny of 1857–58. Sugar is made and exported here. Population 78,522.

Shah-Jehan', the fifth of the Mogul emperors of Delhi, during his father's reign fought against the Rajputs, the Mohammedan states of the Deccan, and the Afghan tribes around Kandahar. For the last four years of the reign of his father, the emperor Jahangir, he was in open rebellion. Greeted as emperor by the nobles on Jahangir's death in 1627, he began a warlike and successful reign, conquering the Deccan kings of Ahmadnagur, Bijapur, and Golconda, though failing to recover Kandahar from the Persians. He was an able and just ruler, and a good business manager as well. The magnificence of his court was unequaled. The splendid "peacock throne" was built by his orders at a cost of nearly $35,000,000. Of other great public buildings which remain as a monument of his greatness are the grand Taj Mahal and the matchless "pearl mosque" at Agra, and the palace and great mosque at Delhi. He was deposed in 1658 by his son Aurung-zeb, and died in 1666.

Shak'ers, a religious sect. They arose in England about the middle of the 18th century, under the leadership of a tailor, James Wardlaw and his wife. They were Quakers, but professed to have had a revelation that the second coming of Christ was at hand, and that he would appear in the form of a woman. Ann Lee was one of their first converts, and her preaching drew such crowds that she and the Wardlaws were imprisoned. While in prison she professed to have received another revelation, which made her accepted as the female Christ whose reign had been promised. She was called Mother Lee, and is considered the head of the Shakers. The new kingdom, by revelation they learned, was to be set up in America, and the first settlement was made in Albany county, five miles from Albany. Their special doctrines are holding property in common; celibacy, or refraining from marriage; and the duty of labor. They have no creed, but are taught by special revelation. Jesus Christ they consider to be a divinely inspired man, representing the fatherhood of God, and Ann Lee as inspired to reveal the motherhood of God. They live in families of brothers and sisters, presided over by elders and elderesses, and deacons and deaconesses. They are very neat and industrious, and are known for their flower seeds and herbs which they raise for market. They make use of singing and dancing in their worship, which has given them their name, their own title being the United Society of Believers in Christ's Second Appearing. They have fifteen settlements in the United States, several of them called Lebanon, from New Lebanon, N. Y., which was the second established in the country. Their property is valued at $10,000,000, and they number 1,728 members. See ANN LEE. See also *The Shakers*, by Evans.

Shakes'peare, William, the greatest English poet and playwright, was born at Stratford-on-Avon, England, near the end of April, 1564, the eldest son and third child of John Shakespeare. He probably went to free school at Stratford. In 1578, his father, who could not sign his own name, but had risen to be high bailiff of Stratford, began to lose money. It is thought that soon after this William was taken out of school, and either apprenticed to a butcher or else worked as a lawyer's clerk. In 1582 Shakespeare married Anne Hathaway. He had three children, a daughter, Susanna, and twins — a boy, Hammet, who died when twelve years old, and a girl, Judith. Both daughters outlived their father. A story has come down to us, whether true or not is not known, that Shakespeare's first attempt at poetry was a ballad at the expense of a certain Sir Thomas Lucy, whose deer park the poet with some companions had robbed. The angry squire had prosecuted him, hence the satirical ballad. This unfortunate piece of poetry only made matters worse, and is said to have caused him to run off to London. Here, according to one account, he was employed holding at the playhouse door the horses of those theatre-goers who came without their servants. However, we know nothing certain of this part of his life. But in 1592 we find a reference to him in Henry Chettle's pamphlet *Kind-Harts Dream*, which appeared in that year. Chettle speaks of him as "exelent in the qualitie he professes" — that is, acting — and praises his "uprightness of deeling" and "his facetious grace in writing." In spite, though, of Chettle's approval, it is certain that Shakespeare was not great as an actor. He did, indeed, have the pleasure of playing several times before Queen Elizabeth, whom he compliments in *Midsummer Night's Dream*. However, the great poet was not himself a mere dreamer. He soon became a theatrical shareholder, by 1597 was able to buy a home at Stratford, and in 1602 purchased a place of 107 acres near by.

WILLIAM SHAKESPEARE.

Probably about 1589–90, Shakespeare began his career as a playwright. Among his earliest comedies were *Love's Labour's Lost*, *The Comedy of Errors*, and *The Two Gentlemen of Verona;* among his earliest historical dramas were the second and third parts of *Henry VI.*, *King Richard III.*, and *King Richard II.;* the first romantic tragedy was *Romeo and Juliet*. The other two early plays *Titus and Andronicus* and the *First Part of Henry VI.*, were, it is thought, partly or wholly the work of other hands. This greatest of series of plays thus begun was ended by *King Henry VIII.* (1612–13), which critics think was written in part by Fletcher.

While writing, Shakespeare still continued to act; he is known to have played a part in Jonson's *Sejanus* in 1603 or 1604, but it is not known when he left the stage. Shakespeare died at Stratford-on-Avon, April 23, 1616, which is supposed to have been the anniversary of his birthday. See Morley's *English Literature*, and *Wm. Shakespeare, a Critical Study*, by George Brandes.

Shale, a variety of sedimentary rock formed from beds of mud or clay. The mud or clay was originally deposited in lakes or in the sea. Compacted by its own weight or by the weight of sediments laid down above it and cemented by mineral matter deposited from solution by the waters percolating through it, the mud or clay becomes shale. Shales are of various degrees of hardness, according to the degree of cementation, compression, etc. Some shale breaks up into slabs appropriate for the construction of walks. Such shale is *flagstone*. Shale occurs in rock systems of all ages later than Archean. (See GEOLOGY.) Soft shale is often ground up into clay for the manufacture of brick, tiles, etc. When subjected to compression, great enough to render it partially metamorphic, shale is converted into slate. If the process of metamorphism goes still further, shale may be converted into crystalline schist, such as mica schist.

Sha'ler, Nathaniel Southgate, American geologist and paleontologist, was born at Newport, Ky., Feb. 22, 1841, and graduated at the Lawrence Scientific school, Harvard, of which he is now dean and professor of geology, and since 1884 geologist in charge of the Atlantic division of the United States geological survey, and member of the National Academy of Sciences. For seven years (1873–80) he had charge of the geological survey of Kentucky, devoting part of each year to that work, and publishing many volumes as the result of his labors. His writings embrace: *Nature and Man in North America; Aspects of the Earth; The Story of Our Continent; Sea and Land; American Highways; A First Book in Geology; The Interpretation of Nature; Features of Coasts and Oceans; Illustrations of the Earth's Surface; Domesticated Animals, their Relations to Man; The Nature of Intellectual Property;* and *Kentucky*, in the "American Commonwealths" series.

Shamo'kin, Pa., a borough of Northumberland county, eastern central Pennsylvania, 20 miles south of Danville, Montour county, and 18 miles southeast of Sunbury, the county seat. It is on the Lehigh valley, the Northern Central, and the Philadelphia and Reading railroads, in the center of the great anthracite coal region. It contains a number of manufactories, machine shops, foundries, and other industries, and is a progressive town. Population 18,202.

Shamyl (*shäm'il*), **Samuel,** a Caucasian leader, was born in Daghestan, about 1797. He was a priest, and was active in uniting the Caucausian tribes against the Russians. He was elected "imam" or head of the Lesghians and was soon in absolute power over the tribes of Daghestan. The new modes of warfare he introduced were very successful, but the Russians hunted him from fortress to fortress, putting to death all their prisoners, in the hope of killing Shamyl. During the Crimean war, the allies supplied him with money and arms, but after the war ended the Russians renewed the attack more vigorously and in several months succeeded in surprising and capturing Shamyl after a desperate fight in which all but 47 of his 400 followers were killed. He was given a home in Central Russia and a pension of $5,000. He died at Medina, Arabia, March, 1871.

Shanghai (*shäng-hī'*), a city in central China, in the province of Kiangsu, and its most important seaport, is twelve miles from the mouth of the Yangtse-Kiang river. The Chinese part of the city has narrow, dirty streets, and is surrounded by a wall, with crowded suburbs. The French and English portions on the north of the Chinese city, parallel with the river, are well lighted and paved, with handsome houses and fine public buildings. The city is strongly fortified. Shanghai was opened to foreign commerce in 1842, and has a large trade with great Britain, Hong-Kong, India, and the United States, in silk, tea, cotton, rice, sugar, paper, hemp, wheat, oils, flower, and fruit seeds, fans, and medicines. About 2,900 vessels enter the port annually. Population 615,300.

Shan'non, the largest river of Ireland, rises in the Cuilcagh mountains and flows into the Atlantic ocean on the southwestern coast of Ireland. From Limerick to the sea, a distance of 70 miles, it forms an estuary or inlet, which is ten miles wide at the sea. Large vessels can reach Limerick, and smaller ones ascend as far as Athlone, while two canals connect the river with Dublin.

Shans, a group of tribes living on the borders of Burma, Siam, and China. They are descended from one of the original races of China, and have been pushed southward, entering the valley of the Irawadi about the 6th century. The shans and the Laos are the same people, and both are closely related to the Siamese. They are a lazy, gay people, fond of gambling and cock fighting, though not unwarlike. The women enjoy equal freedom with the men; slavery in a mild form exists, and serfdom is universal. Their religion is Buddhism. Their country is a succession of wide river valleys separated by ridges, with extensive forests of teak, with iron, rubies, silver, gold, copper, coal, and petroleum among its minerals. The trade of the country is largely in the hands of the Chinese, but the Siamese are noted for their chased work in gold and silver. The first important Shan state was the Mau kingdom, whose ruler conquered all Burma, and parts of Siam, and the Malay peninsula. Mau princes ruled until 1554, when most of the Shan states became tributary to the emperor of Pegu. In 1774–77, Siam conquered the

southern Shan states. The Shans governed by Siam are estimated at 2,000,000, but the numbers ruled by China, and of the independent tribes are unknown. The Shans, in the native territories of British India, number approximately 375,000. See *Among the Shans*, by Colquhoun; *Siam and Laos*, by Cheek.

Shark, the name for any member of a large group of cartilaginous fishes with external gill clefts. The sharks, rays, and skates are united into a large subclass of fishes called *Selachii*. The sharks have gill openings along the sides of the neck, while the rays and skates have them on the under surface of the expanded head. Sharks vary in size from the dogfishes (which see), about three feet long, to the large basking shark, 35 or 40 feet long. They are very voracious and destroy many fish. With four exceptions they are all carnivorous. They are more numerous in warm seas, but are widely distributed. The great white shark, which reaches a length of 25 feet, is the so-called man-eater shark. These animals are common in warm seas and occasionally wander to our coasts. They follow ships for great distances to obtain the refuse that is thrown overboard. The great blue shark, from 15 to 20 feet long, shares with the foregoing, the title of man-eater. Among the sharks found along the Atlantic coast of the United States are: the dogfish sharks, about 3 feet long; the sand sharks, about 6 feet long; the mackerel sharks, 8 to 15 feet long; the hammerhead sharks, 15 to 20 feet long; the small hammerheads, 3 to 5 feet long; the thresher sharks, about 20 feet long, and other sharks that appear occasionally. The sharks represent a very ancient family of fishes, with many clues to ancestral history. Their development is of special interest to naturalists. Their fin rays are used in China for making gelatine, their livers produce oil, and their rough skin, called shagreen, was formerly used in place of sandpaper.

WHITE SHARK.

Shaw, Henry W., an American humorist, was born at Lanesborough, Mass., in 1818. He began to publish his humorous sketches in 1863, under the name of "Josh Billings." They consist of quaint maxims, spelled by sound, and have been very popular. He was a favorite lecturer, and published four volumes of his sketches, and a yearly *Farmers' Allminax*. He died at Monterey, Cal., Oct. 14, 1885.

Shawl, an outer garment or outside wrap, which in its present form has been used for centuries. Cashmere shawls are made of the underwool of the cashmere goat of Tibet. The thread is very fine, selling at $10 a pound, and the colors used in dyeing are permanent, being mostly from native dyes. Some of the shawls are embroidered by hand, but many have the pattern woven into them. Three or four weavers work at one loom, with wooden needles instead of shuttles, and they work on the wrong side of the shawl, where the needles hang in rows. Five shawls are usually made in one year, at one loom, though some of the more elaborate take a year in the process of manufacture. The best cashmere shawls are very high priced, being often valued as high as $1,500 in India. The most beautiful shawls of Persia are made of silk. The manufacture of shawls has been extensively carried on in France, mainly at Paris, Lyons, and Nîmes, and also at Paisley, Scotland, and at Lowell, and other places, in the United States.

Shawnees', a tribe of American Indians, belonging to the Algonquin family, which first settled in New York, Pennsylvania, and Ohio, but were driven west by the Iroquois. They helped the French against the English, and in 1812 sided with the English against the United States. They moved to Missouri and Kansas, and to the Indian territory.

Shear'water, a class of ocean birds of the petrel family. They are brown birds, about a foot long, with webbed feet. They are night birds and spend most of their time in flight, but can swim easily. Their single white egg is laid in a hole in the ground. The sooty shearwater is found on the North Atlantic, but goes south for its breeding grounds. The great shearwater, Manx shearwater of Iceland and Greenland, and the dusky shearwater found at the Bermuda and Bahama islands, are other varieties.

Sheboygan (*she-boi'gan*), a city of Wisconsin, is a port on Lake Michigan, at the mouth of the Sheboygan river, and about fifty-three miles north of Milwaukee. It has a good harbor, and foundries, tanneries, breweries, and factories of shoes, chairs, and toys. Population 22,962.

Sheep, a group of quadrupeds, forming with the goats a natural sub-family. Wild sheep are natives of either mountainous regions or of high table-lands. They live in flocks, and take to flight at the call of their leader, on the approach of danger, though they can defend themselves when necessary. The ram can carry on a contest with a bull, and is always ready to attack a dog. The wild sheep have short wool, covered with long, straight hair.

SOUTHDOWN.

The great mountain sheep found in central Asia, with horns sometimes six feet long, and the Rocky mountain sheep, or bighorn of North America, are among the largest varieties of wild sheep. The common sheep has sprung from the wild animal, and was one of the first animals domesticated by man, as we read in Genesis that Abel was a "keeper of sheep." Their wool was early used in making cloth, the skin for writing on, the milk for a drink, and the flesh for food. They pasture on hilly ground, and thus can be profitably raised on land that is not well adapted to raising crops. The first sheep were introduced into the United States in 1609, and Merino sheep, now the principal variety, in 1801. The Merino sheep was brought from Spain, and owes its value to its fine, soft, silky wool. New York, Pennsylvania, Ohio, Texas, Missouri, California, Illinois, Indiana, Michigan, and Wisconsin, are among the states most largely engaged in sheep raising. The wool or fleece is usually cut off by hand, a shearer "clipping" from twenty-five to thirty sheep a day, but a sheep-shearing machine has been invented and is used in Australia. The Iceland sheep, with three, four, or even five horns, the broad-tailed sheep found in Asia, its tail weighing from 70 to 80 pounds, and carried often on a small carriage, and the Astrakhan and Circassian sheep, remarkable for their fine wool, are noted varieties.

Sheeps'head, a bony fish common along the Atlantic coast and regarded as one of our best food-fishes. They are distinguished by wide cutting teeth, in the front of their jaws, and by grinding teeth behind. Their food is hard-shelled animals, young oysters, other mollusks, barnacles, and the like. They vary in size from two pounds, in the south, to fifteen pounds in the north, but the average size taken is about seven pounds. They range from Cape Cod to Texas. The fresh-water drum and some other fishes are locally called sheepshead.

Shef'field, a manufacturing city of England, is situated in Yorkshire, where the Sheaf and Don rivers unite, thirty-eight miles south of Leeds. The town is well built, over $2,000,000 having been spent in street improvements in 1878. The Church of St. Peter, built in the reign of Henry I.; St. Mary's church, with a fine spire; Albert hall; Norfolk market, built by the duke of Norfolk at a cost of $200,000; music hall, and new town hall with a statue of Vulcan, are among the noticeable buildings. Wesley college, Firth college, Mechanic's institute, Athenæum, St. George's museum, founded by Ruskin, and the Mappin art gallery, are some of its institutions. Sheffield has long been noted for its cutlery, the "Sheffield whittle or knife," being spoken of by Chaucer. The Cutlers' company was founded in 1624, and the cutlers' annual feast dates from that time. The manufactures of the present day include brass, iron, and steel articles of every kind, and also armor plates, railroad springs, tires, and rails.

Sheffield from the Saxon times was the capital of a district belonging to a Norman family named Lovetot, who built a hospital, a mill, and a bridge over the Don. It passed by marriage to the Furnivals, and suffered in the wars of the barons, the castle being burned and many of the people slaughtered. During the Wars of the Roses, the Shrewsbury family, the ruling family of the country, sided with the house of Lancaster. The castle of the earls of Shrewsbury was a fortified building, covering four acres of ground, and here Queen Mary of Scotland was imprisoned for fourteen years. In 1644, the castle was taken by the army of parliament, and soon after torn down. In 1864, a reservoir gave way, with terrible effect; 250 lives were lost and millions of property destroyed. Population 364,243. See *Sheffield, Past and Present*, by Gatty; *Reminiscences of Old Sheffield*, by Leader.

Shel'drake, a large Old-World, salt-water duck of peculiar breeding habits. The common European sheldrake is about the size of a mallard and of brilliant plumage. The head and neck are green with a white collar, and a broad chestnut band below this, over the chest and back. The shoulders and middle of the under parts are black, the wing spot is green, and the bill and its knob are bright carmine. These birds breed in sand dunes, in chambers made by themselves or by rabbits. Nest-chambers, two or three feet deep, are made in a grassy hillock. Each nest-chamber is covered by a movable lid of sod. The nest-chambers are clustered and connected by galleries provided with a common entrance. Sometimes ten or twenty nest-chambers will be found in one group. Inhabitants of the sandy islands of the west coast of Jutland plunder these nests by removing the lid. All eggs above six in number are taken, and also the soft down with which the nests are lined. The sheldrakes of the United States are mergansers or fish-ducks, and belong to a distinct group.

Shell, the hard covering of an animal or an egg. While shells exist in great variety, those of the mollusks are the most typical — for example, those of the common snail and the common clam. These shells are secreted by gland cells in the outer covering of the animal. The outside of a clam shell is a horny layer, differing materially from the inside, which is always pearly. There is also a middle layer, forming a large part of the shell, and composed of regular prisms. The clam shell has, therefore, three distinct layers — outer, middle, and inner. The inner pearly layer is secreted by cells in the general surface of the mantle, while both the outer and middle layers are formed by cells in the thickened margin of the mantle. The substance of the shell is largely carbonate of lime,

but the outer layer is horny rather than limy. The immense variety of sea-shells are formed in a similar way, and the shells afford a means of identifying the animals that formed them. The shell or test of the sea-urchin is made of six-sided plates of carbonate of lime, secreted by the cells of the outer covering of the body. The shell of the lobster and the crayfish, although formed by a similar process, is, nevertheless, made of a horny substance called chitin. This is also the hard covering of beetles and other insects. The shells of eggs are formed by secreting cells within the walls of the oviduct or tube through which the egg passes before it is laid. The shell of the hen's egg has a deposit of carbonate of lime in it. Some minute animals (Radiolaria) have shells formed of quartz or silica, and some secrete a horny covering. The shells of mollusks have been used for money in South Pacific islands, for ornaments, jewelry, for making pearl buttons, etc. The study of shells is called Conchology. See Woodward's *A Manual of the Mollusca* (4th ed. 1880).

Shell, a hollow projectile, filled with powder, which is arranged to explode at the right moment, and which are fired from cannon or other large guns. Shells were at first made of cast iron and fired from mortars, and called bombs. Used first by the sultan of Gujarat in 1480, they were in general use by the middle of the 17th century. In 1842, Shrapnel shells, named after the inventor, were used in the Peninsular war. They are filled with bullets instead of powder, and a small charge, just enough to open them when set on fire by a slow match or fuse. Other shells were filled with pieces of iron and iron rings, but the Shrapnel shell is the one most used in warfare. It is especially a man-killing shell, while the common shell was used to destroy material. Carcasses are shells filled with some burning material which will set fire to buildings; hand grenades are small shells filled with gunpowder and exploded by a time-fuse, which are thrown by hand. See CANNON.

Shel'ley, Percy Bysshe, an English poet, was born Aug. 4, 1792, in Sussex, England, and studied at Eton and Oxford. At Eton he wrote two romances, and, with a fellow-student, published a volume of verse. While at Oxford with his friend, James Hogg, he published another volume of verse, and in 1811 a pamphlet on the *Necessity of Atheism*, for which the two friends were expelled from University college. These early poems are almost unknown now, and only show the erratic nature of the poet, whose mother, when a school was recommended to her as a place where a boy was taught to think for himself, exclaimed: "Think for himself! I only hope he can be taught to think as others do." At nineteen, he married Harriet Westbrook, a girl of sixteen, and lived in Edinburgh and Keswick, where he became a friend of Southey and DeQuincey, and a disciple of Godwin. His plans for reforming the world he started to carry out by scattering through Ireland his *Address to the Irish People*, and other pamphlets, and sending adrift in bottles and boxes his *Declaration of Rights*. His *Queen Mab*, written while living in Wales, where he had gone when his servant was imprisoned for nailing up in public places his *Declaration*, was at first privately distributed, because of its religious and political heresies. He left his wife in March, 1814, and in July, 1814, took a journey through France and Switzerland with Godwin's daughter Mary and a relative, Miss Clairmont. After his grandfather's death his income became fixed, and he retired to Bishopsgate, near Windsor Forest, where *Alastor* was written. His *Mont Blanc* and *Hymn to Intellectual Beauty* are records of his visit to Lake Geneva, where he met Byron. After the death of his wife he married Mary Godwin, and carried on a long suit to get possession of the children of the first marriage, but was allowed only to appoint their guardians and tutors. His *Revolt of Islam* was his last work in England, when he left for Italy in 1818. At Rome, Florence, Naples, Leghorn, and Pisa he spent the rest of his life, surrounded by a circle of friends, which included Byron, Trelawney, and Leigh Hunt, and wrote *Prometheus Unbound*, *The Cenci*, *Adonais*, and some of his finest lyrics, and in prose a *Defense of Poetry*. Among his most beautiful minor poems are *Ode to the West Wind*, *The Cloud*, *The Sensitive Plant*, and *The Skylark*. Shelley and his friend Williams were drowned in a sudden storm on the gulf of Spezia, July 8, 1822, and the ashes of his body, which was burned in the presence of Byron, Leigh Hunt, and Trelawney, were buried at Rome. See *Lives*, by Hogg, Rossetti, Sharp, and Lady Shelley.

Shenandoah (*shĕn'nă-dō'ă*), **Pa.,** a borough of Schuylkill county, in the heart of the anthracite coal region, on the Lehigh Valley, the Pennsylvania, and the Philadelphia and Reading railroads, 13 miles northeast of Pottsville, the county seat, and 84 northwest of Philadelphia. In the 15 colleries in the immediate neighborhood, a large number of miners are employed, which greatly aids the town. It has, besides a number of hat and cap factories and other industries, a brewery, several banks, good schools, churches, etc. Population 20,321.

Shenando'ah, a river in Virginia, draining the valley between the Blue Ridge and the Alleghenies and running northeast 170 miles to the Potomac, at Harper's Ferry. It passes through the richest part of Virginia, and was occupied by both armies, at different times, during the Civil war, and was the scene of numerous battles. See SHERIDAN.

Shere Ali (*shĕr ă'lē*), khan or amir of Afghanistan (1863–79), was born in 1825, the

son of Dost Mohammed, amir of Kabul (1826–63), under whom occurred the massacre of the English army in the Khyber Pass. Shere Ali died in Russian Turkestan, February, 1879. He had many vicissitudes as a ruler, from the rivalry of those who aspired to the Afghan throne, and from the intrigues of Russia, which sought to bring Afghanistan (or Afghan Turkestan) within the sphere of Russian influence. In 1866, he temporarily lost his throne, but regained it two years later. In 1870, the amir had trouble with his son Yakub Khan, heir apparent, who headed an insurrection, which Shere Ali suppressed, and confined Yakub a close prisoner in Kabul. Later on, Shere Ali welcomed a political mission from the tsar of Russia, but declined to receive an English embassy; this aroused the fear of England for its Indian frontiers. Negotiations were fruitless, and the English, pushing forward, occupied Jelalabad and Kandahar. At this, Shere Ali fled to Russian territory, but his son Yakub, now (1879) proclaimed khan, with his tribesmen, resisted the further advance of the British; but peace was declared at Gandamak on condition of the amir receiving a British resident at Kabul. This resident was treacherously slain, however, and a religious war was proclaimed. Kandahar now was garrisoned by British troops, and to relieve them Sir F. (now Lord) Roberts made his famous march to Kandahar, routed the Afghans, and installed the amir, Abdur Rahman (who died Oct. 1901), on the throne.

Sher'idan, Philip Henry, American general, was born at Albany, N. Y., March 6, 1831, his parents having arrived from Ireland a few weeks previous to his birth. Soon after his birth the family removed to Ohio, where his boyhood was spent. He was appointed a cadet at West Point, where he graduated in 1853 and was assigned to the 3d infantry as brevet second-lieutenant. When the Civil war broke out, he was a captain in the 13th infantry and was made quartermaster of the Federal army in Missouri. Seeking more active service he was assigned as colonel of the 2d Michigan cavalry, where he soon displayed the qualities which later won him worldwide fame. He was soon placed in command of a brigade and then of a division of the army of Ohio. He took part in the battle of Perryville, and won promotion to major-general by his brilliant service in the bloody battle of Stone river, Jan. 2 and 3, 1863, where his division lost over 1,600 men. He also distinguished himself at Missionary Ridge. When General Grant was placed at the head of all the armies, he gave Sheridan command of the cavalry of the army of the Potomac. Here he soon distinguished himself in the Wilderness campaign by his celebrated raid around the Confederate army, cutting their lines of communication, advancing nearly to Richmond, defeating the Confederate cavalry at Yellow Tavern, under their renowned leader, General Stuart, who was killed in the fight. In July of that year, when a strong Confederate force under General Early had defeated the Federal army in the Shenandoah valley, penetrating into Maryland and threatening Washington, General Grant saw the necessity of putting that department in the hands of an able general, and in August he placed Sheridan in command in the Shenandoah, with instructions to drive the Confederates out of the valley. Sheridan attacked Early at Winchester, and again at Fisher's Hill, defeating him at both points, capturing 5,000 prisoners and many guns, and pursued them to Stanton. In recognition of this service, he was made brigadier-general in the regular army. Early's army, receiving large re-enforcements from General Lee, again advanced into the valley, surprised the Federal army at Cedar Creek in the early morning of October 19, and drove them back in confusion. Sheridan, who had been called to headquarters at Washington, had reached Winchester on his return, when he heard the guns twenty miles away. Hurrying forward, he reached the field and met his troops retreating in confusion before the enemy. Speedily forming a line to stop stragglers, he rode forward waving his hat and shouting: "Face the other way, boys; we are going back." Confidence was restored, the lines were re-formed, and at 3 P. M. they moved back upon the enemy. The result was the total rout of Early's army, which was pursued up the valley for thirty miles. For this victory he was promoted to be major-general in the regular army, and received the thanks of congress. Returning to the army of the Potomac, in March, 1865, he was conspicuous under Grant in the operations before Petersburg, and in the final battles preceding Lee's surrender. It was his superior generalship at Five Forks, where he entrapped and routed the Confederate right under Pickett and Johnson, capturing 5,000 prisoners, which compelled the evacuation of Petersburg. After the close of the war, Sheridan was placed in command at New Orleans, and later of the department of the Missouri, with headquarters at Chicago. When Sherman was made general, Sheridan was made lieutenant-general, and when Sherman was retired, a special act of congress conferred the further rank of general upon Sheridan. As a field commander Sheridan was unapproachable. Filled with the ardor of battle, so that it was said he raged like a lion, yet his skill was equal to his

GEN. P. H. SHERIDAN.

courage. He never lost a battle; and stood, after Grant and Sherman, one of the greatest of northern generals. Grant said of him: "As a soldier there is no man living greater than Sheridan. He belongs to the very first rank of captains, not only of our army, but of the world. I rank him with Napoleon and Frederick, and the great commanders of history." Shortly before his death, at Nonquitt, Mass., Aug. 5, 1888, Sheridan wrote his *Personal Memoirs*, in two volumes.

Sher'idan, Richard Brinsley Butler, a British dramatist, was born at Dublin, Sept. 30, 1751. He made his first appearance in literature in a farce, called *Jupiter*, written in connection with a school friend. After marriage he settled in London and produced his first and most popular play, *The Rivals*, in 1775. *The School for Scandal* appeared at Drury Lane theatre, of which Sheridan had become owner, and brought prosperity to it by its popularity. He entered parliament, became undersecretary for foreign affairs in 1782, and secretary to the treasury in 1783. His high reputation as a speaker rests mainly on his three great speeches during the impeachment of Warren Hastings. His first speech produced such an effect in the house of commons that the house decided to adjourn without voting, because they were too much under the influence of the brilliant orator to vote impartially. He was in parliament thirty-two years, and was known as a strong speaker, but only equaled this first great speech in a magnificent oration in 1794 on the French Revolution. The Drury Lane theatre became too small, and a new one, built in 1794, was burned in 1809, which loss left Sheridan in great poverty. He died July 7, 1816, and was buried in Westminster Abbey. See *Life*, by Oliphant, in the "English Men of Letters" series; *Sheridan and His Times*, by Moore.

Sher'man, John, an American statesman, brother of General Sherman, was born at Lancaster, O., May 10, 1823. He was admitted to the bar in 1844, and in 1855–61 he was in congress as a representative from Ohio, and chairman of the committee of ways and means from 1860–61. He was elected United States senator in 1861, and continued to serve the state of Ohio in that capacity, except during the presidency of Hayes, when he was secretary of the treasury. In the Civil war, he raised a regiment in Ohio, largely at his own expense, and, as chairman of the committee on finance in the senate, helped to plan measures for sustaining the public credit. The bill for the reconstruction of the seceded states was the joint work of Thaddeus Stevens and John Sherman. He was appointed Secretary of State by President McKinley in 1897, but resigned because of failing health. Of much interest are his *Recollections of Forty Years in the House, Senate, and Cabinet*, published in 1895. He died Oct. 22, 1900. See *Life* by Bronson.

JOHN SHERMAN.

Sher'man, Roger, an American statesman, was born at Newton, Mass., April 19, 1721. He was a shoemaker by trade, then a surveyor of lands, and finally a lawyer and judge. He was in both the Continental and the United States congress from 1774 to 1791. He was of the committee that drafted the Declaration of Independence, was one of the signers of it, and was influential in having it ratified by the state convention of Connecticut, where he had resided since 1761. He died at New Haven, Conn., July 23, 1793.

Sher'man, Tex., a city, the capital of Grayson county, in a rich grain, cotton, and fruit-producing district in Northern Texas, sixty-one miles north of Dallas. It is well supplied by railways, and is an important shipping and manufacturing center. Its industries include a large cotton-seed oil mill, several foundries and machine shops, brick and marble works, planing mills, carriage, furniture, broom, and mattress factories, etc. Here are the Austin college for boys, the North Texas Female college, Sherman institute, the St. Joseph (R. C.) academy, and other institutions. Population 10,243.

Sher'man, William Tecum'seh, American general, was born at Lancaster, O., Feb. 8, 1820. He was the son of Judge Charles R. Sherman, who died in 1829, leaving his family in rather straitened circumstances. William was brought up in the family of Hon. Thomas Ewing, of Lancaster, where he attended the Lancaster academy. From there he went to West Point, where he graduated in 1840, standing sixth in a class of forty-three. He served as second lieutenant in the 3d artillery against the Seminole Indians in Florida in 1840 and 1841. After that, he was stationed at Ft. Moultrie, South Carolina, until 1846, when he was sent to California, where he served through the Mexican war and until 1850, having been made captain

GEN. W. T. SHERMAN.

in 1848. He was married in 1850 to Ellen Boyle Ewing, the daughter of the Hon. Thomas Ewing. In 1853, he resigned his commission and became a partner in the banking house of Lucas, Turner and Co., of San Francisco. In 1858, he took up the practice of law in Leavenworth, Kan., but the next year became superintendent of the Military academy, at Alexandria, La. This position he held until Louisiana seceded in 1861, when he resigned, and coming north was appointed colonel of the 13th infantry in June, 1861. He commanded a brigade in the first battle of Bull Run, and for gallantry in this engagement was made brigadier-general of volunteers Aug. 3. He was next assigned to a command in Kentucky where, finding his small force entirely inadequate to meet the Confederate army under Breckinridge, which confronted him, he earnestly represented the situation to the secretary of war, stating that it would require 60,000 men to expel the Confederates from the Kentucky line, and 200,000 men to move offensively through to the Gulf, and clear the Mississippi valley. For this statement he was charged with being "crazy," but subsequent events proved that his judgment was sound. Sherman was next ordered to Paducah, Ky., and after the capture of Ft. Donelson, was put in command of the 5th division of Grant's army. In the battle of Shiloh, April 6, 1862, Sherman held the key to the position, and by his brilliant generalship saved the day. He was in the thickest of the fight, had three horses killed under him, and was twice wounded. Grant said, "Sherman, with raw troops, held the key to the Landing, and to his individual efforts I am indebted for the success of the battle." In recognition of this service he was made major-general of volunteers May 1, 1862. His next important service was in the operations connected with the siege and capture of Vicksburg. In command of the 15th corps, he went down the river from Memphis; the plan being that Sherman should attack Vicksburg, while Grant should move on Jackson. But the capture of Grant's supplies at Holly Springs brought him to a halt, and permitted the enemy to re-enforce Vicksburg. In the meantime, Sherman advanced on the city, which he assaulted Dec. 29, but found it impregnable to the force he had under him. A few days later, in connection with General McClernand, he stormed Arkansas Post, capturing 7,000 prisoners. In the subsequent battles in the campaign against Vicksburg, Sherman bore a conspicuous part. When Grant's rear was threatened by Gen. Joseph E. Johnston, Sherman was sent against him and captured Jackson, Miss., dispersing Johnston's army. When Grant was sent to succor Rosecrans, after the battle of Chickamauga, he called Sherman to his aid, and placed him in command of the army of the Tennessee. Here he took part in the battle of Missionary Ridge, where Bragg was defeated and driven into Georgia. He was next sent by Grant to the relief of Burnside, who was besieged by Longstreet at Knoxville. When Grant was called to the head of the army, Sherman was given command of the department of Mississippi, and of the three armies of Ohio, Cumberland, and Tennessee. On May 5, he began his great campaign against the Confederate army under Johnston, which ended in the capture of Atlanta, and which included the battles of Dalton, Resaca, New Hope Church, Kenesaw Mountain, and Peach Tree Creek. After the occupation of Atlanta, the Confederate army, under Hood, having moved westward, Sherman sent General Thomas back to Nashville to confront Hood, while with an army of 65,000 men, he began his famous "march to the sea," which was accomplished by the capture of Savannah, Dec. 21. On Feb. 1, 1865, he began his march northward through the Carolinas, closing with the surrender of Johnston's army, April 26, at Durham Station, North Carolina. On May 24, at the head of his magnificent army, which had just completed the march of nearly 2,000 miles in a hostile country, he passed in review before the President, General Grant, and thousands of spectators on Pennsylvania avenue, Washington.

After the war, General Sherman was appointed to the command of the second military division, with headquarters at St. Louis. When Grant was made general in 1866, Sherman was promoted to lieutenant-general in the regular army, and on Grant becoming President in 1869, Sherman was appointed general of the army of the United States. This position he held until, at his own request, Nov. 1, 1883, he was relieved and succeeded by General Sheridan. He died at New York, Feb. 14, 1891. General Sherman's qualities have thus been summed up by one well competent to judge: "Above all his other excellencies shone his promptitude, celerity, and immeasurable activity. What for some commanders were winter quarters were to him a bivouac. Always ready for the start, indefatigable on the march, omnipresent in battle, relentless in pursuit, General Sherman not only made himself more feared but more respected by the enemy than any general in the national armies save, perhaps, the one who commanded them all." In 1875, appeared *Memoirs of General W. T. Sherman, by Himself*.

Sher'ry. See WINE.

Sher'wood For'est, a stretch of hilly country in Nottinghamshire, England, about twenty-five miles long and from six to eight miles wide. It was formerly a royal forest, and is the scene of many of the exploits of the famous Robin Hood. It is almost entirely cleared now, and occupied by country seats and parks. See *Nottinghamshire and Sherwood Forest*, by White.

Shet'land, a group of islands north of Scotland and forming one of its counties. There are more than 100 of them, twenty-nine being inhabited. There are no trees and only one-sixth of the soil is cultivated, but the cliff scenery is very fine, and the coast so broken that no spot is more than three miles from the sea. The fisheries form the leading industry. The little shaggy Shetland ponies are well known. Shetland, the *Ultima Thule* of the ancients, belonged to Scandinavia until 1468, and the Norse language was still spoken in Foula in 1774. Area 550 square miles; population 30,000; chief town, Lerwick. See *The Pirate*, by Scott, and *Orkneys and Shetland*, by Tudor.

Shibboleth (*shib'bō-lĕth*), a word used by the Gileadites under Jephtha after their victory over the Ephraimites, to test the fugitives at the ford. The Ephraimites could not pronounce the "sh," and called it "sibboleth," and so were easily known. The word is still used in the sense of a test.

Shields, South, a town of England, is a seaport in Durham, at the mouth of the Tyne river, nine miles northeast of Newcastle-upon-Tyne. The coast is fine, with picturesque caves hollowed out in the cliffs. The south pier, a gigantic breakwater 5,218 feet long, was begun in 1854. The harbor is lined with ships and boat yards, iron, glass, alkali, and rope works, and paint and varnish factories. The Tyne docks also, which cover fifty acres, are near the town. The first lifeboat was built at South Shields and used first in 1790. The town was a military station in the time of the Romans; salt works were established as early as 1489, and glass works in 1619. Population 80,000.

Shill'aber, Benjamin Penhallow, American humorist, known by his pen name, "Mrs. Partington," was born at Portsmouth, N. H., July 12, 1814, and died at Chelsea, Mass., Nov. 25, 1890. Taking early in life to a printing office, he advanced from that to journalism, and was successively editor of the Boston *Post*, the *Saturday Evening Gazette*, and of a comic journal, *The Carpet-Bag*, to which John G. Saxe was a contributor. In 1854, he published *Life and Sayings of Mrs. Partington*, which gave him a wide reputation. This was followed by *The Partingtonian Patchwork;* by *Rhymes with Reason and Without;* by *Lives in Pleasant Places;* by *Ike and His Friends;* by *Cruises with Captain Bob;* by *Wide-Swath;* and by *Ike Partington's Juvenile Series.* He died at the age of seventy-six.

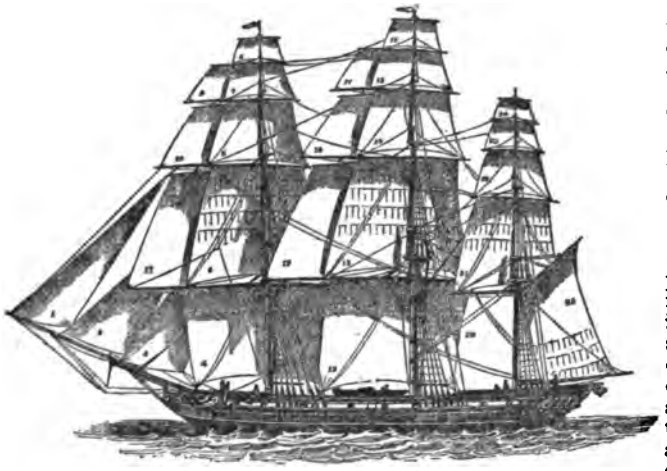
Shi'loh, a town of the tribe of Ephraim, the home of Eli and Samuel, and the religious center of Israel for many years. The site is now occupied by a ruinous village in Palestine, twenty miles northeast of Jerusalem.

Shi'loh, Battle of, one of the most desperate battles of the Civil war, named for a log meetinghouse, two miles from Pittsburg Landing on the Tennessee river. The battle between the Confederates under General Johnston, and the Federal army under Grant, lasted two days, on the first of which the Federals were driven steadily back, but regained the lost ground on the next day, when re-enforced by Buell's command. General Johnston was killed and the Confederates retreated, with nearly equal losses on both sides. The battle began Sunday, April 6, 1862, and is sometimes called the battle of Pittsburg Landing.

Shin'toism. See JAPAN.

Ship, the name given to most sea-going vessels, but usually applied to sailing vessels, those moved by steam being called steamers. The art of building vessels that could be moved on water is very ancient, beginning probably with the simplest forms, such as the canoe and raft, though Noah's ark was more elaborate, and what is remarkable, its proportions are those still considered the best for all purposes by shipbuilders. It was six times longer than its width, and three-fifths of its breadth deep. The nations living around the Mediterranean early learned the art of sailing on the ocean, building wooden vessels moved by oars, as the galleys and triremes, and using sails. Their ships in a storm were often bound outside with heavy ropes, or even with iron bands carried for the purpose, as the ship in Paul's voyage had to be "undergirded." The Scandinavians were early known as fearless sailors, and their warships were made stronger than the galleys used on the Mediterranean, as they had a fiercer ocean to sail over. The English navy was first made of importance by Alfred the Great, who introduced galleys with forty or sixty oars, to defend the coasts against the northern vikings. The crusades made necessary still larger ships and the use of sails, and the *Great Harry*, built by Henry VIII., is considered to be the first ship of the present English fleet. Spain, Portugal, Venice, and the Netherlands had large navies in the 15th century. The adventurous spirit which led to the discovery of America and the passage around the Cape of Good Hope increased the demand for improved sailing vessels, and France, Spain, Sweden, and Denmark were noted for their ships. The first ship built in the United States was the *Virginia*, at the mouth of the Kennebec river, in 1607, and shipbuilding soon became quite an industry in New England seaports. Their ships were original in plan, and built for special purpose, such as frigates for war vessels, schooners and sloops for coast service, whalers for the whale fishery, and the "clippers" for the China and India trade. The clipper ship, the *Great Republic*, was the

largest merchant vessel ever built, and many of them equaled in speed the steamships of the period. A ship, strictly speaking, has at least three masts with square sails. Brigs are smaller than ships, having two masts with square sails. Schooners have two or three



SAILS OF A FULL-RIGGED SHIP.

masts with a variety of sails; and a sloop has only one mast. The cutter is a form of the schooner, and the barkentine is a combination of the ship and the schooner. The introduction of iron and steel into shipbuilding, and the use of steam have changed the mode of building and the size and form of ships, though there is a tendency of late years to revert to sailing vessels. England has been the great shipbuilding country, but Germany, France, Italy, and America are increasing their production largely. See GALLEY, TRIREME, YACHT, STEAMBOAT, NAVY, etc. See *Shipbuilding Industry of the United States*, by Hall, and *Modern Shipbuilding and the Men Engaged in It*, by Pollock.

"Ship'ton, Mother" (Ursula Southiel), a famous English prophetess, was born in Yorkshire, in July, 1488. The earliest record of her prophecies is a pamphlet of 1641, in which she foretells the death of Lord Percy and Wolsey, saying that Wolsey should never reach York. As Wolsey was arrested at Cawood, a few days before his installation as archbishop of York, this prophecy is considered to have been fulfilled. A collection of ancient and modern prophesies in 1645 includes Mother Shipton's prophecies, and a comedy on the subject dates from about 1660. In 1862, a set of doggerel rhymes was circulated, purporting to be Mother Shipton's prophecies, in which it was foretold that the world would come to an end in 1881. It was really written by Charles Hindley. See *Mother Shipton Investigated*, by Harrison.

Shir'as, George, American jurist, and associate-justice of the United States supreme court, was born at Pittsburg, Pa., Jan. 26, 1832, and educated at the Ohio university, Athens, O. He subsequently graduated at Yale, studied law there, and was admitted to the bar in his native city, where he practiced with success until 1892, when he was appointed to succeed Judge Bradley as associate justice of the supreme court of the United States. On that appointment, he removed to Washington, D. C., of which city he is now a resident.

Shiraz (*shē'rāz*), a city of Persia, celebrated in Persian poetry for its climate, wine, roses, and beautiful gardens, is on a broad plain, 35 miles southwest of ancient Persepolis and 217 miles southeast of Ispahan. The walls are about four miles around and there were many fine mosques and other buildings until the earthquakes of 1812 and of 1824, which destroyed large parts of the city and 4,000 of its inhabitants. Another earthquake, in 1853, completed the destruction of the city and killed 10,000 people. The city has been rebuilt, and its wine, which resembles Tokay, is still famous. Rosewater is made in large quantities, and very fine inlaid work is produced. The city was a favorite resort of the Persian princes and was the home of the poets, Hafiz and Sádi, whose tombs are in the neighborhood. Population 50,000.

Shishak (*shī'shak*), the name of several kings of Egypt belonging to the 22d or "Bubastite" dynasty (10th century B. C.). The name of Shishak I., or Sheshouk I., is found on the porch of the great temple of Karnak and on several statues of a goddess, which probably came from Luxor. Jereboam, it is recorded in Kings, fled to Shishak when Solomon wished to kill him, and on his return became king of the new kingdom of Israel, which was formed by the ten tribes revolting from Rehoboam. Shishak marched against Rehoboam in the fifth year of his reign, and took Jerusalem and the treasures of the temple. This conquest of Jerusalem is recorded on the monuments of Karnak, where Shishak I. is represented as dragging before his god, Ammon, three rows of prisoners, marked with the names of such places as Judæa, Megiddo, and Ajalon.

Shoot. In the higher plants the main axis of the body grows in two directions. In general, that part of it which grows downward is the root, and that which grows upward is the shoot. In ferns and seed-plants the shoot for

the most part is differentiated into stem (often with branches) and leaves. In ordinary liverworts (as *Marchantia*), and in the sporophyte of mosses, the shoot is not so differentiated.

Sieve (*siv*) **Vessels** (in plants), often called "sieve tubes," the peculiar vessels characteristic of the bast or phloem portion of the vascular bundle. They are usually more or less elongated, and the name refers to the fact that their walls contain certain areas, known as "sieve plates," which are perforated by numerous openings, like the lid of a pepper-box. The sieve vessels are prominently associated with the transfer of food.

Short'hand or **Phonog'raphy** is a mode of writing which has been invented to enable one to write as rapidly as a man can speak. The first system of shorthand appeared in 1588, and since then nearly two hundred different systems have been published. The first system used a set of marks for words, instead of spelling them out with the letters of the alphabet. In 1602, appeared the *Art of Short Writing by Spelling Characterie*, by John Willis, which made use of signs for the letters of the alphabet. Isaac Pitman's system, called "phonography," was published in 1837, and is now largely used, though some improvements have been made in it. It has been adapted to the Japanese, French, Italian, German, Dutch, Spanish, Hindu, and Malagasay languages. It is based on the use of characters to represent the sounds of the English language instead of the letters. The characters used, curves, lines, dashes, etc., stand also not only for a sound but for words which occur very frequently, as the, and, it, etc., called letter-words or grammalogues. The marks also indicate the vowels by their position either on or above or below the line. The great use of shorthand is in reporting speeches. A speaker utters from 60 to 180 words a minute, or an average of 120 words a minute. A swift writer can make 180 separate strokes in a minute. Now by the use of shorthand it takes an average of one and one-third strokes to represent a word, so that a reporter can in this way take down 200 words in a minute. The various other systems now used are all based upon Pitman's. See *History of Shorthand*, by Pitman; *Shorthand Systems*, by Anderson.

Shoshone (*shō-shōn'e*) **Falls,** a cataract on the Snake river in southern Idaho. The river runs through a deep gorge, between walls of rock, 1,000 feet high. The head of the falls is in the shape of a semicircle, from which the water leaps 210 feet in a sheet 950 feet wide. Niagara Falls are less than 170 feet. The little Shoshone Falls are two cataracts separated by a great rock, with a fall of 182 feet, about four miles higher up the river.

Shosho'nes or **Snakes,** a family of American Indians, which includes the Utes, Comanches, and several other tribes. They have been known by various names, as Buffalo Eaters, Sheep Eaters, and White Knives. They were found by Lewis and Clarke beyond the Rocky Mountains in 1805. Their homes were in the valleys of Snake river, Humboldt river, and Great Salt lake. They have usually been peaceful, having little intercourse with the whites. From 1849 to 1862 there were battles and skirmishes with the advancing settlers, treaties made and broken by the government, until in 1867 they made peace at Fort Bridger, and were settled on reservations in Idaho, Wyoming, Nevada, and Utah. They number about 6,000.

Shot is the name given to all solid projectiles, *i. e.*, anything thrown out or fired from any kind of firearms. The shot used for cannon and machine guns are made of cast iron or steel and were formerly solid balls. Balls weighing more than three pounds are not now made solid. Bar shot were two discs of iron joined by a bar, used to destroy the rigging of a ship; chain shot used in the same way were two round shot fastened together by a chain. Canister or case shot is a tin cylinder filled with bullets. Grape shot was a number of small iron balls held together by canvas or iron plates, but is no longer used. Small shot used in hunting is made of lead in various sizes, from that of large peas to dust shot. The melted lead is dropped from a height through a colander into water. The lead falls in small drops through the holes of the colander, the shot varying with the size of the holes. The fall through the air cools and hardens the lead before it falls into the water. Shot towers are from 100 feet to 150 feet high; the highest shot tower is in Austria and is 249 feet high. The shot is sifted in sieves to separate the different sizes, imperfect ones being discovered by rolling them down an inclined plank, and are finally polished.

Showers of Fishes, a curious phenomenon most common in tropical regions. It is explained by a strong draft upward in the center of a whirling column of air, which sucks up the fish from the water and carries them through the air, dropping them at some distance from their homes. On the Isle of Mull, herrings fell on a hill 1,500 feet from the sea, and 500 feet above it. Sometimes the fishes are alive, but more often they are dead. Showers of frogs and of dead flies have also been noted.

COMMON SHREW.

Shrew, an insect-eating animal having the general appearance of a mouse, but belonging to quite a different order of animals. The

mice are gnawers, the shrews are insect-eaters and are related to the moles. They have a sharp, pointed snout and jaws with numerous, sharp teeth. They inhabit both the Old and New Worlds, living in fields and open woods. Besides insects, they eat worms and mollusks. Water shrews exist also in North America and in Europe.

Shrike, a song bird found in all parts of the world except South America. Shrikes, besides eating insects, prey upon field mice and small birds, capturing them with their bills and not with their talons. Owing to the weakness of their feet, their prey is impaled on thorns, and this habit has gained for shrikes the name of butcher birds. There are about two hundred species in all parts of the world, but only two in the United States. The great northern shrike, which is a winter visitor, is a little above ten inches long, gray above with a black and white tail and whitish undersurface with black bars. It nests in the Arctic circle, but is seen from October to April as far south as Virginia. The loggerhead shrike is common in the Mississippi valley, also through central New York to Vermont and Maine. It is about nine inches long and colored like the great northern shrike, except that there are no black bars on the breast. Its song is rather unmusical.

Shrimp, a name commonly applied to a number of small, slender, and long-tailed crustacea inhabiting salt water. The prawns are closely related and are commonly served in shrimp-salad. These animals are all small,

SHRIMP.

resembling in general form a lobster or crayfish. Some are nearly transparent. They live on the sand in salt water. They are taken in great numbers for food, especially in England and in France.

Shu'brick, William Branford, an American naval officer, was born at Charleston, S. C., Oct. 31, 1790. He entered the navy in 1806. In the War of 1812 he aided in the defense of Norfolk; and in 1813, on the *Constitution*, he helped to capture three ships of war, taking command of one of them, the *Levant*. In 1838, he was head of a squadron in the West Indies, and in 1847 of one in the Pacific, where he captured Mazatlan, on the gulf of California, helping to establish the government of the United States in California. He had command in the Paraguay expedition in 1859. He retired in 1862 with the rank of rear-admiral, and died at Washington, D. C., May 27, 1874.

Shu'feldt, Robert Wilson, an officer of the United States navy, was born at Red Hook, N. Y., in 1822. He entered the navy, rising to the rank of commander in 1853, when he resigned. In the Civil war he was commander of the steamship *Conemaugh*, at Charleston, S. C., and took part in the battles of Morris Island. In 1870, he became commander of the monitor *Miantonomah*, and later had charge of a surveying expedition to Nicaragua. He left the service in 1884, with the rank of rear-admiral, and died Nov. 7, 1895.

Siam (*si-am'*), **Gulf of,** an arm of the China sea, south of Siam and west of Cochin China. It is 245 miles wide at its entrance, and extends inland for 390 miles.

Siam', Kingdom of, in the Indo-China peninsula, is a country whose limits have varied much at different periods of its history, most of the border lands being occupied by tribes more or less independent. By the treaty of September, 1893, the river Mekong was made the boundary between Siam and the French possessions; but in January, 1896, the British and French governments came to an agreement by which France appropriated the territory of 100,000 square miles lying between the Mekong and the Annam hills, thus leaving to Siam a territory of 200,000 square miles. The plain of the Menam valley and the Korat tableland, from 400 to 1,000 feet high, form the larger part of the country. The Menam, 600 miles long, is the principal river, and the Mekhong or Cambodia river is partly within the territory, but is of little use for navigation, being obstructed by falls and rapids. Gold has been found in Siam from the earliest ages, and the mines are now being worked by European speculators; copper, tin, iron, rubies, and sapphires are also found. The animals are those of the tropical regions, the elephant being tamed and used for labor in the teak forests. Some of the famous white elephants are kept in the royal courtyard at Bangkok, but are not held sacred, or fed on golden dishes, according to the stories. The climate is healthy, with two seasons, the wet and the dry, and a rainfall of 54 inches. April is the hottest month of the year. The population numbers 5,000,000, of which about one-third are pure Siamese. There are 3,500,000 Chinese, besides Burmese, Malays, Cambodians, and the Laos, or Shans. The Siamese are small, well shaped, olive colored, with black hair. They are peaceful, vain, social, and lazy, very fond of bright colors and jewelry. The children's heads are shaved, except a tuft on the crown, which is cut off with great ceremony when they are grown. Their houses are built of wood, thatched with palm leaves, and stand on piles. The banks

of the rivers are often lined with wooden houses floating on rafts or bundles of bamboo. The food of the country is mainly rice, fish, and fruit, and a liquor made from rice is used as a drink, but there is very little drunkenness. Betelnut chewing and tobacco smoking are almost universal, the teeth being colored black by the nut and other materials used for the purpose. The Laos or Shans are closely related to the Siamese, about 2,000,000 of them being under the rule of Siam, while other tribes are subject to China. The religion of Siam is Buddhism, and all the Siamese enter the priesthood for a time. The temples are numerous, with gilded minarets, roofs of colored tiles, and quaint pagodas. Siam is governed by a king, the present ruler, being Chulalongkorn I., who succeeded to the throne in 1868. He is anxious to improve his country, and is interested in the introduction of railroads and telegraph lines, and through his influence Siam joined the postal union in 1885, and has an electric light company to light the streets of Bangkok, while education is making distinct progress. In the capital alone there are nearly eighty government and aided schools, and these, together with the schools in the provinces, are under the control of an English chief-inspector. The Government has spent $5,000,000 on railway construction, and telegraph lines have been completed to the length of 1,820 miles. The chief production of the country is rice, with tobacco, coffee, hemp, cotton, and tropical fruits. Manufactures are not developed; only coarse cloth and silk, rough paper and water jars and tiles are made in the country. The cutting of teak, an important industry, is almost entirely in the hands of the British.

Siamese history begins with the year 1350. Cambodia was conquered and made tributary in 1532, and the present dynasty was founded in 1782. Ayuthia was the capital until it was burnt by the Burmese after a siege of two years in 1768. Bangkok (population 250,000) was made the capital by a general named Phya Tak, who drove the Burmese from the country and became king. See *Siam, the Heart of Farther India*, by Coit; *A Thousand Miles on an Elephant*, by Hallett; and *The Land of the White Elephant*, by F. Vincent.

Siamese' Twins, the name of two children, Eng and Chang, born in Siam in 1811. They were united by a band of flesh growing from chest to chest. They were shown as curiosities in the principal cities of Europe and America, and finally settled in North Carolina, where they married two sisters. The Civil war ruined them financially, and they again made the tour of Europe, exhibiting themselves in 1869. They died in North Carolina, two hours and a half apart, Jan. 17, 1874.

Siberia (*sī-bē'ri-ā*), a large territory belonging to Russia in northern Asia. It covers 4,833,500 square miles, stretching from the Chinese empire to the Arctic ocean. A large part of the region is only imperfectly known. It is, however, covered with a network of highlands and mountain ridges of which the Great Altai and Sayan mountains, separating Siberia from Mongolia; the Barguzin and South Muya ridges, with others still unnamed; the Stanovoi mountains, which form a high wall on the coast of the Sea of Okhotsk, are the most important. Some of the peaks of the Altai mountains and a few others rise into the region of perpetual snow. A belt of forests on the northwestern border of the central plain, and beyond that another belt of high plains, 500 miles wide, 1,700 feet to 2,500 feet high, and most of it very fertile, end in an immense lowland stretching to the shores of the Arctic ocean. These lands in western Siberia are very fertile, and are now the granary of Siberia, and contain one-third of the population. Between the Obi and the Irtysh are great marshes, which can be crossed only when frozen, and farther north still, the "tundras" (salt prairies and frozen swamps), where the ground is frozen hundreds of feet deep, and thaws only on its surface in the summer. Trees disappear, only a few low bushes and a few flowering plants surviving the cold. Yet some 50,000 human beings call this region home, and wander over it with sledges drawn by reindeer and dogs. In the southeastern part of Siberia, in the Amur province, are high plains, covered with oak forests, and rapidly filling with emigrants from Russia; while there are fertile tracts on the frontier of Korea, and a splendid harbor at Vladivostok, on the gulf of Peter the Great. The large rivers of Siberia — the Obi, Yenesei, Irtysh, Lena, and Amur, being some of them — assist greatly in the interior communication of this great country, and four lines of railroad have already entered Siberia on the west, one of which, the trans-Siberian line, opened in 1899, established uninterrupted steam communication through the Russian empire. Siberia is the coldest country in the world, and yet the summers are much warmer than is usually supposed, and melons are grown in the open air in some parts, and barley sown in May will ripen by August. The summers, however, are short, and by November all the rivers are frozen, and in the extreme north the thermometer has recorded 75° and 85° below zero. The air is very dry and there is no wind, which makes the cold more endurable.

The native tribes of Siberia, almost exterminated by their various conquerors, number hardly 700,000, and with about 3,000 Koreans, and 15,000 Manchurians and Chinese, added to the Russians, make up the population of 5,727,090, which is increased yearly by about 50,000 Russian immigrants. The Russians belong to the Greek church; the Turkish tribes are Mohammedans; while others are Buddhists. The exiles who are sent to Siberia from Russia at the rate of 20,000 a year, add but little to the population. They are

worn out by the hard two years' journey on foot, and a number of years' imprisonment, and those who survive, looking upon Russia as their home, perish, many of them, in their vain efforts to return. Siberia is very rich in minerals, but mining is still undeveloped; gold, silver, lead, copper, and iron, are mined, however, in considerable quantities, and a profitable trade in timber is carried on. The chief occupations are farming and cattle breeding, while hunting is profitable for the valuable furs of the sable, ermine, gray and white foxes; and fishing is carried on extensively. There are 339 schools, supported in the main by local authorities, with 773 teachers and an attendance of 43,786 pupils.

The earliest inhabitants of Siberia are called by some writers Yeniseians, who were followed by a race of considerable skill, judging from their relics found in mounds. The Turks conquered the country in the 11th century, and were conquered themselves by the Mongols two centuries later. The Russians invaded the region first in 1580, by a band of Cossack robbers, followed for two centuries by other bands of Cossacks, traders, and hunters, dissenters flying from religious persecution, and peasants escaping from serfdom. In the first eighty years the Cossacks had reached the sea of Okhotsk, but Russia's possession was not acknowledged by China before 1857. Bering strait was discovered in 1648 by the Cossack Dejnef, who sailed around the northeastern end of Asia; but as his discovery was not made known, the honor still belongs to Bering. In 1878–79, Nordenskjöld sailed through the Arctic ocean, Bering strait, China sea, Indian ocean, and Suez canal, and returned to Sweden, thus going entirely around Asia for the first time. See *Through Siberia*, by Lansdell; *Tent Life in Siberia*, and *Siberia and the Exile System*, by Kennan.

Sibyl (*sib'il*), a name given to certain inspired prophetesses in the mythical period. Their number varies, but is generally fixed at ten, of whom the most celebrated was the Cumæan, who is mentioned in the sixth book of the *Æneid* as leading Virgil into the lower world. According to Livy she came from the east to King Tarquin, offering him nine books of prophecies, but at such an enormous price that he refused to buy. She then destroyed three, and, returning, offered the remaining six at the same price, and was again refused; destroying still another three, she asked as much for the three left, which Tarquin's curiosity finally induced him to buy. They contained advices regarding the religion and government of the Romans, and were carefully guarded in the temple of Jupiter until 83 B. C., when the temple was burned. A new collection was made of about 1,000 lines, gathered from all the cities of Greece, Italy, and Asia Minor, which was kept until some time between 404 and 408, when it was publicly burned. The Sibylline oracles, written in Greek, in 14 books, containing 4,000 lines, are entirely distinct, being a series of pretended prophecies written by Alexandrine Jews and Christians.

Sicil'ian Ves'pers, the name given to the massacre of the French in Sicily, March 30, 1282, the first stroke of the vesper bell being the signal for slaughter. Charles of Anjou, brother of Louis IX. of France, had conquered Naples and Sicily, but was hated by his Sicilian subjects for his cruelty and injustice. The inhabitants of Palermo at that signal rose against their French oppressors, killing men, women, and children to the number of 8,000, an example followed throughout the island, where the French were hunted like wild beasts. The 600th anniversary of the Sicilian Vespers was celebrated in 1882. See *The War of the Sicilian Vespers*, by Amari, translated by the earl of Ellesmere.

Sic'ily, the largest island in the Mediterranean sea, is also the most populous and the most fertile. It lies off the coast of Italy, separated from it by the strait of Messina, two miles wide. It covers 9,936 square miles and is shaped like a triangle. Sicily is a plain, 500 to 1,900 feet above the sea, crossed in the northern part by a chain of mountains, the loftiest peak being 6,467 feet high. From the center of the chain a range branches off, going through the heart of the island to the southeast. The lower mountain slopes are usually covered with groves of oranges and olives, and the plain with fields of wheat. Mt. Etna rises from the vine-clad plain of Catania, 10,850 feet, with a base of 400 square miles. The climate is warm except in the mountain regions. Magnificent forests of oak, ilex, beeches, chestnuts, and pine are still found, though many have been recklessly destroyed. Dates, figs, almonds, lemons, olives, pomegranates, and grapes are very abundant. The wheat of Sicily is one-seventh that of all Italy, and the barley one-half of the crop of the kingdom. It manufactures two-thirds of the wine of Italy, and exports a large amount of sumac for tanning. The only mineral product obtained on the island is sulphur, of which there are some 300 mines. The sardine fisheries employ a large number of persons, but manufactures are few—mainly cement, crockery, gloves, macaroni, and soap. The population numbers 3,682,766. The people are devout but superstitious, and three-fourths of them cannot read. Elementary education is compulsory, however, for children between six and nine years of age, and though this law is by no means strictly enforced, school attendance is steadily increasing.

There were early Phœnician settlements in Sicily, but the real settlers were Greek colonists who founded cities on the east and south coasts, from 735 to 579 B. C. The first struggle with Carthage, which ended for seventy years by

the great victory at Himera over Hamilcar, in 480, was followed by a Phœnician invasion under Hannibal, but Dionysius the Tyrant checked the Carthaginian conquests; in 210 B. C. the island became a Roman province, was conquered by the Vandals in 440 A. D., ceded to Theodoric, and regained by Belisarius (535). The Saracen occupation, dating from 827, lasted until the Normans took possession in a series of struggles lasting from 1038 to 1090. The Norman, Roger, count of Sicily, in 1130 took the title of "King of Sicily and Italy." In 1194, the crown went by marriage to the German emperor, until 1264, when the pope, Urban IV., a Frenchman, gave Sicily to Charles, count of Anjou. Manfred, the last German ruler, died fighting against the invader, and his son-in-law, Peter of Aragon, continued, the contest, ending with the crowning of his son, Frederick, in 1296. The contests of France and Spain for Sicily and Italy continued, and in 1502, Ferdinand of Aragon defeated the French at Mola, and became king of Naples and Sicily. The peace of Utrecht (1713) gave Sicily to the duke of Savoy, who in 1720 exchanged it with Charles VI. of Austria for Sardinia, but in 1738 Don Carlos, of Spain, was king of the two Sicilies. The Bonaparte rule began with the taking of Naples in 1798, lasting until 1808, when Ferdinand IV. was allowed to remain king of Sicily, afterward taking by the treaty of Paris his old kingdom of the two Sicilies. At last, on May 11, 1860, Garibaldi, with his thousand heroes, took Palermo, and entered Naples in triumph, and the people of Sicily and Naples by a popular vote joined themselves to the Sardinian kingdom. The chief cities of Sicily are Palermo (population 292,799), Messina (population 156,552), and Catania (population 134,680).

THE TWO SICILIES, a kingdom of southern Italy, included the island of Sicily, several smaller islands, and the kingdom of Naples. See *History of Sicily*, by Freeman; and his shorter history in the "Story of the Nations" series.

Sick'les, Daniel Edgar, an American general, was born at New York, Oct. 20, 1825. In 1847, he was sent to the state legislature, and in 1853 went to England as secretary of legation, and became a member of congress in 1856. When the Civil war broke out, he was made colonel of a regiment he had raised in New York, and as brigadier-general commanded in the battles of Chickahominy. At Antietam and Fredericksburg he commanded Hooker's division of the 3d corps, and with the rank of major-general served at the head of the 3d corps at the battles of Chancellorsville and Gettysburg, losing a leg in the fight. After the war, he was commander of the military district of North and South Carolina until 1867, and in 1869 was appointed minister to Spain. In 1892, he was elected to congress from New York city.

GEN. D. E. SICKLES.

Sidd'ons, Sarah, the great tragic actress of England, was born at Brecon, Wales, July 5, 1755. Her father, Robert Kemble, was the manager of a small traveling theatrical company, and she took part in the performances of the company from her earliest childhood, and, at seventeen, married Siddons, a member of the company. Her first appearance at Drury Lane, Dec. 29, 1775, in the character of "Portia" was a failure, and for six years her acting was confined to the provinces. In 1782, she reappeared in London as "Isabella" in the *Fatal Marriage*, and was the queen of the English stage from that time until, as "Lady Macbeth," she took leave of it, June 29, 1812. She gave public readings from Shakespeare and Milton, and appeared occasionally for charitable objects, after leaving the stage. She died at London, June 8, 1831. See *Life*, by Mrs. Kennard, in the "Eminent Women" series.

Sid'ney, Alger'non, was born in Kent, England, in 1622. He commanded a troop of horse in Ireland when his father was lord lieutenant, and in 1644, having declared for the parliament, he was given a command under the earl of Manchester, and was wounded at Marston Moor. In 1645, he was returned to parliament, and in 1646 he became governor of Dublin, his brother being lord lieutenant of Ireland, and afterward was made governor of Dover by the house of commons. Though one of the commissioners, he took no part in the trial of the king, yet called it "the justest and bravest action ever done in England." He was one of the council of state, and spent twelve months in Denmark and Sweden on a political mission. While in retirement in France, he was accused of intriguing with Louis XIV. against both Charles II. and William of Orange. He drew up the constitution of Pennsylvania for his friend William Penn, including in it universal suffrage and religious equality. In June, 1683, he was charged with a share in the Ryehouse plot, and on no evidence but that of the traitor Lord Howard, and his own writings, he was condemned and executed Dec. 7, 1683. His *Discourses Concerning Government* were first published in 1698. See *Lives*, by Headley and Ewald.

Sid'ney, Sir **Philip,** an English courtier and writer, was born Nov. 29, 1554, at Penshurst, in Kent, England. He studied at Oxford, finishing his education, after the fashion of the day, by traveling in France, Germany, and Italy. His uncle Leicester being all-powerful at the court of Elizabeth, Sidney

began at once his public life. He was sent as ambassador to Rudolph II., of Austria, and then to William, prince of Orange. At first a favorite of the queen, he lost her influence by his defense of his father against her ingratitude, and by his opposition to her proposed marriage with the duke of Anjou. In 1580, he retired from court, living with his sister, Lady Pembroke, where he probably wrote his *Arcadia*. His associations with Spenser, and perhaps the circulation of his writings in manuscript, had already given him a wide reputation, which was well sustained by his *Arcadia*, written in 1578–80, which appeared in 1590, and for a century retained its great popularity. It is a pastoral romance, written in poetical prose, and while not free from the "conceits" of the age, is still well worth reading. His *Apology for Poetry* (*Defense of Poesy*), written about 1580, displays his vast reading, and while criticising severely the crowd of common versifiers, names as the best English poets, Chaucer, Sackville, Surrey, and his friend, Spenser. His own poems, *Astrophel and Stella*, a series of 108 sonnets and 11 songs, were inspired by his love for Penelope, a daughter of Lord Essex, and place him next to Chaucer in the long line of English poets. He returned to court, was knighted, and in 1583 received from Elizabeth a grant of 30,000,000 acres in "certain parts of America not yet discovered," and planned to accompany Drake to America. He was ordered, however, to go with Leicester to the Netherlands, where after a brilliant exploit in a chivalrous conflict, he was fatally wounded under the walls of Zutphen, Oct. 2, 1586. Faint from the loss of blood, he called for a drink, but seeing a poor soldier carried by, looking longingly at the water, he handed the cup to him, saying "Thy necessity is greater than mine." See *Life*, by Symonds, in the "English Men of Letters" series.

Si'don, an ancient city of Phœnicia, on the east coast of the Mediterranean, about half way between Tyre and Beyrout. It held the first position among the cities of Phœnicia, so that it sometimes gave its name to the whole region. Its colonies were found throughout the whole ancient world, and its commerce was very large. Its manufactures of linen, glass, purple dyes, and perfumes were sources of great wealth. Even under Assyrian, Chaldean, and Persian rule, it retained its importance, reaching its highest prosperity under the Persians. An unsuccessful revolt in 351 B. C. involved it in temporary ruin, from which it recovered speedily. In 333 B. C., Alexander the Great conquered it, and it fell in succession into the hands of Syrians, Greeks, and Romans, and in the middle ages was taken by crusaders. The present town, called Saida, has 10,000 inhabitants.

Siemens (*sē'menz*), **Ernest Werner von,** a German electrician, was born at Hanover, Dec. 13, 1816. In 1831, he took out his first patent for galvanic silver and gold plating. His work in connection with the telegraphic system of Prussia resulted in the discovery of the powers of gutta-percha in insulating underground and marine cables. He is known as one of the discoverers of the self-acting dynamo. With his brothers he established large houses for the making of electrical apparatus in Berlin, St. Petersburg, London, Vienna, and Tiflis, and in 1892 in Chicago. His scientific papers were collected and published in 1881. He was one of the foremost electricians of the day, sharing with his brothers in many inventions. He died at Berlin, Dec. 6, 1892.

Sie'mens, Sir **William,** the German scientist, was born near Hanover, April 4, 1823. He studied at Göttingen, giving special attention to science. After two visits to England in the interests of his brother's inventions, he made England his home in 1844, and became a British subject in 1859. As manager of the house of Siemens Brothers, he was engaged in constructing telegraph lines, the steamship *Faraday* being designed by him for cable laying. He also built electric railroads. The principle of his "regenerative" furnace has been applied in many ways, but especially by himself in the manufacture of steel. He invented a water meter, a bathometer for measuring ocean depths, an electrical thermometer, and a process of hastening the growth of plants by electric light. In 1874, the royal Albert medal, and in 1875 the Bessemer medal were given him in recognition of his inventions. He was president of the three principal telegraphic societies of Great Britain, of the British association, and in 1883 was knighted. He died at London, Nov. 19, 1883. See *Life*, by Pole.

Siena (*sē-ā'nȧ*), a city of Italy in the center of Tuscany, about sixty miles south of Florence. It is a walled city, with narrow, winding streets. The cathedral, begun in the 13th century, is one of the finest Gothic churches in Italy, with a wonderful eight-sided pulpit, a fine mosaic floor, a series of frescos of scenes in the life of Pope Pius II., and a font with bas-reliefs by Donatello and other sculptors. The church of St. Catherine, the fountain of Fontebranda, celebrated by Dante, the palace and its high tower, the university, founded in 1300, and the Institute of Fine Arts, are among the attractions of the place. There are manufactures of silk, cloth, and hats, and a trade in wine and olive oil. Siena, a Roman colony, became a free republic at the breaking up of the empire and was the head of the Ghibelline towns in central Italy, being a rival of Florence. In 1399, to protect themselves from Florence, the Sienese placed themselves under the duke of Milan, and in 1524, to escape the usurpations of the Petrucci family, they became tributary to the Emperor Charles V., who afterward gave

Siena to Cosmo de Medici, and it became a part of Tuscany. It is the seat of one of the 21 universities of Italy, with (1901) 31 professors, and 231 students. Population 31,367.

Sienkiewicz (*syen-kye'vich*), **Henryk**, Polish novelist, was born at Wola Okrzejska, in Lithuania, in 1846, and was educated at the University of Warsaw. Early in his career, having espoused journalism, he devoted himself to literature, and soon won a high position as a novelist and short story writer. In 1876, he came to the United States, and for a time, in company with Madame Modjeska, his countrywoman, he resided in California, where he designed to establish a Polish colony. In 1880, he wrote a work on *Tartar Slavery*, following this, a few years later, by his masterly novel, *With Fire and Sword*. To this succeeded *The Deluge*, *Pan Michael*, *Without Dogma*, and *Children of the Soil* —all of them remarkable for their vigor of characterization, historical truth, and power of psychological analysis. Meanwhile he had returned to Poland, and from there traveled considerably about the Old World, studying types of character and steeping his imagination in the scenes and histories of various peoples. Patriotic ardor and love of his country reveal themselves chiefly, however, in his works. In 1895, appeared his masterpiece, *Quo Vadis?* —a tale of the time of Nero, written with remarkable vigor and powerful effect. Of his short stories, the best are those that deal with Polish scenes and people. Most of his novels have appeared in American editions, translated by Jeremiah Curtin, and published at Boston.

Sierra Leone (*sĭ-ĕr'ra lē-ō'nē*), a British colony on the west coast of Africa, founded in 1807, and situate southeast of French Guinea. It lies north of Liberia, with 180 miles of coast line, and, stretching toward the interior, covers about 4,000 square miles. The name is sometimes confined to the peninsula south of the Sierra Leone inlet, which is twenty-six miles long, rising to 3,000 feet in Sugar Loaf mountain. The climate of the region is hot and moist, and the lowlands malarious, giving it the name of the "White Man's Grave." The people, numbering about 75,000, are nearly all negroes. Agriculture and trading occupy about one-fifth of the population, but the resources of the country are not fully developed. Coffee, cocoa, tapioca, ginger, maize, and cotton are grown, and there is a little boat building, mat making, and cloth weaving. The capital, Freetown, the most important seaport in West Africa, is a fortified naval depot, and a coaling station. There is a university, founded by the Church Missionary society, a savings bank, a lunatic asylum, and sixty-five schools, with an average attendance of 5,583 pupils. Sierra Leone (Lion mountain) was discovered by Cintra, a Portuguese navigator, in 1462, and so named from the heavy thunder roaring on its mountains. Two attempts have been made to colonize it with freed slaves, in 1787 and 1791; the second effort being made under the Sierra Leone company and supported by the arrival of 1,200 freed slaves from North America. In 1807, it was ceded by the company to the British crown. A railroad from Freetown to to Songstown (32 miles) was opened in 1899. See *Sierra Leone*, by Banbury.

Sier'ra Madre (*mä'dra*), meaning "main chain," a range of mountains in Mexico, stretching north into Arizona. The name sometimes includes the Cordilleras.

Sier'ra Morena (*mō-rā'nä*), a mountain ridge in the south of Spain, ranging from 2,000 to 5,500 feet in height. It has valuable mines of lead, silver, lignite, and quicksilver; and is the scene of many of the incidents in *Don Quixote*.

Sier'ra Nevada (*nē-vä'dä*), "snowy range," a mountain range in southern Spain, crossing the province of Granada, about sixty miles long; Mulahacen, 11,600 feet high, is the highest point of the Spanish peninsula.

Sier'ra Neva'da, a range of mountains in California 450 miles long, merging into the Coast Range. Mt. Whitney (14,886), Mt. Shasta (14,440), and Mt. Tyndall (14,386), are the highest peaks. The mountains are covered with forests, and gold and silver are found there in large quantities.

Sier'ra Neva'da, the name of two ranges in South America, both thought to be parts of the Andes range. The mountains are wooded on the northern slopes, and naked rocks tower 6,300 feet on the southern side. Copper, silver, gold, and coal are found. The highest peaks are from 15,000 to 17,500 feet high.

Sieyes (*sē-ā yās'*), **Emanuel Joseph**, Count, known as the Abbé Sieyès, a prominent figure in the French Revolution, was born at Fréjus, France, May 3, 1748. Entering the church, on account of his health, he became a canon and then chancellor and vicar-general. At the beginning of the struggles for liberty in France, he published three pamphlets on political questions. In the third one, *What is the Third Estate?* (the representative body of the French people) he gave the celebrated answer "Everything; What has it been? Nothing; What does it desire to be? Something." This pamphlet made his name famous throughout France. He was elected a deputy in Paris, and it was on his motion that when the nobles and clergy refused to join the deputies of the people, they declared themselves the National Assembly. The division of France into departments and the celebrated declaration of the "Rights of Man," were mainly his work. He voted for the king's death, but was opposed to a republic, and to the excesses of the revolution. Sent to Ber-

lin, he secured the neutrality of Prussia. With Bonaparte he plotted the revolution of the 18th Brumaire (Nov. 9, 1799), ending in the consulate of Sieyès, Bonaparte, and Ducos. His new ally, however, proved a master, and he resigned his consulship in disgust, though to propitiate him he was given the title of count, an estate, and $120,000. He lived in Belgium during the restoration, dying at Paris, June 20, 1836. See *History of the French Revolution*, by Lamartine.

Sigel (*sē'gel*), **Franz,** an American general, was born in Germany in 1824. He was in the service of the grand-duke of Baden, and became minister of war in the revolution of 1848, but was obliged to flee, and came to the United States. He entered the army as colonel in 1861, during the Civil war, and by gallant service rose to the rank of major-general. He was elected register of New York city in 1871, and appointed United States pension agent for the city in 1885.

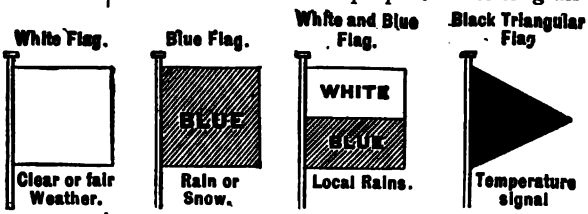
Sigismund (*sĭj'ĭs-mŭnd*), emperor of Germany, was born Feb. 14, 1361. When only nineteen, he became king of Hungary through his wife. He was terribly defeated in an expedition against the Turks at Nicopolis in 1396. Some years later he conquered Bosnia, Herzegovina, and Servia. He became emperor of Germany in 1411. His name is known by his failure to uphold the safe conduct he had granted to Huss, and so allowing him to be burned by his enemies. His succession to the throne of Bohemia after his brother's death was opposed by the Hussites, and he only secured it after making concessions, a year before his death, which took place Dec. 9, 1437.

Sig'naling, any means of sending intelligence to a distance by sight or sound. The earliest signals in war were by means of torches and beacon lights. Ships depend upon a system of flags, varying in arrangement, color, and shape. What is known as *The International Code of Signals*, prepared in 1857, has been adopted by nearly all the nations of the world. It makes use of eighteen flags, with which it has been found that 78,000 different signals can be given, using no more than four flags at a time. The flags are blue, red, yellow, or white, and square or long and pointed, called pennants. When a square flag is uppermost it is a danger signal. Some of the flags are used as letters, and so spell out words. At night, red, green, and white lights are used, instead of the colored flags, and ships in danger fire cannon and send off rockets. In fog, mist, and snow storms, vessels at anchor ring a bell, a steamer moving blows its whistle, sailing vessels use a horn, all at least once in every two minutes. The signals and their meaning are published in the signal book, and copies are made in the different languages of the nations using the system.

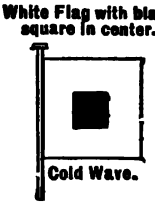
Sig'nal Ser'vice, United States. There are three authorized systems of signaling, those of the army, the navy, and the weather bureau.

In the army, the value of a thorough system was readily seen, and in 1860 an appropriation was made to introduce field-signaling under the charge of an officer with the rank of major. In 1863, the signal corps was placed entirely in the care of a chief, with the rank of colonel. In 1870, a meteorological division was added, and in 1891, this was transferred from the war to the agricultural department. There is a school of instruction in military signaling at Fort Riley, Kansas, where, in a course of six months, is given a thorough knowledge of all the codes, and the practical use of the various sorts of apparatus, consisting of flags, the heliograph, the field-telegraph and telephone trains, used by day; and torches, lanterns, rockets, bombs, and searchlights, used by night. The code used in visual signaling is based upon the Morse system of dots and dashes.

In the navy, the *General Signal Book* and the *Fleet Drill Book* contain the code of day and night signals, so that, in order to send a certain message, it is necessary only to hoist flags representing the number of that message in the proper volume. At night, in place of flags, red and green fireballs are shot into the air to serve the same purpose. For long distance signaling, electric lights are used, and it is even possible to signal a ship below the horizon by casting searchlights upon the clouds.



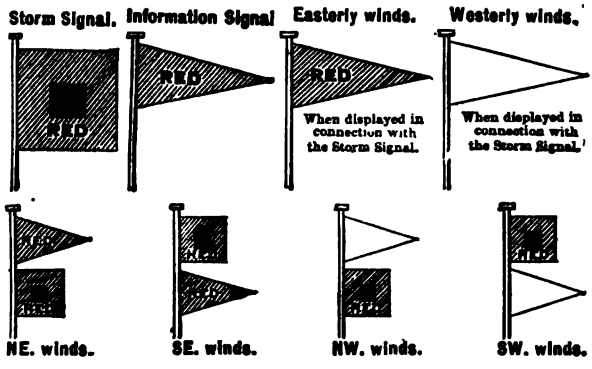
The weather bureau has perfected a system of signals by which it can publish the weather forecasts. Throughout the country are stationed agents who observe the indications of the weather and telegraph forecasts to thousands of towns and cities, which then display the appropriate flag, chosen singly or in combination from among the preceding.



Temperature is forecasted by placing a black flag above the weather flag for higher, and below the weather flag for lower temperature. The approach of a cold wave is announced by displaying the above flag.

Along the seacoasts and on the Great Lakes the following flags signify the approach of dangerous winds: —

When storms of exceptional violence are feared, the news is spread through the aid of rockets, whistles, and other signals. The reports of the weather bureau are given wide publicity, chiefly in the pages of the daily newspapers.



[*At night, red and white lanterns replace flags.*]

Sigourney (*sig'ur-ni*), **Lydia Huntley,** an American writer, was born at Norwich, Conn., Sept. 1, 1791. Her first publication in 1815 was called *Moral Pieces in Prose and Verse.* She compiled books for the young, contributed to magazines, and was one of the earliest women in America to enter the field of authorship. She has been called the "American Hemans." *A Sketch of Connecticut, Pocahontas and Other Poems, Tales in Prose and Verse,* and *Letters to Young Ladies,* are the titles of some of her books. She died at Hartford, June 10, 1865. See *Letters of Life,* an autobiography.

Sigsbee, Charles Dwight, Captain, American naval officer, was born at Albany, N. Y., Jan. 16, 1845, and graduated in 1863 from the United States Naval academy. In the Civil war, he served in the West Gulf squadron and was present at the battle of Mobile bay; he also served in the North Atlantic squadron and was at both attacks on Fort Fisher and at the final assault on the Fort. He also served on the China Station, and at the head of various departments of the Naval academy. He had command successively of the *Kearsarge, Dale, Constellation, Portsmouth,* and of the *Blake,* in the deep-sea explorations undertaken by the United States coast survey. He was in command of the battleship *Maine,* when it was destroyed in Havana harbor, Feb. 15, 1898. During the Spanish-American war he commanded the United States auxiliary cruiser *St. Paul,* in operations against Cuba and Porto Rico, and later was transferred to the *Texas.* Has published *Deep-Sea Sounding and Dredging,* and the *Story of the Battleship Maine and Its Destruction* —a personal narrative.

Sikhs (*sēks*), a religious sect in northern India. The word means "followers," or "disciples." It was founded by Baba Nanak in the 15th century, who rejected the caste system of India and idolatry, and taught the worship of one God. At the end of the 16th century, the holy temple was built at Amritsar, which is the headquarters of the sect. As they increased in numbers, they gradually assumed military power, and in the 18th century, under Ranjit Singh, a young warlike chief, they became a great military force. He kept the treaty he had made with Great Britain, but at his death his large and well-drilled army invaded the British territory in India in 1845. After several battles and defeats, they were at last conquered in 1849, and the Punjab was annexed to the British possessions. At the time of the mutiny in India, the Sikhs remained loyal to England. The Sikhs form about six per cent. of the population of the Punjab, and there are fifteen protected Sikh states connected with the Punjab government. They number about 1,907,836. See *History of the Sikhs,* by Cunningham.

Silesia (*si-lē'shi-a*), a province in southeastern Prussia, covering 15,566 square miles. It is crossed by the Oder river and the Sudetic mountains, between which is a very fertile region, while on the northern and eastern sides of the Oder there are marshy and sandy tracts. One of the most productive coal mining regions of Prussia, covering 530 square miles, is in the southeastern corner of Silesia, and there are also mines of zinc. The crops produced are the usual cereals and flax, beet-root, chicory, and hops. The manufactures are important, including linen, cotton, and woolen goods, beet-root sugar, metal manufactures, glass, and tobacco. The capital is Breslau. The population, including 820,000 Poles, 55,000 Bohemians, and 32,000 Wends, numbers 4,668,378. All schools are under the direction of the minister of public instruction, and elementary education is free and compulsory.

Silesia in the 10th century was under Polish rule; about the end of the 12th century it was divided into Upper and Lower Silesia, and by the beginning of the 14th it was separated into a number of small states, under King John of Bohemia, which in 1526 fell to Austria. Austria and Prussia struggled for the country, the claim of Prussia being based upon a contract by which the duke of Leignitz in 1537 left his lands to the elector of Brandenburg in case he had no other heir. The three Silesian wars, the first, 1740–42; the second, 1744–45; and the last in 1756–63 (the Seven Years' war), ended in securing Silesia to Prussia, except the Austrian duchy of

Silesia, a country south of Prussian Silesia, covering 1,987 square miles, rich in mines, and with a population numbering 605,649.

Silica (*sĭl'i-kă*), a compound of silicon and oxygen (SiO_2), is found in the pure state in the form of quartz or rock-crystal. Flint, sandstone, and chalcedony are nearly pure silica. It occurs also in combination in a large number of abundant minerals which are called silicates, and of which feldspar, mica, hornblende, and clay, are examples. Silica exists in many plants, particularly the grasses, in the quill feathers of birds, and in sponges. Most animals contain very little of it. Silicon, the non-metallic element contained in silica, is never found in the free state, and although it is next to oxygen the most abundant element in the earth's crust, it is merely a chemical curiosity, being very difficult to separate from oxygen. Silica is largely used in making glass, and is an important constituent of porcelain, china, bricks, etc.

Silicle (*sĭl'i-k'l*), a short silique, the peculiar fruit of the mustard family. See FRUIT.

Silique (*sĭl'ik*), the peculiar pod-like fruit of the mustard family, characterized by a false partition which runs lengthwise and divides the pod into two chambers. See FRUIT.

Silk, the name of the cloth and thread manufactured from the fiber obtained mostly from the cocoons of the silkworms. The making of silk probably originated in China, the wife of an emperor being credited with first unwinding a silk cocoon, in 2600 B. C. The silkworm's eggs were brought to Constantinople from China, about 552, by two Persian monks, who carried them in a hollow cane. They were successful in raising them and in introducing the manufacture of silk. The new industry spread through Greece, was carried into Sicily by prisoners of war, and brought to Spain by the Moors. Louis XI. and Francis I. imported workmen from Milan into France and succeeded in starting the silk manufacture, after the cultivation of the mulberry tree for food for the worms had been established, in 1564. In England, silk manufacture began under James I., but received a powerful impulse in 1685, when a large number of silk weavers were driven from France to England by the edict of Nantes. James I. made an effort to introduce the industry into the American colonies, sending eggs to Virginia and offering rewards for their cultivation, but tobacco was more profitable. It was cultivated in South Carolina and Connecticut before the Revolutionary war. There have been several efforts to make the cultivation of the silkworm more general in the United States, one in California in 1854 and a woman's association formed in Philadelphia in 1876, but with no very great result. The manufacture of silk is, however, carried on quite extensively, the center of the industry being Paterson, N. J., where there are more than one hundred silk factories. France is the principal silk-making country, the British silk trade having been very much injured by the introduction of French goods free. The process of manufacture takes the raw silk, obtained from the cocoons of the worm, by winding it off through a reeling machine, cleans, twists, and doubles the threads and winds them on bobbins and reels for the weaver. There is a considerable amount of waste in all the processes, which, known as waste silk, was for a long time considered useless, but in 1857 a method of spinning yarn out of this waste was invented by an Englishman, Mr. Lister, of Bradford, England, which has added very much to the industry. The process of weaving silk from the prepared thread resembles that of weaving cotton or woolen goods. See SILKWORM.

Silk'worm, any larva or caterpillar which produces a silken cocoon used in the manufacture of silk. The name applies especially to the famous silkworm (*Bombyx mori*) that feeds on the mulberry tree. All silkworms are the larvæ of moths. Their eggs are laid to the number of 200 or 300 by a single individual. On hatching, the caterpillars go through several moults. When they reach the fifth stage they eat enormously, and attain a length of three or three and one-half inches. They are now naked, worm-like animals of a pale greenish color. About thirty-six days, or more, after hatching, they begin the formation of the cocoon, in which they undergo the transformations that convert them into moths. The cocoons are the source of the silk. They are usually white or yellowish and about an inch or more long and one-half as broad. The silk comes from a pair of long, tubular glands which open upon the lower lip of the animal. Just as the material of a spider's thread hardens on contact with the air, so this silk substance is formed into a delicate strand. While this is issuing from the orifice in the lower lip, the head of the worm is continually worked back and forth, in such a manner that the thread is wound in spirals around the entire length of its body. There is formed in this manner one continuous thread of surprising length — being nearly four-fifths of a mile long. The thread is matted together by a gummy substance. It is loosened in hot water and the thread, united with those from four or five other cocoons, is unreeled. The process may occupy four days. There are several kinds of silk-pro-

SILK-WORM, LARVA, CHRYSALIS, AND COCOON.

ducing larvæ, but all others are inferior to the mulberry silkworm. The Ailantus silkworm and the polyphemus moth, together with the larvæ of imported mulberry moths, are reared in America. China, Japan, Italy, France, and India are the principal silk-producing countries. The silk industries of the United States amounted, in 1890, to nearly $70,000,000, and are increasing. Paterson, N. J., is the center of the silk manufacture, and is sometimes called the Lyons of America.

Silliman (*sil'i-man*), **Benjamin,** an American scientist, born at Trumbull, Conn., Aug. 8, 1779. He studied at Yale college, and after his appointment there as professor of chemistry, attended chemical lectures for three years at Philadelphia, and for one year at Edinburgh and at London. He filled the chair of chemistry at Yale for about fifty years. He did much to make the study of chemistry and geology popular, by public lectures through the country in 1808. He was the first president of the American Association of Geologists and Naturalists, and founded the *American Journal of Science*, known as *Silliman's Journal*, which he edited for twenty-eight years. His textbook on chemistry was published in 1830, and, in 1853, appeared his *Narrative of a Visit to Europe*. He died at New Haven, Conn., Nov. 24, 1864. See *Life*, by Fisher.

Silo'am, a pool cut in the rocks southeast of Jerusalem, and connected with it by an aqueduct.

Sil'ver, one of the metals, ranking among the commoner metals next to gold in value. It is known by its white color, its luster, and the ease with which it is worked. It is harder than gold, and takes a fine polish. It is never found pure, being always mixed with a little copper or gold, or some other metal, but in what is called its native state is widely distributed. It is almost always found associated with gold, and all gold when mined contains more or less silver. The combinations of silver with other substances, such as sulphur, oxygen, and chlorine, and especially in the ores of lead, form the largest part of the silver ores found. In Europe, the largest silver mines are in Norway and have been worked since 1623. One piece of silver in the Copenhagen museum weighs 560 pounds, and another piece was dug out in Norway weighing over 1,500 pounds. Silver is also found in Saxony, Bohemia, Hungary, and Spain. The mines of silver in the United States are found mostly in Minnesota, Nevada, Arizona, California, Idaho, Utah, Colorado, New Mexico, and Montana. The Comstock lode, a silver mine in Nevada, is probably the most productive silver mine ever worked. The silver region of the western United States was discovered only in 1859, but now produces one-half of the silver of the world, being more than $70,806,626 in 1899. The rich silver mines of Mexico and Peru, worked by the Aztecs, were developed by the Spaniards after the conquests of Cortez in the 16th century. Humboldt reports about 3,000 different mines in operation in Mexico. Australia is now added to the silver producing countries, the yearly product of the silver districts in New South Wales reaching $10,000,000.

Silver is one of the most useful of the metals, being used in coinage, plate, and jewelry, and its compounds in photography, glass staining, etc. It is too soft to be used alone, and is generally mixed or alloyed with copper. Silver coins in the United States contain one-tenth of copper and nine-tenths of silver. See METALLURGY. See also *Gold and Silver*, by Phillips.

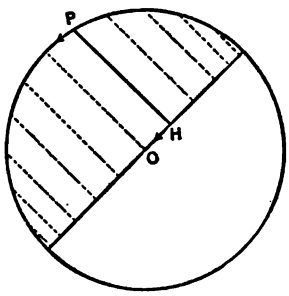
Simms, William Gilmore, American historian, novelist, and poet, was born at Charleston, S. C., April 17, 1806, and died there June 11, 1870. In early life he studied law, but abandoned it for journalism and later for literature. He specially devoted himself to the writing of a series of some 17 volumes of fiction, including romances of colonial life, romantic tales of revolutionary incidents in South Carolina, of which he wrote a history, a geography of the state, and an account of South Carolina in revolutionary times. He was for several years a member of the legislature of his native state, and filled other political offices. He had, besides a fertile mind, a vivid imagination and the power of writing an interesting and realistic novel; he also wrote verse, of which a compilation exists. Of his novels perhaps the most notable are *The Yemassee*, *Guy Rivers*, *Pelayo*, *Carl Werner*, *The Scout*, *The Partisan*, *Count Julian*, *Mellichampe*, and *Border Beagles*. His best, as it is his longest, poem is entitled *Atalantis: a Drama of the Sea*. See his *Life*, by George W. Cable, in the "American Men of Letters" series.

Simon (*se-môn'*), **Jules,** a French statesman and writer, was born at Lorient in 1814. His real name was Suisse, which he changed to Simon. He succeeded Cousin as lecturer at the Sorbonne in 1839. In 1848, he was elected to the chamber of deputies, refused the oath of allegiance to the empire, and by 1869 was one of the most popular leaders of the Republican party. He was minister of public instruction, but was opposed by the church influence, and resigned in 1873. He was elected a life senator in 1875, and in 1876 became prime minister, but resigned because of objections to his views on the freedom of the press. He took, however, a leading part in the revision of the constitution, and was a member of the educational council. Besides editing *Descartes*, *Bossuet*, and *Malebranche*, and contributing to periodicals, he wrote *Liberty of Conscience* and *Liberty*, *Natural Religion*, *The Workman*, *The School*, and *The Government of Thiers*. He died at Paris, June 8, 1896.

Si'mon Ma'gus (Simon the Magician) a sorcerer of Samaria, mentioned in the book of Acts. He was apparently a prominent person in the city of Samaria, about 37 A. D., and was called, because of his skill, "the great power of God." Becoming a convert to Christianity under the preaching of the evangelist Philip, and seeing the apostles Peter and John confer the gift of the Holy Ghost, including probably the gift of tongues, he attempted to buy miraculous power of them. His rebuke by Peter ends the Scripture account of him. Justin Martyr says that he went to Rome, where a statue was erected to him with the inscription "To Simon, the Holy God," and according to Irenæus, he was worshiped as Zeus or Jupiter. Hippolytus records that he met Peter at Rome and that he ordered his followers to bury him, promising to rise on the third day. But these stories rest on very uncertain foundation, and leave only as certain the existence of a great magician called Simon.

Simoom (*si-mōm'*) or **Simoon,** a hot, suffocating wind, common in the deserts of Africa and Arabia. It is very much like a cyclone, with a calm center surrounded by whirling blasts of very hot air, the whole moving slowly from south to north, or from east to west. It often carries along columns of sand, and is indicated by a purple atmosphere. It is very injurious to both men and animals, causing severe pain and a feeling of suffocation. It lasts only for a few minutes, not more than twenty at the most, and occurs in spring and summer.

Sim'ple Harmon'ic Mo'tion is the projection of uniform circular motion upon a diameter of the circle. Referring to the accompanying figure, let P be a point moving with uniform speed in the circumference of the circle. And from the point P, in each of its successive positions, imagine a perpendicular let fall upon the diameter there shown. The motion of the foot of this perpendicular H to and fro along the diameter is a simple harmonic motion, and is often indicated by the letters S. H. M.



SIMPLE HARMONIC MOTION.

The circle in which we have imagined the point P to move is called the *circle of reference.*

The radius of this circle is known as the *amplitude* of the S. H. M.

The time occupied by one round trip of the point H to and fro across the diameter is called the *period* of the S. H. M.

The angle between the radius OP and the radius from which angles are measured in this circle is called the *phase* of the S. H. M.

The value of the phase at the instant from which time is measured is called the *epoch* of the S. H. M.

The distance of the point H from the center of the circle at any instant is called the *displacement* of the S. H. M.

Any S. H. M. is completely described only when we know four things about it, namely:

1 — The *amplitude.*
2 — The *period.*
3 — The *phase* at any time, t.
4 — The *direction* of motion of the point P in the circle of reference.

If we denote the amplitude by A, the period by T, the phase by θ and the displacement at any instant, t. by x, then the equation of S. H. M. is

$$x = A\cos\ \frac{2\pi}{T}\,t$$

$$\text{where } \frac{2\pi}{T}\,t = \theta$$

No one motion in nature is more frequently met with than S. H. M. The motion of a freely suspended pendulum bob is practically simple harmonic. A ball suspended by a vertical spiral spring oscillates up and down in a vertical line with a S. H. M. Air particles set in motion by a tuning fork vibrate to and fro with a S. H. M. Ether particles when traversed by a ray of light probably vibrate with a S. H. M. See Worthington's *Dynamics of Rotation*, or Daniell's *Physics*, for more complete discussion.

Simp'son, Sir **James Young,** a Scotch physician, was born in Linlithgowshire, Scotland, June 7, 1811. He studied in Edinburgh, attracting attention by his ability, and especially by his thesis on *Death from Inflammation*, when he took his medical degree. He rose rapidly in his profession, contributing largely to the renown of the Edinburgh school. In 1847, he was made one of her Majesty's physicians for Scotland. His greatest claim to distinction rests on his introduction of chloroform into medical use in March, 1847. His publications include a large number of medical works. He died May 6, 1870. A bronze statue of him was erected in Edinburgh in 1877. See *Memoir*, by Duns.

Sinai (*sī'nī*), a mountain in the northwestern part of Arabia, known as the place where Moses received the tables of stone, inscribed with the ten commandments. The mountain is a single peak in a great rocky mass which almost fills the peninsula of Sinai, a point of land shut in between the two arms of the Red sea, the gulf of Suez, and gulf of Akaba. There are three separate mountains; Mount Katherine being the one usually thought to be indicated by the name Sinai. This mountain has two peaks, the northern one, known as Mount Horeb, and the southern one, called the Mountain of Moses. This southern peak is generally agreed upon as the place of the giving of the law, though it is still disputed.

At its foot, is the Church of St. Catherine, built about 527 by the Emperor Justinian; a little higher up, the chapel of St. Elias, and on the summit a little pilgrim church. The whole peninsula, as well as the bold, jagged mountains, have a stern, treeless aspect, though palms, acacias, and tamarisks grow in the ravines. The Arabs range over the region with their sheep and goats. There are many caves among the mountains which have been the abodes of hermits, and many inscriptions on the rocks which date back to the era of the early Christians. See *Sinai and Palestine*, by Stanley; *Desert of the Exodus*, by E. H. Palmer.

Singapore (*sing-ga-pōr'*), ("Lion City"), a town of India on the island of Singapore. It was founded in 1819 for the British trade in the East Indies, and is now the most important trading place in southeastern Asia. It is a well-built town, with fine public buildings and all kinds of conveniences in the way of public works. There is a governor's residence, a Protestant cathedral, and a Catholic cathedral, Mohammedan mosques, Hindu temples, Chinese joss-houses, a museum, and hospitals, also fine botanical and zoological gardens. The harbor is large, and is used as a naval coaling station and depot. The population, numbering 185,000, includes 135,000 Chinese, 25,000 Malays, and about 4,300 Europeans. The climate is pleasant, though the death rate is high.

Sioux (*sō*), a group of tribes of American Indians belonging to the Dakota family. They are the principal tribe of the family, and sometimes their name is given to the whole family. They were living near the head waters of the Mississippi when found by the whites. In their wars with the Chippewas and the Hurons, some of them were driven farther south, but in 1822 they numbered about 12,000, and their lands stretched from the Mississippi river to the Black Hills. In 1837, and again in 1851, they ceded parts of their land to the United States. The failure of the government to carry out their treaties irritated the tribes, and they troubled the white settlers for some years and in 1862 made a general uprising, killing nearly 1,000 whites. New Ulm, in Minnesota, a town of 1,500 people, was nearly destroyed. This rebellion ended in the imprisonment of more than 1,000 Indians and the execution of 39 of the leaders, and cost the United States $40,000,000. The Santee Sioux were placed on reservations near Yankton, S. D., where they have become peaceful farmers. After a vain endeavor to settle matters peacefully, Sitting Bull, a young chief, and others going to Washington for the purpose, the hostile tribes gathered in North Dakota and began the war of 1876, in which General Custer perished. Large settlements of the Sioux have been made since in South Dakota. In 1890, under a "messiah," there was another rising of the Sioux in the northwest. They now number about 25,000. See *Forty Years among the Sioux*, by Riggs.

Sioux (*sō*) **City**, a city of Iowa, on the Missouri river, which is crossed by a bridge 2,000 feet long. It is a railroad center and a manufacturing city, and has a large trade, being situated in a fine farming region. There are large meat packing establishments and flaxseed oil mills, and vast quantities of stoneware; here 25,000,000 bricks a year are made. Among the notable buildings are the city hall and public library, the Federal building, and the Young Men's Christian Association building. The city has a good system of public schools, and here is located Morningside college, a Methodist Episcopal institution. Population 33,111.

Sioux Falls, a city in South Dakota, the largest town in the state, is on the Big Sioux river, and takes its name from the falls of the river, which here descend ninety feet. The city was laid out in 1847, and destroyed by the Sioux in 1862. It was rebuilt after Fort Dakota was abandoned in 1870. The buildings are nearly all of red granite. The great industry is the quarrying and polishing of the granite underlying the city. There are also manufactories, a state penitentiary, a public library, the Sioux Falls university, with a large building of jasper, and a Catholic seminary. Population 10,266.

Siphon (*sī'fŏn*), an instrument for transferring liquid from a vessel at one level to another vessel at a lower level. The simplest possible form is shown in the accompanying figure, where the liquid A is being emptied into the vessel D.

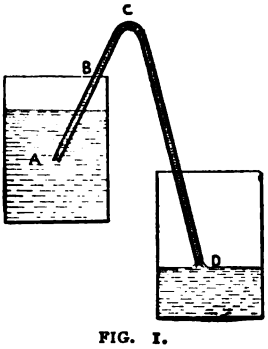


FIG. 1.

In order to start a siphon the pressure of the air must be diminished in the branch C D. The pressure of the atmosphere on the surface B then forces the liquid up the arm A C, and, in flowing down the arm C D, this liquid acts as a pump, and keeps the pressure in C D below that of the atmosphere.

Evidently, however, this pumping must cease as soon as the liquid in the vessel D rises to the same level as the surface B.

It is also clear that, since the water is driven up into the arm A C by means of the earth's atmosphere, no siphon will work in a vacuum.

The most safe and convenient form of siphon, especially for transferring acids, is that shown in figure 2, which is provided

with a mouthpiece for starting, but without danger of getting acid or poison into the mouth. The action will be evident from the figure.

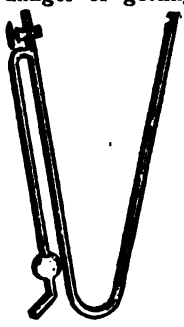

FIG. 2.

Siphonogamy (*sī-fŏ-nŏg'a-mĭ*), a condition in plants in which pollen tubes are developed for the transfer of the male cells to the eggs. The seed plants are siphonogamous; while in the lower plants the male cells usually swim to the eggs. As a consequence, the Spermatophytes are called Siphonogams by some botanists.

Si'rens, sea nymphs in Greek mythology, who sat on the shores of an island off the southwest coast of Italy, and by their songs lured the passing sailors to their death. The *Odyssey* tells the story of Ulysses stopping the ears of his companions with wax, and lashing himself to a mast, till they had sailed out of hearing of the fatal songs. The Argonauts also were carried past in safety, because the music of Orpheus had a stronger spell, seeing which the sirens threw themselves into the sea and were turned into rocks. By the Latin poets they are represented with wings, and in art as birds, with the faces of young women. See *Myths of the Odyssey in Art and Literature*, by Harrison.

Sir'ius. See Dog Star.

Siroc'co, a hot wind which blows on the southern coasts of Italy, lasting sometimes a week. It is hottest in Malta and Sicily, but does not last as long as on the Ionian islands. It is like the simoon, and produces the same feeling of suffocation and exhaustion.

Sisyphus (*sĭs'ĭ-fŭs*), in Greek mythology, the son of Æolus, the founder and king of Corinth, and noted for his wickedness, for which, according to Homer, he was condemned to roll a large stone up a hill, which, when it reached the top, fell back again, so that his task was never ended.

Sit'ka, the capital of Alaska, is on the west coast of Baranoff island. It has a deep harbor, dotted with islands, with snowy peaks rising behind the town. There is a fine green-spired Greek church and an old Russian palace. The climate is cold, with a large rainfall. Population 1,188.

Sit'ting Bull, an Indian warrior of the Sioux tribe, born in 1837. When gold was found in the Black Hills, an effort was made by the United States to purchase the land of the Sioux, to whom it belonged. They were very unwilling to give it up, and Sitting Bull, Red Cloud, and Spotted Tail, with other chiefs, visited Washington in May, 1875, but would not sign the treaty. The failure of the government to keep its promises, and the actions of the settlers, in pushing on to the lands, kept up a feeling of hostility, and the young braves of the tribes gathered around Sitting Bull in Northern Dakota. General Custer, with a small force, was sent against them, and he and his followers were all killed; but the Sioux were at last conquered and Sitting Bull escaped to Canada, but on promise of a pardon surrendered. In the rising of the Indians of the northwest, in 1890, Sitting Bull was killed.

Six'tus, the name of five popes.

Six'tus IV., Pope, was born July 22, 1414, in a small village near Savona, Italy. He had a great reputation as a preacher throughout Italy. He became pope in 1471. He exhausted the treasures of the papal church in providing for his relatives, and took part in a conspiracy against the Medici at Florence. Learning, and especially the improvement of the city, owed much to him. He built the Sistine chapel and the Sistine bridge across the Tiber, increased the Vatican library, and patronized the great painters of his time. His union with the Venetians against the duke of Ferrara brought on an Italian war, which ended in the breaking up of the Venetian alliance. The pope is said to have died from mortification at this result Aug. 13, 1484. See *Lives of the Popes*, by Ranke.

Six'tus V., one of the most able of the popes, was born Dec. 13, 1521, near Montalto, Italy. He was a professor of theology at Rimini and Siena, an eloquent preacher, vicar-general, and cardinal. While Gregory VIII. was pope, he lived in retirement, and was thought to have become old and infirm, which recommended him to the cardinals, who were to select a successor to Gregory. But those who thought to lead him were soon undeceived by his vigorous administration. He stopped disorder, improved the working of the laws, gave liberty to the Jews to worship in their own way, and to trade in his dominions. He built the library buildings of the Vatican, authorized a new edition of the Septuagint and the Vulgate, and in every way carried out his policy of increasing the power of the Catholic church against the Huguenots, the Lutherans, and Queen Elizabeth. He died Aug. 27, 1590. See *Lives of the Popes*, by Ranke.

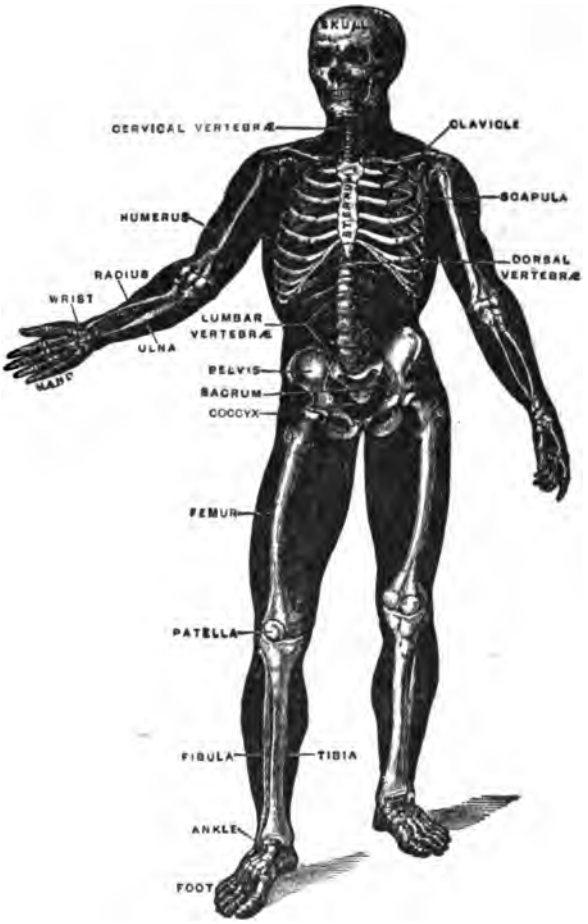
Skag'er-Rack (*răk*), an arm of the North sea, between Denmark and Norway. It is 140 miles long and 70 miles broad. It is subject to violent storms, but when quiet the current runs east on the coast of Denmark, and west on that of Norway. The harbors are all on the coast of Norway.

Skate, a common name of several kinds of the ray. The tobacco box skate, barndoor skate, and briar skate are American varieties, and the tinker and the gray skate are found

in Scotland and in England. Their egg cases, called "mermaid's purses," are often thrown upon the beach. The flesh is coarse and the expanded fins are the parts usually eaten.

Ska'ting is moving on the ice by means of steel blades fastened to the soles of the shoes, called skates. In early times, the shin bones of animals were tied to the feet, and by using a stick to push with, the wearer could move over the smooth surface of the ice. Skates now used are of two kinds, those for speed and those for figure skating. The blades for speed skating are very thin and longer than the foot, while those for making figures are broader and rounded at the toe and heel. In the northern countries of Europe, where the ice has a slight covering of snow, skating is very popular. The motion is rapid, the Frieslanders traveling often 15 miles an hour. Skate racing is often practiced, the fastest time yet made being a mile in 2 minutes and 52 seconds. Figure skating is practiced in America, Canada, Holland, Germany, Norway, Sweden, and Denmark. Ice rinks are used for this amusement, and are often crowded with spectators. Wheel skates or roller skates were invented in 1865, by Mr. Plimpton, of New York; the use of them is a fine preparation for skating, and the amusement has been very popular.

Skel'eton, the hard parts of an animal. Accepted in this broad sense, the skeleton includes the hard outer covering, or exo-skeleton, and the inner bones, or endo-skeleton. As examples of exo-skeletons we have the shells of clams, snails, and other mollusks; the shell or test of the sea-urchins; the limy plates of the star-fishes; the shell of the lobsters and cray-fishes; the bony carapace and plastron of turtles, and the like. The internal bony framework of vertebrated animals is an endo-skeleton consisting of bones and cartilages. The comparative study of endo-skeletons leads to many interesting conclusions. There are similar or homologous parts in them all. For example, the wing of a bat or bird is constructed on the same plan as the flipper of a seal, the fore-limb of a dog, a horse, or a man. That is, corresponding bones can be made out in them all. The same is true of hind-limbs and other parts of the skeleton, including the skull. This serves to unite animals on the line of similitude of structure. The hard parts are for protection, when on the outside, and also for the attachment of muscles. Not only is there correspondence between the bones of different animals, but the muscles, nerves, and blood vessels are also similar. The fossil bones of extinct animals have furnished clues to the past history of life on the globe. There are upwards of two hundred separate bones in the human skeleton. The actual number of distinct bones varies at different periods of life; many bones which



HUMAN SKELETON.

are separated in youth become united in old age. The skull has twenty-two distinct bones in early adult life; but in youth the number is larger, and in old age less. There is a tendency for the bones to unite in old age. There are originally thirty-three separate bones in the spinal column. Twenty-four of these remain distinct throughout life, while the lower nine become consolidated into two groups, the sacrum and the coccyx. Twenty-four ribs bound the chest, and most of them are connected by cartilage with the breast bone or sternum. The shoulder-blades, the collar-bones, and two hip-bones are connected with the arms and limbs respectively.

There are thirty bones in each arm, and the same number in each leg, counting the kneepan. The bones are held together by ligaments. See the illustration for further names. See also FOOT, HAND, and SKULL.

Skim'mer, a class of web-footed, long-winged sea birds, belonging to the gull family. They have a long, thin bill with the upper half shorter than the lower. There are only three known species, each kind being confined to one country. The American skimmers, called shearwaters, skim along the surface of the water in flocks, using the lower part of the bill as a plow to bring up the small fish on which they feed, and holding them with the upper half of the scissors which their bills form. They are also called scissors-bill or razor-bill shearwaters. The other varieties are found in Asia and Africa. See GULL.

Skin, the investing membrane of the body of an animal. In vertebrated animals it consists of two layers, an outer epidermis and an inner dermis or true skin. The former is largely for protection, the latter plays an important part in physiology. The epidermis has neither blood vessels nor nerves, but the true skin is richly provided with both. The dermis is made of a dense feltwork of fibers, and, in the human body, is from one-fiftieth to one-tenth of an inch in thickness in different parts of the body. Its outer surface is raised into little hillocks, called papillæ. These are of two kinds, the vascular papillæ containing a network of minute blood vessels, and the nervous papillæ in which the nerves terminate. There is often an oval touch corpuscle in which the nerve has its ending. The epidermis lies on the dermis and dips into all of its depressions. It is composed of cells, the outer layers of which are reduced to flattened scale-like elements, which are continually falling off or being removed by bathing and friction. They are as continually renewed from a deeper layer of plump cells which divide rapidly. Thus the outer skin has two layers, a horny layer and a mucous layer. The latter is the seat of the pigment or coloring granules which impart color to the skin. In negroes, it includes a rather dense layer of dark granules. All over the body the skin has minute orifices which are the openings of small tubes connected with the sweat glands. These consist of coiled tubes located in the deepest part of the true skin, or just below it. A tubular duct extends from each gland to open on the surface, and as it passes through the layer of the skin it runs in spirals, like a corkscrew. The number of sweat glands varies greatly in different parts of the body, they are fewest in the back and neck, being about 400 to the square inch. On the skin of the palm and sole there are two or three thousand to the square inch. Hairs, nails, hoofs, scales, and like structures are outgrowths from the epidermis of the skin. Consult topics, HAIR and FEATHERS. The skin performs important offices. The watery vapor passed off by it in the form of perspiration amounts to about 2½ lbs. a day. It also liberates carbon dioxide. In some animals, like frogs, it is an important aid in respiration. It is also concerned in regulating the temperature of the body. When the body is covered with a varnish or layer of leaf metal, death results, not from stopping the perspiration as was formally supposed, but by radiation of heat and fall of bodily temperature,— the skin being unable under the conditions to regulate the temperature. The touch corpuscles in the skin give it an important sensory action in connection with the nervous system.

Skull, the hard framework of the cranium including the lower jaw. The skull in fishes, and in mammals, although so different in general appearance, is composed of corresponding bones. They are more separated in the fish, and more modified and united in the higher animals. In sharks and other cartilaginous fishes the skull may be entirely cartilaginous throughout life. The question of the nature of the skull perplexed naturalists for a long time. Early in the 19th century the German philosopher, Oken, and the poet-philosopher, Goethe, declared the skull to be composed of modified vertebræ. This idea was extensively developed by Richard Owen, in his great work on «Comparative Anatomy of the Vertebrates.» Thus arose what was called the vertebral theory of the skull. Huxley showed, however, in 1859, that the bony cranium is preceded by a skull of united cartilage, having neither sutures nor joints. The bones are formed later, being mostly laid down in the membranes surrounding the original cartilaginous skull, which disappears. Therefore, the bones are not primary structures, and the history of the skull shows that they cannot represent modified veterbræ. By comparing the skulls of different animals corresponding bones can be identified, but the study is technical. See Huxley's *Anatomy of Vertebrated Animals* (1878); Parker and Bettany's *Morphology of the Skull* (1877).

Skunk, a carnivorous animal widely known on account of the offensive odor of a fluid which it ejects when frightened or disturbed. There are several varieties found only in the New World in both North and South America. The common skunk is about the size of a small cat, and ranges from Hudson bay to Guatemala. The body is rather stout, the tail is very bushy, and the prevailing colors black and white. It is usually black, with broad stripes of white running lengthwise. These animals burrow and are active at night. They feed on mice, salamanders, frogs, and eggs of birds that nest very low. Sometimes they rob hens' nests, but this is by no means the rule. They are of positive benefit to the farmer, on account of the large number of

beetles, grasshoppers, and field mice which they destroy. Ordinarily they do not run at the approach of man, but, conscious of the protection of their nauseous secretion, move away deliberately. They can eject this fluid at will a distance of from eight to twelve feet. Their flesh is said to be white and sweet. The fur is considerably used, and in the market goes under the name of Alaska sable.

Skye (*ski*), the largest island of the Hebrides, off the west coast of Scotland. It is forty-nine miles long, and from seven to twenty-five miles broad. It is mountainous, with a few tracts of pasture land, and one large plain. The highest peak of the mountains, called the Coolin hills, is 3,234 feet high. The lake Coruisk, the "dread lake" of Scott's *Lord of the Isles*, and Glen Sligachan, thought to be the grandest glen in Scotland, with columns and cliffs over 1,000 feet high, with waterfalls leaping over them, and deep caves at their foot, are among the interesting scenery of the island. Fish abound, and with potatoes form the main diet of the people, and also furnish the principal industry of the island. The inhabitants (which are chiefly crofters) are principally Celtic, speak the Gaelic language, and number 15,800. The principal proprietors are Lord Macdonald, and MacLeod of MacLeod. See *A Summer in Skye*, by Smith.

Sky'lark, an European bird that mounts high in the sky and sings on the wing. It is the lark of the poets. The larks of America belong to a different family. See LARK.

Slate. See SHALE.

Sla'very, the condition of a man who belongs to a master, who has the right to employ him and treat him as he pleases. It probably arose first from captives made by war. It was general among ancient nations, including the Jews. In Greece, slaves were employed not only for domestic service, but as bakers, tailors, seamen, miners, soldiers, and police. They were usually mildly treated and were often freed. A slave was not allowed to wear his hair long, nor to enter the gymnasia and public assemblies, but could appear in the temples and at festivals. At one time there were 200,000 slaves in Attica, being three times the number of the freemen. Roman slavery was very severe, as is seen by their gladiatorial combats. Old and useless ones were often left to starve on an island in the Tiber. The cruelty of the masters was gradually softened by the law — a very cruel one being obliged to sell his slaves. The slave could not own property, though sometimes allowed a small portion of his gains when in trade, and could not testify in the courts. In Great Britain, the Anglo-Saxons made slaves of the Celts and other natives, and had a regular trade with the continent in Irish slaves; but with the Norman Conquest slavery was merged into serfdom. The traffic in slaves continued among Mohammedan nations, Christian captives being sold as slaves in the markets of Asia and Africa. The Barbary Corsairs, down to 1812, carried off large numbers from the coasts of Europe into slavery. Cervantes, for five years a slave, reports 25,000 Christian slaves in Algiers alone. During the middle ages in Europe, the class called serfs were, practically, slaves. They were usually attached to the soil and could be transferred with the land they tilled. They could not hold property, but their oath was taken in evidence, and if injured they were protected by law.

Serfdom died out in England and in Scotland gradually, a curious form of it remaining in Scotland to the end of the 18th century. Colliers and saltworkers were bound by law, on entering a coal work or salt mine, to life service there, their labor was transferred with the ground, and their sons could not follow any other trade, nor seek employment in other mines. In France, the Revolution swept away the last remains of serfdom, and in Italy it ended in the 15th century. It was abolished in 1781 in Bohemia and Moravia, and entirely destroyed in Prussia by the reforms of the 19th century, though the mass of the peasants had been free since the end of the 13th century, while Russia put an end to the system in 1861.

Negro slavery of modern times was the result of the discovery of America, the Portuguese introducing them first into the New World to work their mines and plantations. They were first used to any extent in Haiti, in St. Domingo. Sir John Hawkins was the first English slave-trader, followed by others, until England had carried to America, between 1680 and 1700, 300,000 slaves, and between 1700 and 1786, 610,000 into Jamaica alone. The slave trade was very inhuman, the negroes being so crowded on the ships that a large proportion died on the passage. The first efforts to restrain slavery were made to stop the slave trade. In 1787, a society for this purpose was formed in London, with such supporters as Clarkson, Wilberforce, Macaulay, and Sharp. After several years of struggle, the abolition bill, making all slave-trading by British subjects illegal after Jan. 1, 1808, became a law March 7, 1807. The movement was continued until, on Aug. 28, 1833, an emancipation bill was passed giving freedom to all slaves in the British colonies. Slavery was abolished in the French colonies in 1848, in the Dutch in 1863, and in Brazil in 1888. When the American colonies became the United States, in 1776, there were 300,000 slaves in the country, and in 1790, at the taking of the first census, they numbered 697,897, and were found in all the states except Massachusetts, to which Maine then belonged.

The northern states gradually abolished slavery, Pennsylvania having 64 as late as 1840. In the south, many, with such leaders as Washington and Jefferson, opposed slavery

until the invention of the cotton gin made it profitable and developed it, until even the renewing of the slave trade with Africa, abolished by the United States in 1808, was advocated. The contest between the upholders and the opposers of the system, beginning in the north with the formation of societies for the gradual abolition of slavery, and carried on by literature, by lectures, and finally by the political parties, was met in the south by demands for enlarged territory and national laws protecting their slave property in the free states. The Pennsylvania Abolition society was founded in 1775, with Benjamin Franklin as president, and the New York society, with John Jay and Alexander Hamilton as leaders. In 1831, Garrison established the antislavery journal, *The Liberator*. The formation of a northern republic, free from slavery, was the hope of the extreme abolitionists, as the formation of a southern republic founded on slavery was the aim of the extreme pro-slavery party. The contest ended in the Civil war of 1861–65, in the course of which the proclamation of emancipation was issued by Lincoln, Jan. 1, 1863, setting free nearly 4,000,000 slaves, and confirmed in 1865 by an amendment to the constitution approved by twenty-seven of the thirty-six states.

Slavery still exists, and the slave trade is carried on by Arab slave-traders in the interior of Africa, the tracks of their caravans being whitened by the bones of those who have died on the journey. The Congo Free State, the foundation of missions, and the encouragement of trade by the British and German companies, with the help of all Christian governments, it is hoped, will finally put an end to the terrible traffic, in which over 90,000,000 Africans have been enslaved. See *History of the Slave Trade*, by Clarkson; *Rise and Fall of the Slave Power in America*, by Wilson.

Slavs (*slävz*) or **Slavonians** (*sla-vō'ni-ans*), the name of a group of nations belonging to the Aryan family, living in the eastern parts of Europe and northern Asia. The earliest history represents them as living around the Carpathian mountains, and spreading to the Baltic, the Elbe, and over the whole peninsula between the Adriatic and the Black sea. Since the 7th century they have become settled and gradually formed into independent states. There are two divisions, the southeastern and the western. The Russians, Bulgarians, and Illyrians belong to the first division; the Poles, Silesians, and Pomeranians, called Lechs, the Czechs or Bohemians, and the Slavonic tribes of north Germany make up the western division. The only people that have preserved their language are the Wends or Serbs of Saxony and Prussia. The whole Slavonic population is about 100,000,000. They are represented by ancient writers as an industrious race, living by agriculture and having flocks and herds. The government, at first patriarchal, was gradually usurped by the chiefs and the people were reduced to serfs. There was no middle class between the nobility and the peasants. See LANGUAGES, and LITERATURE.

Slidell (*sli-dĕl'*), **John,** an American lawyer and politician, was born in New York city about the year 1793, and died at London, England, July 29, 1871. After graduating at Columbia college, he studied law, and removing to New Orleans practiced there and became a leader in Louisiana politics. From 1842 to 1845 he served in congress as a state-rights Democrat: in the latter year he was sent as minister to Mexico by President Polk, to adjust difficulties arising out of the annexation of Texas, but the Mexican government refused to receive him. From 1853 to 1861 he was a member of the United States senate, and in the Civil war, when Louisiana seceded, he withdrew, and was appointed Confederate minister to France. In company with James M. Mason, who was named minister to England, both were taken on the high seas by Captain Wilkes, of the United States navy, and brought as prisoners to the United States, where they were confined in Fort Warren. On the demand of England, they were released, however, and proceeded on their respective missions. In France, aided by the sympathy of Napoleon III. for the Confederate government, Mr. Slidell, though unable to secure recognition for his government, procured a ship, the *Stonewall*, for the Confederacy, and negotiated with French capitalists for a loan of $15,000,000. After the war closed, Mr. Slidell settled in England and resided there until his death.

JOHN SLIDELL.

Slime Moulds. See MYXOMYCETES.

Sloane, William Milligan, American educator and author, was born at Richmond, O., Nov. 12, 1850, and graduated at Columbia college in 1868, continuing his studies thereafter at Leipsic and at Berlin. At Berlin, he acted at the same time as secretary to George Bancroft, then United States minister to Germany, aiding him in his historical work. From 1876 to 1883 he was assistant and professor of Latin at Princeton university, and from 1883 to 1896 occupied there the chair of history, with intervening visits to Europe. Since 1896, he has been Seth Low professor of history at Columbia university, New York city. He has also been editor of the *New Princeton Review*, and one of the conductors of the *American Historical Review*. Among his writings are the *Life and Work of J.*

Renwick W. Sloane (his father), *The French War and the Revolution*, a *Life of the Rev. James McCosh*, and *Napoleon Bonaparte, a History* (in four volumes).

Slo'cum, Henry W., American general, was born September 24, 1827, at Delphi, Onondaga county, N. Y. He graduated from West Point in 1852 and was assigned to the 1st artillery, with the rank of second lieutenant. After promotion to first lieutenant, in 1855, he resigned in 1856, practiced law at Syracuse, and was elected to the state legislature in 1860. On the outbreak of the Civil war, he was commissioned as colonel of the 27th New York volunteers and took part in the first battle of Bull Run, where he was wounded. In August, he was made brigadier-general, commanded a brigade and later a division in the army of the Potomac, taking part in McClellan's peninsular campaign in 1862. He distinguished himself at the battles of Gaines' Mill, Glendale, and Malvern Hill and was promoted to major-general of volunteers. He fought at second Bull Run, South Mountain, and Antietam, and as commander of the 12th corps rendered signal service at Fredericksburg, Chancellorsville, and Gettysburg. Later he was transferred with his corps to the army of the Cumberland, succeeded to the command of the 20th corps, and was the first to enter Atlanta. In Sherman's march to the sea and through the Carolinas he commanded the left wing, taking part in the actions of that campaign. After the war, he took up the practice of law at Brooklyn, was elected to congress in 1870, and again in 1884. He died at Brooklyn, N. Y., April 14, 1894.

Sloe, a wild plum, called also blackthorn. It is a shrub growing from four to 10 feet high, though sometimes forming a small tree. The branches end in sharp points or spines. The flowers are white, appearing before the leaves. The fruit, about the size of large peas, is sometimes made into preserves, but is bitter and little used. The leaves resemble tea leaves and have been used to adulterate tea, and the juice is used in making an inferior port wine. The wood takes a fine polish and is used for tool handles and canes. The sloe is thought to be the original of all the European varieties of the plum.

SLOE.

Sloth, any one of a group of sluggish mammals living on trees in the forests of Central and South America. Their limbs end in hook-like claws, and they are the most strictly tree-inhabiting of all animals. They usually cling to branches with their backs downward. They crawl with difficulty on the ground and rarely descend to it. They are covered with long, coarse hair, the shafts of which are roughened or fluted. This hair is naturally grayish, but in the damp forests it is covered with a growth of algæ, imparting to it a peculiar green color, which makes the animal difficult to distinguish among the foliage. The algæ disappear in a dry climate and the hair resumes its natural color. They feed upon leaves, young shoots, and fruit. They are silent, inoffensive animals and move mostly at night. About ten species are known. Fossil sloths of colossal size have been found in the rocks.

Slug, a land snail of elongated form, with a small rudimentary shell, covering the lungs and heart, or entirely absent. These animals have feelers with eyes at the extremities, as in the common snail, but the body is not coiled. The shell when present is a small flattened plate usually concealed in the mantle. Some of the common forms reach in length from two to four inches. They often live in cellars. They live concealed under boards and other objects during the day, but are active at night, feeding mainly on vegetables. In Europe they have caused great injury to garden crops.

Smea'ton, John, a civil engineer, was born near Leeds, England, June 8, 1724. He began business as a maker of mathematical instruments, but continued his studies and experiments, inventing, in 1751, a machine for measuring a ship's path at sea. In 1755, he was appointed to rebuild the Eddystone lighthouse. It was built of stone and was the greatest work of the kind at the time, standing for one hundred and twenty years as a monument of his skill. His other works were Ramsgate harbor, the Forth and Clyde canal, Spurn lighthouse, the preservation of the old London bridge, and the Perth and Banff bridges in Scotland. His scientific reports were published by the Society of Civil Engineers, who regarded them as a "mine of wealth." He died Oct. 28, 1792. See *Lives of the Engineers*, by Smiles.

Smelt, a small fish closely related to the salmon, but usually placed in a distinct family. On the western Atlantic coast two species, one more northern than the other, extend from the Arctic to Virginia. They are each about twelve inches long and silvery in color. When fresh, they have an odor resembling cucumbers, and are highly prized as food. Other similar forms occur in Europe and along the Pacific coast of the United States.

Smiles, Samuel, a Scottish writer, was born at Haddington, Scotland, in 1812. He

studied medicine at Edinburgh and practiced at Haddington and at Leeds, finally becoming editor of the Leeds *Times*. Here he met George Stephenson, which led to his writing his life in 1857. His book, *Self Help*, followed, and was at once a success, which has continued, the sales reaching 150,000 copies and the translations being made in seventeen languages. Some of his other works are *Character*, *Thrift*, *Duty*, *Lives of the Engineers*, *Men of Invention*, *The Huguenots in France*, *The Huguenots in England*, and *Industrial Biography*.

Smith, Adam, a Scottish philosopher, was born at Kirkcaldy, in Fifeshire, Scotland, on June 5, 1723. He studied at Glasgow and at Oxford, and was made a professor in the University of Glasgow. He published his *Theory of Moral Sentiments* in 1759, and later a *Dissertation on the Origin of Languages*, both of which had a great vogue in their day. But the work which gives him his reputation, and makes him the founder of the science of political economy, was his *Inquiry into the Nature and Causes of the Wealth of Nations*, published in 1776. Its clear style, startling doctrines, and curious facts, made it popular at first, but when it was seen how contrary its principles were to the old ideas of things, it was vigorously opposed. After the French Revolution and the excitement attending it had passed by, the book became the leader of a great host of literary works based upon it. Smith became Lord Rector of Glasgow university in 1787, and died at Edinburgh, July 17, 1790. See *Life* by Farrer in the "English Philosophers" series, and by Haldane, in the "Great Writers" series.

Smith, Charles Emory, American journalist, diplomat, and United States postmaster-general, was born at Mansfield, Conn., Feb. 18, 1842, and graduated from Union college in 1861. Commencing his career as a newspaper writer he became, in 1865, editor of the Albany *Express*, and in 1870 editor of the Albany *Journal*. In 1880, he removed to Philadelphia, and there conducted the *Press* of that city. He has been president of the New York State Press association, a regent of the University of the State of New York, a delegate to several national Republican conventions, and from 1890 to 1892 was United States minister to Russia. In 1898, he entered President McKinley's cabinet as postmaster-general.

Smith College, located at Northampton, Mass., was founded in 1871 by Miss Sophia Smith, of Hatfield, Mass., who donated about $365,000 for the purpose. It is a college for women, providing courses of study and facilities for education equal to those which are afforded in the best colleges for young men. It stands in the first rank among colleges for women. It has a faculty of 80, and an attendance of 1,133 students.

Smith, Edmund Kirby, a Confederate general, was born at St. Augustine, Fla., in 1824. He was professor at West Point and a major in the United States army. In the Confederate service he became lieutenant-general in 1862, and general in 1864. He was made commander of the trans-Mississippi department in 1863, and managed it so as to make it self-supporting. He invested Cincinnati in the fall of 1863, but withdrew when the veterans under Sigel entered the city. At the close of the war, Gen. Kirby Smith's forces were the last to surrender. He was president of the Atlantic and Pacific Telegraph company from 1866 to 1868, chancellor of the University of Nashville from 1870 to 1875, and afterward professor in the University of the South at Sewanee, Tenn. He died there March 28, 1893.

Smith, Eli, an American missionary, was born at Northford, Conn., Sept. 13, 1801. He sailed as a missionary of the American board to Malta in 1826. He went to Beirut to study Arabic, afterward making a tour through Greece, Armenia, and Georgia to Persia, thus preparing the way for the Nestorian mission. He was the companion of Dr. Robinson in his explorations in Palestine. His work in improving the Arabic type, by making the letters clearer, and more like the written ones, was important. He spent the last years of his life in connection with Dr. Vandyke, in making the Arabic translation of the Bible. He died in Beirut, Syria, Jan. 11, 1857.

Smith, Francis Hopkinson, American artist and author, was born at Baltimore, Md., Oct. 23, 1838, and as a youth studied, and for some years was actively engaged in mechanical engineering. In the latter capacity he performed considerable work under contract for the United States government. He has, however, made his chief reputation as a water-color painter, among his more notable pictures being: *In the Darlink Wood*, *In the North Woods*, and *A January Thaw*. In literature, he has also achieved a reputation, as well as an illustrator. The following works have come from his pen: *Old Lines in New Black and White; A White Umbrella in Mexico; Well-Worn Roads; Colonel Carter of Cartersville; A Book of the Tile Club; A Day at Laguerre's; American Illustrators; Venice of To-day; A Gentleman Vagabond and Some Others; Tom Grogan; Gondola Days;* and *Caleb West*.

Smith, Henry Boynton, an American theologian, was born at Portland, Me, in 1815. He studied at Halle and at Berlin, Germany, after finishing his theological studies at Andover and at Bangor. He was a professor of philosophy at Amherst college, and of church history and later of theology, at Union Theological seminary in New York city. He held this position for twenty years, which, with translations of works on church history, made

him one of the first theologians of the Presbyterian church. He died at New York, Feb. 7, 1877.

Smith, Gold'win, an English writer, was born at Reading, England, Aug. 13, 1823. He studied at Eton and Oxford and was elected a fellow of University college. From 1858 to 1866 he was professor of history at Oxford. During the Civil war in the United States, he wrote several pamphlets in support of the north, and in 1864 lectured in the United States. He was appointed professor of English and Constitutional history at Cornell university, Ithaca, N. Y., in 1868. Since 1871, he has lived in Canada, where he has edited the *Canadian Monthly*, and founded and edited *The Week* and *The Bystander*. His writings, which are marked by vigorous thought, an incisive and brilliant style, and remarkable powers of compressing much into little space, yet with great lucidity, and the quality of highly interesting the reader, embrace: *Irish History and Irish Character; Lectures on the Study of History; Three English Statesmen; The United States*, an *Outline of Political History (1492–1871)*; *The United Kingdom, a Political History; Lectures and Essays; A Trip to England; Bay Leaves; Guesses at the Riddle of Existence;* and biographies of *Wm. Lloyd Garrison, Wm. Cowper*, and *Jane Austen*.

GOLDWIN SMITH.

Smith, Captain **John,** the founder of Virginia, was born in Lincolnshire, England, in 1580. He traveled in France and the Low countries, and when on his way to join the Christian army fighting against the Turks in Hungary, was robbed by four adventurers. He joined a ship, half merchant and half pirate, and helped to capture a Venetian argosy. He distinguished himself in the service of Ferdinand, duke of Austria; was next sold as a slave, but escaped and traveled through Germany, France, Spain, and Morocco. In 1605, he joined an expedition of three vessels and 105 men, to found a colony in Virginia. On the way out he was accused, by the leaders, of a conspiracy to make himself king of Virginia, and was kept a prisoner on the voyage. Jamestown was founded on the James river in April, 1607. Smith, after being tried and acquitted, was made a member of the council, and was the real head of the colony, saving it from destruction. On one of his journeys into the country for corn he was captured by the Indians, under the chief Powhatan, and his life saved by the chief's daughter Pocahontas. The story, however, has been doubted by late writers. On his return to Jamestown he found the colony reduced to about forty men, who were anxious to return to England, but were induced by Smith to remain until others arrived. He explored the coasts of the Chesapeake bay in two voyages, traveling about 3,000 miles, and making a map of the country. He was superseded in 1609 as governor of the colony by Lord Delaware, and returned to England. In 1614, he explored the coasts of New England, making a map of the country, which he presented to Prince Charles. He undertook the founding of a colony in New England in 1615, but his vessel was captured by a French war ship, and he was carried to La Rochelle. After his escape, he wrote an account of his voyages to New England. He wrote also *General Historie of Virginia, New England and the Summer Isles*, and the *True Travels, Adventures, and Observations of Captain John Smith*. See *Life*, in Sparks' "American Biography." He died at London, June 21, 1631.

Smith, Samuel Francis, an American clergyman, was born at Boston, Mass., in 1808. He served as pastor of a Baptist church in Waterville, Me., and at Newton, and Boston, Mass., edited the *Christian Review* and other Baptist periodicals. He is known as the author of several hymns, but especially of the national hymn, *My Country 'tis of Thee*, which he wrote in 1832, while a theological student at Andover. A Baptist hymn book contains twenty-seven of his hymns. He died Nov. 16, 1895.

Smith, William Robertson, a distinguished Scottish divine, biblical scholar, and orientalist, was born in Aberdeenshire, Scotland, Nov. 8, 1846, and died at Cambridge, England, March 31, 1894. Educated at Aberdeen university, he studied theology at Edinburgh, and at Bonn and Göttingen, and was elected to the chair of Hebrew and Old Testament exegesis at the Free Church college, Aberdeen. While here, he contributed some articles of an advanced character on the Bible for the *Encyclopædia Britannica* adverse to the "standards" of the Free church, which provoked much controversy and led to a prosecution for heresy. Owing to a skillful and powerful defense and to the spread of broader views of biblical criticism and the latitude allowed a writer on questions of inter-

WILLIAM ROBERTSON SMITH.

pretation, the trial was inconclusive, though subsequently (in 1881) he was removed from his chair, but left with its emoluments. This occurred in consequence of Professor Smith writing his later articles for the *Encyclopædia Britannica* on Hebrew language and literature. During his suspension he traveled in Egypt and Arabia, and on his return he became associated with Prof. T. Spencer Baynes in the editorship of the *Encyclopædia Britannica*. In 1883, he became lecturer on Arabic at Cambridge and subsequently professor at that university. The works of this fearless investigator and writer embrace: *The Old Testament in the Jewish Church*, *The Prophets of Israel and their Place in History*, *The Religion of the Semites*, *Fundamental Institutions*, and *Kinship and Marriage in Early Arabia;* also a volume on Isaiah for Professor Perowne's *Cambridge Bible for Schools*.

Smith, Syd'ney, an English author, was born in Essex, England, June 3, 1771. He studied at Oxford and was curate at Netheravon where he became tutor to a young man intending to study in Germany, but the war prevented and sent them to Edinburgh. Here, in 1802, with Jeffrey, Horner, and Brougham, he started the *Edinburgh Review*, writing eighteen articles in the first four numbers. He next lived six years in London, where he made his mark as a lecturer on philosophy, a preacher, and a brilliant talker. The archbishop of York gave him the parish of Forton in Yorkshire, where there had not been a resident clergyman for 150 years, a town, as he described it, "twelve miles from a lemon," but where he lived twenty years as "village parson, village doctor, magistrate, and Edinburgh reviewer." He was afterward made rector of Combe Florey in Somerset and a prebendary at St. Paul's, London. He wrote in all sixty-five articles for the *Edinburgh Review*, *Peter Plymley's Letters*, in favor of Catholic emancipation, and letters and pamphlets on the ballot, the game laws, prison abuses, etc. He is best known, however, as a wit, and the creator of "Mrs. Partington." He died Feb. 22, 1845. See *Life and Letters*, by Holland; *Life and Times of Sydney Smith*.

Smith, Sir **Will'iam Sid'ney,** the hero of Acre, was born at Westminster, England, July 21, 1764. He entered the navy at 11 years of age, and was made lieutenant when only 16 for his courage at Cape St. Vincent. He became captain in 1782; was sent to Constantinople on a mission, and was with Hood at the burning of the ships and arsenal at Toulon. Taken prisoner at Havre de Grâce, he succeeded in making his escape in 1798, and was sent as minister to Constantinople. From here, learning that Bonaparte was about to attack St. Jean D'Acre, he hastened there in command of a squadron. He captured the enemy's vessels in March, 1799, and held the town until Napoleon raised the siege, leaving his guns behind. He was rewarded with a pension of $5,000, and the thanks of parliament. As rear-admiral, in 1805, he guarded Sicily and Naples, destroyed the Turkish fleet in Abydos, 1807, and blockaded the Tagus. He was made vice-admiral in 1810, and admiral in 1821. His death occurred at Paris, May 26, 1840. See *Life*, by Barrow.

Smith, Sir **William,** an English classical scholar and for many years editor of the London *Quarterly Review*, was born at London in 1812 and died Oct. 7, 1893. His name will be familiar to most students by his many compilations—chiefly by his *Dictionary of Greek and Roman Antiquities; Dictionary of Greek and Roman Biography and Mythology; Greek and Roman Geography; Latin-English Dictionary; Dictionary of the Bible; Dictionary of Christian Biography*, and *Dictionary of Christian Antiquities*.

Smith'field or **Smooth'field,** is an open space of nearly six acres in London, and has been used for centuries as a market for sheep, horses, cattle, and hay. It was outside the city walls, and could be used for jousts, tournaments, and executions. The well-known Bartholomew fair was held here; Wallace, the patriot, was executed here by Edward I.; Wat Tyler, with 30,000 peasants, here met Richard II., and was stabbed by the mayor of London. It is best known, however, as the place of execution of the long line of English martyrs from 1401 to 1612. The cattle market, well described in *Oliver Twist*, was closed in 1855. The hay market still occupies a part of the space, but the center is laid out as a garden with fountains.

Smithso'nian Institu'tion, a scientific establishment, which was organized by congress in 1846, to carry into effect the will of James Smithson. He was an Englishman, born in 1765, who devoted his life to scientific pursuits, and bequeathed his estate of $515,169 to the United States, to found "at Washington an establishment for the increase and diffusion of knowledge among men." The original bequest has, through subsequent additions, now reached the amount of $900,000, to the interest upon which congress adds an annual appropriation of about $20,000. The institution is governed by a board of regents appointed by the government. It has large and beautiful buildings filled mainly with the national collections. The principal work of the institution is in the direction of original research, Professor Henry, the first secretary, making the rule that nothing should be undertaken by it which could be done as well somewhere else. Its library of 100,000 volumes has been united with that of congress, and its art collection was transferred to the Corcoran public art gallery. There is in its buildings, the national museum, a bureau of ethnology, and a bureau of international ex-

change; also connected with it are a national park and an observatory. It publishes *Smithsonian Contributions to Knowledge*, *Miscellaneous Collections*, and an annual report. It carries on communication between the library and scientific associations in Europe and America, and has a vast correspondence with all parts of the world.

Smoke, the vapor produced by burning any substance, usually wood or coal. The smoke from burning wood is almost colorless, and consists mainly of carbonic acid and water, while that from burning bituminous coal is darker, being mixed with an oily vapor and soot, or finely divided carbon. The more perfect the combustion, the less smoke; and the great effort in large cities to remove the smoky atmosphere which results from the large amount of smoke coming from factories and foundries and innumerable fires, is mainly in the direction of perfecting the combustion of the coal used. If coal is heated in a close vessel, the oil, tar, and gas, which are formed in the process of combustion, are all driven off consumed, leaving a coke which burns with a smokeless flame, as does also anthracite coal, which has lost the original volatile matter of the coal by natural processes. The need of some practical invention to do away with the smoke of a large city is seen in the black fogs of London, when the moisture of the air absorbs the black, oily particles of smoke, and, growing heavier, settles down in a dark mass, almost putting an end to the vast traffic of the city.

Smoll'ett, Tobias George, a Scotch historian and novelist, was born at Dalquhurn, Scotland, in 1721. He studied medicine and served an apprenticeship with a doctor and apothecary, afterward obtaining a medical degree. He went to London in 1739 and attempted to put his tragedy of *The Regicide* on the stage, but failed, and went as surgeon's mate on the *Cumberland*, which took part in the expedition to Carthagena in 1741. Both these experiences he describes in *Roderick Random*. His first publication was *Advice, a Satire*, in 1746. *Roderick Random* appeared in 1748 without his name, and was a great success, as was also the *Adventures of Peregrine Pickle* in 1751. As editor, in 1756, of the *Critical Review*, he became involved in various difficulties, ending in imprisonment for three months for libel. His *History of England*, from the invasion of Julius Cæsar to 1748, was begun in 1756, four volumes being written in fourteen months. The continuation of the history, bringing it down to 1764, is better known than the first part, forming as it does the continuation of Hume's history. His historical works brought him $10,000. His *Travels through France and Italy* were written after a two years' sojourn on the continent. In a village called Monte Novo, near Leghorn, where he had gone for his health, Smollett wrote his last and best novel, *Humphrey Clinker*, which was published in 1771. He lived only long enough to hear the first rumors of its success, dying Oct. 21, 1771. See *Life*, by Hannay, in the "Great Writers" series.

Smug'gling is the bringing into a country goods liable to duty, without payment of the government dues, and also the evasion of taxes on goods by illegal or secret manufacture. The business of smuggling was carried on largely in early times in England and on the continent, and the stories of the adventures of those engaged in it form a large part of old romances, as in Scott's *Guy Mannering* and *Redgauntlet*. Tea, brandy, silks, and tobacco were the articles brought into England by smuggling, at one period one-half the silks sold paying no duty, and three-fourths of the tobacco used in Ireland escaping the tax. The introduction of free trade in England has made the business no longer profitable The enormous coast line of the United States makes the evasion of custom duties easy, and the long frontier of Canada and the Mexican border also offer opportunities of introducing contraband goods; but smuggling is carried on largely through the regular channels of trade, and under the eyes of the customhouse inspectors, in spite of very careful watching. The schemes for carrying it on are innumerable, women being especially skillful in their evasions. Goods are concealed about the person, as in the hair and in false calves on the legs, in canes and secret pockets, and quilted into skirts or vests. Seizures of large amounts are often made, but the hope of success, and the profits of one successful venture, keep up the practice. The illegal manufacture of spirits has been carried on mainly in the mountainous districts of the south, and the adventures of the revenue officers in those regions afford considerable material for romance.

Smut (in plants), a common disease of the grains of many cereals, as corn, rye, etc., caused by the presence of a parasitic fungus. See ÆCIDIOMYCETES.

Smyrna (*smẽr'nä*), an important seaport in Asiatic Turkey, at the head of the gulf of Smyrna. The gulf runs inland from the Ægean sea for forty-six miles. The city climbs up the slopes, and nestles at the foot of a steep hill, on the summit of which are the ruins of the ancient Greek Acropolis. The streets are narrow and dark, the drainage bad, the climate very hot in summer, and earthquakes are not uncommon. There are some ruins of ancient walls, a theatre, and temples, and a large number of modern mosques, churches, and bazaars, but no fine buildings. Its population of 201,000 contains a large Turkish element, though numerous other races are represented. The Koran encourages public education; so that schools have long been established there, while public

libraries are connected with certain of the chief mosques. It has manufactures of carpets, cotton and woolen goods, and pottery, iron foundries, and machine shops. Its importance, however, is from its commerce, as it has the largest part of the trade of Asia Minor with Europe. It exports raisins, figs, opium, carpets, sponges, licorice, olive oil, tobacco, walnut wood, emery, and poppy seed; and imports cloths, timber, iron, butter, cheese, petroleum, glass, and paper. There is a fine harbor, which is entered annually by over 1,600 vessels. Smyrna, originally peopled by Greek immigrants to Asia Minor, became Ionian before 688 B. C., and was then one of the great trading places of the east. The king of Lydia destroyed it in 630 B. C., and it was more than 300 years before it was rebuilt on a new site. Under the Romans it regained its importance, though rivaled by Byzantium, to whose emperors it belonged. Destroyed by Tamerlane in 1402, it was captured by the Turks in 1424.

Snail, a shelled mollusk belonging to the class *Gasteropoda*. The land snails are widely distributed and are well known. They are air breathers, and, feeding upon vegetation, do much injury in gardens. The animal is spirally coiled so as to fit into its shell. The lower part of the body called the foot can be protruded. There are four tentacles or feelers on the head which can be shortened or extended at will. The longest pair have eyes in their tips. There are slender muscles attached to the apex of the shell and to the animal's foot, by means of which the animal is drawn into its shell. In dry weather or in winter, the opening is often closed by a horny structure, called the operculum. There are an immense number of land snails in tropical countries of considerable size and bright colors. Some of them are tree climbers and secrete a thread of mucous substance, by means of which the body is suspended like that of a spider by its thread. They are eaten as food, especially in Europe. There are also water snails, some of which come to the surface to breathe air, and others which are provided with gills. The common garden snail has 135 rows of 105 teeth each, making 14,175 in all.

Snakes, the largest class of reptiles, the representatives having an elongated body covered with scales. They have no limbs, and no rudimentary bones representing the shoulder arch, but there is a trace of the arch of the hind limbs. They move by pushing the edges of the ventral scales against roughnesses, but can make no headway on a smooth surface. The bones of the skull and jaws are movable, so that the latter can be put on a stretch, which enables the snake to swallow animals larger than the normal size of the mouth and throat. Some possess poison fangs with which their prey is killed, while others coil around their prey and crush it. They shed their skins periodically, and the deserted skins are often seen in fields and woods. Some live entirely on land, though most snakes swim well, others climb trees, and, in the Indian ocean are snakes living habitually in the water. Most of them lay eggs, but a few, including the last mentioned ones, bring forth their young alive. The snakes naturally fall into two groups, the non-poisonous and the poisonous ones. There are about 700 species of non-poisonous or colubrine snakes, which are found in nearly all parts of the world. They are well represented in the United States, and include such familiar forms as garter snakes, blue racers, grass snakes, and blow adders, all of which are harmless. The venomous snakes are represented in the United States by the rattlesnake family. There are about 60 species in this family, all American, and renowned for their venom. Besides rattlers are included the copperhead and water moccasin, the latter being the most dangerous of our snakes. The anacondas, boas, and the like, are powerful non-poisonous snakes. All snakes are more abundant in warm and tropical countries. India is noted for venomous snakes, like the cobra, and the annual number of deaths from snake bites there reaches above 20,000. See BOA, COBRA, MOCCASIN, RATTLESNAKE.

Snake River, the largest branch of the Columbia river. It rises among the Rocky mountains, near Wyoming, and in crossing southern Idaho forms the Shoshone falls, and a part of the northern boundary of Idaho. In southern Washington, as the Lewis river or fork, it joins the Columbia, having made a journey of 1,050 miles. It is navigable for only 160 miles.

Snipe, a common name for a number of favorite game-birds belonging to a group of

SNIPE.

shore birds. They grade into the sandpipers. There are about 100 species, and 30 of these visit the United States mainly during migration. A number of snipes, however, nest within the United States. Among the

more widely known forms are the woodcock, the jack-snipe, the tip-up, and Wilson's snipe. The jack-snipe is the pectoral sandpiper, and the tip-up the spotted sandpiper. The American woodcock is about eleven inches long, and variegated with black, brown, gray, and russet colors. The European woodcock is similar, but considerably larger. The American bird frequents low, wet woods and in the fall visits corn fields and wooded hillsides. They probe for earthworms with their long bills, making holes in clusters. Wilson's snipe is about eleven and one-fourth inches long, and is a favorite game bird. They live in fresh-water marshes and meadows. The tip-up, or teter snipe, is about seven and one-half inches long, and has a white breast spotted with black. The jack-snipe is abundant during migrations. Snipes are also abundant in the Old World.

Snow is water floating in the atmosphere in a crystallized state. When a cloud of water

vapor reaches a temperature below o° C. the process of freezing begins; and, if the air be calm, the crystals thus formed are large and regular. They are most easily observed by collecting them on a piece of black velvet and examining them with a lens. In the accompanying figure are shown the forms of some typical crystals, recently prepared from microphotographs by the United States Weather bureau. The whiteness of snow results from the total reflection of light, which occurs, sooner or later, when a ray of light enters any considerable body of snow from any direction. By the *snow-line*, or limit of perpetual snow, as it is sometimes called, is meant the height above the sea level at which snow does not melt, even in the hottest summers. This elevation varies greatly with the latitude and with local circumstances. In general, it diminishes with the latitude. Snow does not, however, collect to an indefinitely great depth, even in regions which lie entirely above the snow-line; for the pressure soon reaches a point where the snow is compressed into ice and "flows" off as a glacier. See Tyndall's *Forms of Water* (International Scientific series.)

Snow'berry, a common shrub, native of North America, belonging to the honeysuckle family. It receives its name from its white, waxy berries, which remain on the bush after the leaves have fallen, and make it an ornamental shrub.

Snow Bird or **Jun'co,** a sparrow-like bird very common in the United States during winter. They are about six and one-half inches long, with the upper parts slate gray and the lower parts whitish. They are often seen in flocks from ten to fifty on the ground near evergreens. They nest north of New England.

Snow'bunt'ing or **Snow'flake,** a bird about seven inches long, nesting in the far north and, in winter, visiting the United States as far south as the Ohio river. In the breeding season, they are pure white, with black on their wings and tail, and black feet and bill. The

SNOWBUNTING.

winter plumage changes, and the white on the body is clouded with clear, warm brown, and the bill becomes pale. They appear in flocks on the ground and perch on fences, but rarely on trees. With the snow birds they belong to the finch family.

Snow'drop, a class of plants of the same order as the amaryllis. It is a spring flower, with a white, drooping bell, which gives it its name, from its resemblance to a lady's earrings, or drops, as they were called in the 16th century. The root—a bulb—has two or three narrow leaves and a long stem with a single flower.

Snow'shoes, a very broad, flat shoe, used in cold countries for walking on snow. The broad surface keeps the foot from sinking into the snow. The snowshoe worn in Canada is shaped somewhat like a tennis racket, with a short handle, and is from three to five feet long, and from one to two feet wide. It is a wooden frame with a leather covering, upon which the foot is fastened by thongs. The Norwegian snowshoe, called "ski, is a wooden runner, about four inches wide and eight feet long, turning up in front.

Soap is a compound of soda or potash and fat, potash making a soft soap, and soda a hard soap. The principal fats used are

tallow, lard, olive oil, and cocoanut oil for hard soaps, and besides these, linseed oil, fish oil, and castor oil are used in soft soaps. The distinctive property of soap is its power of cleansing, though to what it owes this power has never been decided. It will dissolve in water and in alcohol, and when shaken in water forms a foam or "lather." Soap is made by boiling the fat or oil with a solution of soda or potash, the length of time and the strength of the solution or lye varying with the kind of soap. Yellow soap usually contains rosin. Toilet soaps are made of good yellow or curd soap, the finest being subjected to a process called "milling." The soap is cut into shavings, dried a little, coloring matter and perfumes are added, and then passed between granite rollers and afterward pressed into bars, from which the cakes are cut and stamped. Transparent soaps are made by dissolving common soap in alcohol, pouring off the solution and getting rid of the most of the alcohol by distillation. Soap improves with age, growing harder and dissolving more slowly.

Sobieski (*sō-bē-ĕs'kē*), or **John III.,** king of Poland, one of the greatest soldiers of the 17th century, was born in Galicia in 1624. At that period, Poland was carrying on wars with the Russians, the Tartars, and the Turks, in all of which he distinguished himself, defeating the Turks, especially at Choczim, Nov. 11, 1673, killing 20,000 soldiers. He was chosen king of Poland in 1674, and made it his business to oppose in every way the Turkish power then threatening all Europe, routing them at Lemberg in 1675, resisting successfully their attacks on his camp near the Dniester in 1676, and after a five years' truce, hastening to the relief of Vienna, he drove back their army of 100,000 soldiers, Sept. 12, 1683. Sobieski was fond of books, and a fine scholar as well as a shrewd statesman. He died June 17, 1696.

Soci'ety Islands, a group of islands in the Pacific ocean, divided into two groups, the Tahiti islands and Society islands proper. The Tahiti group belong to the French and consist of five islands. They are of volcanic origin and mountainous, the loftiest point on the island of Tahiti being 7,339 feet high. They have a healthful and mild climate and fertile soil, producing the guava, breadfruit, oranges, lemons, and other tropical fruits. The chief industries are the preparation of copra, sugar, and rum, which, together with vanilla and mother of pearl, form its chief exports. Pigs, dogs, and rats were the only animals found on the islands when discovered, but all domestic animals have been introduced. The people are Malays. The Spanish and English both claimed the discovery of the islands, Captain Cook in 1760 giving them their name. Through the labors of English missionaries the islands, then under Queen Pomare, were Christianized in 1815. The efforts of French Catholic priests to enter the country brought on a dispute with England, and the final establishment of the French authority on the island of Tahiti.

Socrates (*sok'rā-tēz*), a Greek philosopher, was probably born about 460 B. C., near Athens. His father was a sculptor and he is said to have been trained in the same art, and a statue of the Graces at the entrance to the Acropolis was thought to be his work. He served in the army in three campaigns, where his bravery and endurance were praised by his friends. In 406 B. C., he was a member of the senate of 500, and refused, at risk to himself, to put an illegal question to vote. He was short and odd looking, with a flat nose, thick lips, and prominent eyes. He practiced plain living and trained himself to be indifferent to heat and cold, going barefoot and wearing the same clothing the year round. His wife, Xantippe, has been pictured as a scold, and he professed that he married and lived with her as a means of discipline, but a dreamer and reformer is not always the most pleasant companion, and the habits of Socrates must have been at least somewhat trying to an orderly woman.

In middle life he devoted himself to the career that has made his name forever famous. He established no school, and did not call himself a teacher, but frequented the public walks, the gymnasia for bodily training, the schools, and the market places, talking with any one that addressed him, in the hearing of the bystanders. He had, strictly, no disciples, though some persons made a habit of being present at his conversations. As Socrates left no writings, it is from two of these friends and listeners, Xenophon and Plato, that we have the accounts of his teachings, though in Plato's writings it is difficult to tell what part of the reported conversations are the words of Socrates and what part Plato himself put into his mouth. Socrates believed that he had a special religious mission, having learned from the Delphic oracle that there was no wiser man than himself, and interpreting it to mean that the highest wisdom was to be conscious of ignorance, and that it was his duty, by questioning all men, to make them wise by teaching them their ignorance. The subjects of his conversations were human nature, human duties, human relations, and human happiness, as being the most practical and necessary to man. Cicero said, "Socrates called down philosophy from the heavens to earth and introduced it into the cities and houses of men." In the year 399 B. C., an indictment was laid against Socrates, "for not worshiping the gods whom the city worships and for introducing new divinities of his own; next, for corrupting the youth." Plato's *Apology* gives the substance of his defense, a vindication of his whole life, but not given in a way to conciliate the jury of over five hundred Athenian citizens. The vote of con-

demnation was carried by a small majority, though the sentence of death by poisoning was passed by eighty more votes, provoked probably by his apparent indifference to their judgment. The execution of the sentence was delayed for thirty days. Socrates, refusing to escape, as his friends urged him to do, spent his last day in discoursing on the immortality of the soul. In the evening he drank the hemlock, and still talking to his friends, calmly watched the poison doing its appointed work. "Such was the end," says Phædo, "of our friend, whom I may truly call, the wisest, the justest, and best of all the men whom I have ever known." See *History of Greek Philosophy*, by Zeller.

So'da is a compound of sodium and oxygen, the oxide of sodium, sometimes called a mineral alkali. It forms with acids what are known as soda-salts. The soda of commerce is one of these salts, a compound of soda and carbonic acid, and is called sodium carbonate, carbonate of soda, or sal-soda. It is in large crystals, which dissolve in water, and turn to powder in the air. It is sometimes found as a white powder on the top of the ground on the alkali plains of the west, and also in the nitrate lakes of Hungary and Austria, and in springs in Iceland and North America. It is manufactured largely from sea salt, and has been obtained from the ashes of sea plants. It is used in washing and in making soap. The soda used in cooking is usually the bicarbonate of soda. It is prepared by adding carbonic acid gas to the carbonate of soda, in different ways, sometimes making a solution of the soda, and saturating it with the gas, and again by sending a current of the gas over the crystals of soda, and also by a chemical process which takes place when common salt, carbon dioxide, and ammonia are brought together. Caustic soda is made by mixing milk of lime, which is slaked lime stirred up with water, with a solution of carbonate of soda, filtering and evaporating the liquid to dryness. This is made use of in soap making, and in many other chemical industries. There are many other sodium or soda salts, such as the sulphate, called Glauber's salts, the phosphate, the nitrate, and sodium chloride or common SALT, which see.

Sodium (*sō'dĭ-ŭm*) is a metal very much like potassium, of a bluish-white color, and burns with a yellow flame. The compounds of sodium are the only form in which it is found in nature, such as borax, soda-felspar, and especially the chloride of sodium, which is common salt.

Sod'om and Gomor'rah, two cities mentioned in the Bible, and thought to be on the southern shore of the Dead sea. The Scripture account represents them as being destroyed by a shower of fire for the great wickedness of these cities, and the popular belief has assumed that the waters of the Dead sea cover their sites.

Sofia (*so-fē'ä*), the capital of Bulgaria since 1878, stands in a valley of the Balkans. It has been improved since 1891, the old Turkish city with its tumbledown houses and crooked streets being replaced by new French houses, wide boulevards, fine public buildings, and electric lights. A railroad connects it with Vienna and Belgrade. It is the seat of the National university, which supports three faculties of forty-two professors and lecturers, and has an attendance of about 400 students. The city also has a free public library. Its trade is mainly in corn, hides, and wheat. Its hot mineral springs have been celebrated for centuries. Sofia was known as Serdica by the Romans, and was the seat of a famous council in 343. It belonged to the Bulgarians from the 9th century until 1382, when it was captured by the Turks. It 1878, it was occupied by Russia. Population 46,593.

Soils, the different forms of earth on the surface of the rocks, formed by the breaking down or by the weathering of rocks. The soils will vary with the minerals in the rocks, the principal ones being quartz, felspar, clays, mica, and limestone. When the soil is made from the rocks in their original position, they are called sedimentary, but if formed from rocks above them and carried to them, they are known as transported soils. When the soil is carried by glaciers it forms drift soils, and when carried by running water it is known as alluvial soil. They are also known as clays, loams, etc. A mixed soil or loam is usually better than a clay or a sandy soil. The plants grown in the soil take from it from 200 to 600 pounds per acre yearly of the minerals found in it, and the passage of water through it also carries away other quantities, so that where crops are removed, the soil would gradually lose its power of supporting plant life, were it not enriched. This is done naturally by the gradual decomposition of the minerals composing the soil, and also by the artificial process of applying manures and other fertilizers. Another mode of overcoming the difficulty to some extent is by changing the crops grown as the different kinds of crops take up the ingredients of the soil in different proportions.

So'lar Mi'croscope, a modified form of magic lantern, not much used now that gas lanterns and electric lanterns have become so easily available. The only essential difference between the solar microscope and the ordinary magic lantern is that in the former, a beam of sunlight, reflected from a heliostat or porti-lumiere, is employed instead of oil, gas, or the electric arc, for the purpose of illuminating the slide.

So'lar Sys'tem, a term used in astronomy to include the sun, planets, satellites of planets, asteroids, and any "captured" bodies such

as possibly periodic comets. See SUN, PLANET, ASTEROID, MOON, ASTRONOMY.

Solferino (*sŏl-fer-ē'nō*), a village of northern Italy, nineteen miles from Mantua. It stands on a hill with a high tower, called the "Spy" of Italy, from which can be seen the whole plain of Lombardy. It is noted as the scene of the defeat of the Austrian forces by the French and Sardinians, June 24, 1859. The battle lasted sixteen hours, the Sardinians commanded by Victor Emmanuel, the French led by Napoleon III., and the Austrian forces by the emperor, Francis Joseph. The Austrian loss was 20,000, and that of the allied troops 18,000. On June 24, 1870, the bones of the dead on this field were collected in the presence of representatives of France, Italy, and Austria, and buried in three great sepulchres.

Sol'omon, the third king of Israel, the son of David, and his successor. He reigned forty years, from 993–953 B. C., and was famous for his wisdom as well as for his splendid court. His father left him a large army and a full treasury, which he used in keeping peace with the neighboring nations, and in building fine palaces and the temple, the chief glory of his reign. He extended the trade of the country, sending out his fleets and caravans, which brought back gold, gems, and precious woods from Ophir, and horses for his chariots from Egypt. His great wealth, however, came from heavy taxation, and he built altars for the idols worshiped by his heathen wives, which caused the nation after his death to revolt against his son, and ended in the division of the kingdom. The writings that bear his name are the book of Proverbs, Ecclesiastes, and the Song of Solomon, though Ecclesiastes probably belongs to a much earlier period.

Sol'omon's Seal, a species of plants of the lily family, and related to the asparagus. The plant grows from one to four feet high, with broad green leaves, without stems, and drooping, greenish flowers, followed by small black or blue berries. It is found wild in many parts of North America and in Europe.

So'lon, the ancient Greek lawgiver, and one of the "seven wise men," was born about 638 B. C. Though tracing his descent from the royal family of Attica, he had to resort to trade to restore the wealth his father had squandered. He was known as a writer of verses, one of his finest elegies having been quoted by Demosthenes, and several quotations being found in a work of Aristotle's. The beginning of his political career was the Megarian war. The Athenians had several times failed in their efforts to capture Salamis, and had forbidden, on pain of death, any citizen to renew the attempt. Solon, by feigning madness, aroused the people by his poem, and war was declared, with Solon in command, who succeeded in winning Salamis for Athens. He was made archon, or chief ruler, in 594, when the country was in danger of a conflict between the nobility and the peasants. The constitution of Athens, such as had never existed before, was the great work of Solon, and made property and not birth the title to citizenship, the aim being to give the lower classes some control of the law. The laws of Draco were repealed except those against murder; no man could be imprisoned for debt; a limit was placed on the ownership of land; and laws against luxury in food and dress were made. These laws, written on pieces of wood, were preserved in the Acropolis and the people bound themselves by oath to observe them for ten years. Solon traveled then in Cyprus, Asia Minor, and Egypt, meeting Crœsus, king of Lydia, whom he offended by his answer to his question "Who was the happiest man in the world?" Solon replied that it was Tellos, an Athenian who had died for his country. Crœsus asked the question again, thinking to hear his own name in answer as the possessor of great wealth, but Solon gave the place to two Argive youths whom the gods permitted to die in their sleep as a reward for an act of kindness. His last years were passed at Athens, where he opposed unsuccessfully the usurpation of his kinsman Pisistratus. He died about 558 B. C., leaving a command that his ashes should be scattered over the "lovely isle" of Salamis. See *Histories of Greece* by Grote, Curtius, and Cox.

Sol'way Firth is an inlet of the Irish sea, lying between England and Scotland. It is thirty-six miles long and receives the waters of the Derwent and Eden on the English side, and of the Esk, Dee, and Annan on the Scottish side. Near Annan the Solway Firth is crossed by a railway bridge 5,880 feet long, which, built in 1866–69, was almost destroyed by floating ice in 1881. The scenery of the region is painted by Scott in *Redgauntlet* and *Guy Mannering*.

Solyman (*sŏl'i-man*) **I.,** or **Sulei'man II.,** called the "Magnificent," was the greatest of the Turkish sultans. He was born in 1490, and succeeded his father, Selim I. He made many reforms in the internal government of his empire and was known as a patron of learning and of arts. Abroad, he began by extorting in 1521 the tribute refused him by the king of Hungary, and overcoming the Knights of St. John at Rhodes, after a siege of six months, and the loss of nearly 100,000 men. At the battle of Mohács, in August, 1526, he destroyed the Hungarian army, killing King Louis, and, marching on, captured Buda and Pesth. In 1529, he drove Ferdinand of Austria out of Buda, losing 40,000 soldiers in a vain attack on Vienna. He conquered large portions of Armenia and Persia, and the whole of northern Africa except Morocco. A truce, made in 1562, finally left Hungary and

Transylvania to Solyman. He died in 1565, while besieging a small fortress in Hungary.

Somaliland (*sō-mä'lē-länd*), a peninsula on the east coast of Africa, projecting into the Indian ocean, has an area of about 318,000 square miles. It is divided under Italian, British, and French protectorates and the kingdom of Abyssinia, by far the largest portion, however, being controlled by Italy. Game and wild animals abound, but the country is dry, though it produces in some parts grasses, palms, and cacti. The people, numbering about 800,000, are Mohammedans and live by their herds of cattle, camels, horses, and goats, and a trade in myrrh, frankincense, ostrich feathers, coffee, and salt. The British area, 68,000 square miles in extent, has for its chief town Berbera (population 30,000).

Som'erville, a city in Massachusetts, is a suburb of Boston, about two miles from the state house. It has manufactures of flour, leather, iron, and bricks, and slaughter houses, bleaching works, iron foundries, and many fine residences. Population 61,643.

Som'erville, Mary (Fairfax), a Scotch scientist, was born at Jedburgh, Scotland, Dec. 26, 1780. An algebraic sum in a magazine of fashions first interested her in the study of mathematics, in which she afterward became famous. Her first husband, Captain Greig, was Russian consul in London, where she lived for two years until his death. The six years before her second marriage with Dr. William Somerville, she spent in study at Edinburgh. Going back to London in 1812, she attracted attention by some experiments on the violet rays of the solar spectrum, the results being published in the *Philosophical Transactions* of 1826. Lord Brougham asked her to put into popular form Laplace's great work on *Celestial Mechanics*, which she did, publishing her book under the title, *Mechanism of the Heavens*, in 1830. She was granted a pension in 1835 and made a member of the Royal Astronomical society of England and of many foreign societies. She was in favor of "woman's rights" and woman suffrage. When ninety-one years old she still spent five hours a day in mathematical studies. Other works published by her are *Connection of the Physical Sciences*, *Physical Geography*, and *Molecular and Microscopic Science*. She died at Naples, Nov. 29, 1872, having lived in Italy for many years. See *Life*, by her daughter.

Son'net, The. We owe the sonnet, in its structure and design, to Italy; though since Shakespeare's day and that of the early English sonneteers, Sir Thomas Wyatt, the earl of Surrey, and Edmund Spenser, down to the time of Wordsworth, Cowper, Byron, Keats, and Shelley, and the modern English and American bards, the sonnet has always had a peculiar fascination for poets of the first class. The Italian sonnet was written in its perfection by Petrarch, Tasso, and Dante; and though the form of the Petrarchian sonnet has been closely followed by English poets, the Shakespearean form has been a keen rival to it — both dominating other rhyme arrangements of this artistic, poetic form of fourteen rhymed or partially rhymed verse. "The Italian sonnet consisted of fourteen lines, divided into two groups of eight and six lines respectively; the first eight (called the octave) having only two rhymes between them — the first, fourth, fifth, and eighth, being in one rhyme, and the second, third, sixth, and seventh being in the other. There was then a pause in the sense, and the six concluding lines (called the sestette) had two rhymes between them, those rhymes generally alternating in the most finished specimens. In this form of sonnet, Wyatt and Surrey wrote; but since then, the only fixed rule in regard to the English sonnet has been that it should consist of fourteen lines. The great English masters of this form of verse have all differed in their arrangement of the rhymes. Spenser divides the fourteen lines thus: — The first and third lines rhyme one way; the second, fourth, fifth, and seventh another; the sixth, eighth, ninth, and eleventh another; and the tenth and twelfth another, the last two lines forming a couplet with another rhyme. Shakespeare's sonnets consist simply of three quatrains and a couplet, the rhymes being seven in number. In Milton's sonnets there is the classic division into octave and sestette, the former being properly carried out, but the latter being fitted with three rhymes — the ninth and twelfth, tenth and thirteenth, and eleventh and fourteenth rhyming together." Wordsworth is admittedly the greatest of English, modern sonneteers, some of his sonnets, for exalted feeling as well as for felicity of fancy and of diction — such as those dedicated to liberty, and his ecclesiastical sonnets — including not only some of the finest things he ever wrote, but some of the finest that were ever written. Here is one of his sonnets — in its design an apology for and commendation of the sonnet: —

"Scorn not the sonnet; critic, you have frowned
Mindless of its just honors; with this key
Shakespeare unlocked his heart; the melody
Of this small lute gave ease to Petrarch's wound:
A thousand times this pipe did Tasso sound;
With it Camoens soothed an exile's grief;
The sonnet glittered a gay myrtle leaf
Amid the cypress with which Dante crowned
His visionary brow; a glowworm lamp
It cheered mild Spenser, called from Faery-land
To struggle through dark ways; and when a damp
Fell round the path of Milton, in his hand
The thing became a trumpet; whence he blew
Soul-animating strains — alas, too few!"

Sontag (*sŏn'tăg*), **Henrietta,** Countess **Rossi,** a German singer, was born at Coblenz, Prussia, Jan. 3, 1806. She appeared on the stage when only six years old; studied music at Prague, and appeared there at fifteen. She rose to the first rank of European

singers in her brilliant career at Vienna, Berlin, and Paris. After her marriage with Count Rossi, an Italian nobleman, in 1828, she left the stage, but appeared again in 1849, on account of pecuniary troubles. She made a successful tour in the United States, and died at Vera Cruz, Mexico, June 18, 1854.

Soochow (*sō'chou'*), or **Suchau'**, one of the largest cities in China, is fifty miles northwest of Shanghai, on the Imperial canal. It is built on islands, separated by canals. It is a center of the silk manufacture of China, and of printing Chinese literature. It was captured in the Tai-ping rebellion, and retaken by "Chinese" Gordon in 1863, when many of its finest buildings were destroyed. Population 500,000.

Sophocles (*sŏf'ō-klēz*), an Athenian poet, was born in 496 B. C. At sixteen he was chosen to lead the chorus of youths who celebrated the naval victory of Salamis. At the age of twenty-eight, in a dramatic contest, he was awarded the prize which had been given to Æschylus for many years. Only seven of his many dramas are preserved, but these place him at the head of the Greek dramatists. The probable order in which they appeared is *Ajax; Antigone; Electra; Œdipus, the King; Trachiniæn Women; Philoctetes*, and *Œdipus at Coloneus*. *Antigone*, one of the earliest dramas, produced in 440, gained the prize, and so pleased the Athenians that he was made commander with Pericles in the Samian war. There are only fragments and titles of the other plays. He is said to have been beautiful in person, a fine musician and athlete, and a ready wit. His death has been attributed to losing his breath in prolonging his voice in a public reading of *Antigone*, and also to excess of joy at a dramatic victory, but without sufficient authority. He died in 405 B. C., at the age of ninety-one. See *Sophocles*, in Green's "Classical Writers," by Campbell, and *Lectures*, by Schlegel.

Sorbonne (*sôr-bon'*), the earliest and most famous of the colleges of the University of Paris in the middle ages. It was founded in 1253, by Robert of Sorbon, and was the first institution connected with the university that was intended as a place of living as well as of study, as, before this, the great crowd of students of the university had found lodgings wherever they could. It was devoted to the study of theology, and the life was monastic, the students calling themselves "the poor masters of the Sorbonne." It soon became celebrated as the first theological school in Europe, its decision on disputed points was accepted as decisive, and it drew its scholars from all Europe. But when the new learning found its way into France, at the beginning of the 16th century, the Sorbonne, though it had led to the introduction of printing in France, opposed all reform either in study or religion, and lost its position. Its property was confiscated in the revolution in 1792, but the Sorbonne was revived under Napoleon in 1808, and was made the seat of the three departments of the University of France, theology, science, and literature. New buildings were erected in 1884–89, the largest theatre seating 3,000.

Soredia (*so-rē'di-a*) (in plants), minute granules which appear on the surface of many lichens, making them appear powdery. Soredia are scattered by the wind and form new lichens. Each one consists of a few alga cells invested by some fungus filaments. See LICHENS.

Sorghum (*sôr'gŭm*), a plant belonging to the grass family, whose original home is thought to have been the interior of Africa, but it has not yet been found growing wild there. It is nearly related to the sugar cane, and has been cultivated from the most ancient times. It is extensively cultivated in this country for the production of "sorghum molasses," and a large amount of sugar is also manufactured as an incidental product. As a source of sugar, however, it does not compete with the sugar cane and the sugar beet. See SUGAR.

Sorus (*sō'rŭs*) (in plants), a definite group of sporangia, as in the ferns, in connection with which plants the term is chiefly used. See FILICALES.

Sothern (*suth'ern*), **Edward Askew**, an American actor, was born at Liverpool, England, April 1, 1826. His first appearances on the stage in England and the United States were not particularly successful, until in 1858 he assumed the character of "Lord Dundreary" in the comedy, *Our American Cousins*, which was made so rich and entertaining by Sothern's acting that it became famous, the comedy running 140 nights in New York, and nearly 500 nights in London, and again and again repeated at other times. His most successful character next to "Dundreary" was "David Garrick," both characters making his name famous. He died at London, Jan. 21, 1881. See *Memoir*, by Pemberton.

Soudan (*sō-dăn'*), or **Sudan'**, a vast region in Africa, stretching from the Atlantic to the Red sea, and from Egypt and the Sahara in the north to the region of the equator in the south. It is the home of the true negro race. There are three divisions—eastern, western, and central Sudan. Eastern Sudan is sometimes called the Egyptian Sudan, which until 1882 was a province, with Khartum for its capital. It is now divided into six first-class, and three second-class, districts. The regions watered by the Nile are very fertile, yielding great crops of cotton, indigo, sugar, rice, corn, and tobacco. Other parts are bare, though covered with grass in the rainy sea-

son, when they afford pasture to large flocks of camels, sheep, and goats. Other products of the country are ivory, ostrich feathers, gums, india rubber, iron, gold, honey, and wax. Egyptian Sudan covers 950,000 square miles, and has a population of about 10,000,000. The Egyptians for fifty years after 1819 extended their power over the regions around Khartum, but in 1877, and again in 1882, the native tribes rebelled. General Gordon, sent out by the English government to the help of Egypt, was shut up in Khartum, and his mission ended in disaster. In 1897, the Anglo-Egyptian army again sought to recover the lost provinces, and after two years were successful. A convention between the British and Egyptian governments followed, in which it was agreed that they should govern the Sudan jointly through a governor-general. Khartum is now in railway and telegraphic communication with Cairo, and on Dec. 12, 1899, the Sudan was declared open for general traffic. Western Sudan includes the valleys of the Niger, Senegal, and other rivers draining into the Atlantic, and the countries known as French Sudan, and central Sudan, the valleys of the rivers that drain into Lake Tsad. See *Heart of Africa*, by Schweinfurth; *Sahara and Sudan*, by Nachtigal.

Soult (*sōlt*), **Nicholas Jean de Dieu,** marshal of France, was born at St. Amans-la-Bastide, France, March 29, 1769. He enlisted as a private and was six years in reaching the rank of sergeant, but then rose rapidly. He was for five years, from 1794 to 1799, in constant service in Germany and on the French frontier. He served in command of a division under Masséna in his Swiss and Italian campaigns. In 1802, Napoleon made him one of four consular guards, and in 1804 a marshal of France. He decided the battle of Austerlitz by piercing the Russian center, and was in both the Prussian and Russian campaigns. He drove the British out of Spain and held Portugal until driven out in turn by Wellington. As commander in Spain, he gained a victory at Ocaña, in 1809, and subdued Andalusia. Failing to enlist Joseph Bonaparte in his plans, he asked to be relieved of his command, but was sent back by Napoleon after the battle of Vittoria, as the only commander who could turn back the tide of disaster, and successfully meet the strategy of Wellington with his own brilliant tactics. He became a royalist, when Napoleon had abdicated, but went back to him on his return from Elba. He was banished after Waterloo, but in a few years was restored to his former honors. In 1838, at the crowning of Queen Victoria, he was sent as an ambassador to England, and warmly met by his old opponent, Wellington. His last honor was the title "Marshal General of France." He died Nov. 26, 1851. See *History of the Peninsular War*, by Napier.

Sound. See ACOUSTICS.

Sound, The, a strait which forms the passage from the North sea to the Baltic. It is fifty miles long, and lies between Sweden and the island of Zealand. From the 15th century until 1857, all vessels passing through The Sound, with a few exceptions, paid toll. By the treaty of March 14, 1857, these Sound duties were abolished, about $16,000,000 being paid to Denmark, which agreed to keep up the lighthouses on the coast. Nelson forced the passage in spite of its strong defenses in 1801.

Sound'ing is the process of measuring the depth of the sea. It has been done from the earliest times by a rope, marked off into fathoms, with a leaden weight attached. The difficulty was that there was no certainty that the weight had reached the bottom. In 1854, a new method was tried by which the weight or sinker would be removed from the line when it struck the bottom. Wire rope is usually used for deep-sea soundings. Magellan tried to find the depth of the Pacific ocean in his first voyage around the world, and when he could not find the bottom at 200 fathoms, concluded that he had crossed the deepest part of the ocean. In 1818, Sir John Ross found the depth of the Arctic seas to be 1,050 fathoms, and the Antarctic ocean reached 2,425 fathoms, and twice, with 4,000 fathoms length of line, no bottom was reached. See *Deep-Sea Sounding and Dredging*, by Sigsbee.

Sousa (*sōō'za*), **John Philip,** American orchestra conductor and band leader, was born at Washington, D. C., in 1854, and early in life manifested musical talent and proclivities toward the orchestra in theatres, as well as familiarity with the life of a circus musician. Even at the age of seventeen he was a band conductor and one of the first violin players in an opera troupe. From 1880 to 1892 he was band leader of the United States Marine Corps, and since director of his own, Sousa's well-known band. He has composed many orchestral pieces, marches, songs, waltzes, etc., together with several light operas, such as *El Capitan*, *The Bride Elect* (libretto and music), and *The Charletan*. Among his other compositions, many of which have become very popular, are his *Sheridan's Ride*, *The Liberty Bell*, *The High School Cadets*, etc.

South Af'rican Republic. See TRANSVAAL.

South Amer'ica. See AMERICA.

South Austra'lia. See AUSTRALIA.

South Bend, a town in Indiana on the St. Joseph river, eighty-six miles southeast of Chicago. The Catholic university of Notre Dame, the largest Catholic school in the west, is a short distance north of the town; there are fine buildings, a library and Gothic church with the famous "Chimes of Notre Dame,"

five different courses of study, and 700 students. The great Studebaker wagon and carriage works cover nearly 100 acres, and the Oliver plow works occupy 43 acres, and there are manufactories of agricultural implements, furniture, paper, woolens, and flour. Population 35,999.

South Beth'lehem, a town of Pennsylvania, on the Lehigh river, opposite Bethlehem, the principal Moravian town in America, founded in 1745. South Bethlehem has factories of steel, zinc, boilers, and shovels. It is the site of Lehigh university, founded in 1865 by Judge Packer, who gave it 115 acres of land and $2,500,000. The fine buildings stand on a terrace on South Mountain, and include a fine gymnasium, observatory, several fine laboratories and a beautiful Gothic library building. Population 13,241.

South Caroli'na, one of the southern states of the Union, lies on the Atlantic ocean. It is shaped like a triangle with the coast for a base, and includes 30,570 square miles. The country rises gradually from the low, level lands of the coast to the ridge country on the western border, about 2,000 feet above the sea, with Table mountain and other peaks of the Blue Ridge 4,000 feet high. The coast line stretches for 190 miles, with many islands, which leave a sheltered passage for ships between them and the mainland. The Savannah river, forming part of the western boundary, is navigable for 158 miles, and the Santee for 184 miles. Broad, Catawba, Great Pedee, Astley, and Cooper are other principal rivers. The climate is like that of southern Europe, the sea breezes on the coast and the cool winds from the mountains on the west tempering the heat of summer. The rice lands are malarious and in summer are only habitable by the negroes. The pine forests and sand hills of the western mountain region make fine health resorts. The gold belt of the state extends from North Carolina to the southwest, and there are now four mines, though prior to the war gold had been found in sixty places. There are small quantities of silver, lead, copper, and graphite found, and enormous supplies of iron ore; kaolin, from which the finest varieties of china, and also artificial teeth are made, is found in large quantities, and granite, marble, asbestos, soapstone, mica, whetstone, and especially phosphate rock, are abundant. The cereals, hay, tobacco, and cotton are among the farm products of this agricultural state, with great quantities of fruits shipped to the northern market. Cotton has been cultivated ever since the state was settled, and the Sea Island and Edisto Island cotton are of the first quality, the Edisto cotton bringing twenty times as much a pound as any other variety. Rice has been grown since 1693, and the Carolina rice is now considered the best in the market. South Carolina is the chief cotton manufacturing state in the Union, and makes, besides, flour, lumber, turpentine, and tar.

Since 1870, marked improvement has been made in the school system. The report of the state superintendent of education shows that, in 1895, there were 103,729 white pupils and 119,292 colored pupils enrolled in the schools, making a total enrollment of 223,021. The expenditures during the same year for school purposes was $563,743. Of the institutions for higher learning the most important are, South Carolina college, at Columbia; Furman university, at Greenville; Converse college, at Spartanburg; The Winthrop Normal and Industrial college for women; Presbyterian college for women; Greenville Female college; and the Claflin and Orange universities for the colored people.

A company of Spanish slave hunters in 1520 claimed the country of South Carolina for Spain, but the first settlement was made by Huguenots in 1562 near Beaufort. Charleston was founded by English colonists in 1670, under a grant of the land from Charles II., and in 1729 George II. divided the region into North and South Carolina. During the years before the Revolution, South Carolina was a favorite place for emigrants, especially the French Huguenots. In the Revolutionary war, the state suffered from internal struggles, Marion and Sumter and other leaders keeping up a constant war with the numerous Tory forces. Charleston was captured by Sir Henry Clinton, and there were battles at Camden, Eutaw Springs, etc. The articles of confederation were agreed to first by South Carolina, Feb. 5, 1788. The nullification act was passed in 1833, by which South Carolina declared the United States tariff law "null" and not binding upon the citizens of the state, which act was called treason by President Jackson. South Carolina was the first state to withdraw from the Union and the first gun in the Civil war was fired at Fort Sumter, April 12, 1861. In 1671, 200 slaves were brought into the state from Barbadoes, and since 1820 the colored population has exceeded the white. Population 1,340,316.

South Dakota (*dă-kō'tă*) is one of the northwestern states. Minnesota forms its eastern boundary, Nebraska the southern, North Dakota the northern, and Wyoming and Montana the western. It is 375 miles long, and 220 miles broad, which makes it larger than all of New England. The country is in general a high plain, with the Black Hills in the west, and with many rivers and lakes. The country was once covered by a great lake, the deposits from which, many inches in depth, form a rich soil. Underneath is what is called the Dakota basin, stretching from Nebraska to Manitoba, 500 miles, a great subterranean stream, 800 to 1,600 feet below the surface, which is capable of supplying an indefinite number of artesian wells, many having been already sunk. The

Missouri river, forming a part of the southern boundary, and crossing the state, is navigable the whole distance. The James river, generally called "The Jim," is the longest non-navigable river in the United States. Other large rivers are the Big Sioux, Big Cheyenne, and White. The "Bad Lands" are in the southwestern part of the state, in a region covered with rough grass and sage brush, running to the foot of the Black Hills, a range of mountains extending 100 miles, with its highest peak, Harney, 9,700 feet high. The Sioux reservation is west of the Missouri, 11,000,000 acres of it having been bought by the government and thrown open to settlers in 1890. The climate is modified by the winds from the warm current of the Pacific, so that it is warmer than Minnesota, with its dry air and an average of 300 bright days a year. Dakota is a desirable place of residence. The "blizzards," winter winds laden with fine snow, are very severe, but of rare occurrence. Gold was discovered in the Black Hills in 1870, and in spite of the resistance of the Sioux on whose reservation it was found, the miners rushed into the country. In 1877, the hills were thrown open to settlers. The mines are easily worked, furnishing already over $50,000,000 of gold and silver. Lead, tin, mica, copper, lignite, petroleum, natural gas, granite, jasper, marble, sandstone, limestone, gypsum, and salt springs are among the mineral resources of the state. The principal crops are corn of a very fine quality, wheat, oats, barley, potatoes, flax, and hay from the wild grass of the prairies. The University of South Dakota, opened in 1882, has its fine jasper buildings at Vermilion, where the tuition is free for pupils from the state. The Agriculture college at Brookings, School of Mines at Rapid City, Huron college, Yankton college, and Dakota university near Mitchell, are some of the institutions already established in this young state. Yankton, once the capital of the territory of Dakota, Aberdeen, Deadwood, named by the miners from the dead timber of the hills, Rapid City, Sioux Falls, the largest city in the state, Huron, and Pierre, the capital, are the principal cities.

South Dakota is a part of the Louisiana purchase, made in 1803. Lewis and Clarke's expedition ascended the Missouri in 1804–06, and was followed by fur companies with their pioneer stations. The first steamboats went up the Missouri in 1830, and the first settlement was made in 1857 at Sioux Falls. The territory of Dakota was formed in 1861, which was divided into North and South Dakota in 1889, the President's signature making South Dakota a state being written on Feb. 22, 1890. Its total land area is about 77,000 square miles. Population 401,559.

South O'maha, Neb., a flourishing town, adjacent to Omaha City, in Douglas county, the seat of one of the largest meat-packing establishments in the United States. It is on the Chicago, St. Paul, Minneapolis, and Omaha; the Burlington route; the Fremont, Elkhorn, and Missouri Valley; and the Union Pacific railroads. It has a number of fine, public buildings, including schools, churches, banks; its population has grown in the past decade from 8,062 to 26,001.

South Sea Scheme, called the "South Sea Bubble," was a plan originated by Harley, earl of Oxford, to provide for the extinction of the public debt. A company was formed to which was given the monopoly of the trade of the South seas, and certain import duties, and which agreed to pay the government 6 per cent. yearly on its debt of $50,000,000. The stock rose until it was quoted at 1,000, when some of the principal directors sold out. The bursting of the "bubble" followed, many large stockholders fled, and the excitement was so great that parliament was summoned to decide on the best means of helping in the public distress. Though nothing fraudulent was proved against the directors, their property was confiscated for the benefit of the sufferers, and $35,000,000 due the government was remitted, but this only availed to mitigate very slightly the ruin wrought by the "Bubble."

Southampton (*sŭth-hămp'ton*), an important seaport in England, seventy-nine miles southwest of London. There are remains of the town walls built in the 14th century, and four of the seven gates. The oldest church, St. Michael's, shows the Norman architecture, and God's House, dating from the 12th century, is one of the earliest hospitals in England. There are large docks, a new one covering eighteen acres being built in 1890. There is a large cattle trade with Spain and Portugal, and shipbuilding is extensively carried on. Southampton, called in the Saxon *Chronicle* Suth Hamtune, was founded by the Anglo-Saxons. It was burned by the French, Spanish, and Genoese fleets in 1338. Population 75,325. See *History of Southampton*, by Davies.

South'ern Cross, a group of stars in the southern hemisphere of the heavens, at a considerable distance from the south pole. The four principal stars form a rough cross. It was added to the list of constellations in 1679.

Southey (*sowth'i*), **Robert,** an English poet, was born at Bristol, England, Aug. 12, 1774. He studied at Oxford, where a visit from Coleridge gave him the dream of a community to be founded in America, called the "Pantisocracy," which failed for want of means. Coleridge and Southey married sisters, and after various experiments, reading law, a secretaryship in Ireland, two visits to Lisbon, with intervals in London, Southey settled at Greta Hall in the Lake country, where Coleridge lived, and devoted himself

to writing, for a long time supporting Coleridge's family as well as his own. His works number nearly fifty, filling more than a hundred volumes, and many contributions to periodicals besides. *Madoc*, *Curse of Khehama*, *Thalaba*, and *Roderick* are among his longer poems, though he is best known by a few short ones, such as the *Battle of Blenheim*, and *How the Water Comes Down at Lodore*, and by his *Life of Nelson*, which is one of the best biographies in English literature. He wrote also in prose a *History of Brazil*, and *History of the Peninsular War*. His works brought him a competency and were rewarded by a pension, an honorary degree, and the offer of a baronetcy, and in 1813 he was made poet laureate. He died March 21, 1843. See *Southey*, in the "English Men of Letters" series, by Dowden.

Spadix (*spā'diks*) a peculiar spike-like form of inflorescence characteristic of the Aroids (which see), in which the axis is fleshy. The minute sessile flowers occur only on the lower part of the axis as in Jack-in-the-Pulpit, or completely cover it. See INFLORESCENCE.

Spain, one of the European states, forms with Portugal the southwestern peninsula. It is separated from France by the Pyrenees mountains, and at its most southern point from Africa, by the strait of Gibraltar, and washed on three sides by the waters of the Atlantic and the Mediterranean. The Balearic islands, on its Mediterranean coast, belong to Spain. Portugal is a strip of land 400 miles long, cut out of the southwest corner of Spain. The coast line of Spain, 1,317 miles long, is broken by some fine harbors, as Vigo, Corunna, Cadiz, Malaga, and Barcelona. The Mediterranean shore in the south is rocky, sloping upward to the Sierra Nevada mountains. The country is a high plain, crossed by several ranges of mountains, the highest points being in the Pyrenees and the Sierra Nevada. The rivers, of which there are 230, flow mostly into the Atlantic; the Tagus, Guadalquivir, Duoro, and Ebro being some of the largest. The mines of Spain have been worked from the earliest times. There are mines of lead, copper, tin, iron, salt, and coal. Gold and silver were formerly produced in Galicia, but now silver is found only in Seville, while the quicksilver mines of Almaden are the richest in Europe. The largest industry of the country is farming, which employs from 60 to 70 per cent. of the people. Besides the cereal crops, saffron and dye plants, mulberry trees for the rearing of silkworms, and large quantities of southern fruits, are cultivated. Wine is one of the principal exports. Large herds of cattle, sheep, hogs, asses, and mules are raised, and the horses are descended from the Arabian breeds. The manufactures of the country do not equal those of the middle ages, when Spain was noted for its wool and silk goods, and arms. The principal manufactured products are cork, and cotton, besides silk, linen, leather, glassware, and arms. There is a comprehensive postal system, 8,068 miles of railway, 19,868 miles of telegraph lines, and 6,250 miles of telephone lines. Spain has ten universities — at Madrid, Barcelona, Granada, Valladolid, Saragossa, Seville, Santiago, Salamanca, Oviedo, and Valencia — with about 17,000 students. The school system varies with different provinces, the larger cities and a few of the provinces having schools equal to the best in Europe, but in many others the schools are poor. The public and primary schools are supported mainly by the municipalities, and most of the children are educated free. However, a large proportion of the inhabitants are illiterate. There is on an average one school for every 560 persons.

Spain is governed by a hereditary monarchy, its present constitution being settled in 1870. The cortes, as the governing body is called, consists of two parts — the senate and the chamber of deputies. One-third of the senate hold their seats by inheritance, one-third are appointed by the king, and one-third are elected. In 1890, universal suffrage was introduced. The army in time of peace numbers about 98,000, and the navy 15,725 men, besides 9,000 marines. There are in Spain thirteen military schools and colleges.

The Phœnicians and Greek were the earliest visitors to Spain, where they found a race called by the Greeks Iberians, consisting probably of a number of different tribes. The Carthaginians made the first effort to occupy Spain, founding Carthagena, and were expelled by the Romans, in 206 B. C. The Roman conquest of the peninsula was completed in 19 B.C., when Augustus divided Hispania, as they called it, into three provinces. The country became a thorough Roman province, adopting the Latin language and the Christian religion. After the invasion of the Goths, Spain became a province of the Visigoths, until 573, when she became the seat of the Gothic kingdom, which was destroyed in 711 by the Arab and Moorish invaders. The Moorish kingdom in Spain, lasting three centuries, reached its highest prosperity in 756. Cordova, their capital, was the finest city of western Europe, as may be seen in its grand mosque. Their last stronghold in Spain was Granada, which surrendered to the Spanish army, Jan. 2, 1492.

The different provinces of Christian Spain have been at times independent and then conquered and united. Alfonso I. conquered Galicia, with a part of Leon and Castile, and called himself the king of the Asturias; and Alfonso III., taking possession of the whole of Leon, called it the kingdom of Leon. Navarre was an independent state in the 9th century, and became a powerful kingdom. Castile, at first a republic, was afterward sub-

ject to Leon, then again independent until Ferdinand the Great united it with Leon. Aragon, first a part of Navarre, became an independent kingdom, and then was united with Catalonia. In 1037, the union of Leon, Castile, and Galicia, made Ferdinand the Great the most powerful ruler in Spain. The marriage of Isabella of Castile with Ferdinand of Aragon united those provinces, and the conquest of Granada completed the consolidation of the kingdom; which, with the conquest of Naples, the discovery of America by Columbus, and the possession of large parts of the new continent, raised Spain to a high place among European nations. Philip II. exhausted the strength of the country in his wars with the Netherlands, and in his great preparations for the "invincible armada" and in building the Escurial, the great kingdom he had inherited from his father, Charles V., began to show decline. Spain sided with the emperor in the "Thirty Years war," but received nothing in return, and soon became a subject of contest between the different European powers. Philip V. was the first of the Bourbon kings of Spain, whose accession led to the war of the Spanish Succession, ending in the peace of Utrecht in 1712. From 1808 till 1813, Joseph Bonaparte was king of Spain, though the people did not acknowledge him. Ferdinand VII. was restored to power in 1814, and by the help of the French triumphed over the Liberal party in the kingdom. Florida was sold to the United States, and a large part of the South American colonies were lost during this reign. During the regency of Christina and the reign of Isabella, the Liberal party gained ground until Isabella fled to France in 1868, resigning in favor of her son Alphonso VII. There was a provisional government for two years, a short reign by Amadeus of Savoy, and a republic, ending with the second Carlist war from 1872 to 1876. Don Carlos, who claimed the throne as a brother of Ferdinand, withdrew to France, and Alphonso VII. reigned for eleven years. The present king of Spain, Alphonso XIII., was born in 1886, and the country is governed by his mother, the queen regent. The revolt of Cuba led to the Spanish-American war of 1898, that resulted in the complete destruction of the Spanish fleet, and the loss to Spain of all her colonies, save those in Africa. See SPANISH-AMERICAN WAR. Population 18,089,500. See *Philip II.*, by Prescott; *The Moors in Spain*, by Poole; *Wanderings in Spain*, by Hare; and *Castilian Days*, by John Hay.

Spandau (*spän'dow*), a Prussian town, and strong fortress, is situated on the Spree river, eight miles northwest of Berlin. As it defends the capital on that side, it is very strongly fortified, and in its citadel is kept the reserve fund of $30,000,000, reserved by the government ready for war. There is an arsenal a cannon foundry, and gunpowder factories, and a garrison of 4,000 men. One of the oldest towns in Brandenburg, it surrendered to the Swedes in 1634, to the French in 1806, and to the Prussians in 1813. Population 55,841.

Span'ish-Amer'ican War. The people of the United States had long watched the struggle of the Cubans against the tyranny of Spain, and with deep sympathy and indignation had witnessed the inhuman cruelties with which the war had been waged on the part of Spain. The devotion of the Cubans to their cause, the brutality with which the peaceable inhabitants of the island were treated, and the inability of our government to induce Spain to adopt reforms that would be acceptable to the Cubans, made intervention a duty the United States could not evade. The tension of the situation was increased by the destruction of the United States battleship *Maine* by an explosion, while on a friendly visit in the harbor of Havana, on the 15th of February, 1898. Of her crew, 266 men, including two officers, were killed. A naval court of inquiry after thorough investigation declared it to be their opinion that the *Maine* was destroyed by a submarine mine. The American people, while not asserting that the act was one of treachery on the part of the Spanish government, did believe that without complicity on the part of Spanish officials at Morro castle the vessel would not have been blown up by mines operated by electric batteries located within that fortification.

Matters now drifted rapidly toward war. On April 11, President McKinley sent a message to congress in which he declared that he had exhausted every effort to prevent a resort to arms. On April 19, the two houses of congress passed the following preamble and resolutions: —

"WHEREAS, The abhorrent conditions which have existed for more than three years in the island of Cuba, so near our own borders, have shocked the moral sense of the people of the United States, have been a disgrace to Christian civilization, culminating as they have in the destruction of a United States battleship, with 266 of its officers and crew, while on a friendly visit in the harbor of Havana, and cannot longer be endured, as has been set forth by the President of the United States in his message to congress of April 11, 1898, upon which the action of congress was invited; therefore,

"*Resolved*, 1. That the people of the island of Cuba are, and of right ought to be, free and independent.

"*Resolved*, 2. That it is the duty of the United States to demand, and the government of the United States does hereby demand, that the government of Spain at once relinquish its authority and government in the island of Cuba and withdraw its land and naval forces from Cuba and Cuban waters.

"*Resolved*, 3. That the President of the United States be, and he hereby is, directed and empowered to use the entire land and naval forces of the United States, and to call into actual service of the United States the militia of the several states, to such extent as may be necessary to carry these resolutions into effect.

"*Resolved*, 4. That the United States hereby disclaims any disposition or intention to exercise sovereignty, jurisdiction, or control over said island, except

for the pacification thereof, and asserts its determination, when that is accomplished, to leave the government and control of the island to its people."

On April 21, the American minister at Madrid received passports from the Spanish government and on the same day the Spanish minister left Washington. On April 24, Spain issued a declaration of war with the United States, and on the next day the American congress issued a similar declaration. The President issued a call for 125,000 volunteers, and the equipment of army and navy was vigorously pushed. The first action of importance was the naval battle in Manila bay. At daybreak on May 1, Commodore Dewey, in command of the Asiatic squadron of the United States navy, entered the harbor. His squadron consisted of the cruisers *Olympia* (flagship), *Raleigh*, *Baltimore*, and *Boston*, and gunboats *Concord* and *Petrel*, and the revenue cutter *McCulloch*, with two transports. Here he met the Spanish fleet, consisting of the *Reina Cristina*, *Castilla*, *Don Antonio de Ulloa*, *Isla de Luzon*, *Isla de Cuba*, *Gen. Lezo*, *Marquis de Duero*, *Cano*, *Velasco*, *Isla de Mindanao*, some small gunboats, and a transport. The result of the battle was the entire destruction of all the Spanish vessels and the silencing of the land batteries. Commodore Dewey did not lose a ship, nor a man, while the Spanish lost their entire fleet and from 600 to 700 men.

Spain sent to the defense of Cuba, a fleet under command of Admiral Cervera, which took a secure position in the harbor of Santiago. The city of Santiago was also garrisoned by a Spanish army under General Linares. This city and harbor thus became the objective point of American attack. The American fleet, under Admiral Sampson, being unable to enter the harbor, which was thoroughly protected by fortifications, took position before the entrance, to prevent egress of the Spanish fleet. An American army of 15,000, under Major-general Shafter, landed at Baiquiri, near Santiago, June 23. Advancing, they encountered a Spanish force at Las Guasimas June 24, and a sharp engagement was fought, the enemy being driven back. On July 1, a severe and decisive battle was fought on the heights of San Juan and El Caney, overlooking Santiago, resulting in the defeat of the Spaniards. General Linares was wounded. General Vara del Rey, second in command, was killed, and the command of the Spanish forces, which withdrew within the fortified lines of the city, devolved on Gen. Josi Toral.

On July 3, the Spanish fleet under Admiral Cervera attempted to escape from the harbor of Santiago. As the vessels appeared in line they were pursued by the *Brooklyn*, the *Oregon*, the *Iowa*, and the *Texas* of the American squadron, and the converted yacht *Gloucester*. The Spanish ships *Maria Teresa*, *Almirante Oquendo*, and the *Vizcaya*, were within a few minutes forced ashore and surrendered. The *Cristobal Colon* made a desperate attempt to escape, but was run ashore and sunk about sixty miles from the mouth of the harbor. The two torpedo-boat destroyers, *Furor* and *Pluton*, were wrecked within four miles of the harbor. Admiral Cervera, Captain Eulate, and more than 1,300 officers and men were taken prisoners. The loss of life on the Spanish vessels was large, while on the American fleet only one was killed. None of the American vessels was injured seriously in the engagement.

On July 17, General Toral surrendered to General Shafter his army, and the city and province of Santiago de Cuba, which embraced all eastern Cuba. An American army under General Miles landed on the island of Porto Rico at Guanica, July 25, and advanced toward San Juan, occupying various points, without serious fighting. On Aug. 12, a peace protocol, suspending hostilities and providing for the appointment of commissioners to treat of peace between Spain and the United States, was signed at Washington, the French minister, M. Cambon, acting in behalf of Spain. The American troops, in command of General Merritt, and the fleet under Admiral Dewey, made a combined attack on Manila, August 13, and after six hours fighting the Spaniards surrendered the city, with 7,000 prisoners.

The peace commissioners appointed by Spain and the United States met at Paris, Oct. 1. The United States commissioners were William R. Day of Ohio, Senators William P. Frye of Maine, Cushman K. Davis of Minnesota, George Gray of Delaware, and Mr. Whitelaw Reid of New York. After lengthy deliberations a treaty of peace was signed, Dec. 10, 1898. By this treaty, Spain relinquished all claim of sovereignty over, or title to, the island of Cuba, and ceded to the United States the island of Porto Rico, the island of Guam, and the Philippine islands; the United States agreeing to pay to Spain the sum of $20,000,000. The close of the war, which lasted only 113 days of actual hostilities, left Spain with no colonial possessions in the Western hemisphere. See *History of the Spanish-American War*, by H. Watterson.

Sparks, Ja'red, an American historian, was born at Willington, Conn., May 10, 1789. He studied at Harvard, settled as a Unitarian minister at Baltimore, and finally became editor of the *North American Review*. He was ten years a professor of history at Harvard, and for four years its president. His writings include *Life of John Ledyard*, *Life of Gouverneur Morris*, and *Library of American Biography*, in ten volumes. He edited the *Works of Benjamin Franklin*, and the *Writings of George Washington*. He died at Cambridge, Mass., March 14, 1866. See *Memoir*, by G. E. Ellis.

Spar'row, any one of various small birds belonging to the finch family. They are

plainly colored and usually have their plumage streaked with brown, black, gray, and rusty. About thirty common varieties are found in the United States, and among them are a number of good singers. They are hardy birds, feeding on seeds, and some kinds are to be seen in any month of the year. Some kinds go south at the approach of winter, others are permanent residents, and still others come from the far north, where they nest, to spend the winter in the United States. The song sparrow is one of the commonest and rears three broods a year. The chippy is very common about our yards and houses. The most persistent is an imported bird — the common European house sparrow, or English sparrow, which was introduced into the United States about forty years ago. Although destroying many caterpillars, it drives other birds before it, and has become a nuisance and a pest, but they are too numerous, and multiply too rapidly, to be easily got rid of. Other well-known kinds are the fox sparrow, swamp sparrow, tree sparrow, field sparrow, and the white-throated sparrow.

Spar'row Hawk, a small falcon, abundant in the United States. It is about eleven inches long, with a tawny plumage, marked with bluish and black, a rusty-colored crown, and a chestnut tail. There is considerable variation in its plumage. Notwithstanding its small size, it is one of the most active and courageous of birds. The sparrow hawk is the American representative of the European kestril, which is a larger but similar bird. It feeds upon mice, grasshoppers, and other insects. Its nest is usually in a hollow tree.

Spar'ta, the ancient Lacedæmon, the famous Greek city, was in the southern part of Greece on the Eurotas river, about 20 miles from the Mediterranean. It was shut in by mountains, one, Mt. Taygetus, rising 8,000 feet; and the valley was so easily defended that it was not regularly fortified until 195 B. C. The city had few fine buildings; the Acropolis was a steep hill with a temple to Athena on its summit, and the white marble theatre was one of the largest buildings. The city was formed from several scattered hamlets, and was governed by two kings, whose powers were equal, and who were at first priests, judges, and generals as well as rulers. There were three classes of citizens; the Spartiatai, or governing class, the Perioikoi, who were free but had no voice in matters of state, and the Helots, or slaves, who were bound to the soil, cultivating it for its owners, and were also employed in war. The greatness of Sparta is due to the laws of Lycurgus, which made it a nation of soldiers. There is some doubt resting on the received traditions of Lycurgus, but there was certainly a very ancient legal code, dating back to 825 B. C. The citizens, according to this code, lived only for the state, and children were under the public care. If deformed or weak, they were not allowed to grow up; if healthy, they were taken from the mother when seven years old, and drilled in military exercises, in habits of endurance, and skillfulness, and in speaking short sentences, to the point, which last gave rise to the expression, "laconic," from the name of the province, Laconia. Their training is illustrated in the story of the boy with the stolen fox, who was applauded because he bore the torture of the desperate animal tearing his flesh rather than by crying out and confessing that he had stolen him. Between the ages of twenty and sixty all Spartans served in the army, and though allowed to marry and to engage in business, ate and slept in the public barracks. The early struggles of Sparta with Messenia, Argos, and Athens, gave Sparta the victory and made it the chief power in Greece, but its tyranny induced rebellion, and the Thebans under Epaminondas reduced Sparta to its old boundaries. The Macedonians still further cut off its provinces, and finally, with the remainder of Greece, it became a part of the Roman empire. The modern town of Sparta, founded by the Greeks in 1836, the capital of Laconia, occupies a part of the site of ancient Sparta.

Spartacus (*spär'tă-kus*), a leader in a revolt of Roman slaves, about 73 B. C., was born in Thrace. He was first a shepherd, then the head of a band of robbers, and when taken was sold to a trainer of gladiators at Capua. He escaped with seventy others and fled to the crater of Vesuvius. Here he was joined by many runaway slaves, conquered all forces sent against him, and sacked many of the cities of southern Italy. His army increased to 100,000 men, whom he sought to induce to march across the Alps and to seek their old homes, but the fever of revenge and conquest was upon them, and Spartacus continued his fight with the Roman authorities. At last he was defeated by Crassus in 71 B. C. while trying to seize the shipping at Brundusium and slain at Petelia.

Spar'tanburg, S. C., the capital of Spartanburg county, on the Glen Springs, Port Royal, and Western Carolina, and the Southern railroads. It lies about 92 miles northwest of Columbia, the state capital, and 72 miles southwest of Charlotte, N. C. It is the seat of Wolford Methodist Episcopal college, and has a number of churches, schools, and other public institutions. The industries of the region consist of gold and iron mining and limestone quarrying; brick works, carriage factories, etc., are among the other occupations of the city. The population has in the past decade increased from 5,544 to 11,395.

Spathe (*spāth*), the very highly developed bract which invests the spadix. In Jack-in-the-pulpit it is tubular below, and spreads above into an overarching hood. In the calla lily it is very large, and beautifully

white. The spadix with its spathe is characteristic of the Aroids, and in the numerous tropical forms the spathe is extremely varied in form and often brilliantly colored.

Specif'ic Grav'ity. See DENSITY.

Specif'ic Heat, a term used in the physical sciences and in engineering to denote *the quantity of heat necessary to raise the temperature of one gram of a substance through one degree centigrade at any given temperature.* This quantity of heat is known as the specific heat of that substance at that temperature.

Or if we use the *calorie* as the unit of heat an exactly equivalent definition of specific heat is the following: *The ratio between the amount of heat required to raise the temperature of any body one degree and that required to raise the temperature of an equal mass of water one degree.*

The following is a table of specific heats of some of the more common substances: —

Aluminum	0.214	Tin	0.056
Sulphur	0.203	Iodine	0.054
Iron	0.114	Antimony	0.051
Copper	0.095	Mercury	0.033
Zinc	0.095	Platinum	0.032
Silver	0.057	Lead	0.031

See HEAT.

Spec'tacles are instruments used for aiding the sight. They are said to have been invented in the 13th century. The first ones were very clumsy, and there was very little improvement until the beginning of the 19th century. Spectacles are worn for strengthening the vision, when it is weakened by old age, or to remedy any natural defect, such as nearsightedness, and also to protect the eye from too strong light. The glasses or lenses used should be made of the best of glass and carefully ground, though sometimes they are made from rock crystal and called "pebbles." The glasses should be very carefully selected to accomplish the purpose intended, it being often necessary to fit each eye separately. For short sight or nearsightedness, the lens is concave and the weakest glass that will permit distant objects to be seen should be used. For the weakness of old age, which is farsightedness, and is first noticed by one's holding a book farther off in reading, etc., the lens is convex, and the strongest glass should be used.

Spec'trograph. See SPECTROSCOPY.

Spec'troscope. See SPECTROSCOPY.

Spectroscopy (*spĕk-trŏs'ko-py*) is a science which has for its object the determination and description of the various radiations which bodies emit, reflect, and absorb. It is to be carefully noted that spectroscopy does not end in the observation of phenomena, but includes also the description of these phenomena in a manner which is at once the simplest and most complete.

METHOD OF SPECTROSCOPIC SCIENCE.

The examination of a body by means of the spectroscope includes, in general, four steps. These are

A. *The Production of Radiation.*

B. *The Separation of the different Radiations.*

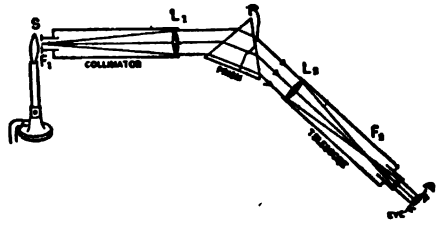
C. *The Recording of the Radiations.*

D. *The Comparison of the Radiations.*

We shall consider the subject from these four points of view.

A. What the spectroscope receives and analyzes is radiant energy. It follows naturally, therefore, that the first step in examining the spectrum of any body is to make that body a source of radiant energy. In many cases this step has already been performed for us. Thus the fixed stars and the gases in which lightning discharges occur are already rendered self-luminous. All we can do, therefore, is to *observe* their spectra; we cannot *experiment* upon them. Bodies at the surface of our earth can generally be made to radiate energy, (1) by heating them, as in the case of a red-hot poker; (2) by passing an electric current through them, as in the case of the Plücker tube; (3) by means of chemical combination, as in the case of the Bunsen flame; or (4) by means of luminescence, of which fluorescence and phosphorescence are examples. As to just how and why these processes cause bodies to emit radiant energy very little is known.

B. Passing now to the second step, namely, the separation of the radiant energy of one wave length from that of the others, this is the peculiar function of the spectroscope, and is usually accomplished in one of two ways, viz., either by interposing in the path of the ray a prism which impresses upon each ray of different wave length a different direction, or by placing in the path of the rays a diffraction grating which accomplishes the same thing. (See PRISM and DIFFRACTION GRATING.) Of these two methods, the first was



A PRISM SPECTROSCOPE ADJUSTED TO VIEW ONE PARTICULAR COLOR IN THE SPECTRUM.

introduced by Newton about the middle of the 17th century, and the second by Fraunhofer near the beginning of the 19th century. The ordinary prism spectroscope, shown in figure 1, is generally made up of three parts, viz., a prism and two astronomical telescopes. One of these telescopes is used to render the rays which fall on the prism parallel to each other, and is therefore called the *collimator.*

The other telescope is made movable so that it can be turned into the proper direction for observing any desired color, and is, therefore, called the *view telescope*. A *grating* spectroscope is essentially of the same construction, see figure 2, except that the dispersion, *i. e.*, the separation of the rays, is produced

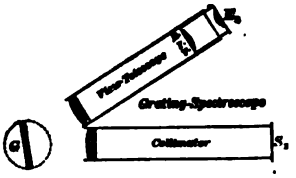


FIG. 2.

by the grating at G, instead of by a prism. The radiant energy is here admitted through the small narrow opening at S_2, called the *slit*.

An image of this slit is produced in the focal plane of the view telescope, and in the ordinary spectroscope is there examined by means of an eyepiece. But if we place a small camera at the end of the view telescope in such a position that the photographic plate will lie in the focal plane of the telescope, we can then obtain a photograph of these images. Such an instrument is called a *spectrograph*.

Among the most powerful spectroscopes known must be mentioned the curved grating instrument devised by Rowland. For the best account of this, see Kayser's *Handbuch der Spectroscopie*. In the same class must be mentioned Michelson's echelon spectroscope, which is well described in Drude's *Lehrbuch der Optik*.

C. Passing now to the manner in which spectra are recorded, this depends partly upon the portion of the spectrum under examination and partly upon the purpose of the examination. If it is merely the appearance of a line a glance of the eye may suffice, provided the line is in the visible part of the spectrum.

But in the ultra-violet part of the spectrum, photography is practically the only available means for obtaining a record. In the infra-red portion of the spectrum, we cannot see and cannot easily photograph what is there; so that here the radiomicrometer or bolometer or radiometer must be used. In general, photography is the best and most easily worked method whenever it is applicable.

D. *Comparison of Spectra.* Let us suppose now that by some means we have analyzed the radiation from a certain body and have recorded its spectrum. The next step in the process is to apply this information to the purpose for which it was obtained. This last step — the interpretation of results — is perhaps the most important one of the four, and the one which demands, in its execution, the largest measure of care and experience. After a spectrum is once obtained it becomes generally necessary to compare it (1) with itself, when the radiation is produced under different conditions; (2) with itself when recorded in another way; (3) with the spectra of other bodies; (4) with some spectrum which has been predicted by theory; or (5) with a standard scale of wave lengths; that is, with an ideal spectrum in which each line differs from its neighbor by one of the units in which wave lengths are measured.

HISTORY OF SPECTROSCOPY.

A bare outline of the steps by which this science has reached the high degree of perfection which it to-day possesses would be something like the following: —

1. Newton, by his careful study of the prism, gave a fairly complete answer to the question of separating the various radiations.

2. Young and Fresnel, by establishing the wave theory of light, along the lines laid down by Huygens, placed spectroscopy upon a sound scientific basis.

3. Fraunhofer, by inventing the diffraction grating, greatly increased the power and simplicity of the instrument.

4. Kirchhoff and Bunsen (1859) showed that each chemical element emits a characteristic radiation and, thereby, established the science of spectrum analysis.

5. Rowland, by the perfection of the plane grating and by the invention of the curved grating, as well as by his superb published spectra of the sun and elements, revolutionized the entire science and gave it a precision hitherto undreamed of.

6. Kayser and Runge, by their study of the spectra of the elements, have shown that there is an order, and not a chaos, running through the thousands of lines already mapped.

7. Michelson (1890–1900) has shown us how a single line in any spectrum may be analyzed and studied in detail; and has thus, at once, multiplied the power and the problems of the science. This he has accomplished by the invention and use of the interferometer and the echelon spectroscope. Kayser's *Handbuch der Spectroscopie* is incomparably the best treatise ever written (1901) on this subject. HENRY CREW.

Spec'trum. If a prism or a diffraction grating be interposed in the path of a beam of white light, it will, provided the beam of white light be small, spread this beam out into a colored band in which the colors are arranged in the following order *red*, *orange*, *yellow*, *green*, *blue*, *violet*. This colored band is called the *spectrum* of white light.

If instead of a pencil of white light, we had passed through the prism a pencil of light from the Bunsen flame, it too would have been separated into its constituent colors, in this case *green*, *blue*, and *violet*, which is the spectrum of the Bunsen flame. If an electric arc had been employed we should have obtained the spectrum of the electric arc, even though a large part of the radiation from the

arc is invisible — has no color — and must be detected by the photographic plate.

So we define the spectrum of any body as the *ensemble* of its radiations, visible and invisible, arranged in the order of their wave lengths. See SPECTROSCOPY.

Speculum (*spek'u-lŭm*) **Metal** is an alloy composed of 126 parts of copper and a little over 58 parts of tin, which is used for the mirrors or "specula" of telescopes. It is very brittle, will take a fine polish, and does not tarnish easily. A silvered glass is, however, taking its place, being just as good and less expensive.

Speke (*spēk*), **John Hanning,** an African explorer, was born May 4, 1827, in Somersetshire, England. At seventeen he entered the Indian army, where between his periods of military service, he collected specimens in natural history and planned available routes of travel. In 1857, he was sent out, with Burton, by the Royal Geographical society to find the great lakes of Central Africa. Speke, when alone, discovered the Victoria Nyanza, and in 1860, with Grant, returned and explored its coasts and followed the river until he was satisfied it was the Nile. It was disputed, however, by Burton and other travelers, and Speke made arrangements for a public discussion with Burton at Bath. But on the morning of the day set, Sept. 15, 1864, he accidentally shot himself. His writings are *Journal of the Discovery of the Source of the Nile*, and *What Led to the Discovery of the Source of the Nile.*

Spen'cer, Herbert, an English philosopher, was born at Derby, England, April 27, 1820.

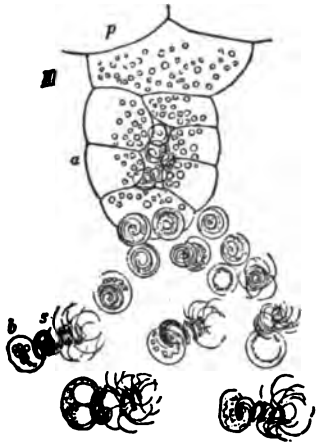
HERBERT SPENCER.

His father was a teacher, and the son received from him a taste for natural science, keeping collections of insects and making drawings of them as a boy. His first work was that of a civil engineer, in which he was engaged for about eight years, publishing during the time several articles in the *Civil Engineers' and Architects' Journal.* From 1848 to 1853, he was an editor of the *Economist.* His first important publication was *Social Statics* in 1850. His great plan was the working out of a system of philosophy which is based on the doctrine of evolution, that is, the theory that the world is the result of a long series of changes, produced by force acting on matter, and resulting in motion. In applying evolution to the study of man in society, Spencer employed assistants to collect and arrange all sorts of facts, in regard to customs, worship, government, etc., of savage tribes, ancient and modern races. His philosophical writings are very numerous, *Principles of Psychology, First Principles, Principles of Biology, Data of Ethics*, and several volumes of essays being among the best known. His brilliant power of drawing conclusions from a vast array of facts, his great knowledge of science, and his wealth of illustration make him popular, as well as give him a high position among philosophers. His most popular works are a small book on *Education*, and *The Study of Sociology*, intended for the ordinary reader.

Spen'ser, Edmund, an early English poet, was born at London, about 1552. He studied at Cambridge, obtaining considerable knowledge of Latin and Greek literature, as is seen in his works, and making a friend of Gabriel Harvey. In 1579, his first work, *The Shepherd's Calendar*, appeared, the first note of the great Elizabethan poetry. It was dedicated to Sir Philip Sidney, one of his stanchest friends, whose acquaintance he had made probably through Harvey. Through Leicester, Sidney's uncle, doubtless, he was appointed secretary to the lord deputy of Ireland, which thus became his home. The country was in rebellion, and Lord Grey suppressed it so cruelly as to be recalled, and Spenser learned the lesson of massacre and extermination, which he afterward advocated, making his name hateful to the Irish nation. His great work, *The Faerie Queene*, was begun in England, but the larger part of it was written in Ireland. The first three books were published in 1590, and brought him great fame, and a small pension, but no political preferment, as he had hoped. Two more cantos and two stanzas were published in 1596, leaving the poem unfinished. The first two books are those usually read, and give the best idea of the beauty of the poem, which places him in the first rank of English poets. Of his other poems, *Colin Clout's Come Home Again*, is perhaps the best known. In 1598, after returning from London to his Irish home at Kilcolman castle, in an insurrection, his home was burned, and he fled with his family to London, which he reached exhausted and destitute, and where he died soon after at a tavern in King street, Jan. 13, 1599. He was buried by Chaucer in Westminster Abbey. See *Spenser and His Poetry*, by Craik, and *Spenser*, by Church, in the "English Men of Letters" series.

Sperm (in plants), the male cell which unites with the egg in the process of fertilization. "Antherozoid" and "spermatozoid" are terms applied to the same body. In all plant groups except the seed-plants, the sperm is chiefly a ciliated, free-swimming cell. In Thallophytes the cilia are variously disposed. In Bryophytes each sperm has a pair of cilia at its anterior end. In Pteridophytes the body of the sperm is large and spirally coiled, tapering into a long slender beak which bears

numerous long cilia. In Spermatophytes ciliated sperms do not occur, except in Cycads



Antheridium of a Fern discharging the Coiled Multiciliate Sperms.

and Ginkgo, the male cells being transferred through pollen tubes.

Spermaceti (*spĕr-mă-cē'tĭ*) is a waxy substance obtained from the oil found in the head of a sperm whale. The oil in the head of an ordinary-sized whale will fill twelve barrels. The oil is drained off and the spermaceti washed with hot water and weak boiling lye. It is a white substance, looking like wax, without taste and with very little odor. It is used for candles and in medicine.

Sper'mary, the male organ of plants, that is the organ which produces the sperms. It is the same as Antheridium (which see), but is substituted for it by those who wish to emphasize the fact that an antheridium holds no relation to the "anther" of flowering plants.

Spermatophytes (*sper'ma-tō-fīts*), the highest of the four great divisions of the plant kingdom, characterized by the production of seeds. The name means "seed plants." This great group has received numerous other names, as "flowering plants," "Anthophytes," "Phanerogams," "Phaenogams," "Phenogams," "Siphonogams," etc. The seed-plants form the most conspicuous vegetation on the earth's surface, and are the plants most usually noticed. They have been evidently derived from Pteridophytes, differing from them chiefly in the production of seeds. The condition which has resulted in the formation of a seed is the presence and retention of a single megaspore ("embryo-sac") in the megasporangium ("ovule"). The two great lines of spermatophytes are gymnosperms and angiosperms. In gymnosperms ("naked seeds") the ovules and seeds are exposed upon the face of the open scale, as in pines, spruces, cypresses, junipers, etc. In angiosperms ("inclosed seeds") the ovules and seeds are inclosed in an enveloping carpel or group of carpels. The gymnosperms are a very ancient race, being represented only by about 400 living species; while the angiosperms are modern, containing more than 100,000 described species. See GYMNOSPERMS, and ANGIOSPERMS.

Spermatozoid (*spĕr'ma-to-zō'id*), (in plants). See SPERM.

Sperm Whale. See WHALE.

Sphagnum (*spăg'nŭm*). A genus of mosses known as the "bog mosses." They are large and pallid forms, which occur in great masses in boggy regions, especially at the north. The sphagnum bogs are great peat formers, and associated with the sphagnums are many strange seed plants, such as carnivorous plants, the rarer orchids, heaths, etc. This association of plants of strange habits seems to be due to the fact that the waters of the bog are poor in nitrogen containing salts, and only those plants which have learned to endure such conditions are found. The genus sphagnum is so peculiar that it forms one of the two great groups of mosses, the other and much larger group being called the "true mosses." Sphagnum is an intermediate form, combining characters which belong to liverworts and true mosses. See MUSCI.

Sphinx (*sfĭnks*), a fabulous creature of Greek mythology. It is represented with the body of a lion, either a human or animal head, and two wings. In Egypt, the head was often that of the reigning king. The great sphinx of Egypt is hewn out of the rock with some of the parts built up by masonry, and was 172½ feet long and 56 feet high. It is situated about a quarter of a mile southeast of the great pyramid. The head is 28½ feet long. There is a small chapel in front of the breast, made of three tablets, and over the door in front are two carved lions. On the pavement was a small lion with an altar between its paws, and a causeway leading to a staircase of thirty steps. Another staircase was built later, and there are also galleries and shafts in the rear. The sand with which nearly the whole of the body—that of a lion crouching close to the ground—is covered, was for a long time thought to have been sifted around it by the desert winds, but it has been shown to have been brought there by workmen. The age of this sphinx is uncertain, but late discoveries prove it to have been at least of the same age as the pyramids. Avenues of sphinxes have been found in Egypt, and several small ones are in European collections. The Grecian sphinx usually had a woman's head, a lion's body, and the tail of a serpent.

Spice Islands. See MOLUCCAS.

Spices, certain vegetable substances, used for flavoring food. They are the product usually of tropical countries, and are brought mainly from the east, though some of them

are found in the tropical regions of America. They come from the different parts of the plant, as ginger from the root, pepper and nutmeg from the fruit, and cinnamon from the bark, and cloves from the bud. Ginger, cultivated in the East and West Indies, is prepared for the market by scalding the roots in boiling water, or by scraping the roots and then washing. The first process makes white ginger, and the last black ginger. Preserved ginger is the young rootstocks preserved in syrup. Nutmeg and mace are obtained from the fruit of trees or shrubs native to Asia, Madagascar, and America. Nutmeg is the kernel or seed of the fruit, which is yellow and looks like a pear that is somewhat round, and has rather hard flesh. Around the nut is a network of fibers called mace, and within the thin brown shell, the nutmeg. The mace is blood-red when fresh, but when dried in the sun turns a light brown. It is sprinkled with sea-water to preserve it and pressed flat. Both mace and nutmegs yield an oil and are used in medicine as well as in food. The trees do not bear fruit until they are eight or nine years old. Cinnamon is the inner bark of the cinnamon tree. The tree is a native of Ceylon, and grows also in China, and South America. The bark is taken from the tree in strips about forty inches long, and gathered into bundles, which makes it ferment so that the outside bark is easily peeled off. It is dried, and rolled up. The best cinnamon comes from Ceylon. Cloves (called so because they look like small nails, from *clavus*, the Latin for nail) is the flower bud of the clove tree. The tree is a native of the Molucca islands, and grows about 40 feet high, and lives to be 100 or 200 years old. The spice is the blossom, and is gathered before it is quite open and dried in the shade. The tree does not grow well except in its native soil. The oil of cloves is used in medicine. Pepper is a berry which grows on a climbing shrub. It is about as large as a pea, and there are twenty or thirty in a cluster. They are yellow when ripe, and black when dried. The black pepper is made by grinding the whole berry, and the white pepper by rubbing off the outer covering before grinding. Cayenne pepper is the pod of a plant, and was first brought from Cayenne in South America. Mustard is obtained from the seeds of a plant, three varieties of which are used — the black mustard found in Europe, the white mustard in Europe, Asia, and the United States, and a weed, called the wild mustard, found in England and the United States. The seeds of the wild mustard are used only to mix with the others. The flour made from the seeds is often adulterated, but mixing it with wheat flour is allowed, as it keeps better, and is less bitter and stinging.

Spi'ders, a distinct group of animals related to scorpions, daddy-long-legs, and mites. United with the latter, they make the class *Arachnida*, which is related to the classes insecta, crustacea, and myriopoda. Their body is separated into two parts, a combined head and thorax, and an abdomen. There are four pairs of walking legs on the thorax which distinguishes them from all insects, the latter having three pairs of legs. The head carries poison-jaws and mouth parts, and, usually, six or eight simple eyes. The arrangement of the eyes is an aid in classifying spiders. They breathe by means of air chambers on the abdomen, which are called lungs. These are two or four in number, and, when the former, there are also air tubes in the body. The spinnerets from which the thread is spun are little knob-like processes on the under side of the abdomen near its tip. There are two, three, or four pairs with numerous horny tubes opening upon them. The substance of the thread is fluid and hardens on contact with the air. It is formed within numerous glands, one of which opens in each horny tube. Fluid issues from the various tubes and is usually united into a single thread. Some spiders, in place of spinning webs, send into the air a slender thread which becomes longer and longer, and, finally, is sufficient to act as a float. They let go their hold and go sailing through the air often for miles, supported by this floating thread. Spiders lay eggs in silken bags, or cocoons, which are sometimes carried about by the female and at other times attached to objects in sheltered places. The kinds of spiders and the webs they form are varied. The common garden spider with its geometrical web is well known. The large black and yellow spider is frequently seen in the fall. The common grass spider makes its web in the form of a funnel in the grass. Some spiders of small size build no webs, but wander about and leap upon their prey like minute tigers. The trap-door spiders inhabit tubular nests in the ground provided with a trap-door to close the entrance. Some triangular spiders, with sharp spines projecting from their bodies, are among the most curious forms. Among the largest spiders of warm and tropical countries is the tarantula, a large, hairy, fierce-looking spider whose bite is poisonous but rarely, if ever, fatal to man. There are also crab spiders (*mygale*), measuring six or seven inches across, which prey upon birds and other small animals. Some of these inhabit our western plains and others are found in tropical regions of the Old World. The king crab is usually regarded as belonging to the same group as the spiders. See McCook's *North American Spiders* (3 vols. 1889–92).

Spike, an inflorescence in which the flowers are sessile, or nearly so, and upon an elongated axis. See INFLORESCENCE.

Spike'let, small spikes which form a part of a larger inflorescence, as in grasses. See INFLORESCENCE.

Spikenard (*spīk'nard*) or **Nard,** a perfume obtained from a small plant, a native of India. It was much prized by the ancients and used in baths and at feasts. The odor is not generally liked by modern nations, and it is now used more in medicine than as a perfume. Some other plants of the same order, used in the place of spikenard, grow on the Alps and other mountains of southern Europe, where the peasants gather them from the rocks.

Spine, a rigid, sharp-pointed outgrowth from plants. Ordinary spines are modified branches and sometimes leaves, which have become stunted on account of deficient food supply. They are most common in plants of arid regions. Sometimes, however, hairs become very rigid and sharp, in which case they are said to be spiny.

Spin'ner, Francis Elias, an American official, was born at Mohawk, N. Y., in 1802. He was in congress from 1855 to 1861, but is best known as treasurer of the United States for fourteen years. In this capacity his signature was placed on all the paper money of the United States, and the very curious autograph, defying imitation, was known all over the world. He retired in 1875, and died Dec. 31, 1890.

Spinola (*spē'nō-lä*), **Ambro'sio,** Marquis of, a great Italian soldier, was born at Genoa, Italy, in 1571. With his brother Frederick he raised a force of 9,000 men whom he kept at his own expense. He served first in the Netherlands. His reduction of Ostend, which had been besieged two years, gave him a great reputation, and he was placed at the head of the Spanish and Italian troops in the Netherlands. His great antagonist was Prince Maurice of Nassau, and in the long struggle between them neither could gain any advantage. After an armistice of twelve years, beginning in 1609 with the renewal of the war, Spinola was once more opposed to Maurice, who died, however, before the walls of Breda. The taking of Breda after a siege of ten months, in May, 1625, was Spinola's last victory. He had spent his fortune in maintaining his troops, but his claims were not acknowledged by the Spanish government, and the vexation of their shameful neglect is said to have hastened his death, which took place in Piedmont, Sept. 25, 1630.

Spinoza (*spe-nō'zä*), **Ben'edict,** the great Dutch philosopher, was born at Amsterdam, Nov. 24, 1632, of Jewish parentage. His philosophical studies gradually drew him away from the Jewish faith, and he was formally excommunicated in 1656, when he changed his name, which was Baruch, to Benedict. In common with all Jewish youth, he had been taught a trade, in his case, that of polishing lenses, by which he now supported himself. At the death of his parents, he contested with his sisters his right to the inheritence, and when he had obtained it, took only one bed. He moved to Leyden, and then to The Hague, where he was offered a professorship at Heidelberg if he would teach nothing opposed to the received religion. He declined the position, also the offer of money by a wealthy friend, as well as a pension, conditioned on dedicating one of his works to Louis XIV., while living on a few cents a day. Separated from his friends, suffering from ill health and want, and harassed by continual persecution, he continued his life of study until his death, at forty-four years of age, Feb. 21, 1677. His philosophical system was based on that of Descartes, and is mainly contained in his *Ethics*, which was not published until after his death. "The world has produced no intellect more profound than that of Spinoza, and Spinoza has produced no book which can be compared with his *Ethics*," which attracted the admiration of such men as Goethe, Fichte, Schelling, and Hegel, and gave character to a school of philosophy. During his life, Spinoza published only two works, *Abridgement of the Meditation of Descartes*, and a *Treatise on Theological Politics*. See *Spinoza and His Environment*, by H. Smith; and *Life*, by Pollock.

Spirogyra (*spi-ro-jī'rä*), a genus of plants belonging to the green algæ, which has received its name from the fact that the very conspicuous chloroplast passes as a broad spiral band from one end of the cell to the other. The species are filamentous forms, and are very common in frothy masses in stagnant fresh water and about springs, being commonly known as "pond scums," or "frog spittle." Spirogyra belongs to the conjugate forms, its filaments becoming connected in pairs by outgrowing tubes at the time of fertilization. See CHLOROPHYCEÆ.

Spitzbergen (*spits-berg'en*), a group of islands in the Arctic ocean, 400 miles north of Norway. They are covered with ice, with sharp projecting peaks, which give them their name, Spitzbergen, meaning "needle-like mountains." On the west coast the climate is affected by the gulf stream, while the eastern coast is icebound and difficult of access. There is a scanty vegetation, with forty species of plants; herds of reindeer, the Arctic fox, and Polar bear are found, with great swarms of seafowl. The longest day is four months, and the long night lasts from Oct. 22 to Feb. 22, in which the moon and stars and occasionally the aurora borealis are the only light. There are no permanent inhabitants, but the islands are visited by Norwegian walrus hunters, and scientific explorers. See *Letters from High Latitudes*, by Lord Dufferin.

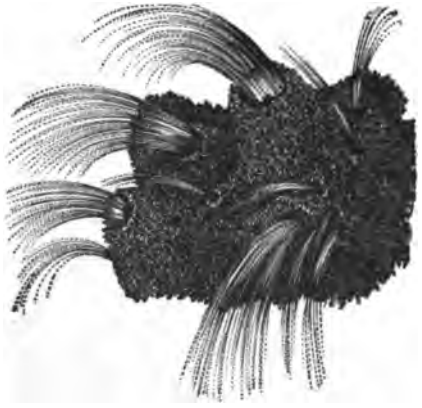
Spof'ford, Ainsworth Rand, ex-librarian of the United States congress, was born at Gilmanton, N. H., Sept. 12, 1825, and educated by private tutors. Early in his career he

settled at Cincinnati, O., as a bookseller and publisher, and became also associate editor of the Cincinnati *Daily Commercial*. In 1861, he became assistant to the librarian of congress, and four years later was appointed librarian-in-chief. In 1897, he was succeeded in this post by J. R. Young, and later by Herbert Putnam. Mr. Spofford has been an industrious compiler of the catalogues of the congressional library, and for some years issued the *American Almanac*. He has also interested himself in copyright matters, and has published a *Manual of Parliamentary Rules*, and edited the *Library of Choice Literature* (10 vols.), the *Library of Historic Characters and Famous Events* (10 vols.), and the *Library of Wit and Humor* (5 vols.).

Spof'ford, Harriet Elizabeth (Prescott), an American author, was born at Calais, Me., April 3, 1835. One of her first contributions to the *Atlantic Monthly*, *In a Cellar*, attracted great attention. She has since published *The Amber Gods; Sir Rohan's Ghost; New England Legends; Azarian, an Episode;* and is still a frequent and popular contributor to the periodicals.

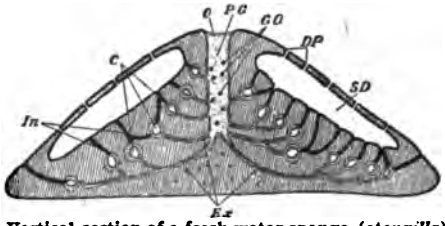
Spokane (*spō'kān'*) **Falls,** a city of Washington, in the eastern part of the state, is on the Spokane river. The water-power at Spokane Falls is owned by a large company, which has built a huge dam and other improvements, making it one of the finest water-powers in the country. Though only settled in 1878, Spokane Falls is a city with electric lights, water works, street cars, telephones, and great hotels. Its chief trade is lumber. Population 36,848.

Sponges, a group of animals intermediate between the protozoa (which see) and animals



SPONGES.

like the hydra and jelly-fishes (cœlentereta). The sponges were formerly regarded as plants, but that was in the days when superficial appearances only were considered. They are distinctly animals, and are usually separated into a distinct subkingdom, called porifera. Although they have no distinct organs, they are clearly a step above the simplest animals. They are many-celled animals and are composed of two distinct layers. The middle layer (mesoderm) is foreshadowed in them, but is not distinctly developed. All



Vertical section of a fresh-water sponge (*spongilla*), showing the arrangement of the canal system. C. ciliated chambers; DP. dermal pores; Ex. excurrent canals; GO. openings of the excurrent canals; PG. paragastric cavity; SD. subdermal cavities; O. osculum.

animals above them have three distinct cell layers. Sponges are mostly marine, but a single genus (*spongilla*) of fresh-water sponges is widely distributed, being abundant in the region about Chicago, as well as in other parts of the United States. These fresh-water sponges are not often noticed by the casual observer. They are clusters of soft, greenish substance looking like algæ. They will, however, shrink when touched, and, if closely watched, a current of water can be seen coming from a crater-like opening in their top. Minute spicules of lime are formed within their substance to serve as a support. They increase by budding and by eggs that are formed in the autumn, and carry the life over to another season. The marine sponges are varied in form, size, and complexity. Their skeletons are either limy, flinty, or horny. The bath sponges and slate sponges represent the horny skeletons only. When they are living, the skeleton is covered with sponge-flesh, and they look on the outside something like a piece of liver, or like a piece of tanned kid, but always with some pores opening into them. They are fished out with a kind of steel fork on the end of a long pole. The flesh is removed, sometimes by imbedding in the sand, and the skeleton is left. The limy sponges and the glass sponges are too hard for commercial use. The sponges are all permeated by branching canals which open by small pores on the surface. These canals lead into larger ones, and, finally, open into chimney-like passages which open outward by an orifice of considerable size. Water carrying oxygen and minute food particles is continually passing in through the small surface pores, traversing the system of canals, and passing out through the crater-like opening. Along the passage way are rounded chambers which are lined by numerous cells provided with flagella. These cells do the feeding. The flagella are hair-like threads of

protoplasm that keep waving and help to produce the currents of water. The simplest sponges are small tubes with many inlets and a single outlet. The more complex sponges have the passage ways very much branched and usually several outlets. Sponges increase by budding and also by the formation of eggs. The sponges of the gulf of Mexico, the Bahama islands, and the West Indies, are of a rather coarse quality. The finest sponges come from the Mediterranean and the Red sea. See Hyatt's *Commercial and Other Sponges* (1883).

Sponta'neous Combus'tion, or burning without the application of fire, sometimes occurs in mineral and other substances. Charcoal, if saturated with oil, may become heated so as to burn, and coals containing iron pyrites, when wet, will catch fire. Phosphorus, when dry, ignites easily, and has been known to melt and burn in a room where the temperature was only 70°, so that in hot weather a fire may be started by large packages of matches. Hay, cotton, tow, flax, rags, straw, leaves, if collected in large quantities, when damp, undergo fermentation, which gives off sometimes enough heat to burn. The cotton rags and waste used in wiping oiled machinery and lamps have probably started many unexplained fires. Spontaneous combustion of the human body has been thought to occur in a number of cases, usually where the individual was an habitual drinker, but is now considered doubtful. Liebig says a dead body filled with alcohol may burn of itself, but not a living one, in which the blood is circulating. See *Letters on Chemistry*, by Liebig.

Sponta'neous Genera'tion of Life, the doctrine that life in some form is developed from non-living matter. The ancients believed that frogs and eels sprang from mud, that insects were generated in dew, that decaying meat bred maggots, that the appearance of other forms of life were to be accounted for by spontaneous generation from lifeless matter. This belief was quite general until the seventeenth century, when the Italian, Francesco Redi, made experiments to test the truth of it. He placed bits of meat in open jars, and others in jars that were covered by fine gauze, and watched for the development of maggots. The blow-flies visited the uncovered meat, but were prevented from reaching the other. Of course, maggots hatched from the eggs, but did not appear in the protected meat, and, by this simple experiment, he proved that maggots did not arise spontaneously from the meat. This was about 1660. He made further experiments and reached the conclusion, not as a matter of opinion, but as a result of experiment, that life arises only from antecedent life, and does not develop spontaneously.

This position was quite generally accepted for larger animals, but with the introduction of the microscope, a new world of extremely minute living beings was made known, and doubts began to be entertained, that those minute beings must always have parents like themselves. It is a well-known fact that fluids, like clear mutton broth, or water in which any vegetable or animal substance has been soaked, will, if allowed to stand, soon become teeming with microscopic life. The possibility of this life arising by spontaneous generation formed a new phase of the question. Needham and Buffon attempted to put the matter to test by boiling infusions, to kill all germs that might exist in them, and corking them tightly. In course of time, these fluids became cloudy and were overrun with microscopic life. But, about 1775, a priest of the period named Spallanzani, showed that their experiments had not been conducted with sufficient care. He boiled infusions for three-quarters of an hour in flasks, and, while the fluid was still boiling, heated the necks of the flasks and, drawing them into a fine point, he closed them by heat. No microscopic life appeared in the flask treated in this way, and the conclusion was drawn that spontaneous generation of life was disproved.

About this time, oxygen was discovered and shown to be necessary to all forms of life. This brought a new point of view, and objection was made to Spallanzani's form of experiments, on the score that oxygen was excluded by sealing the necks of the flasks. In order to test this objection, Schulze and Schwann, in 1836, took up the question again and devised a means of admitting oxygen into the flasks containing fluids that had been boiled. The necks of the flasks were drawn out long, and convoluted, and left open at the ends. In some cases the inlet was heated and air drawn in. In other cases, the air was passed through bulbs containing chemicals that did not alter the oxygen. It was soon discovered that a plug of cotton-wool in the necks of the flasks would act as a filter. It permits the air to pass through and arrests all floating particles and, therefore, does not allow dust or germs to pass through with the air. A flask, or test-tube, is partly filled with an organic infusion; the latter is boiled and, while boiling, a plug of cotton-wool is pushed into the mouth of the vessel. On cooling, the air passes through this plug, but the smallest solid particles are caught in the meshes of the cotton-wool. Organic fluids treated in this way have been known for years to show no sign of microscopic life.

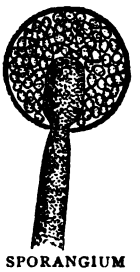
The question was regarded as settled, but, in 1859, it was unexpectedly opened in Paris by Pouchet, who claimed that life was developed in organic fluids even after boiling and preventing the entrance of floating particles from the air. Pasteur, however, demonstrated that Pouchet had been careless, and had admitted solid particles to the flask in the mercury, through which the oxygen had been introduced into the flasks. This closed the question as far

as it could be answered by experiment. Professor John Tyndall added something to the certainty of the matter by an ingenious experiment. He had an air-tight box made with glass windows, through which he passed a strong beam of light in a darkened room. The floating particles in the air, contained within the box, fell of their own weight, and came to rest on the sides and bottom of the box, which had been smeared with a sticky substance to hold them. He could tell when the air was completely cleared of these particles by his beam of strong light, because any minute floating particle would become illuminated, and reflect the light. When they had entirely come to rest, he called the air "optically pure." Through the bottom of this box he had inserted a number of test-tubes with their mouths opening into the chamber, and, by means of a long funnel, and a hole pricked in a rubber membrane at the top, he was able to introduce a variety of organic fluids into these test-tubes. The ends of the test-tubes outside of the box were now inserted into boiling oil and all germs of life that might be contained in the fluids were completely killed. He was able to expose the fluids in these open test-tubes to the optically pure air for months, without any appearance of microscopic life in any of them. To demonstrate that the fluids were capable of supporting such life, he had simply to open for a moment an air-tight door in the back of the chamber and admit some of the outside air. When this was done, the fluids became turbid in a short time, and were teeming with microscopic life. Thus it was demonstrated that microscopic life came from floating germs in the air, and is not spontaneously generated in organic fluids. See Tyndall, *Pop. Sci. Mo.* (vol. 12, 1878); *Floating Matter of the Air*, (1895). WILLIAM A. LOCY.

Spoon'bill, the name of birds related to the Ibises, having long, broadly expanded bills, more like paddles than spoons. They belong chiefly to the Eastern hemisphere, where there are six or seven species. The European spoonbill is a white bird about thirty-two inches long. It breeds in Holland and other parts of Europe. The roseate spoonbill is the only American species. It is abundant in the tropics and also breeds in the southern United States. These birds inhabit marshes, muddy borders of estuaries, and small sea islands over-grown with bushes. They are from twenty-eight to thirty-five inches in length, of a beautiful rose color, deepest on the wings, fading to almost white on the neck, back, and breast. Their tail coverts are deep carmine. They feed at night by gathering insects and shell fishes from the mud in shallow water. In the breeding season they congregate in large numbers.

WHITE SPOONBILL.

Sporangium (*spo-răn'jĭ-ŭm*), an organ of plants which produces asexual spores. In the thallophytes a sporangium is usually a single cell; but in the higher plants it is a many-celled organ. The sporangia of ferns and the pollen sacs of seed-plants are illustrations of many-celled sporangia. In heterosporous plants sporangia become differentiated, the microsporangia producing microspores, and the megasporangia producing megaspores. In seed-plants, the pollen-sacs are microsporangia, and the ovuls are megasporangia.



SPORANGIUM OF A MOULD.

Spore, a plant cell specially set apart for reproduction. Spores have received the greatest variety of names in different groups of plants, but they may all be reduced to two great groups. Asexual spores are those which are formed by the division of a cell, or at least are not formed by the union of cells; while sexual spores are those which are formed by the union of two sexual cells, called gametes. These two types of spores do not differ from one another in power, but in mode of origin. The sexual spore has received the general name oospore; but in plants in which the pairing gametes are similar it is more frequently called a zygospore or zygote. The asexual spores have received very many names. Among the green algæ the characteristic asexual spore is a ciliated, free-swimming cell, and is called a zoospore or swarm-spore. Among fungi, asexual spores have received such names as conidia, ascospores, uredospores, teleutospores, æcidiospores, basidiospores, etc. Among bryophytes and pteridophytes, they are known simply as spores. When heterospory is introduced, they become microspores and megaspores; and in spermatophytes they are known as pollen-grains and embryosacs. Such a multiplicity of names for the same body is very confusing at first, but when the terms are learned they are very convenient in designating either the group or method of origin of the spore referred to.

Sporogonium (*spō-rō-gō'nĭ-ŭm*), (in plants). The leafless sporophyte of mosses, as distinguished from the leafy sporophyte of ferns and seed-plants. When highly organized, it consists of foot, seta, and capsule; and its sole function is the production of spores. See MUSCI.

Sporophore (*spō'ro-fōr*), (in plants), a special branch which bears spores. Used chiefly among the Fungi, where special

spore-bearing branches arise from the mycelium. See FUNGI.

Sporophyte (*spō'ro-fīt*). In alternation of generations (which see) among plants, the generation which bears the asexual spores is the sporophyte, as distinguished from the generation which bears the sex organs and produces the sexual spore, called the gametophyte. In the mosses, the sporophyte is the leafless sporogonium (which see), consisting chiefly of a spore case (capsule) on a stalk. In the ferns and seed-plants, the sporophyte becomes the conspicuous leafy part of the plant, in fact the whole plant of ordinary observation. It is of interest to note that the sporophyte is essentially sexless, and that to speak of "flowers," structures produced by the sporophyte, as having sex organs, is very far from the fact.

Spottsylva'nia Court House, a small village in Virginia, 55 miles northwest of Richmond. It is known as the scene of one of the desperate battles of the Civil war, fought between Lee and Grant, May 10, 1864. When Grant was driven back, with terrible slaughter, he wrote to the secretary of war the famous message, "I propose to fight it out on this line, if it takes all summer." On the 12th the attack was renewed, and the next day Lee, suffering from heavy losses, withdrew to an inner line of intrenchments, from which Grant could not drive him, but moved around him on his way to Richmond.

Spring'bok, a species of antelope found most abundantly in Africa. It is a beautiful creature, larger than the roebuck, brown above and white underneath. The head is white, except a broad band of brown on each side of the eye to the mouth, and a brown spot in the middle of the face. Its name comes from the great leaps it makes, springing into the air from seven to twelve feet. It lives on sandy plains, but great herds will travel to more fertile regions. A traveler describes a vast herd seen by him, pouring through an opening in the hills, a living mass half a mile in breadth and taking hours for the passage. It is growing scarce, though still abundant near the Zambesi river.

Spring'field, the capital of Illinois, is in Sangamon county, a short distance southwest of the center of the state; and, according to the census of 1900, has a population of 34,159. The first settlement was in 1818, and in 1821 the town was made the county seat. In 1837, the capital was removed to this place, and a state house erected. The present capitol building, begun in 1868, first occupied in an unfinished condition in 1876, and completed in 1885, was erected at a cost of $5,000,000.

The surrounding country is a rich agricultural region, the chief products being corn, oats, wheat, hay, fruits, and vegetables. Cattle, hogs, and horses are raised extensively. Bituminous coal is mined in large quantities around the city, and is one of the leading products. During the year ending July 1, 1900, 2,519,511 tons of coal were mined in the county, and four-fifths of this amount shipped by rail to other parts of the country. The principal articles manufactured here are iron, steel, steam engines, boilers, agricultural implements, brick, watches, and woolen goods. It is a railroad center, main lines of the Wabash, Chicago, and Alton; Illinois Central; Baltimore and Ohio Southwestern, and other roads passing through it.

The city has a very efficient public school system. There are fifteen buildings, one for high school purposes with a capacity for 800 pupils, and fourteen other buildings for primary and grammar schools. The school enrollment has reached almost 6,000. Besides, there are several colleges and a number of private schools. Springfield is of historical interest on account of its having been the home of Abraham Lincoln. The house in which he resided, when elected President, still stands; and, in the beautiful Oak Ridge cemetery, just outside the city, is a fine monument erected to his memory, where his remains are deposited. The state fair grounds and buildings, the most extensive in the country, the encampment grounds, and the armory, are located here.

Spring'field, a city in Massachusetts, on the Connecticut river, 25 miles north of Hartford. It is a well-built city, parts of it elevated, with a fine park. It is noted for its fine churches, including a cathedral. The United States armory, employing 3,000 men during the Civil war, and from 500 to 700 ordinarily, and the arsenal, in which 500,000 stand of arms can be stored, are located here. The manufactures of the city are numerous and important, including the Smith and Wesson arms factory, the great car factory at Brightwood, a suburb, and others making gold chains, goldleaf, filters, envelopes, hardware, spectacles, thimbles, etc. Springfield was settled in 1635 by emigrants from Roxbury and called Agawam, from the Indian name of a neighboring river. The city was burnt in 1675, during King Philip's war. Population 62,059.

Spring'field, a city in southwestern Missouri. It is built on a table-land 1,500 feet higher than St. Louis, and has an important trade. There are cotton and woolen factories, flouring mills, and wagon factories. Drury college was founded here in 1873. It was a trading post in 1820, and incorporated in 1830. During the Civil war, it was held by both Federal and Confederate forces in succession, and the battle of Wilson's Creek was fought near the city, Aug. 10, 1861. Population 23,267.

Spring'field, a city in Ohio, in the western part of the state, on the Mad river, eighty miles northeast of Cincinnati. It is in a fine farming

region, and has a large trade in farm products. With good water-power, manufactories are numerous, especially those of bicycles, sewing machines, iron fencing, and farm machinery, including large numbers of mowers and reapers. Wittenburg college, opened in 1845 by the Lutheran church, and Springfield seminary, are institutions of high learning. Population 38,253.

Spur'geon, Charles Haddon, a celebrated English preacher, was born in Essex, England, June 19, 1834. He never received a college education, beginning his great work by making religious addresses. In 1850, while living at Cambridge, he entered the Baptist church, preaching his first sermon in a cottage four miles from Cambridge. When only eighteen he had charge of a Baptist chapel at Waterbeach, and the small congregation was soon doubled. He went to London in 1854, his church there being twice enlarged to accommodate the crowds that flocked to his preaching, until, in 1861, the great "Tabernacle," seating 6,000, was built for him. At one service in the Crystal Palace he preached to an audience of 24,000. His sermons were issued in weekly numbers and translated into many languages. Besides preaching, he conducted a training school for ministers, an orphanage, an almshouse, and built thirty-six chapels in London. His publications reached nearly 100 volumes, including several volumes of sermons. He preached without writing his sermons, which were taken down in shorthand as they were delivered, and carefully revised by himself. The weekly circulation averaged 30,000, but that of particular sermons was much larger. He died at Mentone, France, Jan. 31, 1892. See *Life*, by Spindler, Dyer, etc.

Spy, one employed in war to collect information of the enemy. Spies are always used in regular warfare, and no disgrace attaches to the officers employing them. The dishonor which seems to belong to the person acting as a spy comes probably from the fact that the greater number of spies have been traitors to their country, offering their services freely to the enemy. When a soldier volunteers to penetrate the enemy's lines in disguise, to help his own country and army, it is a brave and honorable act and is so recognized, though the laws of war mete out the same ignominious death to all classes of spies. Major André and Nathan Hale, though hanged, are honored for their devotion and self-sacrifice. The risks of the undertaking have made it attractive to those loving adventure, and many thrilling stories are based upon them, notably Cooper's *Spy*. Political spies are those employed by governments to detect conspiracies. They were used in England in the days of the Tudors, and lately in Ireland. Bismarck was believed to employ them to a large extent, and Napoleon III. had a regularly organized system. Russia has the most perfect arrangements for using spies, both at home and abroad, of any modern nation. See *Secret Service under Pitt*, by Fitzpatrick; *The Two Spies*, by Lessing.

Squid, an elongated cuttlefish extensively used as bait by cod fishers. They are found in nearly all seas and are very abundant on the New England coast. They swim in large schools, following young mackerel and herring, upon which they feed. They are in turn eaten by larger fishes. The common squid ranges in size from six to eighteen inches, or even longer. They swim backward by throwing jets of water through the siphon. They have ten long arms provided with suckers, being in this regard similar to other members of the group (cephalopoda). Giant squids, of a different genus, have been taken, measuring fifty-two feet long, counting the arms. One is reported whose body alone measured twenty-three feet. See CUTTLEFISH.

Squier (*skwir*), **Ephraim George,** an American antiquarian author, was born at Bethlehem, N. Y., June 17, 1821. He was for several years an editor, but becoming interested in the antiquities of the Scioto valley in Ohio, began to make a study of such remains, traveling through the Mississippi valley and the state of New York. He published the results of his work in 1848, in the *Smithsonian Contributions to Knowledge*. While *chargé d'affaires* in Guatemala, he made further explorations there, receiving a gold medal from the French Geographical society for his work. He continued his researches while surveying a railroad route in Honduras in 1853, and while United States commissioner to Peru in 1863. Among his works are *Nicaragua: Its People, Scenery, and Ancient Monuments; Notes on Central America;* and *Peru: Explorations in the Land of the Incas*. He died at Brooklyn, N. Y., April 17, 1888.

Squir'rel, the name for any one of a group of small rodents or gnawing animals. They are found in all parts of the world, except Australia. They are abundant in North America, but are poorly represented in South America and in Europe. There are two natural divisions of the squirrel family, the ground squirrels and the tree squirrels. The latter are graceful, agile animals, with slender bodies and very long bushy tails. They feed mainly on acorns and nuts, but occasionally eat animal food and birds' eggs. They sit upon their haunches and handle nuts adroitly with their fore feet. They cut through the shell with their sharp teeth. The red squirrel, which represents the common squirrel of Europe, is the smallest and prettiest of our tree squirrels. It is about eight inches long, and ranges southward from the northern limit of trees. The gray squirrel is one of the best-known species. It reaches a length of about ten inches, and is common east of the Rocky

mountains from Canada to the Gulf of Mexico. It is subject to great color variations, being sometimes black. This tendency for one species to vary in color is common to all tree

SQUIRREL.

squirrels. Other gray squirrels are found in the western parts of the United States. The fox squirrel is the largest of the species found east of the Great Plains. It reaches a length of twelve inches and has a large tail of about the same length. The tree squirrels have nests provided with food, in hollow trees, in which they pass the severest weather of winter. The ground squirrels make burrows, which they also supply with food.

North America is the richest of all countries in ground squirrels. The group includes such forms as woodchucks, prairie dogs, gophers, and chipmunks. The latter, called also striped squirrels, are the best known. They stand on the dividing line between the burrowing forms and the tree squirrels. They all have cheek-pouches, in which their stores are carried to their nests. The tree squirrels are good eating, and the fur of those inhabiting Siberia and Russia is of commercial value.

Sta'bat Ma'ter ("the mother was standing") is a celebrated Latin hymn on the seven sorrows of the Virgin Mary. It has been set to music by many composers, among them Haydn and Rossini. It dates back to the 13th century, and is thought to have been written by Jacopone, a Franciscan monk. It is used by the Roman Catholic church in its services in passion week.

Stael (*stăl*), **Madame de,** a celebrated Frenchwoman, was born at Paris, April 22, 1766. Her full name was Anne Louise Germaine Necker, as she was the daughter of Necker, the French statesman. She wrote romances in her girlhood, and a volume of *Letters to Rousseau*. She was married in 1786 to the Baron de Stael-Holstein, the Swedish ambassador at Paris, from whom she separated in 1798, though only to save her fortune from his debts, hastening to his bedside when he died. This marriage made her the center of the brilliant society of Paris, for which she was fitted by her wonderful powers of conversation and her strong enthusiasm and passion. She believed in the Revolution, but hated its horrors, making a vain effort to save the life of the queen, and saving Montmorency and other friends from the guillotine at the risk of her own life. She left Paris in 1792, spending four months in London, "four months of happiness saved from the shipwreck of a life," she called them. In 1797, she returned to Paris, where her great influence made Joseph Bonaparte anxious to win her to his brother's cause by offering to secure for her $4,000,000, which was owing to her father from the treasury. She refused the gift, afterward accepting it from Louis XVIII. Napoleon hated her, and finding her "salon" the center of the disaffected party, and himself the butt of the brilliant wit of her circle, he banished her from Paris. She went to Weimar, adding to her intimate circle Schiller, Goethe, and Schlegel. Her book on *The Influence of the Passions* was published in 1796, and the famous one on *Literature Considered in Its Relations to Social Institutions* in 1800, and after her father's death she wrote his life. Her first romance was *Delphine*, her own story, followed by the well-known *Corinne*, written in 1805, after a sojourn in Italy, which made her name known throughout Europe, and revealed Italy to France. Her *Germany* was finished in 1810, and approved of by the censorship, but when 10,000 copies had been printed, the whole edition was seized and destroyed by Napoleon's order on the plea that "it was not French." The manuscript had been saved and the book was published in London in 1813. Her exile now became imprisonment, as she was surrounded with spies, her friends exiled for visiting her, and her walks restricted to a circle of two miles around her home. She escaped to Russia, and finally to London, welcomed in the principal cities, not only because of her genius, but as the enemy of Napoleon. Under Louis XVIII. her old position in Paris was resumed until ended by the return of Napoleon from Elba. In 1811, she had married secretly a French officer, much younger than herself, a marriage acknowledged in her will and made public after her death by her children. She died at Paris, July 14, 1817, leaving unfinished her *Considerations upon the French Revolution*, published by her children, and thought by Sainte-Beuve to be her finest work. See *Life*, by Stevens; *Life and Times*, by Norris.

Stag, the male of the red deer which is found all over Europe and in a large part of Asia. It is a noble animal, about seven feet long, and four feet high at the shoulders, with large, branching antlers. It has been driven from inhabited districts, and is now found only in deep forests. In Scotland, it is

hunted by a form of stalking, but in England on horseback.

Sta'mens, in an ordinary flower, the outer of the two sets of sporophylls or sporangial leaves, the carpels being the inner set. Stamens are microsporophylls, and the spores they produce are microspores (pollen grains). See FLOWER.

Stam'ford, a town of Connecticut, thirty-three miles northeast of New York, on Long Island sound. It is a suburb of New York, and also a summer resort for the business men of the city, whose handsome homes are on all the surrounding hills. There are iron and bronze foundries, manufactories of hats, drugs, sashes, blinds, and locks. The town was settled in 1641. Population 15,997.

Stamp Act, a measure for raising revenue, by requiring the use of government stamps on all legal documents used in the British colonies in America. It was passed in 1765, and was resisted by the colonies because they denied the right of the English parliament to tax them without representation; that is, without their having a voice by their delegates in the matter. Riots took place in many towns and the stamped paper was seized and destroyed. A congress of nine states met and claimed the right of taxation for their own assemblies. The stamp act was repealed by parliament in February, 1766, after a great debate in which Burke made his first speech, and Pitt took the side of the colonists in one of his greatest speeches.

Stamps are issued by governments for use on documents, merchandise, letters, etc. Stamp duties were first imposed in England in 1694. It is a form of indirect taxation, the stamps being bought of the government, and the use of them required by law, and any forgery of them punished. During the Civil war in the United States many articles paid the stamp duty, the last of such taxes being repealed in 1883. Again, in 1898, similar duties were imposed to help meet the cost of the Spanish-American war; but by an act of congress in 1901 most of these taxes were removed. Stamps for the payment of letters were first generally used in England in 1840, at the suggestion of Sir Rowland Hill, and in the United States in 1847. The first English postage stamp was black, with a portrait of the queen, and since then about 1,600 different stamps have been in use in England and her colonies. The first United States stamp, of 1847, had the portrait of Franklin and was worth five cents. There have been a great variety used since, as many as 127 different kinds being in use at one time. Some countries have used the national arms on stamps, and some simply a number with an inscription. Stamp collecting became fashionable about 1864 and has developed into a science called philately, with periodicals and associations devoted to the pursuit. Rare stamps bring large prices, an English one of 1847 with the postal mark will bring about $375.

Stand'ards are weights and measures defined by proper authorities. National standards are defined and preserved by the respective governments of those who use them. There are practically only two groups of standards in use, the *British* and the *Metric*.

The British system is founded upon the standard yard, the standard pound, and the standard gallon. The Metric system is based upon the standard metre, the standard kilogramme, and the standard litre. See POUND, KILOGRAMME, METRE, YARD.

Besides these, the requirements of commerce and of modern science have made necessary standard thermometers, standards of electrical resistance, standards of light, etc. Thus the mercury thermometer, which has been compared directly with the nitrogen gas thermometer at the international bureau of weights and measures at Sèvres, is practically a standard thermometer. The Hefner lamp as tested by the Reichsanstalt at Charlottenburg is practically a standard for sources of light. But these standards, like the ohm, which is the standard of resistance, and the Clark cell, which is the standard of electromotive force, are defined in such a definite manner that they can be copied or made by any one who is equipped to follow the legal prescriptions; and hence they are represented by material or arbitrary standards, as in the case of the metre. See MEASUREMENT.

Stan'dish, Miles, one of the "Mayflower colony," was born in Lancashire, England, about 1584. He served in the army in the Netherlands and sailed with the pilgrims in the *Mayflower* in 1620, though not a member of the Leyden congregation. On reaching Massachusetts he was chosen captain by the pilgrims, and commanded in expeditions against the savages. He settled finally at Duxbury, Mass., where he died Oct. 3, 1656. A monument, 100 feet high, crowned by a statue, has been built to his memory at Duxbury. The story of his unsuccessful effort to secure a wife is told by Longfellow in his *Courtship of Miles Standish.* See *Life*, by Abbot; *Footprints of Miles Standish*, by DeCosta.

Stan'field, W. Clarkson, a landscape painter, was born at Sunderland, England, in 1794. He served in the navy, which he left because of an injury received by falling from the masthead, and began painting theatrical scenes for a living. His first picture that brought him reputation was *Market Boats on the Scheldt*, in 1826. As a painter of marine subjects he stood in the foremost rank, among his best works being *Wreck of a Dutch East Indiaman*, and *Abandoned.* He, with others, founded the Society of British Artists in 1823. He died at Hampstead, May 18, 1867.

Stan'ford, Leland, American public man and philanthropist, was born at Watervliet, N. Y., March 9, 1824, and died at Palo Alto, Cal., June 20, 1893. Early in life he studied law and was admitted to the New York bar; but in 1849, attracted by the gold discoveries in California, he proceeded there and engaged in gold mining and in business in San Francisco. He was one of the organizers of the Central Pacific Railroad company, and entering political life was made Republican governor of California (1861–63). From 1885 to 1893 he was United States senator from California. Out of his large money amassings he gave property to the value of $20,000,000 to found, in memory of a deceased son, a university at Palo Alto, to be known as the Leland Stanford Junior university — a princely and most useful benefaction.

Stan'hope, Lady **Hester Lucy,** was born at London, England, March 12, 1776. For three years she lived with her uncle, William Pitt, as the manager of his household, and his most trusted confidant, and at his death was given a pension by the king. In 1810, she began the life that made her famous, wandering on the eastern shores of the Mediterranean, and settling, in 1814, among the half-savage tribes of Mount Lebanon. She adopted the customs, costume, and religion of the Mohammedans, and obtained great influence over the people, who looked upon her as a prophetess. The old convent, where she lived, was fortified and garrisoned by Albanians and became a refuge for all who needed help. She is said to have sheltered several hundred refugees after the siege of Acre. Her last years were spent in poverty, and she died near Mount Lebanon, with only natives around her, June 23, 1839. See *Memoirs*, published by Dr. Meryon.

Stan'hope, Philip Henry, Earl, an English historian, was born at Kent, England, Jan. 31, 1805. He studied at Oxford and entered the house of commons, where he helped to secure the passing of the copyright act in 1842. His historical works, which rank very high, are *War of the Succession in Spain; History of England from the Peace of Utrecht to the Peace of Versailles*, in seven volumes; and *History of Spain under Charles II.* He also wrote lives of Belisarius, Condé, and Pitt, and edited *Chesterfield's Letters*. He is also known by his courtesy title of Lord Mahon. He died at Bournemouth, Dec. 22, 1875.

Stan'ley, Arthur Penrhyn, dean of Westminster, was born at Alderley, Cheshire, England, Dec. 13, 1815. He was educated at Rugby, under Dr. Arnold, and at Oxford. At Rugby, he was mentioned as the delicate boy in *Tom Brown at Rugby*, who, trembling with fear, still knelt to say his prayers in spite of the jeers and rough usage of his companions. At Oxford, he took the Ireland scholarship, the Newdigate prize for a poem, and a first-class degree; was made a Fellow of University college, and after traveling in the east became a tutor in the college. In 1851, he became canon of Canterbury; in 1856, professor of ecclesiastical history and canon of Christ church, and in 1863, dean of Westminster. As a preacher at Westminster Abbey he had a wide influence, and a great multitude thronged the church whenever it was known that he was to preach. As a leader of the "broad church" party, he invited clergymen of the Scottish church, and of the Nonconformists of England, to address his evening congregations. In 1852–53, he traveled in Egypt and Palestine, gaining material for his work on *Sinai and Palestine* (1856), and in Russia in 1857, embodying the results of the journey in his pictures of the life and history of Russia found in his *Eastern Church*. He was the author of a *Life of Thomas Arnold*, *Memorials of Canterbury*, *Memorials of Westminster Abbey*, and volumes of lectures and addresses. He died at Westminster, July 18, 1881, and was buried by his wife in Henry VII.'s chapel. See *Life*, by Oliver.

Stanley, Sir **Henry Morton,** the African explorer, was born near Denbigh, Wales, about 1840. His name was John Rowlands, and at fourteen he worked his way as a cabin boy to New Orleans, where he obtained employment in the office of a merchant named Stanley, whose name he afterward took. After the death of the merchant, he entered the Confederate army, was taken prisoner, and later served in the United States navy. In 1867, he was a correspondent for the New York *Tribune* in an Indian expedition, and in the same year entered the service of the New York *Herald*. In 1867, he accompanied Lord Napier's expedition to Abyssinia as special correspondent for the *Herald*, and such was his enterprise and skill that the news of the fall of Magdala first reached the British government through the New York *Herald*. While in Spain, still acting as a newspaper correspondent, he was called to Paris, where he received the order from the editor of the *Herald* to "find Livingstone." Traveling by way of Egypt, Palestine, Turkey, Persia, and India, in January, 1871, he reached Zanzibar, and in March set out on his first journey into the heart of the dark continent. Two white men who started with him turned back, but Stanley pressed on with his band of natives, showing the courage and perseverance which have given him so high a place in the long roll of African explorers.

SIR HENRY M. STANLEY.

He found Livingstone, November 10, on Lake Tanganyika, and stayed with him four months, exploring the northern end of the lake and proving that it had no connection with the Nile. He reached England in August, 1872, where he was received with enthusiasm by the whole nation. His book *How I Found Livingstone*, published in the following November, had an enormous sale. As correspondent for the *Herald*, he was in the Ashanti campaign, reaching England again just in time to be present at the funeral of Livingstone, in Westminster abbey.

The death of Livingstone aroused in Stanley a great desire to complete his work. The New York *Herald* and the London *Daily Telegraph* fitted out an expedition, giving him the command, and he left England in August, 1874, for his second African journey. With 350 men he started in November into the interior of Africa. He was ten months in crossing from the eastern to the western coast, arriving at the mouth of the Congo, a white-haired man, the only survivor of his white companions, and with scarcely a third of his native troops. The story of his journey, *Through the Dark Continent* is more exciting than any romance. The direct results of the journey were the determining of the boundaries of lakes Victoria Nyanza and Tanganyika, and the tracing of the Great Congo river from the heart of Africa to the Atlantic ocean, thus changing materially the map of Africa. The opening of the Uganda region to missionaries, the forming of the Congo Free State, and the general scramble for Africa among European nations followed. Stanley acted from 1879 to 1884 under the king of Belgium in organizing the Congo Free State, returning afterward to the United States, where he delivered lectures on his African work. In 1889, he was sent in command of an expedition for the relief of Emin Pasha. He left the mouth of the Congo June 15, divided his forces at Yambuya, 1,300 miles from the sea, was for months hid from the civilized world, but, through disaster and loss of friends and followers, pressed on until he found Emin on the shores of lake Albert Nyanza. On this journey he discovered a great forest in the northern part of the Congo basin, and the huge snow-capped summit of Ruwenzori, 18,000 feet high. Other of his works are *In Darkest Africa* (1890), *My Dark Companions* (1893), *Slavery and the Slave Trade in Africa* (1893); *Congo and its Free State; Coomassie and Magdala;* and *Through South Africa*. In 1899, he was knighted.

Stan'ton, Edwin McMasters, an American statesman, was born at Steubenville, O., Dec. 19, 1814. He graduated at Kenyon college, and practiced law at Steubenville, at Pittsburg, and finally at Washington. In 1860, he was made attorney-general of the United States, and in 1862 secretary of war. This important position he held during the Civil war, and many decisive movements of the army were made at his suggestion. Difficulties with President Johnson led to his resignation in 1868, congress passing a vote of thanks for his ability and faithfulness. He was nominated judge of the supreme court by Grant, but died Dec. 24, 1869, before his commission was made out.

Stan'ton, Eliz'abeth Ca'dy, an American reformer, was born at Johnstown, N. Y., in 1815. Her attention was first drawn to the wrongs of women in her father's law office, where she heard their bitter complaints of the injustice of the laws. When fitted for college, having won the first prize in Greek, she could find no college that would admit a woman, and when attending the world's anti-slavery convention in London in 1840, with her husband, who was a delegate, all the women delegates were refused admission. One of these was Lucretia Mott, with whom she joined in the work of reform, the first woman's rights convention being held at her home in Seneca Falls, N. Y., July, 1848. Ever since she has been one of the most prominent workers in the cause, addressing legislative and political bodies, and her efforts have been successful in many directions.

Star Cham'ber, a court which met in the council chamber of the palace of Westminster. The roof of the room was decorated with gilt stars, which is supposed to have given the court its name. It was founded or restored in 1487 by Henry VII. to assist in bringing to justice the great landowners and nobles. It was independent of a jury, who were too often afraid of the nobility, and could inflict any punishment but death. The trial was conducted by written questions, unless the accused chose to confess. This confession became such an abuse, torture being used to extort it, that in 1641 the court was abolished.

Star of Beth'lehem, a class of plants belonging to the lily family, somewhat like the hyacinth. It is a native of the Eastern hemisphere. The common variety comes from France and Switzerland, and is found everywhere in gardens, with its clusters of white flowers, and narrow, green leaves, growing from bulbs.

Starch, a vegetable substance found in most plants, particularly in the seeds, bulbs, tubers, etc. For commercial purposes, starch is obtained from numerous plants, chief among which are wheat, corn, rice, and potatoes. It has the same elements as sugar, — carbon, hydrogen, and oxygen, — but in different proportions. It is made up of small round grains or granules, which differ in shape in each species of plant. As usually prepared, it is either a white powder, or irregular white columns, which come from the breaking up of a

dried cake of the material. It does not dissolve perfectly in cold water, but with hot water the granules burst, forming a clear paste, which is the starch used in the laundry. When heated to about 320° it is changed into dextrine, which is the gum used on postage stamps. Starch is found especially in the cereals, in potatoes, in carrots and parsnips, in sago, tapioca, and rice. Potatoes are about one-fifth starch; rye, oats, wheat, and corn nearly two-thirds; and rice about nine-tenths. Starch is made from corn, by soaking it for forty-eight hours in water, then grinding it and straining through sieves, after which the starch is allowed to settle in vats, when it is washed, bleached, and dried. Potato starch is made by grating the potatoes, adding water and straining, settling, washing, and drying. Wheat starch and rice starch are made by slightly different processes, in order to remove the gluten which they contain. Arrowroot, tapioca, sago, and cornstarch are forms of starch used as food. Starch is also used in the manufacture of calico, and other cloths, in mounting photographs and in the laundry. It is also used in the manufacture of glucose, (which see). Cornstarch was first made in the United States in 1842. The factories at Oswego, N. Y., and Glen Cove, on Long Island, are the largest starch factories in the world. There are about 100 starch factories in the United States, making corn, wheat, and potato starch, of which 10,000,000 pounds are exported yearly.

Star'fish, the name for a number of marine animals having arms or rays arranged around

STARFISH.

a central disk. As these are symmetrically arranged, the animal is said to have radial symmetry. There are several varieties, but the common five-rayed starfish is the type. It is reddish, or yellow, in color, and those along the New England coast commonly vary from one inch to one foot in diameter. It lives on the sea bottom and crawls sluggishly by means of tube-feet. It is often seen in shallow pools left by the retreating tide. The skin is stiffened with plates and nodules of lime. The mouth is in the center of the disk, on the under side, and the animals feed on decaying fish and other animal matter, as well as on small shelled mollusks. Their means of locomotion is peculiar. There are four rows of tube-feet in furrows along the lower sides of the arms. These tube-feet are filled with water and connected with a system of water tubes running through the body. On the back of every starfish may be seen a little rounded knob, which is porous and leads into the water-vascular system. From this tubercle, a tube leads downward to join a circular canal surrounding the mouth, and from this central canal a tube extends into each arm or ray. These latter canals are connected with the tube-feet and also with internal pockets, one for each tube-foot. The nervous system consists of a ring about the mouth and a nerve running from it into each arm. At the extremity of each arm is found a little red eye-spot which is sensitive to light. Some other starfish have eleven to thirteen rays, and some resemble five-sided pin cushions in form. The brittle starfishes have a central disk, with long, slim, muscular rays by means of which they move. Their tube-feet are not developed. All starfishes possess the power of restoring, or regenerating, lost or injured parts. See ECHINODERMATA, SEA URCHIN. See also Romanes' *Jelly-fish, Starfish,* and *Sea Urchin* (1884).

Stark, John, an American soldier, was born at Londonderry, N. H., Aug. 28, 1728. He served in the French and Indian wars and at Ticonderoga in 1758. At Bunker Hill he was colonel of a regiment which he had enlisted; was at the front in the attack on Trenton, and in the battle of Princeton. He raised a new regiment in 1777, and was given command of the New Hampshire troops sent against the British troops from Canada. On Aug. 16, 1777, he fought the battle of Bennington, receiving for it the thanks of congress and the rank of general. With a new force recruited by him in New Hampshire he cut off Burgoyne's retreat from Saratoga, and after serving in Rhode Island and New Jersey, had charge in 1781 of the northern department, with headquarters at Saratoga. He died May 8, 1822, the last but one of the generals of the Revolutionary army. See *New Hampshire Soldiers in the War*, by Hammond; and *Life of John Stark*, by Edward Everett, in Spark's "American Biography."

Star'ling, a name for a number of common birds found only in the Eastern hemisphere, but lacking in Australia. This is the more remarkable as a starling is found in New Zealand, and others in various southern Pacific islands. The common starling of Europe is the best known. It is a beautiful bird with a dark plumage, having metallic, green, and purple reflections, and each feather tipped

with buff. It nests near houses in bird boxes, when they are provided, and is easily tamed. It can be taught different notes and also to speak words; it is therefore often caged. They kill an immense number of insects and are beneficial to the gardener. A starling inhabiting the steppes and plains of western Asia devours so many locusts that it is called the locust bird. The ox-pecker of Africa is also a starling.

Stars, those heavenly bodies which appear as bright points having fixed positions in the sky. The spectroscope in the hands of Fraunhofer, Huggins, and others, has shown that these so-called "fixed stars" are really gigantic and very distant suns; for they give continuous spectra crossed by dark lines, indicating, as in the case of our central luminary, a solid or liquid core surrounded by incandescent vapor.

Ptolemy and Hipparchos divided the stars which are visible to the naked eye into six different groups, according to their brightness. These groups are called *magnitudes*, and since the invention of the telescope, this classification has been extended, so that now astronomers grade the stars into about 14 or 15 groups. In the first magnitude they place the 14 brightest stars, including Sirius, Vega, Arcturus, etc.; in the second group are 48 stars, including the Pole star and two Pointers; in the third, 152; in the fourth, 313; in the fifth, 854; and in the sixth, 2,010, making a total of 3,391, which is practically all the stars which can be seen without the aid of a glass. The number of stars which can be photographed, or which can be seen with our largest refracting telescopes, runs into the millions. As to the distances of the fixed stars, this is known only in a few cases, and even then very roughly. This quantity is determined by measuring the annual parallax of the star, a quantity which, except in a very few cases, is so minute as not to exceed the errors of measurement. The nearest star, so far as known, is α Centauri, whose parallax is only ¾ of a second of arc, and even this, our nearest neighbor, is at the stupendous distance of four "light years," *i. e.*, at a distance such that light would require four years to traverse it.

The student should bear in mind that, although these stars are said to be "fixed," most of them exhibit, in fact, a small amount of motion, say a second or so in a year. In addition to this motion across the heavens, which is measured in angle and which is called *proper motion*, stars nearly all exhibit a motion toward us or away from us, what is called *motion in the line of sight*. The measurement of this latter motion is one of the recent achievements of the spectroscope, based on Döppler's Principle. See Miss Clerke's *System of the Stars;* Chambers' *The Story of the Stars;* Lockyer's *Meteoric Hypothesis*, and Scheiner's *Astronomical Spectroscopy*. See NEBULA, PARALLAX, TELESCOPE.

Stat'en Island, the chief island in New York harbor, forming Richmond county, N. Y., and the borough of Richmond in the enlarged city now known as Greater New York. It received its name from early Dutch settlers in honor of the states-general (Dutch *Staten*). It has an area of 58½ square miles, and is about thirteen miles in length and eight miles in breadth. It is separated from Long Island by the narrows, and from New Jersey by the Kill von Kull and Staten Island sound, and has steam-ferry communication both with New York city and with New Jersey, while the Staten Island Rapid Transit railroad reaches the towns, villages, and watering places of importance on the island. Close to Clifton is Fort Wadsworth, and on the north shore is Sailor's Snug Harbor, an asylum for aged and infirm mariners. At Stapleton is a United States marine hospital, and between St. George and Tompkinsville is a United States lighthouse station. On the island are the residences of many of the business men of New York city.

States' Rights, a term used in the United States to indicate a doctrine, based upon an understanding of the constitution, which assumes that the different states of the Union are independent, and that the citizens of a state owe allegiance only to the state; that the states are joined together only for certain purposes; and that the acts of the general government must be approved by the separate states, which possess the right also to "nullify" or to pronounce them of no authority, or if necessary to secede from the Union. The first appearance of this idea was in 1798, when the legislatures of Kentucky and Virginia protested on this ground against the alien and sedition laws, which permitted the President of the United States to remove from the states aliens or foreigners whose presence might be considered dangerous, and to punish sedition in the states. In 1811, and again in 1819, the matter recurred in connection with the United States Bank charter, Henry Clay and the state of Maryland claiming that the government had no authority to create a bank. In 1832, South Carolina attempted to carry the principle into action by pronouncing the high tariff "null and void," and not binding on its citizens. The passage of a compromise tariff law settled the trouble for that time. In 1860–61, the southern states carried out the principle by seceding from the Union, and their action was followed by the Civil war.

State Univer'sity of I'owa, located at Iowa City, was founded in 1847. It comprises a college of liberal arts including civil and electrical engineering, and colleges of law, medicine, dentistry, pharmacy, and school of pedagogy. It is open to students of both

sexes, and has an attendance of 1,438, with a faculty of 102.

Statics (*stăt'iks*), a branch of mechanics. In pure mechanics (or dynamics, as it is frequently called), the effects of forces upon bodies are considered. If the effect of forces upon a body is to change the rate of motion of the body, the forces acting are said *not* to be in equilibrium. Forces and effects of this kind are studied under the head of kinetics. In all other cases, forces are said to be in equilibrium and are studied under the head of statics. If one holds a steel spring in his hands and bends it, he recognizes that there are forces acting upon the spring by the fact that the shape of the spring is temporarily changed. These forces do not produce any motion in the spring; they are in equilibrium.

It is this group of forces which is considered under the head of statics. For another illustration allow a locomotive to stand at rest on a steel bridge. The bridge sags slightly as the locomotive takes up its position. But the upward force with which the bridge tends to regain its original shape is exactly equal and opposite to the weight of the locomotive. These stresses produced by the locomotive and the strains which result from them illustrate the kind of problems studied under the title of statics.

Statics may, therefore, be defined as the science of the equilibrium of forces. It is very important in this connection for the student to distinguish carefully between a body which is at rest and one which is in equilibrium. A pendulum bob at the end of its swing is in rest; but it is not in equilibrium for at that very instant it is being set in motion by its weight. The two general conditions of equilibrium for any body are: 1, That the sum of all the forces acting upon the body shall be zero, and, 2, That the sum of all the moments of force acting upon the body shall be zero.

The application of these general principles to the cases of simple machines, such as the lever, inclined plane, etc., is the portion of statics ordinarily studied in physics; while the application of these same principles to various structures, such as bridges, roofs, etc., is the part of statics which is pursued by engineers. The conditions under which fluids remain in equilibrium form the science of hydrostatics.

Stevinns (1548–1603) showed that a force can be completely represented by a straight line. And it is upon this simple fact that a branch of mathematics called graphical statics has been recently founded, and has furnished many elegant geometrical solutions of engineering problems. For an unusually interesting history of statics, see Mach's *Science of Mechanics*. Minchin's *Treatise on Statics* (Clarendon Press) contains an extraordinarily clear presentation of the entire subject.

Steam is the vapor of water. Water gives off vapor without being heated, but this process is usually called evaporation, and the word "steam" is limited to the vapor which arises from boiling water. Steam is lighter than air, and occupies much more space than water; a cubic inch of water will make nearly a cubic foot of steam. Water boils at 212° and makes steam, which has the same temperature as the water, but really contains more heat, so that the steam from a boiling teakettle will burn more severely than the boiling water. This extra heat is called latent heat, because it does not affect the thermometer. The boiling temperature, 212°, is practically constant in vessels which have a free outlet for the steam; but in closed vessels, like boilers, the boiling-point may be raised, and much pressure is produced at the same time. The pressure increases faster than the temperature; for instance, the pressure at the boiling point, 212° is one atmosphere, but it becomes two atmospheres at 249°, four atmospheres at 301°, and twenty atmospheres at 444°. When the engineer opens a valve to let off steam, the rushing noise it makes shows its power. Steam is used to produce motion, as in the locomotive and other machines; in heating houses; and in other operations where heat is required.

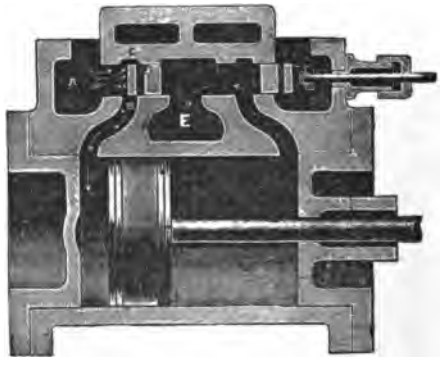
Steam'boat, a vessel moved by steam. A half successful experiment was made by Papin to use steam to propel a boat as early as 1707, but it was not until the perfecting of the steam engine by Watt that any advance was made in steam navigation. Early inventors of steamboats were William Henry, 1783, and John Fitch, 1785–96, in the United States, and William Symmington and Henry Bell in Great Britain, but the first steam vessel to make a voyage of any considerable length was the *Clermont*, made by Robert Fulton in 1807. She was a boat 133 feet long, and made the voyage of 150 miles from New York to Albany in 32 hours. In the same year, Col. John Stevens built at New York the *Phœnix*, which was taken around to the Delaware river by sea because Fulton had a monopoly of steam navigation on the Hudson. This was the first steamboat to make a sea voyage. The first passenger steamboat in operation in Europe was the *Comet* on the Clyde river in 1812, although a successful boat had been on the Clyde canal as early as 1802. The first steamship to cross the ocean was the *Savannah*, a ship of 350 tons, which made the voyage from Savannah, Ga., to Liverpool and thence to St. Petersburg in 1819. Both sails and steam were used. The voyage to Liverpool was made in 25 days. The first vessels to cross the Atlantic using steam the whole distance were the *Great Western* and the *Sirius*, which reached New York on the same day, April 23, 1838. Since then the transatlantic steamship service from New York has

been continuous. All the earlier steamboats were propelled by wheels either at the side or at the ends. The screw propeller was introduced by Smith and Ericson about 1840 (see SCREW PROPELLER), and since then all ocean steamers and many inland steamers use it. Iron and steel have superseded wood for large ships, and steamships have continued to grow in size, in power of engines, and in speed. The voyage from New York to England is now made in a little over five days. The largest and fastest steamers on the ocean to-day are: —

Deutschland, length 686 feet, displacement 23,000 tons, average speed 23.36 knots per hour, H. P. of engines 35,000; *Oceanic*, length 704 feet, displacement 28,000 tons, average speed 20.48 knots per hour, H. P. of engines 28,000; *Wilhelm der Grosse*, length 648 feet, displacement 20,000 tons, average speed 22.79 knots per hour, H. P. of engines 28,000. The average daily coal consumption of the *Deutschland* is 570 tons. Still larger steamships are in process of construction by the Hamburg and the North German Lloyd companies. In the United States, steamship building has until recent years been largely confined to vessels for inland waters. The river steamboats of the United States are fine examples of boat building. They must ascend rivers against strong currents, and often need to travel in shallow waters, and carry large amounts of freight, or tow large fleets of barges. This has developed a large vessel of only a few feet draught and with very powerful engines. On the western rivers most of the boats have stern wheels. The steamers on the Great Lakes rival ocean steamers in speed, size, and equipment. Most of them are engaged in the transportation of grain and of iron ore. Since 1883, ocean steamship building in the United States has developed largely, owing to the impetus given by the construction of the large government cruisers and warships of "the new navy." The largest and finest commercial steamships built in the United States are the *St. Louis* and *St. Paul*, built by Wm. Cramp & Co., at Philadelphia, for the American line.

Steam En'gine, an apparatus for doing mechanical work by means of heat applied to water. The steam engine is a form of heat engine, of which the gas engine and hot-air engine are two other commercial forms. The first steam engine dates back to the second century before Christ, in the toy æolipile of Hero, and in conjuring apparatus used by priests. The beginning of the modern steam engine was in the water-raising engine of Thomas Savery in 1698. In this, the steam acted directly on the water to be raised. The first use of the piston was by Papin in 1705, in a modification of Savery's engine. In the same year, Thomas Newcomen made a piston engine which approached more nearly our modern form. It was as its name implied, an "atmospheric engine." The piston working in a cylinder was connected by a chain with one end of an overhead beam. Steam admitted from the boiler to the cylinder allowed the piston to be raised by a heavy counterpoise hung from the other end of the beam. Then the valve was shut and the steam in the cylinder condensed by a jet of cold water. This left a vacuum in the cylinder and the piston was forced down by the pressure of the atmosphere, and work was done by lifting a pump rod which was fastened to the other end of the beam. The common story is that a lazy but ingenious boy named Humphrey Potter, who had been set to turn the valve, made the engine close and open its own valves by means of cords and thus invented the first automatic valve gear. Newcomen's engines were used solely for pumping water from the English collieries. The modern steam engine is due to James Watt, an instrument maker for the University of Glasgow. Watt's great advances were, (1) in condensing the steam in a separate vessel called the condenser, thus keeping the cylinder hot, (2) in adding an air pump to help maintain the vacuum of the cylinder and remove the condensed steam, (3) in jacketing the cylinder so as to prevent cooling off by conduction and radiation, (4) in making the engine double acting, that is, in forcing the piston back not by the atmosphere but by steam admitted at the other end of the cylinder, (5) in using the steam expansively, in other words, in stopping the admission of steam when the piston had made only a part of its stroke, and allowing the rest of the stroke to be performed by the expansion of the steam already in the cylinder. He also made many inventions of important details, such as the throttle valve, for regulating the admission of steam, the centrifugal governor (see article GOVERNOR), the indicator for studying the actions in the cylinder (see article INDI-

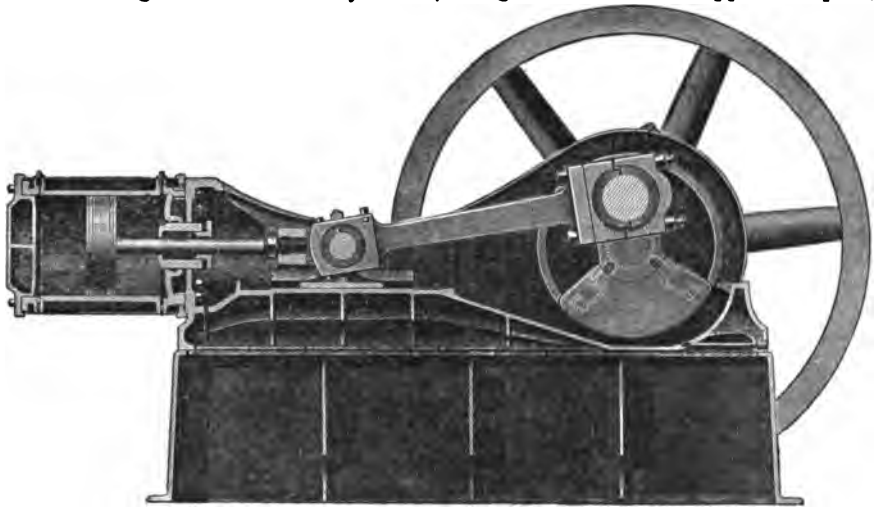
PISTON AND CYLINDER.



PISTON CYLINDER AND SLIDE VALVE.

CATOR), and, in conjunction with Murdoch, the slide valve for controlling the admission and release of steam. He also patented the use of two or more successive cylinders on one engine, or the modern compound engine plan, which is now used in all large engines where economy of fuel is important. Watt's inventive career extended over more than a half century, and he is rightly called the father of the modern steam engine. For the full history of the steam engine, see Thurston's *Growth of the Steam Engine.*

The action of a simple steam engine with the slide valve, one of the simplest forms, can be easily studied from the diagram. This is a horizontal section of a cylinder, showing the piston in the cylinder and the valve below. As shown, the piston has reached the extreme left of the cylinder, and the port B on the right is connected with the exhaust E. This exhaust connects with the atmosphere in non-condensing engines, or with the cold condenser in condensing engines. Live steam is at the same time entering the left end of the cylinder at B from the steam chest A, thus moving the piston back to the right. The time of the admission and cut-off of the steam, and the connection with the exhaust is fixed by the mechanism which moves the valve. The number of valve mechanisms in use is very great, but they all serve the general purpose seen above. Among the best known valve-mechanisms is that due to George H. Corliss. In the Corliss valve-mechanism, there are two separate ports at each end of the cylinder, one for the steam chest and one for the exhaust. This or a modified form is often used on large engines. To convert the straight-line backward and forward motion of the piston into rotary motion, a connecting rod and crank on a fly wheel are used. The efficiency of a steam engine depends largely upon allowing the steam to expand as far as possible, so that its temperature and pressure are as low as possible when it leaves the cylinder. Steam is consequently not used at full pressure through the whole stroke, but connection with the steam chest is cut off at a proper fraction of the stroke and the piston is then moved by the expansion of the steam. Steam engines are rated in horse power, one H. P. representing the work of 33,000 foot-pounds per minute. (See DYNAMOMETER.) The performance of a steam engine is indicated by the pounds of steam or water it consumes per H. P. per hour. For non-condensing engines, 35 lbs. of steam at 100 lbs. pressure is a common performance. The best large condensing engines give records of from 17 to 20 lbs. of steam at 100 lbs. pressure for one H. P. for one hour. The following are terms used to designate different forms of engines. "Horizontal," "inclined," and "vertical" refer to the position of the cylinder. "High" and "low," as applied to speed, are relative terms. A speed of 150 revolutions per minute is a medium speed. Much above or below this is called "high" or "low." "Non-condensing" and "condensing" are terms referring to the exhaust. In a non-condensing engine the exhaust is directly into the air, in a condensing engine the exhaust steam is condensed usually by contact with cool running water. Simple and compound are terms referring to the number of expansions used in the engine. In a simple engine, there is a single cylinder and a single expansion; in the compound engine there are at least two cylinders and two expansions. Compound engines are more economical. Rotary engine is a form of engine in which the piston rotates. In the common steam en-



SECTION OF STEAM ENGINE.

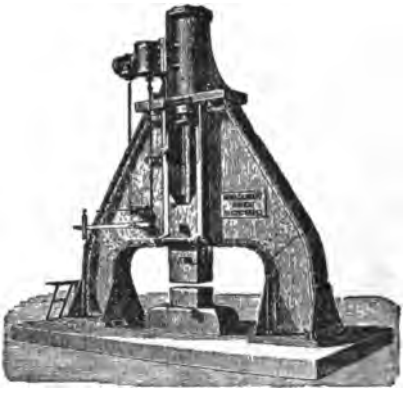
gine the piston moves backward and forward. A rotary engine has the very decided mechanical advantage of compactness and of direct application of power without crank and flywheel, but no rotary engine of the many that have been invented has ever shown itself economical or durable, if we except the steam turbine. See STEAM TURBINE.

A LOCOMOTIVE is a steam engine arranged with wheels so as to drive itself on an iron or steel track. As a steam engine the locomotive has a number of special features. It carries its furnace and boiler with it, and must also be supplied with an auxiliary car or "tender" for carrying water and fuel. The engine is double, that is, there is a high pressure cylinder with piston on each side of the locomotive. Many modern locomotives are also compound steam engines, that is, the steam expansion takes place in two cylinders, a high-pressure and a low-pressure cylinder.

The steam pressures commonly used are from 150 to 200 pounds per square inch. The oscillating straight-line motion of the piston is converted into the rotary motion of the driving wheels by the usual mechanism of a crosshead and crank. The engine must be reversible. This is accomplished by a link-motion due to Stephenson, by which the connection of the valve mechanism with the driving parts can be shifted through an angle. A requirement of the locomotive is the development of a large power in a limited space and with a limited weight. This means the burning of a large amount of fuel per square foot of grate area, and requires forced draft. It is accomplished by exhausting steam directly into the smoke stack. The American and European locomotives differ little as steam engines, but present quite different external appearances. The large cab for the engineer, the pilot or "cow-catcher," the headlight, the prominent whistle and bell, are striking external features of the American locomotive. The frame of the engine and boiler is also quite different, that of the European locomotives being more rigid than can be used on American railroad tracks. The first successful locomotive is due to George Stephenson, and was used to haul coal for the Killingworth colliery in 1815. At the opening of the Stockton and Darlington railroad, a line of 37 miles opened in 1825, a Stephenson engine, weighing eight tons and capable of a speed of 16 miles per hour, was used. Of the early locomotives, R. Stephenson's *Rocket* was one of the most famous. At a competitive trial of locomotives, in 1829, this engine showed a speed of from 25 to 30 miles per hour. These early locomotives are pygmies compared with the heavy high-speed machines of to-day. Speeds of 100 miles per hour have been frequently exceeded in the last few years by express locomotives. The largest locomotive in the world is one in use on the Illinois Central railroad for hauling freight trains over some steep grades on its line. It was built by the Brook's Locomotive works, and weighs, without tender, over 230,000 pounds. The largest locomotive works in the world are the Baldwin works at Philadelphia, Pa.

A. P. CARMAN.

Steam Ham'mer, a hammer which is raised by the direct action of steam on a piston in a steam cylinder. It is used in forging iron, particularly for large and heavy work. The first idea of the steam hammer is due to James Watt, but the first practical scheme of a steam hammer is due to James Nasmyth. His first machine was made in 1843. The piston moved by steam raises the hammer head or "tup," until the steam is cut off and allowed to escape, when the piston with the tup falls, striking the object placed on the hammer. The blows may be regulated so gently as just to crack an egg, or to strike with a force of tons. In modern steam hammers, the force of the blow is increased by the pressure of the steam above the piston, and by automatic valve mechanisms the blows can be repeated with great rapidity. The largest steam hammer ever built is that built for the Bethlehem Iron works in 1891. The piston with tup weighs 125 tons, the cylinder



STEAM HAMMER.

has a diameter of 76 inches, and the length of the stroke is 16½ feet. Such large hammers are no longer used, as the work is done better and cheaper by large hydraulic presses. The

Bethlehem steam hammer has been superseded by a 14,000 ton hydraulic press.

Steam Tur'bine, a form of steam engine in which the rotation is produced by the impact of a jet of escaping steam on the blades of a wheel. There are two forms of the steam turbine in use, the Parsons and the DeLaval. In the Parsons steam turbine the steam from the boiler strikes the blades of a series of turbines fixed on one shaft, and finally escapes into a condenser or into the atmosphere at a low pressure. In the DeLaval steam turbine, the jet of high-pressure steam strikes a series of steel buckets on a wheel similar to a Pelton water wheel. The speed of steam turbines is very high, that of a 150 H. P. Parsons turbine is 4,800 revolutions per minute, while that of a 50 H. P. DeLaval machine has the enormous speed of 15,000 revolutions per minute. These very high speeds require special reducing gearing before use for most machinery. The Parsons turbine has been used successfully directly on dynamos, and also on the shafts of the propeller of an experimental steamer, the *Turbina*. This boat is the fastest boat in the world, having made 34½ knots per hour. It is 100 feet long and has three turbines of a total H. P. of 2,000. Tests of turbines have shown a remarkable low consumption of steam per H. P., that of small steam turbines rivaling that of the best large compound steam engines. For steamships, a great advantage claimed, in addition to economy, is that of the small size and weight of the turbines. Mechanically, the turbine has the great advantage over the piston steam engine that no mechanism is needed to change a backward and forward straight-line motion into rotary motion. Much is being done to develop the steam turbine, but it has not yet come largely into use for general commercial work.

Sted'man, Edmund Clarence, an American poet, was born at Hartford, Conn., Oct. 8, 1833. He studied at Yale, and began his literary career as a journalist, acting as correspondent for the *New York World* during the Civil war. He also contributed to magazines. His first volume of poetry, published in 1860, was rapidly succeeded by others. *Victorian Poets*, which has gone through several editions, appeared in 1875, and *Poets of America* in 1885. He has edited, with Ellen M. Hutchinson, *The Library of American Literature*, in eleven volumes, and has also brought out a Household edition of his poems.

Steel, a term applied to carbonized iron which has a high tensile strength and is elastic. As used formerly, it designated a form of carbonized iron which would harden on being heated to a certain temperature and suddenly cooled, but this definition no longer holds good, for the carbonized iron produced by modern methods and used extensively in structural work now goes by the name of steel. Iron is used in the industrial arts in the three forms of cast iron, wrought iron, and steel, and each form has its own marked physical properties, fitting it for special purposes.

Cast iron is produced by heating iron ores to a high temperature in a blast furnace in connection with various fluxes, particularly limestone. The molten metal contains considerable carbon in a dissolved state and usually silicon, phosphorus, and sulphur. The amount of carbon in cast iron varies from 1.5% to 4.5%. Cast iron can be melted and cast in moulds. It is only slightly malleable (except by special treatment), is rigid and has great resistance to crushing, but is more or less brittle and not adapted to tensile forces. Wrought iron is nearly pure iron, and in modern metallurgical processes is usually got by removing the carbon and other impurities from cast iron. The common method of making wrought iron is that of "puddling," which consists of melting cast iron in the chamber of a flame furnace (see FURNACE) and in removing the carbon, phosphorus, etc., by stirring the molten metal and sometimes adding oxidizing materials. Wrought iron is very malleable, can be welded, has a high tensile strength, shows a fibrous structure rather than a crystalline structure at a break. Steel has been made since very early times by a process called "cementation." This consists of taking a high grade of wrought iron, rolled into bars, putting these in fire-clay boxes with finely divided charcoal, and heating them from three to six days. This recarbonizes the iron, and produces cement or blister steel. Bars of blister steel may be welded together (then called shear steel), or they may be melted in crucibles and cast, then called crucible steel. High-grade tool and spring steel is made by this process, while the cheaper open-hearth and Bessemer processes are used in the manufacture of the great quantities of steel used in engineering construction work. The Bessemer process was invented by Sir Henry Bessemer in 1858, and is regarded as one of the most important of modern industrial achievements. It has made steel manufacture cheap, and it is doubtful if modern methods of transportation by rail and steamships and much of modern machinery would be possible without the cheap Bessemer steel. The Bessemer process consists of burning out the carbon and silicon of crude pig iron by blowing finely divided air currents through the molten metal. The process is conducted in a pear-shaped vessel, called a converter. The Bessemer converter has been little changed from the original form of its inventor. A common size is eight feet in diameter and 15 feet high, and is made of boiler plate, lined with refractory material, ganister for the "acid process," and a mixture of pitch and lime for

the "basic process." The difference in processes to be used depends on the impurities present in the particular pig iron. When the carbon and silicon are burnt out, a proper amount of carbon is added and the steel is poured out and cast. In the open-hearth process, the steel is made by melting together proper quantities of cast, wrought, and scrap iron on the hearth of a flame or reverbatory furnace. The steel from the open-hearth process is commonly more reliable and uniform than that by the Bessemer process, but the latter is the cheaper, and is the steel for most engineering work. Steel is highly elastic, has the greatest tensile strength of any of the metals, and the steels with the higher percentage of carbon, can be hardened and tempered for tools. The term steel is thus used to include a wide variety of carbonized iron made by very different processes and each grade has its special properties. No general law connecting properties with composition has been discovered, and indeed the form the carbon takes in steel is yet undetermined. The uses of steel have greatly increased within a few years, as it has superseded wood, stone, and brick in so many ways, as in bridges and large buildings, and for ships it is now used almost exclusively. The production of iron and steel in Germany, Great Britain, and the United States in 1899 was as follows:—

	PIG IRON.	STEEL.
Germany	8,029,305 tons	6,290,434 tons
Great Britain	9,454,204 "	4,933,010 "
United States	13,838,634 "	10,736,806 "

Steel-building-construction, a method of constructing tall city buildings by building a framework of steel to carry floors and floor loads, and walling this framework in with a wall of light brick or stone work. These buildings differ from the older buildings in that the masonry walls do not carry the loads of the building. They are really an application of the method of the steel-bridge to architecture. The tall office buildings of Chicago, New York, and other American cities are the best examples of this new architectural method. Among the tallest of these buildings are the Masonic Temple, Chicago, 20 stories, 274 feet high, and the Ivin's Syndicate building, New York, 30 stories, 350 feet high to roof.

Steele, Sir **Richard,** a British author, was born at Dublin, Ireland, in March, 1672. He studied at Oxford, but in 1694 suddenly enlisted in a troop of horse guards. His pamphlet known as *The Christian Hero* was published in 1701, followed by very different work in the shape of three plays, *Grief à la Mode*, *The Lying Lover*, and *The Tender Husband*. In 1706, he received a court appointment under Queen Anne, and also the post of gazetteer, with a salary of $1,500, which, with two wealthy marriages, one in 1705 and the other in 1707, gave him ample means. His dissipation, however, kept him in pecuniary trouble most of the time, his life being spent, as he says, "in sinning and repenting." On April 12, 1709, appeared the first number of the famous *Tatler*, a tri-weekly paper which was followed in March, 1710, by the more famous *Spectator*, in turn succeeded in March, 1713, by the *Guardian*. Addison, who was a friend and old schoolmate of Steele, was his valued and valuable assistant in all these enterprises; as he said, "I fared like a distressed prince who calls in a powerful neighbor to his aid; I was undone by my auxiliary; when I had once called him in, I could not subsist without dependence on him." The characters of Sir Roger de Coverley and Will Honeycomb are said to have been first suggested by him, and his fame rests mainly on the essays contributed to these papers. His political career in parliament ended in impeachment and expulsion, for what were considered treasonable writings in *The Crisis*, a pamphlet published by him in 1717, and answered by Swift. He again entered parliament after the death of Queen Anne, was knighted by George I., and in 1722 published his best comedy, *The Conscious Lovers*. He died Sept. 1, 1729. See *Memoir*, by Austin Dobson, in the "English Worthies" series; and *Life*, by Aitken.

Steel'ton, Pa., a borough of Dauphin county, on the Susquehanna river and the Pennsylvania canal, three miles southeast of Harrisburg, with which it is connected by electric railway. Here is the large plant of the Pennsylvania Steel company, engaged in the manufacture of Bessemer steel, for rail, bridge, and construction works. It has, besides, several saw, planing, and flour mills. It is served by the Pennsylvania, and by the Philadelphia and Reading railroads. It has a number of churches, schools, banks, and other public buildings. Population 12,086.

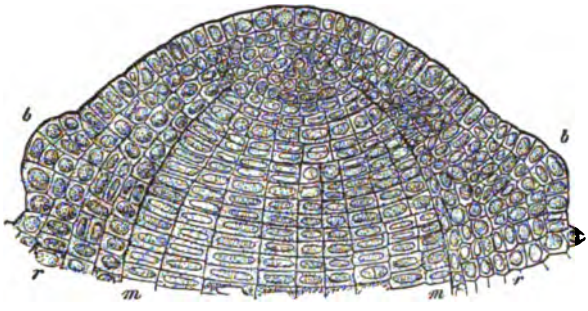
Stein (*stīn*), **Heinrich Friedrich Karl, Baron von,** a Prussian statesman, was born at Nassau, Germany, Oct. 26, 1757. He entered the service of Prussia in 1780, and in four years was head of the mines in Westphalia. He was called in 1804 to be head of the department that controlled customs, taxes, and trade, but being unable to work with the king he resigned in 1807, while in retirement writing an essay on political reform. Before the year was ended, however, Frederick William III. had to recall him, and in less than a year Stein carried out the measures he had planned, which laid the foundation of Prussia's greatness. He abolished the remains of serfdom, did away with privileged classes and all monopolies, and supported the army reforms. But Napoleon, who had advised his recall, now fearing him, insisted upon his dismissal, and in 1808 he withdrew to Austria, and finally to Russia, after having issued his *Political Testament*. He was influential in forming the union against Napoleon. After his return to Prussia, he established a so-

ciety for publishing the historical documents of Germany. He died in Westphalia, June 29, 1831. See *Life and Times of Stein*, by Seeley.

Stele (*stēl*) (in plants). The mature stems and roots of higher plants have three great regions. The outermost is the epidermis; next within is the cortex; while the central or axial region is the stele. The stele is derived from the plerome (which see), and is characterized by developing the vascular bundles. To it also belongs the pith of dicotyledonous stems. In the trunk of an ordinary tree the epidermis has disappeared; the cortex is mostly represented by the corky part of the bark; while the whole mass of wood and the inner fibrous bark belong to the stele.

Stelvio (*stĕl'vē-ō*), **Pass of,** is the highest carriage road across the Alps, remarkable for its beautiful scenery. It is 9,042 feet above the sea, 33 miles long, and forms part of the great road between Milan and Innsbruck.

Stem. In general, the axis part of a differentiated shoot, and in this sense it includes



Vertical section of stem tip, showing growing point (*s*), forming leaves (*b*), cortex (*r*), and central cylinder (*m*), in which the woody bundles are to appear.

the shoot axis of mosses and leafy liverworts. Its special application, however, is among fern-plants and seed-plants, in which group the vascular system is developed. In structure there are several distinct types of stems, but they are all developed in the same general way: At the growing tip of the stem there is a single cell (most Pteridophytes) or a group of cells (some Pteridophytes and all Spermatophytes) known as the apical cell or cells. These apical cells are meristimatic, and by their division organize the two or three great regions of the stem. In the stem of an ordinary seed plant the three embryonic regions, beginning at the outside, are the dermatogen, periblem, and plerome (see all three). The dermatogen gives rise to the epidermis, the periblem to the cortex, and the plerome to the stele. The chief differences among stems consist in the various organizations of the vascular or woody tissues in the stele. For example, in the Gymnosperms and Dicotyledons, the woody bundles are organized into a hollow cylinder, within which is a definite pith; while in the Monocotyledons the woody bundles are scattered in the stele. The usual function of stems is to display foliage leaves, but sometimes they become much modified, especially when they are subterranean. In this case they are usually used for the storage of reserve food, and become variously thickened and distorted, being called tubers, rootstocks (rhizomes), etc.

Stephen (*stē'ven*), king of England, was born at Blois in 1105. He was the grandson of William the Conqueror and nephew of Henry I., king of England. On the death of Henry I., Stephen claimed the throne, though he had taken the oath of allegiance to his cousin Matilda, on whom Henry I. had settled the succession. He was crowned Dec. 26, 1135, but never received the confidence of his people. The kingdom was badly governed, the nobles and clergy were against him, and he had to struggle with Matilda for the throne. In 1141, Stephen was taken prisoner and Matilda acknowledged queen. He was exchanged for Robert of Gloucester, the queen's brother. The queen left England and Stephen reigned quietly until 1152. Henry, the son of Matilda, then contested the throne and the long struggle ended in Stephen making Henry his heir. King Stephen died at Dover, October, 25, 1154.

Stephens (*stē'venz*), **Alexander H.,** an American statesman, was born in Georgia in 1812. He was a member of congress from 1843 to 1856. He was opposed to secession, and made a speech against it before the legislature of Georgia in November, 1860, and when a delegate to the secession convention held at Milledgeville, in January, 1861, voted against the ordinance of secession. He was, however, elected vice-president of the Confederacy, and was one of the prominent statesmen of the seceding states. He was imprisoned at Fort Warren in Boston harbor for five months at the close of the war. He was in congress from 1874 to 1882, when he was elected governor of Georgia. He died at Atlanta, Ga., March 4, 1883. He published in 1867–70 *War between the States*. See *Life*, by Cleveland.

Ste'phens, James, an Irish Fenian, was born at Kilkenny, Ireland, in 1824. He became an active member of the Young Ireland party, was slightly wounded in a scuffle, and was obliged to escape in disguise. He spent his time while living in Paris in studying the secret organizations of the continent, and in 1853 traveled through Ireland, preparing the way for the Fenian conspiracy, of which he was the head. In 1864, he was arrested at Dublin, but escaped to New York, where he was deposed by the Fenians. He returned to Ireland in 1891.

Stephenson (*stē'ven-son*), **George,** an English inventor, was born at Wylam, near Newcastle, England, June 9, 1781. His first earnings were got for herding cows at four

GEORGE STEPHENSON.

cents a day, from which he advanced to eight cents for hoeing turnips. At fifteen, he was earning $3.00 a week for tending an engine, and paying eight cents a week for lessons in reading, writing, and arithmetic, which he studied at night by the light of his engine fire. In his leisure hours he studied his machinery, taking his engine to pieces to examine its construction. His first invention was a safety lamp, called the "Geordie," for which he received $5,000 as a public testimonial. He was given the keeping in order of the engines at Killingworth colliery, and here, by permission of Lord Ravensworth, built his first locomotive in 1814, and called it *My Lord*. In 1821, he had charge of the building of the Stockton and Darlington railroad, and in 1826, of the line between Liverpool and Manchester, at a salary of $5,000 a year. When the first line was finished, in 1825, a trial was made of different locomotives, resulting in the choice of the *Rocket*, made by his son Robert and himself, which traveled at the then unheard-of rate of 30 miles an hour. His life now became a very busy one. Railroads sprang up all over the country, and his time was spent in superintending their building, sometimes dictating letters and reports for twelve hours at a time. He was besieged by inventors anxious for a recommendation, offering large sums for the use of his name, but he would never give it except to an invention of real merit. His later years were spent in the quiet pursuits of the country, growing fruits in his garden, nutting in the fall, and watching the nest-building birds in the spring with all the delight of his earlier life. His biography by Smiles is considered one of the best biographies in the language. He died Aug. 12, 1848. See *Life*, by Smiles.

Ste'phenson, Robert, the son of George Stephenson, was born near Newcastle-upon-Tyne, Oct. 16, 1803. He helped his father in the survey of his first railroad and spent three years as civil engineer in South America. On his return, he had charge of his father's locomotive works and assisted in building the famous *Rocket*, which won the prize as the best engine at the opening of the first passenger railroad in England. He was his father's assistant in all the railroad building that followed and rose to the highest rank in his profession. Among his great works are the Britannia and Conway tubular bridges, the Victoria bridge at Montreal, and two bridges across the Nile at Damietta. He was a member of parliament, received many honors from abroad, and at his death, Oct. 12, 1859, was buried in Westminster Abbey. See *Lives of the Engineers*, Vol. v., by Smiles; *Life of Robert Stephenson*, by Jeaffreson.

Stereoptican (*stē're-ŏp'ti-kŏn*). See MAGIC LANTERN.

Ste'reoscope, an instrument which combines two different pictures of the same object into one, making it appear solid. Two photographs are taken of the object, one as it appears when looked at with the right eye and the other as it looks with the left. These are transposed, that is, the right picture placed on the left, and vice versa, mounted, and introduced into an instrument having a double lens, or a single lens cut in two, which makes the two images blend into one and stand out as they seem to when looked at by the eye alone. The lenses act as magnifying glasses, and also incline toward each other, which helps to blend the pictures. The stereoscope was first invented, in 1838, by Sir Charles Wheatstone. See *Stereoscope*, by Brewster.

Ste'reotyping is the art of making solid casts of pages of movable type, to be used in printing. When the pages of matter to be printed are ready for the press, casts are taken from them, either in type metal or in copper. Type metal, which is used in stereotyping, is an alloy of lead, antimony, and tin, and sometimes copper, and is much cheaper than copper, which, however, is the more durable, so is used where large numbers are to be printed. Taking the casts of the printed sheets in copper is called electrotyping (which see). Stereotyping was invented by William Ged, an Edinburgh goldsmith, about 1725. A cast is first made by pouring a mixture of plaster of paris and water over the types, and when it is hardened, or set, taking it off and drying it in an oven. This cast, which is a perfect copy of the page to be printed, is dipped into the melted type metal, forming a cast of the metal, which is trimmed and planed to fit the block on which it is to be mounted. This cast is called a stereotype plate. The process used now is the invention of Genoux in 1829, called the papier maché

process. It is much cheaper and more rapid, and has come into general use. Folds of soft, thin paper, pasted together and wet, are laid on the face of the type and beaten with a hard brush, so as to fit in all the holes in the type. The hollows made in this way on the outside of the paper are filled with clay and brown paper pasted over, and the whole is dried till it can be lifted off the type, when the cast of type metal is made from it by pouring in the hot metal. The paper cast can be kept and any number of new casts made from it. In printing newspapers, the stereotype plates are made to fit round a cylinder, and the paper is pressed into the holes of the type by a roller. In the large newspaper offices a cast can be made in ten or twelve minutes. See *Stereotyping and Electrotyping*, by Wilson.

Sterne, Laurence, a British writer, was born at Clonmel, Ireland, Nov. 24, 1713. He studied at Cambridge and became a clergyman. In 1759, he wrote the first two volumes of the *Life and Opinions of Tristram Shandy*, which has made him forever famous. Its success was signal and he became the "lion" of the fashionable world. The other two volumes followed in the same year and were as heartily welcomed as the earlier ones. The rest of the work, which reached nine volumes, was written at Coxwold, where he had moved from his Yorkshire parish. *The Sentimental Journey through France and Italy*, published in 1768, was the result of a tour through those countries in 1765. He published also two volumes of sermons. His fame rests on his humor and the immortal characters of "Corporal Trim," "Yorick," and "My Uncle Tobey," found in *Tristram Shandy*. He died at London, March 18, 1768. See *Life*, by Fitzgerald; and *Sterne*, in the "English Men of Letters" series, by Traill.

Stettin (*stĕt-tēn'*), a Prussian city, is the capital of Pomerania. It is on the river Oder, sixty miles northeast of Berlin. The citadel and several forts which formed the ancient fortifications were removed in 1874. The churches of St. Peter (1124), and of St. James, founded in the 14th century, the palace, town hall, two ornamental arches, and several fine squares, are among the noticeable features of the city. It is one of the chief seaports of Germany, and manufactures soap, matches, clothing, sugar, paper, sewing machines, and bricks; has oil refineries; and is engaged extensively in shipbuilding. Stettin was the seat of a princely dynasty, from 1107–1637; was occupied by Sweden from 1648–1720, and by the French from 1806–13. Population 210,680.

Steu'ben, Frederic William Augustus, Baron, a general in the Revolutionary war, was born at Magdeburg, Prussia, Nov. 15, 1730. He served when only fourteen in the siege of Prague, and rose in the army until, in 1752, he was on the staff of Frederick the Great. He came to America in 1778 and offered his services to Washington, who gladly accepted them, as it was in the dark days of Valley Forge. He was appointed inspector-general, and remodeled the army. He took part in the siege of Yorktown, and spent his whole fortune in clothing his men. Congress in 1790 voted him $2,400 yearly and a township of land near Utica, N. Y., where he died Nov. 28, 1794. See *Life*, by Kapp.

Steu'benville, a city in eastern Ohio, is on the Ohio river sixty-eight miles below Pittsburgh. It is in a rich farming country, with large coal mines and natural gas, and has a large trade. It stands high on the right bank of the river, is well laid out, and has foundries, machine shops, rolling mills, boiler works, and factories of nails, white lead, paper, glass, beer, etc. The city is built on the site of Fort Steuben, which was erected in 1787 and named after Baron Steuben. The permanent settlement was made in 1797. Population 14,349.

Ste'vens, Alfred, an English sculptor, was born at Blandford, Dorset, England, in 1818. His great work which ranks him among the great sculptors of England, is the monument of Wellington for St. Paul's Cathedral, London, one of the finest pieces of modeling in England in the 19th century. It was begun in 1856, but was left still unfinished at his death May 1, 1875. In 1892, it was moved from the side chapel, where it had been almost hidden, to the place for which it was originally intended. See *Alfred Stevens and His Work*, by Stannus.

Ste'vens Point, a town in Wisconsin, is on the Wisconsin river, 161 miles northwest of Milwaukee. It has a lumber trade and a number of mills. Population in 1900, 9,524.

Ste'vens, Thaddeus, American statesman, on the Republican and antislavery side, was born at Peacham, Vt., April 4, 1792, and died at Washington, D. C., Aug. 11, 1868. After graduating in 1814 at Dartmouth college, he studied law and practiced at Gettysburg, Pa., and was subsequently drawn into politics, serving for a time in the state legislature in the Whig interest, and becoming an active advocate of the public school system of Pennsylvania. In the Whig interest, he later on served several terms in congress, and meanwhile removed to Lancaster, Pa., where he rose to a prominent position at the bar. In congress, in 1850, he opposed the Clay compromise measures, including the Fugitive Slave law. In 1858, he was returned to congress as a Republican, and became one of the ablest leaders of that party, and manifesting great powers as an orator. He was a pronounced advocate of emancipation and the enfranchisement of the negro; was bitterly hostile to the seceding states, and stringent in his proceedings against them. He lived to take an active part in the unsuccessful impeachment

of President Johnson, and to see the readmission into the Union of the first group of reconstructed secession states. Though skeptical in his religious opinions, he was reverent in his attitude to Christianity — the devout faith of his mother. Part of his estate he bequeathed to an orphan asylum at Lancaster, Pa., to be open to both white and colored children.

Ste'venson, Adlai E., was born in Christian county, Ky., Oct. 23, 1835. After graduating at Central college, he studied law and was admitted to the bar in 1858. He began the practice of law in Metamora, Ill., and remained there for ten years. He then removed to Bloomington, was elected congressman for that district in 1874, and again in 1878. He was appointed first assistant postmaster-general in 1885 by President Cleveland, and in 1892 was elected Vice-president of the United States on the ticket with Grover Cleveland.

Ste'venson, Robert Louis Balfour, a Scotch writer, was born at Edinburgh, Nov. 13, 1850. He studied at Edinburgh and fitted himself for the bar, but soon turned his attention to literature. He obtained material for his works by journeys on foot and by canoe in France, a trip across the Atlantic as a steerage passenger, and across America in an emigrant train, and a residence for his health in Samoa. His first articles in the *Cornhill* and other periodicals attracted attention by their style. His earliest works included *An Inland Voyage*, *Travels with a Donkey in the Cevennes*, and some of his finest essays in *Familiar Studies of Men and Books*, *A Child's Garden of Verse*, published in 1885, and *Underwood* and *Ballads* are volumes of poetry. His novels include *Kidnapped*, *The Black Arrow*, *The Master of Ballantrae*, and *The Wrecker*. But the one which has perhaps made him most famous, as a new contribution to literature, is the *Strange Case of Dr. Jekyll and Mr. Hyde*, published in 1886. His works on Samoa, *Across the Plains*, and *Memories and Portraits*, indicate the great variety of his talents. He died at Apia, Samoa, Dec. 8, 1894. See *Life*, by Graham Balfour.

R. L. STEVENSON.

Stevinus, Simon, a Dutch mathematician, statesman, and soldier, born 1548; died 1620. Very little is known of his early career. His achievements are principally the following:—

1. He invented a number of ingenious proofs for certain theorems in statics and hydrostatics. He also constructed a carriage which was successfully operated by sails.

2. He left an important treatise upon the subject of fortifications.

3. He introduced and advanced the use of (but did not invent) the system of double entry in bookkeeping, and the use of decimal fractions.

He held a number of important offices under the Dutch government. For a detailed account of his work in science, see Mach's *Science of Mechanics*.

Stew'art, Balfour, a British scientist, was born at Edinburgh, Nov. 1, 1828. In 1859, he was in charge of the Kerr observatory, and in 1870 he was professor of physics at Owens' college, Manchester. He is known as one of the founders of spectrum analysis, and his name is associated with such subjects as terrestrial magnetism and the relation between sun spots and temperature. His *Treatise on Heat*, *Elements of Physics*, *Conservation of Energy*, were all used as textbooks. He died in Ireland, Dec. 19, 1887.

Stew'art, William Morris, United States senator and lawyer, was born at Lyons, N. Y., Aug. 9, 1827, spent his early life in Ohio, and entered Yale college; but before graduating was attracted by the gold discoveries in California, and proceeded thither in 1850. Here he mined in Nevada county, Cal., and amassed wealth, after which he studied law and was admitted to the California bar. In 1854, he was attorney-general of that state; but some years later he removed to Virginia City, Nev., and became interested once more in mining, and in the development of the famous Comstock lode. In 1861, he was chosen a member of the territorial council, and two years later member of the constitutional convention. From 1864 to 1875 he was United States senator from his district, and became prominent as a free-coinage advocate. Meanwhile he resumed the practice of his profession, though, in 1887, he was again elected to the United States senate, of which chamber he continues to be a member.

Stickleback (*stĭk'k'l-băk*), the name for small fishes with spines on the back. There are about twenty species, all inhabiting the northern hemisphere, and their spines vary from two to fifteen. They live in fresh, brackish, and salt waters. The common freshwater stickleback is about four inches long, with three or four spines. It is abundant in streams in the United States and in Europe. In America it ranges from New York to Greenland. The brook stickleback is abundant in small brooks, from New York to Kansas, and north to Greenland. Its length is two and one-half inches, and there are five spines on the back. The largest stickleback is the many-spined stickleback, a salt-water fish found on the eastern side of the Atlantic. The sticklebacks are nearly all nest builders.

The males alone build the nests and guard them. They are provided with glands which open on the ventral surface, secreting a gelatinous substance used in holding the parts of the nest together. The nest is made of stems of water plants and is attached to a stationary object. It is barrel-shaped with two openings, through which a current of water continually passes. Several females deposit eggs in one nest in different layers. They are fertilized by the male as soon as laid. He keeps guard, not only while the eggs are hatching, but after the young fish are born.

Stig'ma (in plants), a specially constructed surface in connection with the carpel, for receiving the pollen. The surface is composed of papillate outgrowths which secrete a sugary solution. By means of this solution the pollen grains are held and nourished for the development of the pollen-tubes. The stigma usually occupies some special region of the style, either its more or less broadened apex, or a line or band down one side. See FLOWER.

Stilicho (*stil'i-kō*), **Flavius,** a famous Roman general, was born about 359 A. D. He rose rapidly, and in 384 was sent as ambassador to Persia. In 394, he was governor of the western empire, as guardian of Honorius, the son of the emperor, who had been given into his charge by Theodosius. On the death of Theodosius he marched against Alaric, and also procured the death of his rival Rufinus, who had command of the eastern empire. He again attacked Alaric in northern Italy, defeating him at Pollentia and Verona (403). He desired to help his own family to the imperial succession by marrying his son to the daughter of Theodosius, as he had already succeeded in marrying his daughter to the son of Honorius. To forward this plan he made an alliance with Alaric, but the great inroad of 200,000 barbarians compelled him to abandon his alliance. He forced them to surrender, and large numbers were sold as slaves. Honorius, the emperor, was excited against Stilicho by an enemy of his at court, and the army was induced to revolt. Stilicho fled to Ravenna, where he was murdered Aug. 23, 408. Three months after his death, Alaric and his Goths were at the gates of Rome.

Still'water, a town in Minnesota, on the St. Croix river, eighteen miles by railroad from St. Paul. It has the lumber trade of the St. Croix valley, and has flour mills, sawmills, a foundry, and a large barrel manufactory. Population 12,318.

Stipule (*stip'ul*), a constituent part of many foliage leaves, usually occurring as a pair of small more or less leafy outgrowths on each side of the base of the petiole, as in clover. Sometimes stipules become much modified, as when in the smartweeds they unite about the stem and form a short sheath, or when they appear as thorn-like processes. They are very constant in their occurrence in certain groups of plants, and are therefore of considerable service in classification.

Stir'ling, a town of Scotland, on the River Forth, twenty-nine miles from Glasgow. The castle stands on Castle hill, which is 420 feet above the sea. Most of the present castle belongs to the days of the Stuarts, whose sovereigns often kept court there. There is the Douglas room where the earl of Douglas was stabbed by James II. in 1452; the parliament hall of James III.; the palace of James V. and the chapel of James VI.; the church of the Holy Cross; the statue of Bruce; the guild hall; the old and the new bridges; the Smith institute, with art gallery, reading room, and museum, are other interesting places. The town is connected with nearly all the most important events in Scottish history, the deaths of Alexander I. and William the Lion; Wallace's victory at Stirling bridge; a siege of the castle by Edward I.; birth of James III.; crowning of Queen Mary; slaughter of Lennox and the capture of the castle by Monk. Stirling has manufactures of tartans, tweeds, carpets, agricultural implements, etc. Population 18,895. See *History of the Chapel Royal of Stirling.*

Stir'ling, James Hutchinson, a modern Scottish philosopher, was born at Glasgow, June 22, 1820. He studied medicine and practiced a short time in Wales. He went to Germany to study philosophy, his first work, *The Secret of Hegel*, published in 1865, giving him at once a high rank among philosophers. He has written also a *Text-Book to Kant; Sir William Hamilton*, an attack on his philosophy of perception; *Lectures on the Philosophy of Law*, and *As Regards Protoplasm.* Other miscellaneous works are *Jerrold, Tennyson, Macaulay*, and *Burns in Drama.*

Stock'holm, the capital of Sweden, is built on several islands and a part of the mainland, between a bay of the Baltic and Lake Mälar. It is considered one of the most picturesque sites in Europe. The palace dating back to 1697, the St. Nicholas church, in which the kings are crowned, the House of Nobles, the town house, and a magnificent granite quay are on the island called the "Town"; the Knight's island, west of the Town, is occupied by public buildings, such as the houses of parliament, the old Franciscan church in which many of the kings of Sweden have been buried, and the chief law courts. In Norrmalm, a district north of these islands, is the national museum with very valuable collections of antiquities, coins, and paintings, the academy of fine arts, the Hop garden with a statue of Linnæus, the royal library of 250,000 volumes, and an observatory. Ship island, lying east of the Town island, is the headquarters of the Swedish navy, and still farther east is the beautiful island of the zoological gardens. The islands are con-

nected with each other and the mainland by bridges, and small steamers ply rapidly between them. Though the harbors are closed for three or four months every winter, there is a large trade, and considerable manufacturing of sugar, tobacco, silks, ribbons, candles, linen, cotton, and leather. Stockholm was founded by Birger Jarl in 1255, besieged by the Danes in 1389, captured by Christian II. of Denmark in 1520, when a terrible massacre followed, known as the "blood bath of Stockholm." The city contains 302,462 inhabitants, the mass of whom are Scandinavians, and adhere to the Lutheran Protestant church. There is a state faculty of medicine with 273 students, and a private philosophical faculty. Public elementary education is free and compulsory, and all children not attending the public schools must furnish proofs of having been privately educated.

Stock'port, a city in England, thirty-seven miles east of Liverpool. It is built on the slopes of a deep ravine where two small rivers unite to form the Mersey, which is here crossed by a railroad viaduct, 111 feet high and 1,875 feet long. There is a 14th-century church, rebuilt in 1817, market hall, free library, museum, and St. Peter's square, with a statue of Richard Cobden. Stockport was first the site of a Roman station, then of a Norman castle, which was taken by Prince Rupert in 1644. It is now an important seat of the cotton industry, and has grown rapidly, in spite of riots and strikes and the cotton famine of 1861–64. There are also iron and brass foundries, engine and machine shops. Population 75,253.

Stock'ton, a city of California, on an arm of the San Joaquin river. It has a good harbor and the river is navigable at all seasons from San Francisco. The city is supplied with water by artesian wells. There is a convent, a state lunatic asylum, and factories of ironware, paper, woolens, flour, soap, carriages, etc. Population 17,506.

Stock'ton, Francis Richard, American author and humorist, was born at Philadelphia, April 5, 1834, and after graduating at the high school of that city he took to journalism as a profession, and to contributing to the magazines (under the signature of "Frank R. Stockton"). Joining the staff of *Scribner's Monthly*, he wrote much for it, and for *St. Nicholas*, of which he became assistant editor, and in which appeared many of his delightful stories for the young. He has since become a prolific and industrious author, his stories revealing a quaint but unobtrusive humor, with a brightly graphic quality, and a literary style that commends his work to the educated and refined. His more prominent works: *The Ting-a-Ling Stories*, *Rudder Grange*, *The Rudder Grangers Abroad*, *The Late Mrs. Null*, *The Lady or the Tiger*, *The Hundredth Man*, *Pomona's Travels*, *Adventures of Captain Horn*, *The Clocks of Rondaine*, *The Casting Away of Mrs. Leeks and Mrs. Aleshine*, *The Merry Chanter*, *The Dusantes*, *The Girl at Cobhurst*, *The House of Martha*, *The Watchmaker's Wife*, etc. Died Apr. 20, '02.

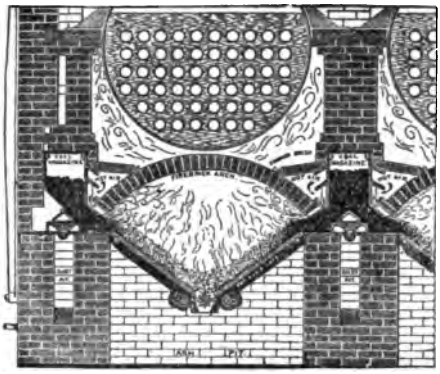
F. R. STOCKTON.

Stock'ton, Robert Field, an American naval officer, was born at Princeton, N. J.. in 1795. He entered the navy in 1811, went to Africa in 1821, and helped to secure the republic of Liberia for the colonization society. He was sent to the West Indies against the pirates and served in the Mediterranean. In 1845, he was sent to the Pacific coast, and the next year with Frémont conquered California for the United States. In 1851, he was elected United States senator. He died at Princeton, N. J., Oct. 7, 1866.

Stod'dard, Richard Henry, American poet, critic, and man of letters, was born at Hingham, Mass. July 2, 1825, and for a time attended school in New York, after which he worked as an iron moulder, meanwhile with love and assiduity cultivating the Muses. He subsequently held a position in the New York customhouse, was confidential clerk to General McClellan, city librarian in New York, and reviewer for the New York *Mail and Express*. With poetic power, he possesses the true lyrical note, with an affluent imagination, and much love of the beautiful. He is well endowed as a critic, and his prose is that of a scholar and literary student. Many of his shorter poems have found their way into the heart, such as his *The Two Brides*, *The Flight of Youth*, *Along the Grassy Slope I Sit*, *Pain in Autumn*, and *The Dead*. His chief published volumes embrace *The Book of the East*, *A Century After*, *Songs of Summer*, *Poems* (complete edition, 1880), *The Lion's Cub and Other Verse*, *Under the Evening Lamp*, *Adventures in Fairy Land*, *The King's Bell*, together with a *Life of Humboldt*, a *Life of Washington Irving*, etc. He has also edited *The Bric-à-Brac*, and the *Sans Souci* series.

Stok'ers (mechanical), an apparatus for feeding furnaces with coal by mechanism operated by power. Finely broken coal is used, and is ordinarily stored in elevated bins in front or over the furnace. From these elevated bins it runs down through chutes into the coal magazine of the stoker. It is then fed regularly to the fire by some mechanism. In the Roney stoker, coal is carried down to the fire on a series of connected

rocker bars, arranged on an incline. In another common furnace the coal is pushed down the inclined sides of the furnace by an oscillating pushing bar. The advantages of a



GRATE FEED OF A MECHANICAL STOKER.

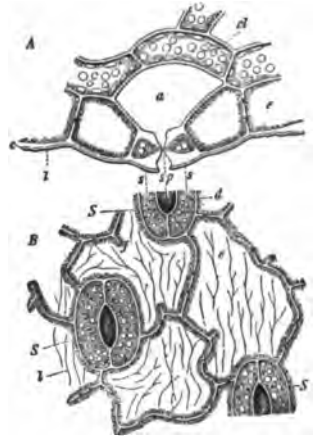
mechanical stoker are that coal is fed more uniformly, smoking is decreased, a lower grade of coal can be used with advantage, and hand labor is saved. Mechanical stokers are to-day used in many large stationary furnaces.

Stoke-upon-Trent, a manufacturing town in Staffordshire, England, on the Trent river. It is a modern town noted for its factories of porcelain, earthenware, tiles, and tesselated pavements, which are among the largest in the world. There is also carried on coal mining, bricklaying, and iron works. There are statues of Wedgwood and Minton in the city. Population 35,352. See *Borough of Stoke-upon-Trent*, by Ward.

Stolon (*stō'lŏn*), a branch especially adapted for propagation, as in the ordinary houseleek. The houseleek, surrounded by its stolons, each bearing a young plant at its tip, is sometimes called "hen and chickens." An equivalent word is "offset."

Stom'ach, an organ of digestion, present in some form in all animals above the sponges, with the exception of a few degenerated parasites. It is merely a receptacle for the food, and is provided with glands which secrete a digestive fluid. Digestion is, however, carried farther and completed in the intestine and, therefore, the stomach is not the sole organ of digestion. The stomach of the human body is a sac located on the left side just below the diaphragm. It has four coats: an outer, firm, serous coat; a muscular coat, with fibers arranged in longitudinal, transverse, and oblique directions; a coat of loosely woven fibrous tissue; and an inner, mucous coat. The glands which secrete the gastric juice are derived from the latter coat. There are two varieties, those nearer the heart, called cardiac glands, and those at the other end of the stomach where the intestine is joined, called the pyloric glands. The latter are the more important. The stomach is under control of the nervous system, both as to its movements and as to the secretion of gastric juice. When food is introduced into the stomach the secretion of gastric juice is stimulated through the nervous system. The gastric juice contains a ferment called pepsin, which acts especially on proteids like lean meat, white of eggs, gluten of bread, etc. This action takes place in the presence of acid, and in the glands are certain cells which provide hydrochloric acid in small amount. When this is deficient, grave stomach disorders arise. The food is reduced to a condition called chyme and is passed on into the intestine. The object of digestion is to render food soluable so that it may pass by absorption through the walls of the stomach and intestine. This is not a process depending upon life, as it can be performed with artificial gastric juice outside the body. The characteristic action of the gastric juice is upon proteids, while the pancreatic juice, which is introduced into the intestine, is a universal digester, of greater efficiency than the gastric juice. It aids in digestion of starches and fats as well as in completing that of the proteids.

Stomata (*stō'ma-ta*) (in plants). Narrow openings are developed in the epidermis of all aerial parts of plants which require and emit gases. (See AERATION.) Gaseous ex-



STOMATA AND LEAF.

changes especially abound in green tissues; hence stomata are chiefly displayed by the foliage leaves of the higher plants. Each stoma consists of two specially organized epidermal cells, called guard cells, which are crescentic in surface view, and being in contact by their concave faces leave a lens-shaped opening between them. This opening leads into the system of intercellular passageways among the working cells, and thus provides for a free exchange of gaseous substances between the working cells and the

outside air. The guard-cells change form with the varying amounts of moisture in the air, and so regulate the size of the opening between them. Stomata have been called "automatic gateways" on account of this peculiar power of the guard cells. See LEAF, and TRANSPIRATION.

Stone Age is a term used to designate a stage of culture in man's development, not a chronological period in geological history. It refers to the period among any people when the use of metals is unknown, or, if known at all, does not involve the knowledge of smelting. At such a time stone is largely used in making implements and tools, though other materials, such as wood, bone, and shell are also employed. The stone age is known to have existed in Europe many hundreds of years ago; in North America it continued among the Indians until the last century; in some other places, it probably exists at the present time.

The great mass of evidence for the Stone Age has been gathered in Western Europe, and that period has been subdivided into the Paleolithic (old stone) and Neolithic (new stone) eras. During the earlier time the implements were rudely chipped and left rough and irregular; in the later time they were often highly polished and finished with great care.

Paleolithic man is thought to have existed in southern Europe, while much of the continent was covered with ice. His presence there is known by the chipped flints found in place in beds of gravel and loess of France, which Prestwick and Lyell identify as drift formations from the early ice invasion.

Neolithic implements, of which specimens are much more numerous, have been collected in the oldest lake-dwellings of Switzerland, and especially in Denmark. They are nowhere associated with river gravels, nor have Paleolithic remains been found in Denmark. In that country the polished stone implements and bits of pottery found in the shell-heaps or Kjökken-Mödding (kitchen-middens) indicated that man had reached a higher stage of culture by the time he had reached that region in his northward migration after the retreating ice-sheet.

In America, the same subdivision of periods has been attempted, but thus far the evidence seems to show the presence of Neolithic man only. The specimens brought forward to prove the presence of Paleolithic man seem to be rude "rejects" thrown aside before completion.

Stone, Lucy (Blackwell), American reformer and advocate of woman's rights, was born at West Brookfield, Mass., Aug. 13, 1818, and died at Dorchester, Mass., Oct. 18, 1893. Graduating at Oberlin college in 1847, she devoted herself to the advocacy of woman suffrage, and to the cause of antislavery, of which she became a zealous worker. She lectured widely in favor of woman suffrage, organizing wherever she went local societies of the Woman's Suffrage Association, of which she was one of the founders, as well as editor of the (Boston) *Woman's Journal*, which was its mouthpiece. She aided in organizing, in 1850, the first national Woman's Rights convention at Worcester, Mass., and was always zealous in the cause she held dear to her heart. In 1855, she married Henry B. Blackwell, though stipulating to bear her maiden name.

Stone Circles, or **Standing Stones,** groups of stones, sometimes two or three standing alone and sometimes arranged in circles, found in Britain, Scandinavia, France, etc. They were called Druidical circles in Britain, Cromlechs in France, and Dom-rings in Scandinavia. Sometimes they are bowlders rolled into place, and sometimes pillar stones, fastened in position by smaller ones at the base. Somctimes there is a single circle, and again there will be one or two smaller circles within. Examination of these circles in Scotland proves that they were cemeteries of the bronze age. The largest stone circle in Scotland is that of Stennis, in Orkney. It is surrounded by a trench thirty feet wide and six feet deep, inclosing two and a half acres. There are thirteen stones still standing, the highest being fourteen feet.

STONE'HENGE is a circle of stones on Salisbury Plain, England, and was classed as one of the four wonders of England. It is a set of circles and oval figures. The first circle has pillars of stone about thirteen feet high and four feet apart, and stones placed across on top. There are about 140 stones of the different circles, some being twenty-three feet high. It is also found to be a burial place. The stone circles of Norway and Sweden seem to be burial-places of the iron age. The circles are rare south of the Baltic, there being only a few in France and Algeria. See *Rude Stone Monuments*, by Fergusson.

Stones, Precious, are certain mineral substances used in jewelry, and for other ornamental purposes. They are called precious because of their rarity and expensiveness. The diamond, ruby, sapphire, oriental amethyst, and emerald stand first in the list of precious stones, because of their brilliant color, luster, their hardness and durability, and their rarity. The topaz, garnet, turquoise, tourmaline, opal, agate, jasper, and onyx are of the second class, while there is still a large class of stones used for ornaments, such as lapis lazuli, malachite, and the moonstone, which are not called precious stones. There are also two substances, derived from animals, used in jewelry, pearls and corals, and also amber, which is a fossil resin. The cutting and polishing of precious stones is necessary to bring out the sparkle and luster, so much valued. When the sparkle is desired the stone is cut with many faces, or "facets," as

in the diamond, but when the color is important, it is cut with a smooth and usually rounded surface. The hardness of the stone adds to its value, as it admits of a higher polish, retains it longer and wears better. The diamond is the hardest of the precious stones. The great value of these stones has led to many efforts to produce artificial imitations, but without success. The usual imitations are made of a soft flint glass, called stress or paste, which is colored, and sometimes has thin plates of the real stone over or under it. See DIAMOND, PEARL, SAPPHIRE, etc.

Stoneworts (*wûrts*), the common name of species of *Characeæ*, which see.

Stony Point, a rocky point on the Hudson river, forty-two miles north of New York. There was a fort here and one on the point opposite during the Revolutionary war, which were captured by the British, but the Stony Point fort was retaken by Anthony Wayne, in a bold night attack, July 16, 1779.

Stor'age Bat'tery, a form of voltaic battery in which the energy, when once used up, may be replaced by a process known as "charging."

Like almost every other form of voltaic cell, the storage cell consists of two conductors of the "first class," and one conductor of the "second class." In this case the conductors of the first class are *lead* and *lead peroxide*, while the conductor of the second class is a solution of sulphuric acid.

This form of voltaic cell was devised in 1860 by Planté, a Frenchman. He started with two lead plates in sulphuric acid. By passing an electric current from one of these plates through the acid to the other, he succeeded in oxidizing the anode, while the cathode remained metallic lead. By frequently changing the direction of the current passed through the cell the lead plates were rendered porous and spongy, and made to present a large surface. This process is known as "forming the plates." Finally a current is passed through the cell in one direction until one plate is thoroughly oxidized, while the other remains spongy metallic lead. This process is known as "charging the cell."

The charging simply restores the oxygen to the positive plate and removes the oxygen from the negative plate. Voltaic cells are divided into two classes according as they require charging or not. Those which do require charging are called *secondary* cells; while cells of the Daniell or Bunsen type which are made up once for all and continue to work until one of the electrolytes or one of the electrodes is exhausted are called *primary*.

In 1881, Faure devised a process of putting a paste of red lead (lead peroxide) on the positive plate and shortening the process of forming. But in the very best cells of recent years there has been a partial return to the process of Planté. When a storage cell is being used the current, *in the cell*, flows from the spongy bed plate to the plate which is covered with lead peroxide (PbO_2). The result is that the former is oxidized and the latter reduced from lead peroxide to lead oxide. When all the peroxide is used up, the cell must be charged again.

From the preceding it is evident that what is stored up in this cell is chemical energy, and not electricity, as is sometimes popularly supposed. The great merit of its storage cell is its high electrical pressure, more than two volts, combined with a very low internal resistance. This low resistance permits the use of enormous currents without wasting much energy inside the cell.

Storage cells are used for an endless variety of purposes; but their principal use may be reckoned as that of a "booster" in helping the dynamo during the busy hours at the electric light station and at the street railway power house. Many tons of storage cells are employed also in driving automobiles and small launches. Storage cells are often called "accumulators."

Stor'er, Bellamy, American diplomat and lawyer, was born at Cincinnati, Aug. 28, 1847, and graduated at Harvard and the Cincinnati Law school. In 1870, he was admitted to the bar, and began to practice in Cincinnati. From 1891 to 1895, he was member of the 52d and 53d congresses, acting with the Republican party. In 1897, he was appointed United States minister to Belgium, and was transferred (April, 1899) from the embassy at Brussels to the post of United States minister to Spain, to fill the vacancy occasioned by the departure from Madrid of Stewart L. Woodford, on the outbreak of the war with Spain. He still (1901) remains at the United States legation at Madrid.

Stork, a large heron-like bird with bill much longer than the head and very stout at

STORK.

the base. The common migratory stork of Europe is the best-known member of the

family. It is a friendly bird, nesting on housetops, old chimneys, and steeples, as well as on tall trees, and is regarded as a bird of good omen. It breeds in Holland and Germany, but not in France, Italy, or Russia. It is about three and one-half feet long, white, except the wings which are partly black. In the autumn these birds gather in large flocks and migrate to Africa, where they spend the winter. They frequent marshy places and feed on frogs, fishes, snakes, slugs, young mammals, and insects. There are about twenty species of storks living in tropical and temperate parts of the world. There is only one form that breeds in North America, viz., the wood ibis, which is about the length of the European stork. It is mainly white, with glossy black on the wings and tail. The head and upper part of the neck have no feathers and are of a dusky color. It breeds as far north as the southern limit of Illinois, and is an occasional summer visitor farther north. See ADJUTANT BIRD.

Storm, a violent disturbance of the weather, especially as regards wind and rain. By means of simultaneous observations of the barometer it has been found that the atmosphere of the earth is made up of regions of high and regions of low pressure — or as they are called by meteorologists — anti-cyclones and cyclones respectively. It is the cyclones, or regions of low pressure, rotating in the northern hemisphere in a direction contrary to the hands of a watch, that constitute most of our storms. In the United States these cyclones originate mostly in the region west and northwest of the Mississippi — between the Rocky mountains and the Mississippi river, or in the region about the gulf of Mexico. Many of the storms of the Atlantic originate about the gulf of St. Lawrence; while the storms of Great Britain take their rise mostly in the mid-Atlantic.

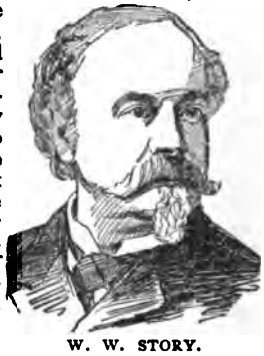
It is by knowing the general trend and rate of motion of these cyclones, and by studying the latest telegraphic reports, that the weather forecaster is able to predict all large storms with admirable and increasing accuracy. Thus the usual storm track in the United States is to the east and over the Great Lakes to the gulf of St. Lawrence. There is a great variety of local storms, such as the *typhoon* of the China sea and the waters about the Philippine islands, the wind storms of Arabia. the *blizzards* or heavy snow storms accompanied by driving winds, tornadoes, etc. The entire subject of storms must, however, be yet considered as an imperfectly understood department of an imperfectly developed, but highly important, science — meteorology. See CYCLONE.

Storrs, Richard Salter, an American clergyman, was born at Braintree, Mass., Aug. 21, 1821. He studied at Amherst college and at Andover Theological seminary. He was pastor of the Church of the Pilgrims, Brooklyn, N. Y., 1846–99, having had one of the longest pastorates in the city. For a number of years he was one of the editors of the *New York Independent*, and was president of the American board of missions. He was noted for his eloquence and beautiful style in the pulpit and his aptness and readiness in occasional addresses, and ranked as one of the first pulpit orators in America. He died June 5, 1900.

REV. DR. STORRS.

Sto'ry, Joseph, an American jurist, was born at Marblehead, Mass., Sept. 18, 1779. He was a graduate of Harvard. He was in the state legislature in 1805, and in 1808 entered congress. He was made a judge in the supreme court of the United States in 1811, holding the position for thirty-four years. In 1829, he became a professor in the law school of Harvard university. He was an authority on all legal questions in the United States, his works, *Commentaries on the Constitution of the United States*, *The Conflict of Laws*, and *Equity Jurisprudence*, being very valuable. He died at Cambridge, Mass., Sept. 10, 1845. See *Life*, by his son.

Sto'ry, William Wetmore, American sculptor and poet, was born at Salem, Mass., Feb. 19, 1819 (the son of Joseph Story, the distinguished jurist), and after graduating at Harvard studied law and was admitted to the bar. Among the product of his work as a lawyer are *Reports of Cases* (1842–47), a *Treatise on the Law of Contracts*, on *The Law of Sale of Personal Property*, together with a memoir — *The Life and Letters of Joseph Story*. In 1848, he abandoned law for sculpture, and to assist him in his study of fine models he removed to Rome where he afterward chiefly resided, until his death at Vallombrosa, Italy, on Oct. 7, 1895. His allegorical statues — *Cleopatra*, *Medea*, and *The African Sibyl*, *Simiramis;* statues of George Peabody, of Edward Everett, of Francis Scott Key, and the busts of Lowell, Bryant, Theodore Parker, Josiah Quincy, and of his father — represent the bulk of his



W. W. STORY.

achievement in art. In literature, he published from time to time, poems, essays, and rambles in Italy. The chief of these works which show his culture and sympathies are *Roba di Roma*, *Conversations in a Studio*, *The Castle of St. Angelo and the Evil Eye*, *Poems*, *Excursions in Art and Letters*, and *A Poet's Portfolio*.

Stowe, Harriet Beecher, an American writer, was born at Litchfield, Conn., June 14, 1811. She belongs to the celebrated Beecher family, being the daughter of Dr. Lyman Beecher, and the sister of Henry Ward Beecher. She was noted as a child for her fondness for writing, and at twelve years of age astonished her teachers with a composition on the question, "Can the immortality of the soul be proved by the light of nature?" Moving to Cincinnati with her father's family, she there married Calvin E. Stowe, then a professor in Lane Theological seminary. In that region and through the servants employed in her own family she learned much of the evils of slavery. Her husband's connection with many prominent abolitionists, and his knowledge of the workings of the underground railroad; a pro-slavery riot in the city, when many of the intended victims were concealed and fed by herself and her friends; a sojourn of a brother in the south, with his observations on the slave trade; all helped to fit her for her work. Her first published volume was made up of sketches written for the papers and periodicals of the day, and called the *Mayflower*. In 1850, her husband became a professor in Bowdoin college at Brunswick, Me., and there the great American novel, *Uncle Tom's Cabin*, was written. The characters were, many of them, taken from life, and many incidents were obtained from her brother's journal of his southern tour, and others from the lips of fugitives from slavery. The story appeared first as a serial in the *National Era*, a paper published at Washington, D. C., and made a great sensation, bringing the author both unexpected fame and undreamed-of financial returns. It was translated into many foreign languages, including Russian, Polish, Wendish, Armenian, Arabic, Chinese, and Japanese, and has been brought out on the stage repeatedly. More than a million copies, probably, have been printed in the English language. Besides its power as a story the book had a strong influence in bringing about the Civil war, as it opened the eyes of the people to the evils of the system of slavery. Other works of Mrs. Stowe's are, *Dred*, *The Minister's Wooing*, *Agnes of Sorrento*, *Old Town Folks*, and *My Wife and I*. She died at Hartford, Conn., July 1, 1896.

HARRIET BEECHER STOWE.

Stradivari (*strä-dē-vä'rē*), or **Stradivarius Antonio,** a celebrated Italian violin maker, was born at Cremona, Italy, in 1644. Besides violins, he made viols, guitars, and mandolins. His instruments are known for their finish and fine tone. He was the first to finish them neatly on the inside. The great care with which he selected and cut his wood, the study he gave to the shape and proportions, and the luster of the varnish used, all combined to make an instrument without a rival. They are carefully preserved by those possessing them, and bring great prices, ranging from $1,000 to $3,000. Stradivari died at Cremona, Dec. 17, 1737.

Straf'ford, Thomas Wentworth, Earl of, an English statesman, was born at London, April 13, 1593. He studied at Cambridge, traveled in France and Italy, and entered parliament in 1614. In the parliamentary struggle with Charles I. he sided with the opposition, against "not the king, but his evil ministers." In 1628, he was made president of the Council of the North, by Charles I., and in 1632, governor of Ireland. There is much difference of opinion as to his administration. His aim was to make the king absolute in Ireland, and his system, called "thorough" by himself and Laud, was severe. But he brought the country into a state of prosperity unknown before or since. He raised the revenue, improved the army, cleared the seas of pirates, and introduced the cultivation of flax, which is still the most important industry of Ireland. In 1639, he became the king's principal adviser, and was made Earl of Strafford, as he had before been made Viscount Wentworth. When the Long parliament met, in November, 1640, he was charged with high treason and imprisoned. His guilt was not proved, the principal charge being his telling the king, "You have an army in Ireland that can reduce this kingdom," to which only one witness testified. But he was convicted as a man dangerous to the public liberties, and Charles gave his consent to the execution, not daring to refuse the popular clamor. "Put not your trust in princes," cried Strafford, when told of his doom, though he had written to the king, releasing him from his promise that he should not suffer in person or fortune. He was executed on Tower Hill, May 12, 1641. See *Lives*, by Foster, in "Eminent British Statesmen," and by Elizabeth Cooper.

Straits Settlements. See MALACCA.

Strakosch (*strä'kosh*), **Clara Louise (Kellogg),** American operatic singer, was born at Sumterville, S. C., July 12, 1842, and received her musical education at New York, where she made her début at the Academy of

Music in 1861. Pursuing her studies, she appeared in the season of 1864–65 as "Marguerite" in Gounod's *Faust*, as well as in *La Somnambula*, *Lucia di Lammermoor*, and other operas, achieving great success. In 1867, she appeared also in England, where the wide range and perfection of her soprano voice attracted attention. Later on, she organized an English opera company, and with it appeared in the chief cities of this country and of Europe. Of recent years, after her marriage to Mr. Strakosch, she has appeared chiefly at concerts. Her repertoire once embraced about forty operas.

Stras'burg, a city of Germany, and since 1871 the capital of Alsace-Lorraine, is on the river Ill, two miles from the Rhine. It has been strongly fortified by the Germans, who rebuilt the citadel, dating back to 1682, and placed fourteen forts on the surrounding heights. The finest building in the city is the cathedral, founded in the 11th century and not finished until the 15th. It is one of the finest Gothic churches in the world, with a spire of open stone work, 466 feet high, a magnificent rose window, 42 feet across, and in the minster the wonderful clock (see CLOCK). Other fine buildings are the Protestant Church of St. Thomas, the palace, the library, the arsenal, and the new university. The university was founded in 1621, and became famous, especially in medicine and the study of the languages, but was broken up during the French Revolution. In 1819, it was established again by the union of two academies, founded in 1803 and 1808. In 1872, it was reorganized as a German university, with new buildings, laboratories, a library of over 700,000 volumes, in place of the old one of 200,000 volumes, which was entirely destroyed in the siege of 1870, a faculty of 115, and an attendance of 1,145 students. As Strasburg stands near the borders of France, Germany, and Switzerland, it has a large trade, and also a great variety of manufactures.

Strasburg was colonized by the Romans during the reign of Augustus, and Julian here won a victory over the Alemanni in 357 A. D. It became a free town of the German empire in the 13th century. In 1681, it was seized by the French and confirmed to them by the treaty of Ryswick. After a siege of seven weeks, Strasburg surrendered to the Germans, Sept. 28, 1870. Population 150,268.

Strat'ford de Red'cliffe (Sir Stratford Canning), an English diplomatist, was born at London, Nov. 4, 1786. He studied at Cambridge, and began his political career by acting as secretary of a mission to Copenhagen. He went to Constantinople in 1808 as secretary, and in 1810 became ambassador. He negotiated the treaty between Russia and Turkey in 1812, which released the Russian army of the Danube in time to attack Napoleon on his retreat from Moscow. He was minister to Switzerland in 1814; at the congress of Vienna, as commissioner, in 1815; and minister to the United States from 1819–23. In 1825, he was again sent to Constantinople; again in 1831, on a mission to draw the boundaries of the new kingdom of Greece; and once more, from 1842 to 1858, he was ambassador at Constantinople. Here his influence was so great as to gain him the name of the "Great Elchi." He induced the sultan to begin a series of reforms, which improved the condition of the native Christians, and made every effort to prevent the Crimean war. He retired from public service at the close of the war, spending a part of his leisure in writing poetry. He died Aug. 14, 1880. See *Life*, by Stanley Lane Poole.

Strat'ford-on-Avon, a town in Warwickshire, England, twenty-two miles southeast of Birmingham, celebrated as the birthplace of Shakespeare. It stands on the Avon river. "Shakespeare's house," where the poet was born, is on Henley street, and belongs to the government, having been bought for $15,000 and restored. The old guild hall was restored in 1892, and is occupied by the grammar school of King Edward VI., where Shakespeare was educated. The old church, with Shakespeare's and Anne Hathaway's graves, contains also an American stained glass window representing the "Seven Ages." The Shakespeare fountain was presented by an American, George W. Childs, in 1887; and the Shakespeare memorial theatre was built in 1877–79. Anne Hathaway's cottage, near by, also belongs to the nation. Stratford-on-Avon is an important agricultural center, but its prosperity depends largely on the Shakespeare visitors, who number 20,000 or more every year. Population 8,318. See *Sketch Book*, by Irving; *Our Old Home*, by Hawthorne; *Statford-on-Avon*, by Lee.

Strathco'na and Mount Royal, Lord, formerly known as Sir Donald A. Smith, high commissioner for Canada at London, was born in Scotland in 1820. He early in life entered the service of the Hudson Bay company, and was the last resident governor of that fur-trading corporation. For a time he represented Selkirk, Manitoba, in the Dominion parliament and was a director of the Canadian Pacific Railroad company. In the Boer war, he raised the "Strathcona Horse" for service in South Africa, equipping 500 men at his own expense. He is known for his active philanthropy.

Strauss (*strous*), **David Friedrich**, a German writer, was born at Würtemberg, Jan. 27, 1808. He began life as a country pastor, but after a year became professor in a seminary, and then went to Berlin for study. While teaching and lecturing at Tübingen, he published, in 1835, his *Life of Jesus*, which made a great excitement throughout Germany, and resulted in his dis-

missal from his position at Tübingen. His next publications were defenses of his work, which were followed by his second great work, *Christian Doctrine of Belief*. He published lives of Schubart and Ulrich von Hütten, and some brilliant lectures on Voltaire, and in 1864 a new *Life of Jesus*. *The Christ of Faith* and *The Old and the New Faith* are his latest works. His style of writing places him very high among German writers. He died Feb. 8, 1874. See *Life*, by Zeller.

Strauss, Johann, Austrian dance-music composer and conductor, known familiarly as "The Waltz King," was born at Vienna, Oct. 25, 1825, and died there June 3, 1899. He came of an eminently musical family, his father being a noted musician, while two of his brothers were composers of dance music. On his father's death, he became conductor, and toured the world with his own and his late father's orchestra. At the same time, from an early age, he composed waltses and operettas, which have held the stage with great favor. In 1872, he conducted an orchestra of 1,000 performers at the Boston Peace Jubilee; he was for a time also musical director to the Emperor Joseph at Vienna. His most famous waltz pieces are *Wiener Blut*, *Künstlerleben*, and *An der schönen blauen Donau*. Of his operettas, the following are best known: *Indigo Cagliostra*, *La Tsigane*, *Die Fledermaus* ("The Bat"), *Der lustige Krieg* ("The Merry War"), *Simplicius*, *Eine Nacht in Venedig*, and *The Gypsy Baron*.

Straw is the stem of grasses, such as wheat, oats, and barley. It is used on farms for feeding animals and as bedding for them. Its chief use in the arts is in the making of paper and hats. Wheat straw is most used for plaiting, the process by which the straw is prepared for hats, bonnets, and baskets. The straw is usually split into strips and plaited or braided by women and children. They are sold by the "score," or twenty yards in a piece. The finest straw plaits are made in Tuscany, and are made from whole wheat. The wheat is sown very thickly and the crop pulled up and cut off by hand for threshing. The plaiting of the finer straws is so trying to the eyes, that the plaiters cannot work more than two hours a day. Large quantities of straw plait are also sent out from Canton, China. The straw braids which are brought to this country are made into hats and bonnets by a machine which sews a hundred of them a day, and are pressed by another machine at the rate of four a minute. The Panama hats are made from straw from the leaves of a palm tree, and are braided by the Indians in South America.

Straw'berry, species of *Fragaria*, a genus of the rose family. It contains about twelve species, which are found in the temperate regions of the northern and southern hemispheres. The fruit is really a much enlarged and fleshy receptacle, in the surface of which the very small seed-like akenes are more or less imbedded. The strawberry is comparatively recent in cultivation, and in America it is said to be the most important of the small fruits. The ordinary commercial varieties are all from the Chilian strawberry (*F. Chiloensis*), whose name indicates its origin. The common wild strawberry of the eastern United States was once extensively cultivated, but it has about passed into disuse.

Streat'or, Ill., a city of La Salle county, on the Vermillion river, the center of a productive agricultural and coal-mining district, 92 miles southwest of Chicago. It is served by a number of railroads, including the Chicago and Alton, the Wabash, the Chicago, Burlington, and Quincy, and the Atchison, Topeka, and Santa Fé railroads. Its industrial establishments embrace foundries and machine shops; flour and planing mills; brick, tile, and sewer-pipe works; and manufactories of flint and Bohemian ware, window, and rolled plate glass, etc. The city has a number of fine churches, schools, banks, libraries, an opera house, and other civic institutions. Population 14,079.

Strength of Mate'rials, the resistance which materials offer to changes in form, such as elongations, compression, bending, and twisting. Such changes in form are called "strains," and the force with which the material resists a strain is called a "stress." In the use of materials for a structure or a machine, it is all important to the designer to know how much strain a given force will produce, whether the material will recover from the strain when the straining force is removed, and how great the strain can be before breaking takes place. A structure must be designed so as to withstand without permanent set the loads that it is to carry. In most cases it is equally important to determine what is the least amount of material which can be safely used under the given conditions. Experiments to determine these facts cannot be made on the completed structure, for while tests of complete structures are important, they cannot reveal all that is necessary to know, and besides would be an expensive way of determining safety limits. But by analysis of the forces and loads, the designer can reduce even in complex structures, such as bridges and roofs, the forces to comparatively simple straining actions in the individual parts, so that he can make his plans from the results of experiments on the materials used. Such experiments are called tests of strength of materials, and the machines for making the tests are called testing machines. (See TESTING MACHINES.) The behavior of materials under loads is that, under any load, there is a strain (elongation, compression, bending, twisting, etc.), and there is developed at the same time a stress resisting force which tends

to restore the material to its original form. In 1676, Robert Hooke first stated his law that in elastic materials the stress is proportional to the strain, a law which is assumed to be strictly true for structural testing. The ratio between the stress and the strain is called the "coefficient of elasticity." For practical purposes there are as many kinds of coefficients as there are kinds of strain, as coefficient of tension, of compression, of bending, and of torsion. As long as Hooke's law holds, the material regains its original form as soon as the straining force is removed. But if the strain goes beyond a certain amount, depending on the material, the material remains permanently deformed or "set," and we say it has been strained beyond "the elastic limit." In engineering work it is very important that no part of a structure or machine shall be strained beyond the elastic limit. If the load be still further increased the material will break under the load, and we have the breaking force or "ultimate strength of the material." From the above it is seen that the important tests which are commonly required are, (1) amount of elongation, of compression, of bending, and of torsion produced by different forces, (2) elastic limit in each case, (3) the ultimate strength or breaking force in each case. Stresses and straining forces are in British and American engineering practice stated in pounds per square inch. We can thus express the average tensile strength of timber as 10,000, of cast iron as 20,000, of wrought iron as 60,000, and steel 100,000 or over, meaning so many pounds per square inch cross section. The strength of any material depends on not only the composition of the material, but also on its physical condition, the treatment which it has undergone, the way the load has been applied, etc., and in every case a wide margin must be allowed between the possible loads as shown by the tests and the actual loads, and to allow for conditions which cannot be fully taken into account. The term "factor of safety" is used to express this relation between working loads and theoretically possible loads. Thus for a working tensile strain, one-fifth of the ultimate strength may be used for good wrought iron or the "factor of safety" is five. Besides the tension, compression, bending, and torsion tests, there are a number of other tests which are made on materials for special purposes, as tests on paving bricks for hardness and durability, tests of cements and limes. For detailed information on the strength of materials and testing, see Unwin's *Materials of Construction*, or Merriman's *Mechanics of Materials*.

Strobilus (*strō-bī'lus*) (in plants), a name given to the cone-like cluster of sporophylls which is best displayed by equisetums, club mosses, and gymnosperms. In gymnosperms it is often called a "flower," and it really stands for the flower in plants without floral leaves. It is probably the structure from which true flowers have been derived.

Strych'nine. See POISONS.

Stu'art or **Stew'art,** the name of a royal family of Scotland and England. The name is derived from the office of steward of Scotland, which was given to one of the family by David I., king of Scotland, and became hereditary in the family. The family is of Norman origin, the first ancestor in England receiving lands from Henry I. The marriage of Walter, the sixth steward of Scotland, in 1315, to Marjory, daughter of Robert Bruce, brought the crown of Scotland to the Stuarts. "It came with ane lass," said James V. Robert II., the son of Walter Stewart and Marjory Bruce, came to the throne in 1371 as the first of the Stuart kings. Between 1371 and 1714, fourteen Stuarts sat upon the Scottish and six of these also on the English throne. The last Stuart sovereign was Queen Anne. The house of Hanover, to which the present ruling family of England belongs, is connected with the Stuart family, through Sophia, electress of Hanover, who was the granddaughter of James I. See *The Royal House of Stuart*, by Gibb and Skelton.

Stu'art, Gilbert Charles, an American painter, was born at Narragansett, R. I., in 1755. He studied at Edinburgh, worked his passage home, and began painting at Newport, R. I. He returned to London in 1775, where he suffered from poverty until befriended by Benjamin West. He gained a high rank as a portrait painter, rivaling Reynolds and other English artists. In 1792, he returned to America, and painted the well-known portrait of Washington, and also those of Jefferson, Madison, and John Adams. He died at Boston, July 27, 1828. See *Life*, by Mason.

Stu'art, James Ewell Brown, a noted Confederate cavalry general, was born in Patrick county, Va., Feb. 6, 1833, and died from mortal wounds at Richmond, Va., May 12, 1864. His early career was spent as a mounted rifleman in Texas and Kansas, engaged in Indian warfare. When the Civil war broke out, he held a captaincy in the Union army, but resigned this to enter the Confederate service, in which he became the most distinguished of cavalry officers in the army of Northern Virginia.

GEN. J. E. B. STUART.

He took part in the battles of Bull Run, Antietam, and Fredericksburg, and conducted raids through the Shenandoah valley and into Pennsylvania. Being promoted to the rank of major-general, he was assigned to the command of the cavalry in Lee's army, and did good service for the South in the battles of the Wilderness. He covered the retreat after the battle of Gettysburg, and was mortally wounded at the battle of Yellow Tavern, in contact with the forces under Gen. Philip H. Sheridan. See McClellan's *Life and Campaigns of Major-General J. E. B. Stuart.*

Stu'art, Moses, an American clergyman and writer, was born at Wilton, Conn., in 1780. He studied at Yale, and became pastor of the Congregational church in New Haven, in 1806. From 1810 to 1848 he was professor of sacred literature at Andover Theological seminary. He published two Hebrew grammars, several commentaries, *Hints on the Interpretation of Prophecy*, and *Conscience and the Constitution.* He died Jan. 4, 1852.

Stubbs, William, an English historian, was born at Knaresborough, England, June 21, 1825. He studied at Oxford, and became a clergyman, settling at Navestock, in Essex, in 1850. In 1866, he was appointed professor of modern history at Oxford. He was made bishop of Chester in 1884, and changed to the see of Oxford in 1889. His writings are historical, and are marked by great learning and rare impartiality, and hold the highest rank in English history. He has edited a large number of ancient histories and chronicles, such as *Gesta of Henry II. and Richard I.; Memorials of St. Dunstan*, and *Chronicles of the Reigns of Edward I. and Edward II.* His historical works include *Constitutional History of England, The Early Plantagenets*, in "Epochs of Modern History," and *Seventeen Lectures on the Study of Mediæval and Modern History.* He died April 22, 1901.

Sturgeon (*stûr'jŭn*), a large fish of both salt and fresh water, having an elongated body and the skin provided with five rows of large bony plates. There are about twenty species, all living in the northern hemisphere. The skeleton and skull are cartilage, and the bony plates, which are formed in the skin, cover the head. Between the larger plates are smaller ones. The snout is elongated, the mouth, upon the under side, is tube-like and without teeth. In front of it hang four barbels. Its food is plants and small fish, which are sucked into the mouth. The common sturgeon is found on both sides of the Atlantic and ascends rivers to spawn. It reaches a length of eight to twelve feet on the Atlantic coast, and is larger in European seas. It ascends the Hudson to Albany, and its red flesh is jocularly called "Albany beef." The shovel-nosed sturgeon and the lake sturgeon, are common in the great lakes and waters of the Mississippi valley. They do not enter the sea. A sturgeon of the Pacific coast reaches a weight of 600 pounds, but the largest of all inhabit rivers flowing into the Caspian

STURGEON.

and Black seas. They are known as Hurso, and reach a length of twenty-five feet and a weight of nearly 3,000 pounds. The sturgeon's air bladder is the principal source of isinglass and the roe of caviar.

Stuttgart (*stŏt'gart*), a city of Germany, is the capital of Würtemberg. It is about two miles from the Neckar river and 127 miles southeast of Frankfort, and is surrounded by hills, which are covered with vineyards, gardens, and beautiful houses. Near the Palace Square, in the center of the city, is the old castle, belonging to the 16th century, the new palace, the theatre, academy, the jubilee column (1841), a statue of Schiller, and the railroad station, which is one of the finest in Germany. There is a famous polytechnic school, a conservatory of music, a museum and art gallery, and the royal library of over 500,000 volumes, including a fine collection of 7,000 Bibles. Stuttgart has one of the largest book trades in Germany, and manufactures beer, pianos, chemicals, chocolate, and furniture. Its fairs for the sale of books, hops, cloth, and horses are celebrated. It has been the capital of Würtemburg since 1842. Population 176,318.

Stuyvesant (*stī've-sant*), **Peter,** the last Dutch governor of New York, was born in Holland in 1602. He was in the army in the West Indies, became governor of Curaçoa, and lost a leg in the attack on St. Martin. He was made director-general of the New Netherlands, as the country was then called, in 1646. He was conciliatory toward the Indians, and just toward his subjects; but when a convention demanded that "no new laws should be enacted but with the consent of the people," Stuyvesant commanded the separation of the assembly, saying, "We derive our authority from God and the company, and not from a few ignorant subjects." In 1650, he helped to decide the boundaries between

the Dutch and English possessions, and in 1655 took the region around the Delaware from the Swedish settlers. When the English war ships, in 1664, appeared before New Amsterdam (New York), he was obliged to yield to the will of the people, and surrendered the city, the treaty being signed Sept. 4, 1664, in Stuyvesant's house on his farm, known as the "Great Bowerie," from which the Bowery in New York received its name. He lived eighteen years after the surrender on his farm, where he died August, 1682. See *History of New York*, by Martha J. Lamb, and *Knickerbocker's History of New York*, by Washington Irving.

Style (in plants), that part of a carpel which rises from the ovary as a more or less elongated beak, and bears the stigma. It relates the stigma properly to pollination. It is usually a slender cylindrical body, but it is often much modified in form, as in the common iris or flag, in which it resembles a small petal. In case the style is lacking, the stigma is said to be "sessile" on the ovary. See FLOWER.

(*a*) Style.
(*b*) Stigma.

Stylites (*stī'lī'tēz*), **Simeon,** a member of a class of hermits who spent their lives on pillars (Greek *styletes*). He was the founder of the order, and lived in the beginning of the 5th century. He was a Syrian monk and spent nine years in a monastery without stirring from his cell. Then, in his desire for holiness, he ascended a pillar near Antioch, where he spent 30 years. The pillar was 72 feet high and only four feet square on the top. His fame brought crowds of pilgrims, to whom he preached, making many converts from the pagan churches. He died on his pillar in 459, when seventy-two years old, and was buried with great pomp at Antioch. Other monks followed his example down to the 12th century.

Styx (*stiks*), in Greek mythology, is one of the rivers of the lower world, around which it flows seven times. Charon ferries the souls of the dead over this stream. It is named from the nymph Styx, the daughter of Oceanus, who first came to the help of Zeus against the Titans.

Sub'marine' Nav'iga'tion. See TORPEDO.

Suck'er (in plants), a very strong-growing branch which arises in an unusual position, as from the older parts of trees and shrubs, often at the base, or in connection with wounds. The process known as "pollarding" is for the purpose of inducing the development of suckers by means of wounds. Suckers are often called "watersprouts."

Suck'er, the name given a number of freshwater fishes of North America, with thick, fleshy lips bordering a sucking mouth. There are about sixty species in the family, which embraces the buffalo fishes of the Mississippi valley, the common suckers, and the mullet or red horse. They feed on plants and small water animals. The common sucker, or white sucker, reaches a length of eighteen inches, and is very abundant in streams from Canada to Montana and Florida. They are eaten, but the flesh is rather tasteless and bony. The remora (which see), having a sucking disk on the back of the head, is also sometimes called a sucker, and the name is also applied to the hag and certain other fishes.

Sucre (*sō'krā*), a name for Chuquisaca, the capital of Bolivia, which see.

Sue (*sū*), **Marie Joseph Eugene,** a French writer, was born at Paris, Dec. 10, 1804. He practiced surgery for some years in the army, in Spain and at Navarino, using his experience in his novels. The *Mysteries of Paris*, a famous novel, was his first success. It was printed in ten volumes in 1842, and appeared first in the columns of the *Journal of Debates*. *The Wandering Jew*, with which Sue's name is most associated, was also printed first in a newspaper, and issued afterward in ten volumes. He wrote later the *Seven Capital Sins* and *Mysteries of the People*. The last work was condemned by the court at Paris as immoral and seditious. In 1850, he was elected a deputy to the assembly, but went into exile after the accession of Napoleon III. and died in Savoy, Aug. 3, 1857.

Suez (*sō-ez'*) **Canal,** a passage connecting the Mediterranean and Red seas, was begun

in April, 1859, under the French engineer, De Lesseps. Half the money for the great work was raised by subscription in Europe, and the other half by the khedive of Egypt. The

canal was finished in 1869. It cost about $100,000,000, and is 87 miles long and originally from 150 to 300 feet wide at the top, and 26 feet deep. In 1886, it was widened and deepened. The highest point cut through is not more than 50 feet above the ocean. "Sidings" or side basins, to allow vessels to pass each other, are built every five or six miles. Since 1887 the canal has been lighted by electric light. It costs a vessel about $500 to make the passage, and takes a little over twenty-four hours. In 1899, 3,607 vessels passed through the canal, and the number of passengers, military and civilians, was 221,347.

Suffren', Pierre Andre de, a French naval hero, was born at Saint-Cannat, France, July 17, 1726. He entered the navy when only fourteen, was captured in the bay of Biscay, but soon released, and served six years with the Knights of Malta. Returning to the French service he was in the action of Minorca (1756), and was taken prisoner in the destruction of the Toulon fleet in 1759. From 1767, he served four years in the service of Malta, entering the French navy again in 1772. He was with the fleet blockading Gibraltar, and in command of five ships sailed to Madras, where he was in two or three battles, and conquered Trincomalee (1782). He was made vice-admiral of France on his return to Paris, where he was received with the greatest honors. He is called "one of the most dangerous enemies the English fleet has ever known, and, without exception, the most illustrious officer that has ever held command in the French navy." He died at Paris, Dec. 8, 1788. See *Studies in Naval History*, by Laughton.

Sugar, the name of a great number of substances which have a certain chemical composition and are soluble in water. The sugar of commerce, however, is chiefly derived from sugar cane and sugar beet, the latter supplying nearly two-thirds of the sugar used by the world. In these and other plants the sugar is an essential food, and is manufactured out of raw materials by green plants. The sugar cane (*Saccharum officinarum*) is thought to have originated in India, but it is not known wild. In the United States, sugar cane is most extensively cultivated in Louisiana, but it is also an important industry in Florida and Texas, and is cultivated to some extent in Mississippi, Alabama, and Georgia. Cuba and the Hawaiian islands are also great centers of the sugar-cane industry. The sugar-beet (*Beta vulgaris*) came from Burgundy, and is extensively cultivated in Europe. In the United States, the sugar-beet industry is comparatively recent, and is most largely developed in California. Maple sugar is a sugar of minor commercial importance, the maple chiefly used being *A. saccharinum*. The principal centers of this industry are Vermont, New York, and Ohio.

Su'liotes, a mixed race who inhabited the valley of the ancient Acheron in what is now European Turkey. They were of Greek and Albanian origin, and were descended from a number of families who fled from Turkish oppression to the mountains of Suli, whence their name. For several years they resisted the Turks, but, vanquished at last, took refuge in the Ionian islands. Though they helped in the war of Greek independence under their brave leader, Marco Bozzaris, their country was not included within Greek boundaries, by the treaty of 1829, nor by the extension to that treaty of 1881, but most of them established themselves in that country. See *History of Suli and Parga*, by Perhaebos.

Sul'la, Lucius Cornelius, a Roman dictator, was born in 138 B. C. As questor in 107, under Marius, in Africa, he induced the Mauritian king to surrender Jugurtha, whom he brought in chains to the Roman camp. He was in the war against the Cimbri, and in Cilicia, where he was sent by the senate to restore the king to his throne. On his return to Italy, in 91, the rivalry between him and Marius threatened to break out openly, but was checked for a time by the social war, in which Sulla won a brilliant success. He was given command in the second war against Mithridates, but Marius affected his expulsion from Rome, only to be in his turn driven out by Sulla. The four years he spent in the east were years of great success, in which he took Athens and won the victory of Chæronea. He crossed the Hellespont, forced Mithridates to ask for peace, landed at Brundusium and fought before the gates of Rome the great battle with the Samnites in which 50,000 men fell on each side. Sulla was now master of Rome and Italy. His dictatorship was marked by the cruel murder of his enemies. He published a list of proscribed persons whom any one might kill and in this way got rid of his enemies, to the number of nearly three thousand. He made some changes in the government of Rome, mainly in the direction of strengthening the senate, and taking the power from the people. He spent his last years at Puteoli in dissipation, bearing the marks of it in his blotched face, compared by the Greeks to a mulberry sprinkled with meal. He died in 78 B. C., at the age of sixty. The inscription on his monument, said to have been composed by himself, asserts that none of his friends ever did him a kindness, or none of his foes a wrong, without being well repaid.

Sul'livan, Sir Arthur Seymour, an English composer, was born at London, May 13, 1842. He studied at Leipsic. He wrote *Kenilworth*, a cantata; the overtures *In Memoriam* and *Marmion*, and the oratorios, *The Prodigal Son*, *Light of the World*, *Martyr of Antioch*, and *The Golden Legend*. He is best known by his hymn tunes, (by *The*

Lost Chord especially) and by his songs, and burlesque operas. The operas were written in connection with W. S. Gilbert and were very popular, especially *H. M. S. Pinafore*, which ran for 700 nights, and *The Mikado*. Later he wrote the opera *Ivanhoe*. He received many honors, and in 1883 was knighted. He died Nov. 22, 1900.

SIR ARTHUR SULLIVAN.

Sulphur (*sŭl'fŭr*), one of the non-metallic elements. It is found very widely distributed in the mineral kingdom, partly free, partly in combination with other elements. It is usually abundant in volcanic districts, large quantities coming from Sicily. It is found in many parts of the United States, but cannot compete with that from Sicily. The free sulphur is found mixed with earthy matter or pure in the shape of crystals. In combination it is found combined with iron and copper as iron and copper pyrites; with lead in galena; with zinc in blende. It is also found in the form of sulphates, as the sulphates of lime and magnesia. In vegetables, it exists in the proteids or albuminoids of seeds, etc., in the oils of mustard, garlic, and asafœtida, and in the juices of some plants. In animals, it is found in the tissues, the hair, saliva, etc. Sulphur is a solid, brittle, yellow substance, without taste or smell, and will not dissolve in water. When heated it forms a thin yellow liquid, and heated to the boiling point, it forms a yellow vapor. This vapor condenses into a fine yellow powder, called "flowers of sulphur." When it is melted it is poured into moulds, which makes the common roll sulphur, or brimstone. When heated in the air it takes fire, burning with a blue flame, and changes into sulphurous acid, with suffocating fumes. Sulphur is used in making matches and gunpowder, and as sulphurous acid, in bleaching and in the destruction of insects, and the germs of disease, and also in the manufacture of sulphuric acid, or oil of vitrol, which is a compound of sulphur, oxygen, and hydrogen. Large quantities of the acid are used in preparing sodium sulphate from common salt, as a preliminary step in one of the processes for making soda.

Su'mac, species of the genus *Rhus*, which contains over 100 species, chiefly tropical. In the United States there are about ten species, some of them well-known shrubs or small trees, with leaves which show bright red to purple autumn coloration. The common poison oak or poison ivy (*R. Toxicodendron*) is a sumac whose foliage is very poisonous. The most common form is *R. glabra*, or "smooth sumac," a shrub which often covers large and especially barren areas, with large compound leaves, and dense crimson velvety clusters of fruit.

Suma'tra (*sō-mä'trä*), one of the largest islands of the Indian archipelago, lies on the equator. It is 1,115 miles long and 275 miles broad, and is a dependency of the Netherlands. The Chain mountains in several ranges, from 7,000 to 10,000 feet high, cross the island, with seven or eight active volcanoes, and a number of mountain lakes. There are large rivers on the western side of the island, and the forests are so thick that it is said an ape can travel across the island from tree to tree without once descending to the ground. A Dutch expedition in 1877, exploring only a small part of the western side, collected 400 varieties of timber. The animals of the eastern side are entirely different from those on the western side. The orang-outang and the bru are the most common apes. The bru is employed by the natives to gather their cocoanuts. The tiger, the Malay bear, the hog, the two-horned Sumatran rhinoceros, and the elephant are among the best-known animals. The python, from 15 to 20 feet long, the cobra, and the crocodile are all found on the island; and 250 species of spiders have been discovered since 1858. Gold and coal are mined; rice, sugar, coffee, pepper, cocoanut, sago, corn, and sweet potatoes are cultivated. The people are of different tribes of the Malay family. The island became known in 1508 to Europeans, through a Portuguese explorer, and Portuguese trading stations were formed on the coasts. The Dutch drove out the Portuguese, but did not completely occupy the coast until 1881, and large parts of the interior are still unexplored. The population of Sumatra is 2,334,090. In 1832, what is known as the "culture system" originated in Java and spread to the western coast of Sumatra. This meant the officially superintended work of the natives in the culture of various products; but, in 1870, this system was abolished, and native labor is now only required for the production of coffee. The Europeans and those connected with them live under the laws of the mother country, while there are separate laws for the natives. Schools are provided for Europeans, natives, and orientals. See *Indian Archipelago*, by Wallace.

Sum'ner, Charles, an American statesman, was born at Boston, Mass., Jan. 6, 1811. He studied at Harvard and adopted the profession of law. He edited a law journal, the *American Jurist*, and three volumes of law decisions, chiefly those of Judge Story, and lectured in the law school at Harvard. He carried his law studies on farther in Europe at the Sorbonne, and spent two or three years in traveling, receiving marked attention when

in England. His appearance in politics dates from July 4, 1845, when he delivered his oration on *The True Grandeur of Nations*, which denounced the use of war to de-

CHARLES SUMNER.

cide national questions, and attracted general attention in both America and Europe. He succeeded Daniel Webster in the senate of the United States in 1850, and retained his position through successive re-elections until his death. He helped to form the Free Soil party, and stood almost alone in the senate at that time in his opposition to slavery. His strong, uncompromising attacks upon slavery were bitterly resented by the southern members of the senate. This hostile feeling resulted in an attack upon Sumner while sitting at his desk in the senate chamber, from the effects of which he suffered for nearly four years. His speech on *The Barbarism of Slavery*, delivered in June, 1860, was occasioned by the struggle over the admission of Kansas as a free state. As chairman of the committee on foreign relations, in March, 1861, he argued against the seizure of the southern commissioners in the Trent affair, made a powerful speech on *Our Foreign Relations*, and one on *Our Claims against England*. He was selected in April, 1865, to deliver the eulogy on Lincoln. His opposition to the treaty with San Domingo, in 1869, brought him into difficulty with President Grant, and ended in his supporting Greeley for the presidency in 1872. Among his last important measures were the introducing of the civil rights bill and the resolution to remove the names of battles from the colors of the army. His publications are made up of his public addresses, and fill fifteen volumes, prepared for the press partly by himself and partly by his literary executor, Longfellow. See *Memoirs and Letters*, by Pierce; *Life*, by Lester. He died at Washington, D. C., March 11, 1874.

Sun, The, our nearest star and the central body of the solar system. For the inhabitants of the earth, no other body in the heavens compares for an instant with the sun in point of interest and vital importance. For not only are the orbits of the earth and the other planets determined by the sun, but all forms of life on the earth are immediately dependent upon the heat and light which we derive from the sun.

The distance of the sun from the earth is nearly ninety-three million (92,897,000) miles, a stretch which baffles the imagination. Professor Young illustrates this quantity by saying that if a child were provided with an arm long enough to reach the sun and thus burn his hand, he would die of old age before he learned that he was burnt, assuming, as Helmholtz found, that sensations travel along the nerves at the rate of about 40 feet per second. Even light itself, traveling with the stupendous speed of 186,000 miles per second, requires 499 seconds for the trip from the sun to the earth.

The diameter of the sun is approximately 866,500 miles, a distance nearly twice as great as the diameter of the moon's orbit, while the mass of the sun is 1,332,000 times that of the earth, making its density about 1¼ times that of water, and the attraction of gravitation at the surface of the sun 27 times as great as at the surface of the earth. The weight of an ordinary man at the solar surface would, therefore, be such that he could not stand erect with his present strength of muscles.

The period of rotation of the sun was first determined after Galileo had discovered spots on the solar surface; and this rotation takes place in a very remarkable manner, for Carrington found that at the sun's equator spots travel once around the sun in 25 days, while at latitude 30°, the period is 26½ days, and at latitude 40° is no less than 27 days. Hence the sun rotates most rapidly near the equator and diminishes constantly in angular speed as one approaches the poles. This fact has never been satisfactorily explained.

As to the constitution of the sun and as to the nature of sun spots there are almost as many "theories" as there are men. What is reasonably certain, however, is that practically all of the elements which have been found in the earth's crust are to be found in the sun, making it highly probable that at some time the earth has been split off from the sun in the manner suggested by the nebular hypothesis. Concerning the interior of the sun practically nothing is known; for its temperature is outside the range of our experiments. The white surface of the central body of the sun is called the *photosphere*. The spectroscope shows that this photosphere is surrounded by a layer of incandescent gases which we call the *chromosphere*. Certain parts of this chromosphere appear at times to be heaped up into brilliant clouds thousands, and even hundreds of thousands, of miles high; these are called *prominences*.

Beyond the prominences and the chromosphere is a halo of light seen only at times of

eclipse. It is called the *corona;* but beyond the mere fact that it is an appendage of the sun little is known about it. The fact, however, that its spectrum contains bright lines would seem to indicate that it consists partly, at least, of a self-luminous gas.

The best account of solar phenomena is to be found in Professor Young's delightful volume, *The Sun*, published in the "International Scientific" series.

Sun'day Schools are schools for religious instruction, meeting on Sunday. There were schools for religious instruction in connection with the Jewish synagogues, and also among the early Christians. Luther established such schools in Germany, and Knox in Scotland. But the credit of founding the modern system of Sunday schools belongs to Robert Raikes, who in 1780, when living in Gloucester, England, gathered the children from the streets on Sunday and hired teachers for them, at 25 cents a day. These schools opened at 8 A. M., lasted until the children went to church, and after the second service, began again, holding until 5:30 P. M. The children were taught their letters, reading, and the church catechism. The first Sunday school in London was started by Rowland Hill in 1784. There are now, it is estimated, 7,000,000 scholars in the Sunday schools of Great Britain. The first regular Sunday school in America is thought to be the one started by Bishop Asbury in Hanover, Va., in 1786, though there had been schools for instruction on Sunday at Roxbury and Plymouth, Mass., as early as 1674 and 1680. There were some years ago 7,000,000 children in the Sunday schools of the United States, held in the churches of all denominations, including Catholics and Quakers. The instruction is by voluntary, unpaid teachers, a plan adopted first by the Methodists in England. For many years a uniform series of Bible lessons has been used in the United States, and to some extent in Europe. In 1890, the number of teachers engaged in Sunday school work was estimated to be nearly 2,000,000, with almost 18,000,000 pupils.

Sun'derland, a seaport of Durham, England, is at the mouth of the Wear river, thirteen miles northeast of the city of Durham. Among the public buildings are the town hall, free library, museum, art gallery, winter garden, and Victoria hall, the scene of a terrible accident in 1883, in which 182 children were killed. There are over seventy churches, an infirmary, an orphan asylum, and several theatres and clubs. People's park contains a monument of Havelock. There are two iron bridges over the Wear, the older one built in 1793–96 and widened by Robert Stephenson in 1858–59. There are four large docks and five piers at the harbor. Coal and coke, bottles and glass, earthenware, lime, etc., are exported. Sunderland is noted for its iron shipbuilding yards, of which there are thirteen on the river. Iron, glass, chemicals, rope, paper, and lime are also manufactured. The famous Pemberton coal pit is three hundred and eighty-one fathoms deep, and some of the workings reach under the sea.

Sunderland is known to have been a town as early as 1311. It was a small place till the beginning of the 19th century, but since then, owing to the improvement of its harbor, and the growth of the Durham coal trade, it has grown fast. Population 147,398.

Sun'fish, a common name used to designate a number of different fishes. The freshwater sunfishes, of which there are about twenty-five species, are abundant in the Mississippi valley. They are bass-like fishes. The most common one is generally known as the pumpkin-seed. It reaches a length of eight inches and is of bright colors—greenish olive, with bluish sides spotted with orange, and the belly and lower fins orange tinted. It is very abundant in ponds, lakes, and streams of the east. In western rivers sunfishes rarely come south of the latitude of Chicago. The marine sunfish, or head-fish belongs to an entirely different family. There are three species inhabiting the open sea. They are large fishes, with a very short body, and look like huge fish-heads provided with fins. They reach a weight of seven or eight hundred pounds and a length of seven or eight feet. They are not good for food, but a healing oil is derived from their livers. Their habit of basking in the sun at the surface of the water gives them their name, while that of freshwater sunfishes is derived from their bright colors.

Sun'flower, species of *Helianthus*, a genus of the great composite family. There are many species native to the United States, but the best-known form is *H. annuus*, a common species in cultivation, distinguished by its great stature and very large heads. It is a native of the western plains. The seeds yield a drying oil nearly equal to that of linseed.

Supe'rior, a city of Wisconsin, is at the head of Lake Superior, on the St. Louis, Superior, and Allouez bays. It is the terminus of the Great Northern, the Northern Pacific, the Chicago, St. Paul, Minneapolis, and Omaha, and the Duluth, South Shore, and Atlantic (Canadian Pacific) railways. The city has thirteen miles of water front, with extensive ore, coal, grain, lumber, and merchandise docks, and its lake commerce amounts to over five million tons annually, as much as the marine business of Boston or New Orleans. Superior has a perfectly landlocked harbor, and is the natural outlet for all the country lying west of Lake Superior and extending as far as the Pacific. The city boasts of the largest dry dock on the Great Lakes, and a great shipbuilding plant, where originated the type of boat known as the whaleback. It is the distributing point of

the northwest for coal and oil. There are sixty churches, a state normal school, ten large ward schools, with over 6,000 pupils, two high schools, a business college, three parochial schools, three hospitals, a $50,000 Carnegie public library, two daily and six weekly newspapers, four banks, thirty-five miles of paved streets, complete sewerage system, electric light and gas plants, an excellent filtering system of water works, and twenty-six miles of electric street railway. The manufactures are chiefly flour, lumber, iron, furniture, barrels, bags, coke, and twine. The climate is crisp, dry, and beautiful, cool in summer and relatively mild in winter. The original settlement was made at the east end of the city in 1853, but from 1858 to 1882 the place was practically dead. In 1882, an attempt to build a city was made four miles east on St. Louis bay, which proved so successful that the two settlements were united in 1891 and incorporated as the city of Superior. The growth has been very rapid, the last census showing a gain of 160 per cent. Superior is now the second city in Wisconsin, having a population of 31,091. It is the county seat of Douglas county.

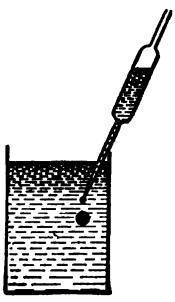
Supe'rior, Lake, the largest body of fresh water on the globe, is the highest and most western of the great lakes. It is bordered by Michigan, Wisconsin, Minnesota, and Ontario. Its greatest length is 412 miles; its greatest breadth, 167 miles, and it covers 31,200 square miles, making it a little larger than South Carolina. The surface of the lake is 601 $\frac{6}{10}$ feet above sea level, and its mean depth is about 475 feet, its greatest depth being 1,008 feet, or 406 feet below the sea. Its surface is 20$\frac{1}{2}$ feet higher than that of lakes Huron and Michigan, due to the fall at the rapids of St. Mary's river, the only outlet, where the average discharge is 86,000 cubic feet per second. Lake Superior is very near the watershed between Hudson bay and the Mississippi, and so receives no large rivers, the largest being the St. Louis and the Nipigon. These rivers, together with hundreds of small streams, drain into the lake 82,000 square miles. The largest island is Isle Royale, which is forty-four miles long. Keweenaw Point reaches far into the lake. At Grand Isle bay, about 100 miles west of Sault Ste. Marie, are the pictured rocks, sandstone cliffs from 50 to 200 feet high, in many places, of fantastic shape and marked by bands and blotches of red and yellow. The boundary line between the United States and Canada is drawn through the center of the lake from its outlet to the mouth of the Pigeon river, but includes Isle Royale in the United States. See Crossman's *Chart of the Great Lakes.*

Surabaya (*sö-rä-bï'ä*), a seaport on the north coast of Java and on the strait of Madura. Here the Dutch have a marine arsenal, a cannon foundry, and a mint. There are also machine, sugar, and furniture factories. Population 145,690, of whom 6,000 are Europeans and nearly 7,500 Chinese.

Surakarta (*sö-rä-kär'tä*), a city in the center of Java, but joined by rail with Samarang on the north and Surabaya on the east. It is the home of the native sultan of Surakarta, who is a dependent of the Dutch government. Population 124,000.

Surat (*sö-rät'*), a city of India, on the Tapti river, 160 miles north of Bombay. It stretches for more than a mile along the river in the form of a bow, and is surrounded by suburbs spread in the midst of gardens. There are four fine Mohammedan mosques, two Parsee fire temples, three Hindu temples, a clock tower 80 feet high, and the old citadel. Surat was founded in the 16th century, and was three times burned by the Portuguese. After the building of a strong fort in 1546, Surat became one of the greatest trading cities in India, the English and Dutch, as well as Portuguese, establishing themselves there. By the beginning of the 17th century, Surat had trading relations with western Europe, India, Arabia, Persia, Ceylon, and the East Indies. Here, too, the Mohammedan pilgrims embarked for Mecca. In this century it was pillaged several times by the Mahrattas, lost most of its trade to its new rival, Bombay, and in 1800 came into the hands of the British. It later regained some of its trade and became the largest city in India, but was ruined by a fire, followed by a great flood, in 1837. Surat exported large quantities of cotton during the American Civil war. Population 109,229.

Sur'face Ten'sion is a phenomenon exhibited when two liquids (or a liquid and a fluid) which do not mix are brought into contact. For instance, a drop of oil placed in a mixture of water and alcohol, which has the same density as the oil, will neither sink nor rise; but it will gather itself up into a sphere, *i. e.*, it will assume a shape in which it has the least possible surface. In other words, it acts as if it were covered with a thin elastic skin which was continually tending to contract to the least possible area.



A DROP OF OIL FREED FROM GRAVITY.

Another illustration of this phenomenon is seen when mercury is placed, in air, on glass, as indicated in the figure. The mercury does not flatten out and run all over the glass as it would do if gravitation alone were acting upon it; but it gathers itself up into a more or less spherical shape. This globule is exactly what we should expect if the mercury were covered

MERCURY ON GLASS.

with a thin elastic membrane tending, all the while, to contract into the smallest possible area. This tendency of liquid surfaces to become a minimum is known as *surface tension*. There is no skin or membrane over the surface of liquids; but the particles lying on the surface and very near the surface are in a different physical condition from the particles in the interior of the liquid; and hence this surface effect, the details of whose explanation would lead us too far.

The numerical value of the surface tension of any liquid is *the force per centimeter which a single surface exerts* across any line drawn upon it. The unit in which surface tension is measured is, therefore, *dynes per centimeter*. See C. V. Boys' *Soap Bubbles and the Forces which Mould Them* (Soc. for the Promotion of Christian Knowledge: London), the finest elementary and popular treatment in the English language.

Sur'rey, Henry Howard, Earl of, an early English poet, was born between 1516 and 1518, probably in Suffolk, and was the son of the duke of Norfolk. In 1532 he accompanied Henry VIII. to France, and spent a year in study at Paris with Henry's son, the duke of Richmond, who was betrothed to his only sister. In 1542 he was sent to Fleet prison for challenging a gentleman to a duel, and the next year suffered another imprisonment for breaking windows in the streets at night. In 1544 Surrey went to France as marshal of the invading army, and distinguished himself at the siege of Montreuil, where he was badly wounded. But the next year he was defeated by a larger French force, and was superseded by the earl of Hertford. For his bitter speeches against Hertford he was imprisoned, and later, with his father, sent to the Tower, charged with high treason. His only offense was in having added to his own arms those of his ancestor, Edward the Confessor. In vain did he ably defend himself at his trial; he was found guilty and was beheaded Jan. 21, 1547. His poems were published after his death, together with those of Wyatt. They are sonnets, lyrics, elegies, paraphrases of the Psalms and Ecclesiastes, and translations. He was the first English sonneteer and one of the best. See Morley's *English Literature*.

Surveying (*sûr-vā'ing*), a branch of applied mathematics devoted to measuring land. There are two great branches, plane surveying and geodesy. Plane surveying is used where such small areas are measured that the surface of the earth can be looked on as plane. Where large areas are measured, as states and countries, then the curvature of the earth must be taken into account and the science of land measurement becomes geodesy. Plane surveying is divided into branches, such as: land surveying, having to do with fixing property lines and areas of tracts of land; topographical surveying, having to do with levels, and general contours of the landscape; hydrographical surveying, having to do with areas and depths of rivers, lakes and other bodies of water; mining surveying, having to do with the direction and lengths of mining shafts and galleries; railroad surveying, etc. One of the most important geodetic surveys now going on is the U. S. Coast survey. It was started in 1832 by F. R. Hassler, and has now covered nearly the whole coast of the United States, the results being embodied in a sectional map on a scale of one mile to the inch. Eventually the whole country will be mapped out on this scale. Surveying and geodesy are applications of geometry and trigonometry, and involve the measurement of length and directions of lines. All plane surveying could be done by the measurement of lengths, but it is most convenient to measure angles also. The chief instruments are the chain or tape, the compass, level, and theodolite. In geodetic surveying, instruments for measuring latitude and longitude must also be used.

The survey of public lands of the United States is in charge of a surveyor-general. The land is divided into townships, each six miles square. The townships lying between two meridians six miles apart make a range. The townships are then divided into "sections," a mile square, these containing 640 acres. Land titles in the western states mostly refer to the original United States survey, and in this respect differ from the land titles in the older states, where boundaries and corners are fixed by various natural and artificial marks.

Susa (*sōsă*), a city of Persia, the same as the Shushan of Daniel and Esther, the modern Sus, and one of the most important cities of the Old World. Its name and its ground plan are traced on Assyrian monuments of the reign of Asur-banipal, about 600 B. C. At the time of Daniel's vision "at Shushan in the palace," it belonged to Babylon, but it was brought by Cyrus under Persian rule, and the later kings made it the capital and winter residence of the Persian empire, building there a strong citadel and a treasure house. Alexander is said to have found vast treasures here, and though Babylon soon became the chief city, it was still very rich when it fell into the hands of Antigonus (315 B. C.). Later, its fortifications were destroyed by the Arabs. Its ruins, among them the palace described in Esther, cover about three square miles.

Suspen'sor (in plants), an organ of the embryo, by means of which it is placed in proper relation to its food supply. It is mostly restricted to the embryos of seed-plants, and is usually a more or less filamentous structure, at the end of which the embryo proper develops. See EMBRYO.

Susquehan'na River, The, is formed by two branches, the north branch, 350 miles long, rises in Schuyler lake, in central New

York; the west branch, 250 miles long, rises in the Alleghany mountains. The two unite at Northumberland, Pa., and the river flows south to Harrisburg, southeast into Maryland, and after a course of 150 miles falls into the north end of Chesapeake bay. It is a shallow stream, much broken by rapids. In the spring immense quantities of lumber are floated down the Susquehanna. Canals have been dug along its banks for 125 miles along the north branch, and for 124 miles along the west branch. Its lower course is noted for ducks and other wild fowl. Its chief branch is the Juniata. The Susquehanna is also noted for its wild and picturesque scenery.

Suttee (*sŭt-tē'*), meaning "a virtuous wife," a once common usage of India, in accordance with which, on the death of her husband, the faithful widow burned herself on the funeral pyre along with her husband's body, or, if he died at a distance, was burned on a pyre of her own. The custom was practiced in India as early as the times of the Macedonian Greeks, and was grounded by the Hindus on various of their sacred books and laws. But it is now known that no countenance to this barbarous rite can be found in the oldest and most sacred Hindu books. Nevertheless suttee, though not enforced on an unwilling victim, and not practiced except in certain castes and families of old descent, was made almost necessary for well-born widows, by the force of public opinion, unless they were willing to risk their own happiness here and hereafter. The rite no doubt came from a belief, common to many savage races, that it was well to send wives, slaves, horses, favorite weapons, etc., along with great men into the other world, by burying them with them, burning them, or slaying them at their tomb. In 1823, about 900 widows were burned in India. In 1829, through the efforts of Lord William Bentinck, any encouragement of suttee was made murder. The custom is now rarely practiced.

Swabia (*swā'bĭ-a*), a southwest German duchy, stretching from Franconia to Helvetia and from Burgundy and Lorraine to Bavaria. It was so named from the Germanic Suevi, who drove out the Celts of this region in the 1st century B. C. The Alemanni became a part of the Suevi nation in the 5th century, and from this time there were dukes of Swabia. Under the Hohenstaufen emperors, who were Swabians, this duchy became the richest, most powerful, and most civilized country in Germany. But when the Swabian line of emperors died out, Swabia became the scene of feudal wars, and this unhappy state of affairs lasted for centuries. In particular Swabia suffered terribly in the Peasants' war of 1525, in the Thirty Years' war (1618–48), and in the wars of the French Revolution. From the time of the Reformation the rulers of Würtemberg struggled with the German emperors for the control of Swabia. This struggle ended in the founding, in 1806, of the kingdom of Würtemberg, which includes most of the old duchy. The name now denotes the south central part of Würtemberg, the adjoining part of Baden, and the southwestern part of Bavaria.

Swal'lows, insect-eating birds with long pointed wings, noteworthy for rapidity of flight. There are about one hundred species of swallows found in all parts of the world. Six of these are common in the United States. All of them devour an immense number of insects and are beneficial to the farmer. The common barn swallow is widely distributed and abundant. It is about seven inches long, with a long forked tail. The upper parts are steel blue, and the under parts buffy, with white spots on the tail and deep chestnut on the throat. Their nests are mud pockets usually placed on a beam in barns. The cliff, or eve swallow, is a square-tailed bird smaller than the foregoing, which builds numerous nests in colonies under the eves of barns, other buildings, and cliffs. The bank swallows are our smallest swallows, being about five inches long. They dig tunnels in sand banks two or three feet deep with a nest of grass and feathers at the end. The tree swallow has the under parts white. It nests in hollow trees, or in bird boxes near dwellings. The rough-winged swallow resembles the bank swallow. It is common in the west, making nests in sand banks. The purple martin is the largest of our swallows, being about eight inches in length. Swallows resemble the swifts, or chimney swallows, and goat suckers, but the latter birds belong to quite a different order. See MARTIN, SWIFT.

Swan, a name for a number of water birds, famous for their long graceful necks, and related to ducks and geese. They inhabit temperate regions and feed upon seeds, roots, and fish spawn. They have white plumage, except the black swan of Australia — a very beautiful bird with a long neck, having a graceful curve. It is a dull black, with white on the wings, and a carmine bill crossed by a white band. The European swan, partly domesticated in parks, has a long graceful neck. It is pure white and one of the most graceful of all animals. South America has a competitor for grace and beauty in the black-necked swan, a small swan with white plumage except the head and neck which are dark seal brown. The common swan reaches a length of about five feet and a weight of thirty pounds. The swans of North America are the trumpeter and whistler swans, with straighter necks and, therefore, less grace and beauty than other members of the group. They are smaller than the common swan.

Swansea (*swon'sē*), a seaport of Wales, on the Tawe river, forty-five miles northwest of Cardiff, is the most important city of South

Wales. Its growth is due to its tin plate manufacture, two-thirds of the British output being manufactured here. It is also the principal seat of copper smelting in Great Britain, perhaps in the world, and in its vicinity are extensive coal mines. It has large docks, covering sixty acres, a good harbor, and is several hours nearer the open sea than any other considerable port on Bristol channel. The McKinley tariff greatly injured Swansea's tin plate trade. The town charter dates from the days of King John. A tower is still standing of the castle built here by the earl of Warwick in 1099. Population 105,472.

Swe'den, the eastern portion of the Scandinavian peninsula, makes with Norway one kingdom. It is over 600 miles long; its greatest width is 200 miles, and it covers 172,876 square miles. In the northern parts the land rises from the gulf of Bothnia to the Kiölen mountains, which form the boundary line between Sweden and Norway, their highest peaks rising above the snow line. South of this region is the mountainous district made up of the great table-lands of Jemtland and the valleys of Herjedal and Ljungan, where there are good pasturage and timber lands. The mountainous region further south, from Lake Siljan to Lake Wener, is the mining part of Sweden, and includes the noted iron mines of Danemora, and the copper works of Fahlun. Lakes Wener, Mälar, and Hielmar almost cut the country from east to west, and with Lake Wetter make up a large lake district, which is the commencement of the most fertile part of Sweden, the lower end of the peninsula between the Cattegat and the Baltic. The lakes of Sweden cover one-eight of the surface; the largest is Lake Wener, the outlet of which to the Cattegat is the river Göta, noted for its picturesque rapids. The rivers are small and unimportant, the largest being the Angerman.

Summer and winter succeed each other with almost no spring or fall. Usually not enough grain is grown to supply the home market, though barley does better than oats or rye. Other crops are potatoes, hemp, flax, tobacco, and hops. Pine, fir, and beech trees are of great value for timber, tar, pitch, charcoal, and firewood. These trees mainly make up the great forests which cover more than a fourth of the surface. Bears and beavers are now scarce; but wolves, lynxes, martens, eagles, etc., are still common.

Copper, iron, alum, vitriol, marble, lead, sulphur, and a little coal, gold, and silver are found; mining is the most important business after farming. Iron and shipbuilding head the list of manufactures. Iron, timber, and copper are the chief exports; yarn, wool, leather, coal, and cotton the main imports.

The money unit is the rixdaler, worth about 29 cents. The national debt is $25,403,129. The three provinces of Sweden are Norrland, Svealand, and Gothland, but for purposes of government it is divided into 25 laens. After Stockholm, the capital, the largest city is Gottenburg (population 126,849). The Swedish permanent army of 39,123 men is in part quartered on the landowners, the soldiers working in time of peace as field laborers in return for their support; in time of war they are paid by the crown. Every Swede between the ages of twenty and twenty-five must serve in the national guard, and a reserve of 450,000 men is formed of conscripts between the ages of twenty-one and forty years. Sweden is a constitutional and hereditary monarchy, the succession being in the male line. The king has a council or cabinet of ten ministers. The diet meets every year; the upper house has 127 members chosen for nine years, who must have a certain amount of landed property, or income; the lower house has 188 members. A small property qualification is required in the voter, who must be a native having attained his majority.

The state church, to which the king must belong, is the Lutheran; but no civil disabilities attach to those not of the national religion. Education is compulsory, and there are free schools. The University of Upsala was founded in 1476, and has an attendance of 1,386 students; and the smaller University of Lund numbers 581 students. There are 107 public and private high schools, with 18,266 pupils, and 12 normal schools with 1,272 pupils.

In early times the Swedes lived in the north of Sweden and the Goths in the south. Eric Edmundson is said to have first conquered the whole of Sweden near the end of the 9th century. At this time Swedish history begins, and we find the Swedes generally at war with their Norwegian and Danish neighbors, and busily engaged in ravaging the eastern shores of the Baltic. In 1000 A. D., Olaf Schooszkönig was baptized a Christian, and the burning of the national temple at Upsala, in the reign of Ingiald (1080–1112), finished the overthrow of the old Pagan religion. The murder of King Eric in 1161 was the beginning of a disastrous period of civil wars, lasting 200 years. At length the nobles offered the throne to Margaret, queen of Denmark and Norway, thus uniting the three Scandinavian countries in 1347.

In 1523, Gustavus Vasa made Sweden again independent of Denmark, founded a long line of Swedish kings, of which he himself was one of the greatest, and raised half barbarous Sweden to an honorable place among civilized nations. In Vasa's reign, Protestantism was made the state religion. Gustavus Adolphus (1611–32), one of the greatest generals of his age, spent the greater part of his reign in wars with Poland and Russia, for the possession of Ingria, Livonia, and other Baltic districts, and in defending Protestantism in Germany. His affairs at home were ably managed by the wise Oxenstien, who, after

the death of Gustavus at the battle of Lützen, carried on the government during the minority of Christina. This strange queen's most popular act was her abdication. Charles XI. (1660–97) so greatly increased the kingly power that the diet acknowledged it to be absolute. The warlike career of the gifted but reckless king, Charles XII. (1697–1718), who humbled Frederick IV. of Denmark, and Peter the Great of Russia, and dethroned Augustus II. of Poland, nearly ruined his country. His sister Ulrica was chosen queen on condition of giving up the absolute power wielded by the last two kings. In the reign of Ulrica, the last of the Vasas, and her husband, Frederick of Hesse-Cassel, the country was divided into two factions of nobles — the "Hats," or French party, and the "Caps," or Russian party. Gustavus III. (1771–72), who recovered the lost power of the crown and put down these factions, was murdered. Charles XIII. (1809–18) was forced to cede Finland to Russia. Charles was childless, and chose Napoleon's general, Bernadotte, prince of Pontecorvo, as crown prince. Bernadotte's success in getting possession of Norway endeared him to the people, and he ascended the throne, in 1818, as Charles XIV. He ruled ably, and has been succeeded by his son Oscar I., and his grandsons Charles XV. and Oscar II., the present king. Population 5,097,402. See Fryxell's *History of Sweden* (English translation).

Swe'denborg, Eman'uel, was born at Stockholm, Sweden, Jan. 29, 1688, the son of a bishop, and of noble family. He was graduated at the University of Upsala, and, after four years of travel, was given a position in the College of Mines by Charles XII., who became his friend. For some years he busied himself in writing a host of scientific works, mainly practical, on bridges, air guns, docks, blood circulation, copper manufacturing, etc. Suddenly his scientific work stopped, and in 1749–56 appeared in twelve volumes a Latin work which he called *Heavenly Secrets*. He announced that the Lord had appeared to him, and had sent him to be the herald of a new church, and that his office was to interpret the Word of God according to its true meaning. *The New Jerusalem and Its Heavenly Doctrine* and many other theological works followed. Swedenborg made no effort to found a church, but confined himself to the work of announcing the new doctrines which were to be its basis. As a man he was modest and retiring, genial and happy, and lived a most simple and quiet life. He died at London, March 29, 1772. Since his death, religious societies have been founded on Swedenborg's teachings, and are banded together in America as the general convention, and in England as the general conference of the New Church. See *Life*, by Wilkinson.

Swift or **Chim'ney Swal'low,** a small bird abundant in the eastern United States, nesting in chimneys. Notwithstanding its common name, the bird is not a swallow, having only a superficial resemblance to the latter birds, while in structure it is very different. It is closely related to the humming birds and the goat-suckers. The bird is about five and one-fourth inches long, of sooty-brown color, with a paler throat. The feathers of the short tail end in sharp bristles, which aid in climbing. There is only one kind in the United States east of the Rocky mountains, but there are about fifty species inhabiting the warmer parts of the world. In most of them the salivary glands are highly developed, and the secretion from them is used as a glue to hold the nest together and to its support. In China one species constructs a nest that is used in making soup.

Swift, Jon'athan, was born at Dublin, Nov. 30, 1667, after his father's death, and was brought up in poverty, what little support he had being furnished by relatives. He spent seven years at Trinity college, Dublin, most of the time in disgrace with the authorities. He was then taken into the family of the politician and ex-minister, Sir William Temple. Four years later his pride drove him away from his patron's house, and he became a clergyman. But soon threw up the Irish living he had had for two years, and went back to Sir William's service, remaining there till his patron's death in 1699, and publishing an edition of Temple's works (1700–03). In 1704, appeared his first work, *A Tale of a Tub*, the wildest and wittiest satire of the 18th century. This work cost him a bishopric and forced him to be contented for life with the deanery of St. Patrick's, Dublin. In politics he was at first a Whig, but in 1710 he joined the Tories and became easily the most powerful pamphleteer in England, his *The Conduct of the Allies* being an English classic. The death of Queen Anne put the Tories out of power, and Swift retired to St. Patrick's. His famous *Drapier's Letters*, written in 1724 against the copper money which was to be supplied to Ireland by a certain Wood, who had bought the right from the English government, made him at one bound the most popular and most powerful man in all Ireland. A reward of $1,500 was offered for the name of the author, but no one of the many in the secret thought of betraying him. At last the scheme was given up. In 1726, Swift published his most popular work, *Gulliver's Travels*. Almost as great a masterpiece is *The Modest Proposal*, in which he suggests, in seeming cold blood, that in order to relieve their poverty and distress the Irish should sell their children as food for the rich. Swift died Oct. 19, 1745. See John Forster's *Life of Jonathan Swift*; and Thackeray's *English Humorists*.

Swim'ming. The weight of the human body is so little greater than that of water, that it can readily be floated, especially when,

as in swimming, it is forced through the water by the arms and legs. Benjamin Franklin suggested as a good way to learn to swim, to wade out breast deep, and tossing an egg into the water in the direction of the shore, to plunge after it; it will soon be discovered that it is easier to swim than to sink. In swimming on the breast, the stroke is made by vigorously kicking out the legs — previously bent up — and at the same time thrusting the arms straight ahead in the form of a wedge, then drawing up the legs for another stroke, while the arms are swept through the water in the form of a half circle. The stroke, is made most powerful by keeping the feet as widely apart as possible. Breast swimming is the easiest method and is always used for long distances. A faster way is to swim on the side; the under arm only being thrust forward, while the other is thrust downward and backward. In over-hand swimming each arm is thrown out of the water alternately, the swimmer at the same time turning from side to side; this is the fastest method. In swimming on the back the arms are not used at all. In treading water the swimmer stands upright and treads the water as if walking up a pair of stairs. In floating the swimmer lies on his back, keeping his face only out of the water. It is easier to swim in salt water than in fresh, as it is more buoyant. The Greek story of Leander's famous swim across the Hellespont was made probable by Lord Byron's performing the same feat in 1810. In 1875, an Englishman, Matthew Webb, swam 20 miles in 4 hours and 42 minutes, and the same year swam the English channel from Dover to Calais, the tide carrying him on a zigzag of about 50 miles, in 22 hours. A fourteen-year-old girl, Agnes Beckwith, swam five miles in 67 minutes.

Swinburne (*swin'burn*), **Algernon Charles,** an English poet, was born at London, April 5, 1837, the son of Admiral Swinburne. He was educated at Baliol college, Oxford, and spent some time in study in France. Two plays, *Queen Mother* and *Rosamond*, were his first writings, followed by his best-known poem, the tragedy, *Atalanta in Calydon*. His later poems are *The Armada*, and *An Autumn Vision*. Swinburne enjoys great popularity in America as well as in England, being especially remarkable for his facile metrical invention; and was for a time under consideration as successor to Tennyson in the English poet laureateship. His chief prose writings include *A Study of Shakespeare, A Study of Ben Jonson, A Study of Victor Hugo, Wm. Blake: a critical Essay, Essays and Studies*, and *Prose Miscellanies.*

ALGERNON C. SWINBURNE.

Swine are among the most important of food animals. For the wild boars, from which swine are probably descended, see BOAR. The word boar is now used of the male hog; the female is termed sow — the young are called pigs, and when half-grown, shoats. A sow has two litters a year of from eight to twelve pigs each, or even more; and it has been calculated that in ten generations the descendants of a single sow would number over 6,000,000. Pork is held to be unwholesome in warm countries, and the ancient Egyptians, as also the Jews and Mohammedans, did not use it.

The Neapolitan hog is the finest of the Italian breeds; it is black, with a short snout, and upright ears. The Berkshire English swine are both black and white, and make fine bacon and hams. One of the most valuable of English breeds is the Essex, a black hog, which is easily fattened, and at 12 to 18 months furnishes from 250 to 400 pounds of dressed meat. Suffolk swine, though small, put on a large amount of fat for the food they eat. Chinese swine are easily fattened, but are chiefly used to cross with English breeds. Pork packing is one of the great branches of business in the United States. Its leading centers are Chicago, Cincinnati, and Kansas City, in the order named. In 1890, the packing establishments put on the market 3,047,651,000 pounds of hog product, not counting hogs killed by farmers for their own use, or sold by them in towns and cities. This output was nearly three times that of 1873.

Swit'zerland, an inland country of Europe. Its greatest length from east to west is 180 miles, its greatest width from north to south, 130 miles, and its area 15,976 square miles. Switzerland is the most mountainous country on the globe. Its principal chains are the Alps and the Jura. The Alps run from east to west along the southern or Italian frontier, and their windings and spurs fill more than half the country. The mean height of the highest chain is from 8,000 to 9,000 feet. The Jura run northeast from the western corner of Switzerland, and are a series of parallel ridges shutting in long and narrow valleys; their mean height is not over 4,000 feet. In the angle formed between them and the Alps lies the plain of Switzerland, 1,400 feet above the sea, and 100 miles long by from 20 to 30 broad. To the east of this tableland is the Thur hill country, between lakes Zürich and Constance. The Jura, the plain, and the hill country are the main divisions of northern Switzerland. The Alpine region is divided into the valleys drained by the Rhône; those drained by the Ticino; the Grisons, valleys drained by the branches

of the Rhine and Danube; the Bernese Oberland, sloping toward the plain of Switzerland; and the Forest cantons, surrounding Lake Lucerne. Everywhere above 9,500 feet high the mountains are covered with everlasting snow, which descends along the hollows in glaciers to a much lower level, and in this way covers the higher parts of the country with a vast sea of ice. The lowest part of Switzerland is in the valley of the Rhine, between Constance and Basel, and the banks of lakes Zürich and Maggiore.

Good coal is not to be had, and the houses are mostly wooden, so that the forests, which cover one-sixth of the surface, are very valuable. The trees, cut on the heights and trimmed of their branches, are slid down the icy slopes to the valleys below and loaded on rafts. The chief business is that of the herdsmen and shepherds, who spend the summer with their cattle on the mountains, living in rude huts called châlets, and there the butter and cheese are made. The plain of Switzerland is a rich farming region; large quantities of grapes are grown at Vaud and Neuchâtel, and the orchards of the Thur country and Lake Constance furnish the Kirchwasser, the common drink of the people. In Switzerland, out of every 100 square miles 30 are filled with rocks, glaciers, and water; 17 with forests; 11 with plowed lands; 20 with meadows, and one with vineyards. The manufactures are chiefly confined to the northern cantons — silk in Zürich, Aargau, Glarus, and Basel; cotton in Zürich, St. Gall, Appenzell, Aargau, Glarus, and Neuchâtel; watchmaking in Geneva and Neuchâtel; straw plaiting in Aargau and Lucerne, etc. Though without a seaport, Switzerland's trade in proportion to population has long been greater than that of any European country, except England. The chief imports are wheat, salt, raw silk, and cotton; the chief exports are charcoal, cattle, silks, cottons, watches, and jewelry.

Each of the twenty-five cantons of Switzerland rules its home affairs, in some of the cantons by means of a representative assembly, in others by the Landesgemeinde or assembly of all the men in the canton. The federal legislature has two houses, the state council and the national council. The president of the republic, elected by the federal assembly for the term of one year, has little power, being merely one of the federal council of seven, which is chosen for three years. Almost every head of a family has his plot of ground, and there are no great estates or powerful landowners.

There is no standing army, but every citizen is obliged to serve as a soldier, so that the children are taught at school to bear arms, from the age of eight passing through annual exercises and reviews. In fifteen cantons the German language prevails; in five, the French; in one, the Italian; and in one, the Roumansch, a Latin dialect which still lingers in the Grisons. Basel, Bern, and Geneva are the centers of the Protestant part of Switzerland, while the Alpine region is almost wholly Catholic. Three years schooling is required for every child, and in every district there are both primary and secondary schools. There are many higher and specialized schools that are largely attended; and five universities situated at Basel, Bern, Zürich, Geneva, and Lausanne. Basel university dates back to 1460. The total attendance is 3,992. Switzerland has 1,505 post offices; 2,347 miles of railway, and a very complete system of telegraphs, which is almost wholly under state control. The chief towns are Zürich (population 150,239), Basel (population 112,842), Geneva (population 104,044), Bern (population 63,994), and Lausanne (population 56,000).

The first people of Switzerland were the Helvetii in the northwest, and the Ræthians in the southeast, both of which races were conquered by the Romans, and had parts of their territories settled by Burgundians, Alemanni, and Goths. From the 5th to the 7th century, Christianity was adopted. In the early part of the middle ages the country formed part of the German empire. In the 13th century civil wars broke out, during which many of the towns obtained special rights and charters. The attack of the emperor, Albert I., on the great towns caused the men of the Forest cantons in 1307 to begin a war against Austria, which gained them freedom in 1315. A league of eight cantons was formed in 1352, followed by other wars with Austria, ending with the famous Swiss victory of Sempach. In 1415, Aargau and Thurgau were conquered from Austria, and Ticino, beyond the Alps, was annexed three years later. In 1476, the battles of Granson and Morat (Murten) were won from Charles the Bold, and in 1499 the emperor, Maximilian, was defeated in six engagements.

Zürich, under the preaching of Zwingli, became a Protestant city in 1523, followed by Bern and other northern cantons. A religious war was waged against the Catholic Forest cantons, in which the Catholics were successful. In the treaty of Westphalia, at the end of the Thirty Years' war in 1648, the European states acknowledged the independence of Switzerland. The French seized Switzerland in 1798, but it recovered its freedom in 1814. Since that time the chief events have been local rebellions and other attempts of the people in the various cantons to get back powers which they had gradually lost to corporations and great families. In 1844, the radical party organized bodies of armed men, called the Free Corps, for the purpose of driving out the Jesuits. The Catholic cantons formed in their defense the league called the Sonderbund. After several town revolutions, a majority of the federal diet declared against the Jesuits and the Sonderbund, and waged a successful civil war against the Catholic cantons. The present constitution was chosen in 1874. Population 3,312,551. See

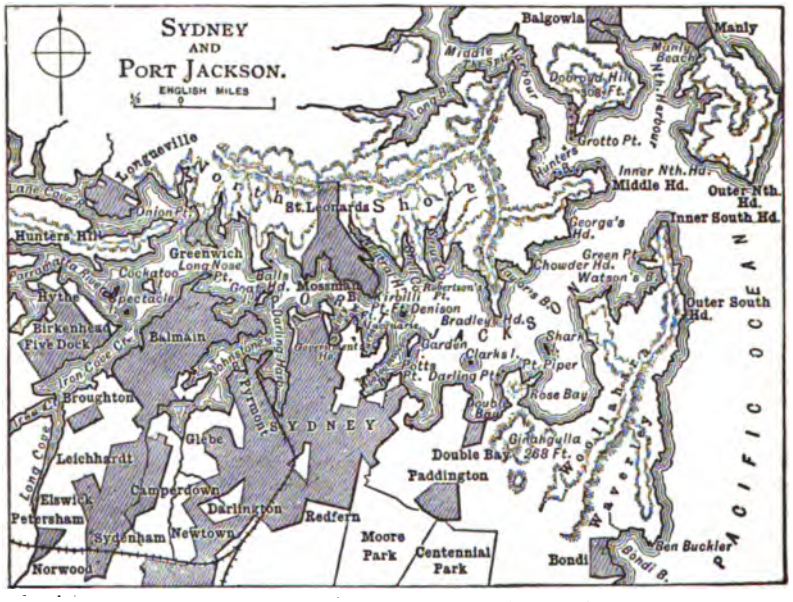
Zschokke's *History of Switzerland* (English translation); and *The Swiss Confederation*, by Adams and Cunningham.

Sword'fish, a large fish of the open sea, having the bones of the upper jaw extended into a long blade. There is only one species found abundantly in the Mediterranean, and less abundantly along the New England coast. It is also found in the Pacific and other seas. The body is rather elongated but stout, the dorsal fin is high, the ventrals are absent. These fish are dark blue in color, and range in size from four to fifteen feet or more, and from 150 to 800 pounds. They eat nearly all kinds of fish. Rising in the midst of a school, they strike several with the sword and eat them deliberately. They are sought as food, and harpooned from the bowsprit of small vessels. In former years about one and one-half million pounds, annually, were brought into eastern ports of the United States.

SWORDFISH.

Syc'amore, the common name in the United States of the plane or buttonwood tree, well known for its white bark and broad leaves, and round balls. The true sycamore is a species of fig, common in Egypt. The wood is so lasting that it was used for mummy cases. It is the tree mentioned in the Bible.

Syd'ney, a city of Australia, the capital of New South Wales, is on Port Jackson, a bay of the Indian ocean. The city looks like an old English town with some fine public buildings, as the exchange, the government house, the parliament houses, the treasury, the university, and two cathedrals. It has several fine parks and a botanical garden of 38 acres. There are four colleges connected with the university, which has a faculty of 49 members and an attendance of 519 students. There is also a college for women, a free museum, a free public library of 144,244 volumes, and an observatory. It has a fine harbor, with extensive shipyards and docks, and is defended by several forts and batteries. Population estimated 438,300.



Symbiosis (*sim-bī-ō'sis*) (in plants), the living together of two kinds of organisms in more or less intimate relation. The word sometimes has a very general application, including even such a case as a vine and the tree upon which it climbs. Generally, however, it is used only in connection with cases of intimate organic union. The most notable case is the association of an alga and a fungus in the formation of a lichen. Various forms of symbiosis are recognized, dependent upon the significance of the relationship between the two symbionts. Parasitism is one form, in which one symbiont is more or less injurious to the other. This form is amply illustrated by the numerous cases in which parasitic fungi attack living plants and animals. Mu-

tualism is that form of symbiosis in which the relation between the two symbionts is mutually helpful. Many botanists consider the lichen an illustration of this, in which the alga and fungus are of help to one another. (See LICHENS.) Helotism is a form of symbiosis in which one organism enslaves another in order to use its products. In this case the enslaving symbiont is benefited, while the enslaved symbiont is neither injured nor benefited. Many botanists think that this is the form of symbiosis displayed by lichens, the fungus enslaving the alga in order to obtain the food which it manufactures, and still protecting it within the meshes of the mycelium. (See LICHENS.) Root tubercles and mycorrhiza (see both) are also illustrations of symbiosis of complex character. In fact, the phenomenon of symbiosis is displayed more extensively among plants than was formerly supposed.

Symmes, John Cleves, an American pioneer, was born on Long Island in 1742. He obtained from congress in 1788 a grant of 1,000,000 acres along the Ohio, between the two Miami rivers, and a colony from New Jersey made the first settlement on the land, naming the town Losantiville, which was changed by Governor St. Clair to Cincinnati. Symmes City was also founded at North Bend, a few miles below, and for some years was a rival of Cincinnati, until Fort Washington was established at the upper town.

Symmes, John Cleves, nephew of the above, was born in 1780 in New Jersey. He was in the War of 1812, and afterward settled at Newport, Ky., where he developed, in lectures and writings, his idea that the earth is a hollow globe, and can be inhabited. He died at Hamilton, O., May 28, 1829.

Symonds (*sim'ondz*), **John Addington,** an English man of letters who wrote largely on Italian history and literature, was born at Bristol, Oct. 5, 1840, and died at Rome, April 19, 1893. His chief writings are an *Introduction to the Study of Dante; Studies of the Greek Poets; Sketches in Italy and Greece; The Renaissance in Italy; Italian Byeways;* with *Lives* of Shelley, Ben Jonson, Sir Philip Sidney, Boccaccio, Benevento Cellini, Michael Angelo, and *Shakespeare's Predecessors in the English Drama.* His work is marked by accurate learning and much critical insight. *The Renaissance in Italy* is his chief work, which forms in its several parts seven volumes, and on which the author spent eleven years of intelligent labor.

Sympathet'ic Nerv'ous Sys'tem, a nervous system developed in vertebrated animals above the fishes. It consists of a double row of ganglia united by nerve trunks, and is located within the cavity of the body, along each side of the spinal column. In this way two chains are formed, reaching from the base of the skull to the end of the body cavity. The ganglia are collections of gray matter, or nerve cells, and nerve fibers pass through them to and from the spinal cord. The sympathetic system is connected with the central nervous system by numerous nerve trunks, or communicating branches. It also sends branches to the viscera. It acts as a kind of relay center for regulating the blood supply to the abdominal viscera, and assisting in other involuntary actions. See Gray's or Quain's *Anatomy* for a longer description.

Sympetalous (*sim-pĕt'al-ŭs*) **Flowers,** those in which the petals are more or less united, as distinguished from those which are polypetalous, in which the petals are entirely distinct from one another. The sympetalous condition is characteristic of families of the highest rank, in which the corolla takes such forms as a bell, urn, tube, trumpet, etc. The noun form is "sympetaly." Equivalent terms are "gamepetalous flowers" and "monopetalous flowers." See FLOWER.

Synagogue (*sĭna'-gŏg*), the name of the Jewish house of worship, or church. Synagogues were first established in Judæa, when the country was under the Greek and Persian rule, and were sometimes used for schools. The synagogue has seats and desks on the floor for the men, and galleries for the women. There is an ark containing the Hebrew copies of the books of Moses, and a platform for the reader, and a smaller platform for the preacher or lecturer. The congregation must face the east while certain prayers are recited. Modern synagogues have arrangements for a choir and are more like Christian churches.

Syncarpous (*sĭn-kär'pŭs*) **Flowers,** those in which two or more carpels are organized together to form a single pistil, commonly called a "compound pistil." The contrasting term is "apocarpous," or "carpels distinct from one another." See FLOWER.

Synergids (*sin'er-jids*) (in plants), two cells which are associated with the egg in angiosperms, and with it form the group of three cells, called the "egg apparatus." This group is situated at the micropylar end of the embryo sac, to which the pollen tube comes. The name means "helpers," and refers to the fact that these cells are of service in the process of fertilization. During this process one of the synergids becomes disorganized, contributing of its substance to the nourishment of the pollen tube and its contents. See EMBRYO SAC.

Syracuse (*sĭr'a-kūs*), a city, once the largest city of Sicily, its walls being 22 miles around, and its inhabitants numbering anywhere from 500,000 to 1,000,000. It was formed of five towns, and was sometimes called Pentapolis. Ortygia, the first part of Syracuse, was built on a small island, connected with the mainland by a causeway. The modern city is fortified, and has palaces.

churches, convents, and a fine cathedral, built on the site of the ancient temple of Minerva. There are many ruins of the ancient city — the old theatre, cut out of the rocks, with sixty rows of seats, for 24,000 spectators; ancient quarries, 60 to 80 feet deep, sometimes used as prisons, one of them being called "the ear of Dionysius"; a great aqueduct; and extensive catacombs. The fountain of Arethusa, on the island of Ortygia, has been restored by the city. The trade is in wine, brandy, oil, fruits, salt, saltpeter, and sulphur. Syracuse was founded by the Corinthians in 734 B. C., and grew rapidly, sending out several colonies. The government was in the hands of a few leading families, and in 487, after a revolution in which the people had driven them out, they returned, and the despot or "tyrant," Gelon, became master of Syracuse. He was a great ruler and the city prospered under him, as also under the reign of his successor, Hiero. In 466, Thrasybulus was expelled and the city enjoyed a free government for sixty years, during which it was victorious over Athens. Dionysius restored the "tyranny," strengthened the city, and overcame Carthage. In 212 B. C., the city, which had joined the Carthaginians, was conquered by the Romans. It was burnt by the Saracens in 878, and has been three times nearly destroyed by earthquakes. Its present population is estimated at 26,346.

Syr'acuse, a city of New York, is on Onondaga lake, about half way between Albany and Buffalo. It is a handsome city, with broad, shaded streets and ornamental squares. The state armory, asylums for idiot and for orphans, a home for aged women, savings bank, courthouse, etc., are among the fine buildings. The great industry is the manufacture of salt, which has been made in the region since 1654, when the springs were visited by Jesuit missionaries and the salt carried to Quebec. There are a large number of companies engaged in the business, and several millions of bushels of salt are yearly produced. Other manufactures are extension tables, musical instruments, picture frames, mowers and reapers, boots and shoes, hardware, and cigars, with Bessemer steel works, blast furnaces, foundries, etc. The city annually expends $402,714 to maintain its public schools, which have a force of 474 teachers, and an attendance of 19,064 pupils. Syracuse university is on a hill overlooking Lake Onondaga, was founded by the Methodists in 1870, and has three departments, liberal arts, fine arts, and medicine. There is a hall of languages, the Holden observatory, and a library building containing Leopold Von Ranke's fine historical collection of books. Syracuse was first settled by an Indian trader in 1787. In 1789, it was called Salt Point, and the manufacture of salt begun by white settlers. The place was soon called Salina, and grew slowly until it was incorporated as a village in 1825. In 1847, Salina and Syracuse, which were rival villages, were united with the name Syracuse. Population 108,374.

Syr'acuse Univer'sity, Syracuse, N. Y., a coeducational institution, has colleges of liberal arts, applied science, fine arts, medicine, and laws. It has 150 instructors and lecturers, with an attendance of 1,600 students.

Syria (*sir'i-a*), a division of Turkey, lying on the Mediterranean sea between Asia Minor and Arabia, including 109,509 square miles. The country is crossed from north to south by a double mountain chain, Lebanon, the highest part having its summit 10,000 feet above the sea. The valley between the two ranges, Lebanon and Anti-Libanus, is about 2,300 feet above the sea, and was the site of the cities of Heliopolis and Baalbek. This valley separates into two parts, through one of which the Leontes river makes its way to the Mediterranean, while the other descends rapidly to the valley of the Jordan. At the lake of Tiberias the valley is 650 feet below the level of the sea, and at the Dead sea, 60 miles below, it is 1,300 feet below sea level. The region around the Dead sea is full of salt and without vegetation. The coast line of Syria is broken by the bays of Tripoli, Beyrout, Acre, and Saida. The Jordan, Litany (Leontes), Asi (Orontes), Barada, and Awaj (the Abana and Pharpar of the Bible) are the principal rivers, with the Euphrates on the eastern border. The plains of Esdraelon, Sharon, and Gaza are level tracts, and the region around Damascus is a sandy desert in which are the ruins of Palmyra. Iron, quicksilver, coal, salt, and bitumen are the minerals of the country. The climate varies from the cool summers of the slopes of Lebanon to the tropical heat of the Jordan valley, with a dry season from April to October. In spite of the imperfect methods and ancient implements used in agriculture, the crops are large. Wheat, barley, rice, cotton, hemp, indigo, tobacco, are important crops, while all kinds of fruit are grown. Vineyards cover the hills, and forests of cedar and pine the mountains. The horses are very strong and handsome; the broad-tailed sheep is found here only; cattle are small and poor, and wild animals abound in the mountains. The manufactures of the country are unimportant, though the rearing of silk worms is carried on extensively. Its chief city is Damascus, with a population of 140,500.

The people of Syria are of many races and sects. The Mohammedans are mostly Arabs though there is a small proportion of Turks, the ruling race. The Mohammedans, Druses, Maronites, Greeks, that is, adherents of the Greek church, Armenians, Catholics, Protestants, and Jews represent the religious divisions. The schools are carried on mainly by

the Greeks, Catholics, and especially by the Protestant missionaries, who founded the college at Beyrout. The Syriac language belongs to the Semitic group, and is an Aramaic dialect. The ancient Syriac is still the sacred language of the remnants of the Christian churches of Syria and Asia Minor, though it is practically a dead language to the best educated among them. The oldest book in Syriac still existing is a translation of the Bible, made about 200 A. D.

The Kingdom of Damascus, which occupied the central part of Syria, was conquered by the Assyrians about 740 B. C. Along the Mediterranean was Phœnicia, with such cities as Tyre and Sidon, the greatest commercial nations of the ancients, but conquered also by the Assyrians. Anakims, Canaanites, Ammonites, and Moabites were tribes living beyond the Jordan and in the southwestern parts of Palestine. The entrance of the Israelites into Palestine took place about 1500 or 1300 B. C., and their power lasted 1,500 years. A part of the nation, the ten tribes, were taken captive by the Assyrians in 721, the Samaritans found in the country at the time of Christ being descendants of the remnant of the Israelites and the colonists from Babylonia, that took the place of the captives. Judah fell before Nebuchadnezzar, but the people were restored to their land after seventy years of exile, though the country was still governed by Persian rulers. The battle of Issus (333) gave Syria to Alexander the Great, but at his death the country was divided, Egypt holding Palestine, and Seleucus Nicator ruling northern Syria, where he built Antioch, for many centuries one of the greatest of eastern cities. Syria was conquered by the Romans about 63 B. C., and ruled by Roman officers. In the 7th century A. D., it became a part of the Mohammedan empire, and in the 11th century was in the hands of the Seljuk Turks, whose cruel treatment of Christian pilgrims led to the crusades. The Christian princes ruled only a short time, the land being overrun by the Mamelukes and the opposing forces of Tamerlane. Since 1517 it has belonged to the Ottoman empire. Population 3,317,600.

T

Tab'ernacle was the tent first raised by Moses in the desert as a sign of God's presence among the people. It was divided into the sanctuary proper, which formed the front part, and the holy of holies. A sort of court yard, formed by curtains hung between columns, ran round the tabernacle. The entrance was toward the rising sun, and was shut in by another costly curtain, into which, as in the first covering, figures of cherubim were woven. The court was much larger on the eastern side, for here the people gathered to worship. Here also stood the altar, made of acacia wood, on which a fire was kept burning, and the brazen laver or basin. The sanctuary contained the gilded table holding the showbread, the golden candlesticks, and in the center the golden altar of incense, upon which the high priest burned incense morning and evening. In the holy of holies was kept the ark of the covenant, an acacia wood box, gold-plated and gold-lined, in which was kept the two tables of the Ten Commandments. On top of the ark were the two cherubim, and between them the symbolical presence of the Jehovah — the Shechinah.

Only once a year, on the Day of Atonement, did the high priest enter the holy of holies, while the sanctuary was the ordinary place of the priests, and the court that of the Levites. The Levites had charge of the tabernacle, carrying it from place to place on the march of the Israelites. The tabernacle was permanently set up in Shiloh, and was probably removed to Nob and thence to Gibeon, from which Solomon seems to have carried it away, in order that all the nation might worship at Jerusalem.

Ta'bor, a celebrated mountain of northern Palestine, rising from the plain of Esdraelon to a height of 1,000 feet and commanding the widest and finest view in Palestine. It is thickly clad with forests of oak and other trees. It was renowned from early times as the place of Christ's transfiguration, though it is now believed that at one time a city stood on its summit. In the times of the crusades, Tabor was studded with churches and monasteries. Here Deborah and Barak summoned the warriors of Israel before the battle with Sisera; ten thousand Jews were slain near by in a battle against the Romans in 55 B. C.; and at its foot Napoleon gained a great victory over the Turks.

Tabriz (*tä-brēz'*), an old city of Persia, on the Aji river, forty miles from lake Urumiah. A ditch and a brick wall with seven gates surround the city. Water, a rare thing in the east, is plentiful. The fine ruin, the "Blue Mosque," is covered in part with arabesqued blue tiles. The citadel is a brick building, whose walls have been cracked by earthquakes. The chief manufactures are leather, silk, and gold and silver smithing. Tabriz is on a caravan route, and is a city of business importance, doing a large trade with Russia.

Tabriz, the ancient Tauris, became the capital of Armenia in 297 A. D. Zobeida, the wife of Haroun-al-Raschid, greatly enlarged it. It was sacked by Timur in 1392, and after being held by the Turkomans, was taken by the Persians in 1500. The place has often been damaged by earthquakes, that of 1721 causing, it is said, the death of 80,000 persons. Population 180,000. See Eastwick's *Three Years' Residence in Persia.*

Tacitus (*tas'i-tus*), **Calus Cornelius,** the Roman historian, was born probably about 55 A. D. He enjoyed the favor of the emperors Vespasian, Titus, and Domitian, and married a daughter of Agricola. He held several public offices, became known as an orator, and was a close friend of the younger Pliny, through the appointment of the two to carry on the prosecution of Marius. Eleven of his letters are addressed to Pliny. Tacitus probably lived for a time after Hadrian came to the throne. His *Life of Agricola* is one of the finest biographies which has yet been written. His other works are *Histories*, *Annals*, *Germany*, and his first and less valuable *Dialogue on Orators.* These histories are the most trustworthy sources of knowledge of the times of which they treat, and have given their author high rank among the world's historians. He died, it is thought, in 118 A. D.

Tacoma (*tă-kō'mă*), a city of Washington, is on Puget sound, at the head of navigation. The sound, which is from three to five miles wide, narrows near Tacoma to an inlet less than a mile wide and five miles long. The city is built on a bluff, 200 feet high, overlooking the sound and the Cascade range, with the snowy peaks of Mt. Tacoma in the distance. The city was laid out by the Tacoma Land company, an organization by the managers of the Northern Pacific railroad, which in 1873 bought 16,000 acres near the little village of Tacoma, that consisted of one sawmill and the houses of its workmen. They made it the terminus of their road and built there two hotels, the last one costing three-quarters of a million of dollars. The salmon fisheries of Puget sound, the hop fields in Puyallup valley, the great forests of white pine and cedar on the neighboring mountains, and the coal and iron and other minerals of the region, furnish the materials of the large trade of the city. A regular transport service has been established between Tacoma and London, trains laden with hops meeting the steamers at New York, and its harbor is a starting point of steamers for Alaska. The works of the Tacoma Lumber

company cover 80 acres in the city, and they own 150,000 acres of timber land and 5,000 acres of coal land. The lumber and other products are loaded at the wharves of the city for China, Japan, and Australia. There are also large smelting works and wheat elevators. Population 37,714.

Tadolini (*tad-o-lē'nē*), **Adamo,** an Italian sculptor, born at Bologna in 1789. In 1812, his *Dying Ajax* gained him a grand prize. Among his works are *The Abduction of Ganymede*, *A Bachante*, and a *Statue of Washington.* He died in 1872.

Taft, Lara'do, American sculptor, was born at Elmwood, Ill., April 29, 1860, and graduated at the University of Illinois, and at the École des Beaux Arts, Paris. In 1886, he settled in Chicago, and became instructor in the Art Institute in that city and lecturer on art at the University Extension department of the University of Chicago. He has produced many busts and ideal subjects, and among other fine decorative work undertaken by him he decorated the Horticultural building of the World's Columbian exposition. The symbolic beauty and fine workmanship of these decorations won for the artist-sculptor great praise. Among his many busts, etc., are those of Schuyler Colfax, in Indianapolis, a statue of General Grant, and the fine reliefs for the Michigan regimental monuments on the field of Gettysburg. Mr. Taft is a member of the American Sculpture society and of the Western Society of Artists.

Taganrog (*tăg-an-rŏg'*), a seaport of south Russia, stands on the north shore of the sea of Azov. It was founded by Peter the Great in 1696. The shallow harbor forces ships to unload into barges half a mile from the quay. Wheat is the chief export, but linseed, skins, wool, etc., are also sent out. The place is strongly fortified and is the main port of the sea of Azov. Alexander I. built a beautiful palace and has a monument here. Other buildings are the admiralty, cathedral, and marine hospital. French and English gunboats damaged Taganrog by bombardment in 1855. Population 51,965.

Taglioni (*tăl-yo'nē*), **Maria,** perhaps the world's greatest dancer, was born at Stockholm in 1804. Her father was a noted Italian ballet master, and under his guidance she first danced at Vienna in 1822. Five years later, Paris went wild over the accomplished ballet girl. She married Count Gilbert de Voisin in 1847, and left the stage. She died in 1884.

Ta'gus, the largest river of the Spanish peninsula, rises on the frontier of New Castle and Aragon, flows through the Spanish and Portuguese territory, and, after a course of 540 miles, falls into the Atlantic by an inlet at some places five miles broad. Near its source, and also near Toledo, the river runs between rock walls several hundred feet high. The navigable part of the river, 115 miles, is wholly within Portugal. Lisbon and Toledo are on the Tagus.

Tail'or Bird, a small bird about the size of a warbler, living in India, Ceylon, and southern China. There are about seven species. The common tailor bird is olive green above and yellowish white underneath, with a pale brick-red crown. In making its nest, leaves at the end of a twig are sewed together, or sometimes the edges of one large leaf are united. The bill is used as a needle and fibers and grass are used as threads. This habit gives it its name of tailor bird. The united leaves do not form the nest, but are merely a receptacle for it. The nest proper is made of wool and vegetable fibers and is lined with hair.

NEST OF THE TAILOR BIRD.

Taine, Hippolyte Adolphe, a well-known French critic, was born at Vouziers, France, April 21, 1828. He studied at the Bourbon college, and in 1864 was made professor of the history and æsthetics of art in the school of arts. One of his first essays was crowned by the French academy. Among his most important works is *History of English Literature*, a clear and valuable criticism written in brilliant style. In 1871, the University of Oxford conferred upon him the honorary degree of LL. D., and in 1887, he was elected to membership in the French academy. His other writings embrace *Voyage in Italy*, *Voyage to the Pyrenees*, *The Ancient Régime*, *Notes on England*, and *The Ideal in Art.* He died at Paris, March 5, 1893.

Tai-pings, the name given to the Chinese rebels who rose in 1850 and laid waste some of the best provinces of China. The capture of Pekin by French and English troops in 1860, followed by a treaty, giving foreign merchants valuable privileges, made it to the interest of the American, French, and English governments to re-establish order in China. An American citizen, Ward, who had taken service under the emperor, showed a remarkable talent for disciplining irregular troops, and was the chief means of the success of the imperial forces in defeating the rebels at Shanghai in 1860 and 1862. In this

year Ward was killed, and "Chinese" Gordon was placed in command of his force, which became famous as Gordon's brigade. The Tai-pings were defeated in over sixteen engagements, and in 1864 almost every important city held by them was captured. The rebellion was not, however, stamped out until 1867.

Tait, Peter Guthrie, an eminent Scotch physicist, was born at Dalkeith, April 28, 1831, and died at Edinburgh, July 4, 1901. He was educated at he Edinburgh academy and university, and later at St. Peter's college, in Cambridge, where he graduated senior wrangler, and first Smith's prizeman. In 1852, he was appointed a Fellow of Peterhouse; and in 1854, professor of mathematics in Queen's college, Belfast; but since 1860 he has been professor of natural philosophy in Edinburgh. Few men have ever exercised a more thoroughly healthful influence on the teaching of physics than the subject of this sketch. At the same time he has set a wholesome example, to both students and instructors, by a very important series of contributions to knowledge. As evidence of this, witness the two quarto volumes of his *Scientific Papers* recently (1898) published by the Cambridge Press. Among his other important publications may be mentioned: *Dynamics of a Particle*, 1856; *Quaternions*, 1867; *Recent Advances in Physical Science*, 1876; Thomson & Tait's *Natural Philosophy;* and a series of textbooks covering the ground of his university lectures.

Taj Mahal (*tăzh ma-häl"*), a costly tomb built in Agra, India, by the Mogul emperor, Shah Jehan, as a burial place for his favorite wife, Noor Mahal. It is said to have cost $4,000,000, and its building employed 20,000 workmen for twenty-two years. It is of white marble, 100 feet long and wide, and 200 feet high. It is an eight-sided palace resting on a marble terrace, supporting which is a terrace of red sandstone. A dome flanked by cupolas surmounts the building and minarets rise from the four corners of the marble terrace. Inside and outside are mosaics of precious stones and beautiful tracery. The whole Koran is written in precious stones on the walls. This tomb of tombs has been described by travelers as "a glimpse of Paradise."

Talc (*tălk*), a mineral consisting of magnesium silicate containing a little water, much like mica in appearance, and easily divided into thin flakes, which can be bent and are transparent, but are not elastic like mica flakes. It is much softer than mica, however, and can be readily scratched by the finger nail, and feels greasy when rubbed with the fingers. It is silvery white, greenish white, and green with a pearly luster. It is found in crystalline and in masses. The massive varieties cannot always be separated into flakes. Massive talc, called also soapstone, steatite, potstone, and French chalk, is quarried in large quantities in Vermont, New Hampshire, Massachusetts, Maryland, Virginia, and North Carolina, and in smaller quantities in other states. Soapstone in slabs is largely used for wash tubs, etc., and for tables in chemical laboratories. It does not crack when exposed to moderate heat as slate usually does.

Tallahassee (*tal-la-has'sē*), the capital of Florida, stands on high ground, twenty-one miles north of the gulf of Mexico. The capitol was begun in 1826. There are railroad car and machine shops, a cotton factory, and a seminary. The old Spanish fort of San Louis is near by, and sixteen miles away is the well-known and beautiful spring Wakulla. The town is noted for its flowers. Tallahassee was made the territorial capital in 1822, but was not laid out until 1824. Population 3,931.

Talleyrand (*tal'li-rănd*) **Perigord, Charles Maurice,** Prince, a famous French diplomatist, was born at Paris, Feb. 14, 1754. His father, count of Talleyrand, would have had him enter the army, had he not been accidentally lamed when a child. So he became a priest and rose to be bishop of Autun. As a member of the national assembly of 1789 he was a hearty friend of Mirabeau, and at the feast of the federation in the next year, he headed a procession of 200 priests wearing the national colors over their white robes and performed mass on the altar set up in the Champ Mars. After the fall of Louis XVI., Talleyrand went to England, and then to the United States, where he reaped a fortune by speculation. He went back to France as soon as his name was crossed off the list of exiles, and in 1797, as the newly appointed minister of foreign affairs, welcomed Napoleon on his return from his famous Italian campaign. He greatly helped Napoleon to seize absolute power, and as his minister of foreign affairs became the most able diplomat in Europe. An estrangement, however, separated the two co-workers, Talleyrand resigning in 1807. To his intrigues was chiefly due Napoleon's fall in 1814, for which treachery he was for the third time made foreign minister by Louis XVIII. At the time of Napoleon's return from Elba, he was in Austria as French commissioner to the congress of

TALLEYRAND.

Vienna, but after the battle of Waterloo accompanied the king to Paris. He soon resigned his office, but still had great influence throughout the nation, men of all parties thronging his salon. He came to the front again after the revolution of 1830, as ambassador to England. His personal *Memoirs* and his *Memoir on the Commercial Relations of the United States*, are the most valuable of his writings. He died May 20, 1838.

Tallien (*tă-lyăn'*), **Jean Lambert,** a French revolutionist, was born at Paris in 1769. He first came to the front in 1792 as editor of a Jacobin newspaper, which gave him great influence. As secretary of the Commune he helped on the September massacres. He was a supporter of Marat, and was eager for the death of Louis XVI. and the Girondists. In 1793, he was sent to Bordeaux to root out this party, where he gained lasting infamy by his reckless cruelty. In 1794, he came back to Paris to become president of the convention, and to save himself from the attacks of Robespierre, he organized the destruction of the Terrorists, though he had himself been perhaps more guilty than they. Tallien now became one of the most influential men, but his past crimes could not be forgiven, and in 1798 he was forced to leave the council of five hundred. He died Nov. 16, 1820.

Talmadge (*tăl'mij*), **Thomas De Witt,** American Presbyterian clergyman and lecturer, was born at Bound Brook, N. J., Jan. 7, 1832, and was educated at the University of the City of New York, and a graduate of the Theological seminary of New Brunswick, N. J. He was pastor successively of the Reformed Dutch churches at Belleville (N. J.), Syracuse (N. Y.), and Philadelphia (Pa.), and from 1869 to 1894 he was in charge of the Central Presbyterian church at Brooklyn, N. Y. In 1895, he accepted a call to the First Presbyterian church at Washington, D. C. He is the editor of *The Christian Herald*, and has been also editorially connected with *The Christian at Work*, *The Advance*, and with Frank Leslie's *Sunday Magazine*. He has published, besides many volumes of lectures and sermons, the following: *Crumbs Swept Up*, *Around the Tea-Table*, *Mask Torn Off*, *Abominations of Modern Society*, *The Marriage Ring*, *Old Wells Dug Out*, *The Pathway of Life*, *Everyday Religion*, *From Manger to Throne*, *Woman: Her Powers and Privileges*, *Sundown*, etc. Died Apr. 12, '02.

Tal'mud. See LITERATURE, JEWISH.

Tambourine (*tam-bŏr-ēn'*), a very old musical instrument, used by Basques, Italians, and Gypsies. It is a piece of parchment stretched on a hoop furnished with little bells, and is sounded by the hand, fingers, or elbow. It is used to accompany singing and dancing, and has been adopted by the Salvation Army.

Tam'erlane. See TIMUR.

Tam'many Society, the most powerful political club in the world, is an organization of the Democratic party in New York city, which was founded in 1789. It was nearly ruined at the time when both the city and it were under control of the Tweed ring. It has been more or less opposed by outside Democrats in New York at various times, but is to-day supreme in the councils of the party.

Tam'pa, Fla., a thriving city and port of entry at the head of Tampa bay and the mouth of Hillsboro river, the capital of Hillsboro county, thirty miles from the gulf of Mexico, in western central Florida. It has a spacious harbor, and has steamship connection with Mobile, New Orleans, New York, Havana, Key West. It has railway connection with the Florida Central and Vennisula, the Savannah, Florida and Western, and other railroads. Its chief industry is the manufacture of cigars; fruit culture, the fishing trade, and the shipment of phosphate are other occupations of its townspeople. Population 15,839.

Tampico (*tăm-pē'kō*), a Mexican seaport in the state of Tamaulipas, on the Panuco, five miles from the gulf of Mexico, and 235 miles northwest of Vera Cruz. Its harbor has a dangerous bar, and is unsafe. Trade is carried on chiefly with New York, New Orleans, and Liverpool. Population about 8,000.

Tanager (*tăn'a-jēr*), the name for members of a large family of birds mainly confined to tropical America. There are about 350 species. Two forms are abundant in the eastern and southern United States. The scarlet tanager is our most brilliantly colored bird, and is familiar to most people who live within its range. It is a little more than seven inches long; the male, during the breeding period, is bright red with black wings and tail, the female is clear olive green above and greenish yellow below. After the nesting period the male becomes colored like the female. They inhabit both high and low woods and usually nest in oaks. Our other tanager is the summer redbird, a more southern species, which ranges north to New Jersey and southern Illinois. The male is bright rose red throughout, with the wings a little dusky. The female is dull olive above and yellow below.

Tananarivo (*tă-nă'nă-rē-vō'*) or **Antananarivo,** the capital of Madagascar, and residence of the sovereign of the island, is built on a long hill 7,000 feet above the sea. The houses are of wood or bamboo, roofed with bamboo or mats. The palace is sixty feet in height, and stands on the top of the hill. Courts are held in the open air near the house of the prince royal; and public meetings take place in a great natural amphitheatre, holding 100,000 persons. Witches and sorcerers are

thrown over a precipice 300 feet high. The habits and ways of the people have been greatly bettered under the teaching of missionaries. Population estimated at about 260,000.

Tancred (*tang'kred*), an Italian prince, was born in 1078. He joined the crusaders under his cousin, Bohemund, the son of the crusader, Robert Guiscard. He fought bravely at the siege of Nicaca in 1097, and in the battle of Dorglaeum saved the Christian army from being cut to pieces. In the massacre which followed the capture of Jerusalem, whose walls he was one of the first to mount, he alone had any mercy for the conquered, in whose behalf he risked his own life. Tancred defeated the advance guard of Saladin, and had a great share in the capture of Ascalon. After taking Tiberias he was made prince of the city. He defended against great odds the city of Antioch, whose governor his cousin Bohemund had left to raise recruits in the west. Tancred carried his arms as far as Tripoli, and succeeded in driving the Saracens out of Syria. He died at Antioch in 1112. He is one of the leading heroes of Tasso's famous poem, *Jerusalem Delivered.*

Taney (*taw'nĭ*), **Roger Brooke,** chief-justice of the United States, was born in Calvert county, Md., March 17, 1777. He was graduated at Dickenson college, Pennsylvania, studied law, and took part in politics as a Federalist. He afterward became a Jackson Democrat and was made attorney-general in President Jackson's cabinet in 1831. Two years later, he was appointed secretary of the treasury, as his chief knew that he could be depended upon to remove the government deposits from the United States bank to local banks, the refusal to do which had caused the dismissal of Secretary Duane. Taney succeeded the great Marshall as chief-justice of the supreme court in 1837. His most famous decision was that in the Dred-Scott case, in 1857, in which the negro Scott brought suit to gain his freedom, on the ground of his having been carried by his master from the slave state Missouri into free territory. The decision, denying the right of citizenship to negroes, and also the authority of congress to keep slavery out of the territories, caused a greater excitement throughout the country than any decision of the supreme court before or since. Chief-justice Taney died at Washington, D. C., Oct. 12, 1864. See *Life*, by Prof. Samuel Tyler.

Tanganyika (*tăn-găn-yē'kă*), meaning "the meeting place of waters," is the name of a great Central African lake discovered by Burton and Speke in 1858. It lies south of Victoria Nyanza and Albert Nyanza, and northwest of Lake Nyassa; it is about 400 miles long and from 10 to 60 miles wide, and is about 2,700 feet above the ocean. A wide bay at the southern end was named Lake Liemba by Livingstone. The eastern coast is hilly, and the western coast mountainous and covered with forests. There are many small rivers flowing into it, and the river Lukaga flows from it, though Burton thought that it acts only as a drain in the rainy season, returning its waters to the lake in the dry period. Ujiji, where Stanley found Livingstone, is the principal town on the lake.

Tangier (*tăn-jēr'*), a seaport of Morocco near the western entrance of the strait of Gibraltar, is built on high ground and is defended by forts. It is the principal center of commerce in Morocco, has important trade with Europe, doing a foreign business of $3,000,000 yearly, and is the residence of consuls and the diplomatic corps sent to Morocco. Tangier, once called Tangis, is an old city, and is thought to have been founded by the Carthaginians. It became the capital of a Roman province, was held by the Portuguese for nearly two centuries, and in 1662 was presented to Charles II. of England as part of the dowry of Catherine of Braganza. England held it for twenty-two years. In 1844 it was bombarded by the French. Population about 30,000.

Tanjore (*tăn-jōr'*), an Indian city, 180 miles southwest of Madras. There are two strong forts; in the larger one, is the rajah's palace, in the smaller, one of the finest of Indian pagodas. Silk, muslin, and cotton cloths are manufactured. Tanjore was first the capital of a Hindoo state of the same name, which was conquered by the Mahrattas, and fell into the hands of the British about 1800. Population 54,390.

Tannhauser (*tan'ow-zer*), a famous knight of the middle ages, who, according to the German legend, goes to Venusberg and enters the cave palace to behold the wonders of the Lady Venus and her court. Conscience smitten at the life of careless pleasure he lives here, he betakes himself to Rome to crave forgiveness of the pope. The pope, however, holding a wand in his hand tells Tannhäuser that he can as little get God's forgiveness as that dry wand can become green again. In despair the knight goes back to Lady Venus in the mountain. But three days afterward the wand begins to sprout and bears green leaves, and the pope at once sends messengers to every country, but in vain — Tannhäuser can nowhere be found. Such is the story as told in the popular ballad once sung all over Germany. On this Saga, Wagner based his well-known opera, *Tannhäuser.*

Tan'nin or **Tan'nic Ac'id** is of great importance in tanning leather. The chief source of tannin is oak bark, though in America hemlock bark is much used, while the mimosa or wattle barks of Australia are also important. However, tannin is found in the bark

and leaves of most forest trees, as the elm, willow, horse chestnut, and pine, and in many fruit trees, as the pear and plum. Coffee, tea, and especially Paraguay tea, also contain tannin.

Tantalus (*tan'ta-lus*), noted in Greek myth for the punishment he received in the lower world. He was the son of Zeus, and for making known the counsels of his divine father, or for other reasons, — the stories differ, — he was in the lower world stricken with a fearful thirst, and had to stand up to the chin in a lake, the waters of which escaped him whenever he tried to drink. Clusters of fruit hung over his head, but missed his grasp whenever he reached for them; at the same time he was in terror lest a huge rock, hung over his head, and ever threatening to fall should crush him. From Tantalus comes our word "tantalize."

Tapajos (*tä-pä-zhōs'*), an important river of Brazil and a branch of the Amazon, is formed by the junction of the Arinos and the Juruena. After flowing north for over 1,100 miles, the Tapajos falls into the Amazon twenty miles below the town of Santarem. Its upper waters are only eighteen miles from those of the Paraguay. There is one fall of thirty feet, but otherwise the river is navigable for the greater part of its length.

Tap'estry, an ornamental figured cloth, used for lining walls and covering furniture. The Jews and Egyptians were skillful tapestry workers. In France, the ladies of the nobility used their needles in making beautiful tapestry for the adornment of churches and monasteries. About the 9th century this work began to be done by the loom. The Flemings excelled in tapestry weaving, and in the 14th and 15th centuries the factories of Brussels, Bruges, Antwerp, Lille, and Valenciennes were noted, and in the next century the factory at Fontainebleau. The art of weaving tapestry was introduced into England near the end of the reign of Henry VIII. A famous and very old factory is that of the Gobelins at Paris. So slow is the work that thirty-nine square inches is considered a fair year's work for one artist. Perhaps the most remarkable piece made by hand is the Bayeaux tapestry, which commemorates the Norman conquest. It is 214 feet long, and is of great historical value, as it shows the old Norman costumes in great detail, and also pictures events of the conquest not mentioned by any chronicler.

Tapio'ca, a farinaceous substance prepared from cassava meal, which, while moist or damp, has been heated for the purpose of drying it on hot plates. By this treatment the starch grains swell, many of them burst, and the whole agglomerates in small irregular masses or lumps. In boiling water it swells up and forms a viscous jelly-like mass.

Ta'pir, the name for several thick-skinned mammals with elongated snouts, inhabiting India, the adjacent Malayan islands, Central and South America. The tapirs, united with the rhinoceroses and horses, form a group of odd-toed ungulates, or hoofed animals; all other hoofed animals having an even number of toes. The tapirs have three toes behind and four on the front feet, but only three of these are used. The Old World tapirs are larger than those of the New World, the common Indian form being eight feet long and thirty-nine inches high at the shoulders. Their legs and front part of their body are black, but the sides and back of the hinder portion are white (see illustration). Those of the New World are brown or blackish when adult. The common South American form is about seven feet long, and inhabits thickly wooded districts as far as the Andes. It is there replaced by a mountain form living at altitudes of 7,000 and 8,000 feet. There are also two species in Central America whose habits are little known. Tapirs commonly feed on young leaves, shoots, and fruits. Those of South America are destructive to plantations. They are hunted for their flesh and hides.

MALAY TAPIR.

Tar, an impure turpentine got by burning the wood of pine and cone-bearing trees, and by distilling peat, bituminous coal, and shale. The early Greeks made tar, and the people living along the gulf of Bothnia now make it in the same way, by burning wood in a heap covered with turf, much as charcoal is made. In Sweden, trees are partly stripped of their bark, and when cut down, some six years later, are found much richer in resinous matter. In the United States, most wood tar comes from North Carolina, though it is also made in other parts of the country. It is usually made of pitch pine, and is burned in tar kilns, which are piles of pine billets in the form of an inverted cone, covered with logs, green twigs, and earth. The kiln is lighted at the top, and the tar runs out through a wooden spout at the bottom.

Coal tar is made when illuminating gas is manufactured from bituminous coal. For a long time this tar was a mere waste product, but it is now widely used as a covering to protect iron work from the weather; and the pitch is used for pavements, roof covering, etc. By distilling coal tar, benzene or benzol and other volatile products are obtained, which are very valuable as raw materials in the preparation of artificial dyes.

Tarantula (*tä-ran'tū-lä*), the name commonly applied to any large running spider of

warm countries. The true tarantula is a native of southern Europe, and got its name from being common in the neighborhood of Taranto, Italy. The bite was considered very dangerous, and was fabled to produce an epilepsy which could be cured only by dancing, until exhausted, to lively music of a particular kind. The tarantulas, using the name in its wide meaning, are dark colored, hairy spiders, with mandibles that work up and down, instead of sideways, as is the direction in most other spiders. They live under rocks and in holes which they make in the ground and line with silk. They do not spin webs, but rush upon passing insects and other prey.

Tarifa (*tä-rē'fä*), a famous Spanish city, is twenty-five miles southeast of Cape Trafalgar. It has old walls, towers, a fortress, and a Moorish castle. Tarifa was founded by the Moors, who forced all vessels passing through the strait of Gibraltar to pay tribute at this town, from which comes our word "tariff." The Castilians captured Tarifa in 1292 and held it in the face of several sieges by the Moors. The French besieged it in vain in 1811, but captured it in 1823. Population about 13,500.

Tar'iff, a table or catalogue of duties charged on different kinds of merchandise when imported into a country. The first tariff act in the United States was drawn up by Alexander Hamilton, then secretary of the treasury, in 1789. Its purpose was to put money into the country's empty treasury. It listed only 51 articles, and charged duties ranging from 5 to 15 per cent. Between 1789 and 1804 six acts amending or adding to the first measure were passed. The tariff of 1812 was a war measure and doubled all import duties.

The Lowndes-Calhoun bill of 1816 was the first tariff measure enacted to protect industries, in addition to producing a revenue. Many manufactures had sprung up during the war, and this bill was passed avowedly to protect these young industries. It was not wholly set aside till 1842. Under it ad valorem duties ranged from 7½ to 33 per cent. It was followed by the Clay tariff of 1824 and the "tariff of abominations," as it was called, of 1828, both of which further raised duties. The modifying tariff of 1832 endeavored to readjust duties more equally. The compromise tariff of 1833 provided for taking off one-third of the duties each year until a uniform rate of 20 per cent. should be reached.

The Polk-Walker tariff of 1842 owed its passage to Robert J. Walker, President Polk's secretary of the treasury. It remained in force until 1861. It threw overboard the idea of protection and aimed to be a tariff for revenue only. Duties were reduced considerably, and in 1857 further reduced to an average of 15.66 per cent.

The Morrill tariff of 1861 was avowedly protective, and more than doubled existing duties, which were raised higher yet by the bill of 1883. The McKinley tariff bill of 1890 increased duties about 60 per cent., though it also enlarged the free list. A special section which has proven to be of value in enlarging our foreign trade was inserted in this bill. It gave the President power to remove from the free list sugar, molasses, coffee, tea, and hides, in the case of any country which charged unreasonable duties on the products of the United States. This is known as the reciprocity section.

The election of 1892 placed in power the Democratic party, which was pledged to a tariff for revenue only. Accordingly, a measure known as the Wilson bill was passed, and became law in 1894. This law removed duties from raw materials, and effected lower duties in general. It also provided for an income tax, which feature was set aside by the supreme court. In 1896, the Republican party again came into power and the Dingley law was passed, which established a tariff on somewhat lower lines than the McKinley law.

Tarpeian Rock (*tär-pē'yan*), at first the name given to the whole Capitoline hill in Rome, but afterward only to the southern part of it. In the time of Romulus, a vestal virgin, Tarpeia, the daughter of the governor of the Roman citadel on the Capitoline, covetous of the golden bracelets worn by the Sabine soldiers, and tempted by their offer to give her what they wore on their left arms, opened the gate of the fortress to the Sabine king. Keeping their promise to the letter, the soldiers crushed Tarpeia to death beneath their shields, which were carried on the left arm, and she was buried on the part of the hill which bears her name. Afterward traitors were often hurled from the Tarpeian rock.

Tar'quin, the name of two kings of Rome. According to the story, Lucumo, the son of a Corinthian nobleman who had settled in Etruria, resolved to improve his fortune by going to Rome. On the way an eagle swooped down and snatching off his cap carried it high into the air, then descending, placed it on his head again. His wife Tanaquil, who was skilled in augury, prophesied from this omen the highest honors for her husband, who took the name of Tarquin. He became the guardian of the children of King Ancus Marcius, and was chosen to succeed him on the throne. His reign was a glorious one. He waged successful war against the Latins, Sabines, and Etrurians, built the Roman sewers, which remain uninjured to this day, laid out the Circus Maximus and the Forum, and began the building of the capitol, and instituted the great Roman games. He was, however, murdered after a reign of thirty-eight years, through the influence of the sons of Ancus Marcius.

His son L. Tarquin the Proud, in 534 B. C., murdered the king, Servius Tullius, his father-in-law, and usurped the crown. He ruled ably, though tyrannically, and made Rome the acknowledged head of Latium. But his heavy taxes, and especially his persecution of the popular party, which had supported the former king, Servius Tullius, caused widespread discontent. At the same time a fearful omen encouraged his enemies; from the altar in the royal palace, a serpent crept forth and devoured the entrails of the victim. At last came the rape of Lucretia by the king's son Sextus. The senate deposed the tyrant, the army revolted against him, and he was forced to flee. Three attempts to reinstate him failed, and Tarquin's reign was followed by a republic at Rome. He died 495 B. C.

Tar'sus, a city of Asiatic Turkey, on the Cydnus, about ten miles from the Mediterranean. It is built of stone, and is surrounded by a rich country. There are mosques, caravanseries, and public baths. Wheat, barley, cotton, and gall nuts are exported. Tarsus is said to have been founded by Sardanapalus. Alexander captured it and it became a large and important city under the Romans. Tarsus is noted as the birthplace of St. Paul. Population about 20,000, former population 100,000.

Tartar'ic Ac'id is found in grapes, tamarinds, pineapples, and several other fruits, usually in combination with potassium. It is generally got from argol, which is produced during the fermentation of grapes. The acid is usually seen in the form of colorless, transparent crystals, which are soluble in water and alcohol. The crystals, when gently warmed, become strongly electric. Tartaric acid is largely used in calico printing and dyeing, for making lemonade, and in drinks and lozenges as a medicine. The acid potassium tartrate, called cream of tartar, is extensively employed as an ingredient of baking powders.

Tar'tars, in its widest sense, includes all the tribes living in the tablelands of central and northern Asia, who are not of Aryan blood, that is, the Tartars proper, the Kirghiz, the Kalmucks, the Manchu Tartars, the Mongols proper, and the Tunguslans. In a narrower sense, they comprise the Mongolian or Turanian people of Turkestan. These tribes are the wandering Kirghiz, the Uzbecks, who are the ruling class, the Kiptchaks, the Buddhist Kalmucks of eastern Turkestan, and many other tribes. In central Asia the words Turk and Tartar are used interchangeably to mean Mongolian. Tartar tribes, as distinct from Turks, formed the bulk of the great Mongolian migrations from the 4th to the 10th century, which planted the Tartar in southern Russia. Tartars and Turks made up the hordes which followed Genghis Khan and Timur.

Tar'tary, the name given formerly to a broad belt of territory reaching from the seas of Japan and Okhotsk to the Caspian or perhaps to the Don. Khiva was formerly called Independent Tartary; and the Crimea was called Little Tartary, and also Crim Tartary, from the name of the tribe which settled there in the 13th century. The name is applied now, if at all, to the Turkestan region.

Tashkend (*täsh-kend'*), a city of Russian Turkestan, on the Saralka river. It stands in a rich plain, and is surrounded by a wall 12 miles around, which is pierced by 12 gates. The houses of mud, thatched with reeds, are scattered among gardens and vineyards. A fortified castle, which is the home of the governor, mosques, colleges, old temples, and a bazaar are the chief buildings. Gunpowder, silk, cotton goods, and iron are manufactured. A large trade is carried on with Bokhara, Mongolia, and the Russian provinces of Orenburg and Petropavlovsk. Tashkend is an important military point and was long coveted by the Russians, who captured it in 1854. Population 156,506. See Vambery's *Travels in Central Asia.*

Tasmania (*tas-mā'ni-ä*), (formerly known as Van Diemen's land), is an island lying south of Victoria, Australia, and separated from it by Bass strait. The colony is a British possession and at the beginning of the century was a penal settlement. Transportation of criminals to it ceased in 1853. Its area is 26,385 square miles, with a population, in 1891, of 146,667. The aborigines of Tasmania are now entirely extinct. The capital is Hobart, situate on the south of the island, with a population of about 30,000. The other chief town is Launceston (population 20,000). The principal occupations are agriculture and stock-raising; wool, wheat, hay, and oats being the chief exports. Fruit is now being successfully cultivated, especially apples and pears, which in size, appearance, and in variety far surpass those of this country and Britain. The climate is healthy and temperate. The island is known to contain tin, coal, gold, and silver. Education is unsectarian and compulsory for all children between seven and fourteen. Government is exercised by a responsible ministry, with a parliament consisting of two chambers. A resident governor represents the crown. Population, in 1901, estimated at 160,000.

Tasso (*täs'o*), **Torquato** (*tor-kwä'to*), an Italian poet, was born at Sorrento, March 11, 1544. His father, also a poet, lived in exile, and Torquato was brought up by his mother, and went to school to the Jesuits till his tenth year, when he joined his father at Rome. He passed some years in study and in helping his father by copying and correcting, when he left for Padua to study law, where he wrote his first poem, *Rinaldo,* and, after a course of philosophy at Bologna, returned to become a

member of a literary academy established by one of his friends. While at the court of Alphonso II., duke of Ferrara, in 1575, Tasso finished his masterpiece, *Jerusalem Delivered*, but rashly sent it to a society of scholars, critics, and churchmen at Rome, instead of publishing it at once. Their criticisms drove him to madness. He believed he had been denounced to the Inquisition; and one evening in 1577 he drew his dagger to stab a servant, whom he fancied to be one of his secret enemies. He was imprisoned, but escaped to his birthplace, where he recovered his reason. Two visits to Ferrara were followed by two returns of madness, after one of which he suffered an imprisonment of seven years, being set free in 1586. In 1595, the excitement of his visiting Rome to be crowned a poet — the same honor which had been bestowed on Petrarch — caused an illness from which he died April 25 of the same year. See Milman's *Life of Torquato Tasso.*

Taste, the sense by which such properties of substance as sweet, sour, bitter, salt, etc., are distinguished. The principal organ of taste is the tongue, especially its sides, base, and tip. The soft palate and the arches of the palate have also the sense of taste. The sense of taste is weakened by any great change in temperature, either of heat or cold, as after holding the tongue in ice water, or in very hot water, the taste of sugar will not be noticed. It is necessary that bodies to be tasted should be dissolved, so as to come in contact with the nerves of taste. Any substance which will not dissolve in the fluids of the mouth will be found to be tasteless, and only recognized by the sense of touch in the tongue. Bitters and acids excite sensations of taste in the most diluted forms. One part of quinine in 1,000,000 parts of water can be easily distinguished from pure water. The sense of smell is affected by most substances as well as the sense of taste, and taste and smell together form what is called the "flavor." The great use of the sense of taste is to direct in the choice of food, and in the lower animals it is even a surer guide than in man. Usually articles that are agreeable to the taste are desirable for food.

Tattoo'ing, a widespread custom among savages of marking the skin with figures by means of slight cuts or punctures and a coloring matter. It is almost universal in the South Sea islands. New Zealanders cover often the whole face and sometimes the chest, arms, and other parts of the body with tattoo patterns. A boy is tattooed on entering manhood; the operation causes considerable pain, but is born unflinchingly. A bone, edged with teeth, is dipped in a thick mixture of charcoal and water, and hammered through the skin by means of a piece of wood. The marks last for life, and look black on a brown skin, but are dark blue on the skin of a European or American. Tattooing seems to have been common among the nations with whom the Jews came in contact, as they were forbidden to practice it. The Bedouin Arabs and many tribes of American Indians tattoo, and sailors all over the world print anchors and other marks on their arms.

Tauchnitz (*touch'nits*), **Karl Christoph Traug,** a famous German printer and bookseller was born at Grosspardau, near Leipsic, Germany, in 1761. Bred a printer, he began a small printing business of his own in Leipsic in 1796. Publishing and type-founding were added to it, and it became one of the largest establishments of the kind in Germany. In 1809, he began to issue classic works in such fine and cheap editions that they circulated throughout Europe. By offering a prize of a ducat for every error pointed out, he brought out a remarkably correct edition of Homer. In 1816, he introduced stereotyping into Germany, and applied it to music, an experiment which had not been tried before. The well-known Tauchnitz edition of English authors, which now numbers some 1,600 volumes, was begun in 1842 by his nephew. The elder Tauchnitz died in 1836.

Taun'ton, a city of Massachusetts, on the Taunton river, thirty-five miles south of Boston. The falls of the Taunton river furnish water-power for its many factories. Taunton has long been noted for its manufacture of brick and iron, and its copper works are the oldest and largest in the United States. Other products are locomotives, tacks, machinery, fire brick, crucibles, cotton, flannel, and silver-plated ware. The Taunton river is noted for its herring, shad, and alewife fishing. There is an academy, a public library, and the state insane asylum. Several ponds, many shade trees, and the "green" — a public square — help to beautify the place. Taunton was settled in 1638 by a company from Taunton, England. It became a city in 1864. The town site was known to the Indians as Cohannet. It was King Philip's favorite hunting ground, and during King Philip's war it was saved from attack by the king's friendship for one of the citizens. Population 31,036.

Tau'rus, a range of mountains in Asia Minor, which forms the water-shed between the waters flowing into the Mediterranean and those flowing into the Black sea. There are two divisions of the range, the Taurus on the south and the Anti-Taurus running northeast. Snow-covered mountain tops are numerous, rising above thick forests that everywhere mantle the mountain sides. The highest peak is Arjish Dagh in the Anti-Taurus range (13,100 feet). Other noted peaks are Bulghar Dagh (11,400 feet), Gok Dagh, and Ak Dagh, each 9,800 feet. The principal pass between Syria and Asia Minor, called in early times the Cilician Gates, is formed by the valley of the upper Cydnus.

Tax'es are levied on property and persons for the support of a government. In early times rulers often raised revenues by means of property owned by the government or crown, or belonging to the king or prince himself. The possessions of subjects were often confiscated outright, fines were imposed, and in Europe for many years crimes were punishable by the payment of a stated sum of money. The Jews paid taxes mainly in the form of the first fruits of their lands and the firstborn of their flocks, and it was the heavy burden of taxation that caused the revolt of the Ten Tribes after the death of Solomon. In Athens, a royalty on the products of the mines, import duties, market licenses, assessments on wealthy citizens, and tribute from dependent nations were some of the ways used for raising money. In Rome, under the republic, to the spoils of conquered nations and their tribute were added, under the empire, tolls, taxes on grain, on the privilege of Roman citizenship, etc. In Europe, under the feudal system, kings were supported by their own lands, and in war claimed the services of their barons and knights at their own expense. Venice, in the middle ages, began the modern system of taxation by taxing land and levying import duties; but throughout Europe, until the French Revolution, and in some cases since, the nobles and clergy were privileged classes and paid no taxes. In many countries of Asia the right of taxation was given or sold to governors of provinces or to the highest bidder, a practice which often resulted in wringing from the people all that they had, which caused widespread misery. In Europe, too, taxes were sometimes farmed out at a lump sum.

In the United States, taxes are imposed by the federal, state, and municipal governments. Federal taxes are in the form of customs duties on imports and excise duties, mainly on liquors and tobacco. Both import and excise duties are indirect taxes, that is, not paid directly by the consumer. The bulk of state taxes are laid directly on property. The heaviest taxes are usually those laid for local purposes by the county or city. Besides the ordinary city or county taxes, assessments are often made on property specially benefited, for opening streets or roads, for street lamps, sewers, water service, etc.

Unjust and unfair taxation has often caused discontent and even revolutions, and how to tax without oppressing the people is a deep problem. Turgot, the French statesman, called it the art of plucking the goose without making it cry. In most countries it is now recognized that no tax can be levied without the consent of the representatives of the people who have to pay it. It was England's attempt to raise a stamp duty and a customs duty on tea in America that caused the revolt of the colonies under the celebrated cry: "No taxation without representation."

Taxidermy (*tăx'i-der-mĭ*), the art of preparing the skins of animals for the purposes of the naturalist. In preparing small animals for stuffing, the skins are removed, the flesh clinging to them is cleaned away, and they are anointed with arsenical soap. This keeps the skin supple and prevents decay and attacks of insects. Larger skins are prepared with a powder containing arsenic, burnt alum, oak bark, and camphor. The animals are then stuffed and mounted.

Taxon'omy, that division of botany which deals with the classification of plants. It is one of the oldest of subjects, and not very long ago it was the only form of botanical instruction given in the schools. Specialists in this study are called "taxonomists" or "systematists," but the plant kingdom is so vast that no one can be a specialist in the taxonomy of all groups. Accordingly there are "algologists," who classify algæ; "mycologists," who classify fungi; "bryologists," who classify mosses; "pteridologists," who classify ferns. Ordinarily when a man is called a systematist or a taxonomist, without any qualification, he is a specialist in the classification of seed-plants. The early attempts to classify plants were purely artificial, that is there was no effort to indicate their real relationships. For example, one of the earliest groupings of seed-plants was into herbs, shrubs, and trees. This brought together many wholly unrelated plants and kept apart many which are closely related, just as unrelated words are brought together in a dictionary by the accident of their first letter. The artificial system was most highly developed by Linnæus, who invented an elaborate scheme on the basis or the number of stamens and pistils in the flower. This scheme was used until quite recently, but it has now been entirely replaced by natural systems. These systems attempt to group plants together which are really related, a "family" meaning about what the term means among human beings, if one substitutes species for individuals. A natural system of classification can only become perfect when the complete development and structure of every plant is known. Hence such systems are being constantly revised as knowledge increases.

Tay, the largest river of Scotland, pours into the German ocean a greater bulk of water than any river of Great Britain. The Dochart is the chief feeder of Loch Tay, and from this lake the Tay flows past Dunkeld and Perth, at the mouth of the Earn widening into the Firth of Tay, from three-fourths to a mile wide, and falling into the German ocean about ten miles below Dundee, after a course of 120 miles. It is navigable to Perth, and the tide flows a mile further up. The salmon fisheries of the Tay are valuable.

Tay'lor, Bayard, American author and traveler, was born at Kennett Square, Pa., in

1825. At seventeen, he was apprenticed in a printing office, and soon began to publish poems in newspapers and magazines. In 1844, he made a walking tour of Europe, an account of which he published as *Views Afoot*. After writing for several newspapers, he joined the editorial staff of the *New York Tribune*, in which paper appeared his accounts of his travels in California, Mexico, up the Nile, in Asia Minor, India, China, and Japan. In 1878, he became minister to Germany. Taylor was a quick worker, throwing off many volumes of verse, fiction, sketches, essays, translations, and criticisms, besides his eleven books of travel. Some of his best travesties are in his *Echo Club*. Among the finest of his poems are *Bedouin Song*, *The Quaker Widow*, and *The Old Pennsylvania Farmer*. His masterpiece is the translation of Goethe's *Faust*, "one of the glories of American literature." Perhaps the best of his novels is *The Story of Kennett*, which is largely his own story. Taylor died at Berlin, Dec. 19, 1878. See *Life*, by Conwell.

Tay'lor, Jeremy, a great English churchman, was born at Cambridge, Aug. 15, 1613. He was the son of a barber, and was graduated at Cambridge university, becoming a clergyman before he was twenty-one. During the Civil war he seems to have followed the royal army, and was afterward withdrawn to Wales. Here, buried from the world for thirteen years, he kept a school at Newton, and employed his leisure in writing the works which gave him fame. Chief among them are, *Liberty of Prophesying*, *Holy Living*, and *Holy Dying*. At the Restoration, Taylor, as a stanch Loyalist, was made bishop of Down and Connor, an Irish see. Seven years later, he died Aug. 13, 1667. See *Life*, by R. A. Wilmott.

Tay'lor, Zachary, twelfth President of the United States, was born in Orange county, Va., Sept. 24, 1784. His father was an officer of the Revolutionary war, and one of the first settlers of Louisville, Ky., where Zachary was taken as a boy and lived till his twenty-fourth year, working on a plantation and getting but little schooling. Taylor entered the army in 1808 as lieutenant, and in 1812, as captain of a company of fifty men, two-thirds of whom were down with fever, he defended Fort Harrison, on the Wabash, against a large force of Indians, led by the famous chief Tecumseh. Promoted to the rank of major for his gallantry, he was employed during the war in fighting the Indian allies of England. He built Fort Jesup in 1822, and ten years later served as colonel in the Black Hawk war. In 1836, he was ordered to Florida, where he gained an important victory over the Seminole Indians at Okechobee, for which he was appointed brigadier-general and made commander of the United States forces in Florida. Just before the breaking out of the Mexican war, in 1845, General Taylor was ordered to Corpus Christi, occupying the point with a force of 4,000. The next spring he marched across the disputed territory between the Nueces and the Rio Grande, and built Fort Brown, opposite Matamoras. The Mexicans demanded that he should retire beyond the Nueces, and on his refusal, General Arista crossed the Rio Grande with a force of 6,000. On May 8, General Taylor defeated him at Palo Alto with 2,300 men, and a few days later drove him from a new position at Resaca de la Palma across the Rio Grande. War was at once declared by congress; 50,000 volunteers were called for; and Taylor was made a major-general, re-enforced, and ordered to invade Mexico. On Sept. 9, with 6,625 men, he attacked Monterey, which was defended by 10,000 regular troops. After ten days' siege and three days' hard fighting, it surrendered. All but 5,000 volunteers and 500 regulars of his army were now sent to aid General Scott at Vera Cruz, and he was left with this small force to oppose President Santa Anna's army of 21,000. He took a strong position at Buena Vista, fought a desperate battle and won a decided victory. This victory against enormous odds caused the utmost enthusiasm, and General Taylor, known as "Old Rough and Ready," was nominated by the Whigs for the presidency and elected. Entering the White House in 1849, he found a Democratic majority in congress, with the small but vigorous Free Soil party holding the balance of power, while such exciting questions as the admission of California, the settlement of the boundaries of Texas, the organization of the newly-acquired Mexican territories, etc., were stirring the nation. Worn out by the unaccustomed turmoil of politics, the rough, good-natured old soldier did not long enjoy his honors, but died July 9, 1850, sixteen months after his inauguration. See *Lives*, by Fry, Montgomery, and Stoddard.

ZACHARY TAYLOR.

Tea, the prepared leaves of *Thea Chinensis*, or the drink made from them. The plant is probably native to India, and was introduced into China and Japan. In the intense tropical conditions in which the native plants grow, they become small trees; but in the colder climate of China and Japan they become bushy, with smaller and tougher leaves. The black and green teas are not derived from different plants, but are the results of the different methods of preparation. Enormous quantities of tea are produced in China, Japan, India, Ceylon, and Java, but most of it is used by the native populations.

Teach'ers' Institute, a gathering of public school teachers of a state or county. An institute is held yearly or oftener, and lasts usually from one to two weeks. Free instruction is given the teachers, by lectures, class drills, etc., in the best methods of teaching and governing schools. The members of the institute, as well as specially engaged lecturers, take part. Institutes have proved a valuable help to teachers, and have raised the standard of teaching throughout the country. The first institute was held by Henry Bernard, state superintendent of schools in Connecticut, in 1839.

Teak, the name of *Tectona grandis*, a member of the verbena family. It is a forest tree of India, and its timber is prized as by far the most serviceable of all timbers for ship-building. The timber resembles mahogany, and is more durable and much lighter than oak.

TEAK.

Teal, small ducks belonging to the group of river ducks. They are abundant in Europe, America, and most other parts of the world. There are ten or fifteen kinds in the United States. The two best-known forms are the green-winged and the blue-winged teals. The former is a beautiful little duck, about fourteen inches long, abundant during migrations, and one of the best ducks as food. They feed on seeds of grass, small acorns, fallen grapes, water insects, small snails, and worms. The blue-winged teal, with a blue band across the wings, is larger, being about sixteen inches long. It is the most numerous of the smaller ducks in the eastern United States. West of the Rocky mountains it is replaced by the cinnamon teal.

Tecumseh (*tē-kŭm'se*), a famous chief of the Shawnee Indians, was born near the site of Springfield, O., about 1768. His brother, the prophet Elskwatawa, preached against the use of the white man's liquor and food, and about 1805 Tecumseh tried to gather all the western Indians into a confederacy against the whites. As a result, 400 gathered at Greenville. In 1811, while the chief was away urging the Seminoles and Creeks to rebel, General Harrison marched on his encampment to demand that plunder should be given up and that the warriors should go back to their tribes. The prophet decided to fight, but was worsted and his prestige among the Indians destroyed in the battle of Tippecanoe. On the outbreak of the War of 1812, Tecumseh led a large force to the support of the British in Canada. He was made a brigadier-general in the English service, and fought bravely in several battles. He was twice wounded, at Maguaga and while bravely defending a ford on General Proctor's retreat before General Harrison. At the siege of Fort Meigs, where he and Proctor held joint command, he saved the lives of the American prisoners. At the battle of the Thames, in Canada, he believed he would be killed, so he laid aside his general's uniform and sword, and, dressed as an Indian warrior, fought desperately till he was shot down (Oct. 5, 1813). See *Life*, by Benjamin Drake.

Teeth are structures derived from the skin of the mouth, involving both the epidermis and the dermis. Those of vertebrated animals only need be considered. In fishes and snakes, they are usually sharp processes without sockets, arising from bones of the jaws and the mouth parts. In crocodiles and all mammals, they are located in sockets. The teeth always show the habits and food of animals, and, therefore, are much used by naturalists in classification. They are of great importance to the students of fossil life, because they are usually well preserved on account of their hardness. They have been of great service in tracing the evolution of animal life during geological periods. In the herb-eating animals, there have been slow changes in the pattern of the crown of molar teeth which can be read by students like hieroglyphics. The teeth of mammals contain living pulp on the inside provided with nerves and blood vessels; this is surrounded by dentine or ivory, a bony substance produced from the dermis. The dentine is covered above the jaws by enamel, which is the hardest substance in the human body. The roots are covered with cement which joins the enamel and sometimes extends into it. When the enamel is broken or worn through, the much softer dentine is exposed; this decays and leads to cavities in the teeth, and to their destruction, if the cavities are not cleaned and filled. The typical number of teeth in mammals is 44, 22 on each jaw, and not 32, as most people suppose, because the latter number is found in man. Teeth of mammals are divided into incisors, or cutting teeth, canines, or sharp tearing teeth, premolars which appear earliest, and molars, or grinding teeth. There are usually two sets which appear in succession, the milk teeth, or temporary ones, and the permanent set. The teeth are subject to great modifications. The great cutting teeth of beavers and the tusks of elephants are modified incisors, the tusks of the walrus, and those of the wild boar, are enlarged canines. The molars, or grinding teeth, have a pattern on the crown that is characteristic of the different groups of Mammals.

Tegner (*teg-nĕr'*), **Esai'as,** a popular Swedish poet, was born at Kyrkerud, Sweden, in 1782. He was graduated and appointed lecturer on æsthetics at the University of Lund. His poem, *Sweden*, which appeared in 1811, brought him widespread popularity. The next year he took charge of a parish, besides the chair of Greek in the university, and yet found time to write, among other works, *Axel*, a poetic romance, and his epic, *Frithiof's Saga*, which at once became the most popular poem of Sweden. Its author was at once made bishop of Wexio, sat in the national legislature in the chamber of the clergy, and became noted as a political leader and speaker. When just about to be appointed archbishop, Tegner had an attack of insanity, which he inherited. He recovered his sanity but not his health, and died in 1846. *Axel* and *Frithiof's Saga* have been finely translated into English verse by Longfellow.

Teheran (*teh-rän'*), capital of Persia, stands seventy miles south of the Caspian sea, on a wide stony plain. On the northeast are the Elburz mountains, the highest peak of which is Demavend, 22,000 feet above the sea. The town is built mainly of mud houses, packed within a mud wall twenty feet high and four miles around. The finest building is the bazaar of Taki Khan. In the suburbs is the shah's palace, called the ark or citadel, and the castle of the kajar's, another royal home. In 1849, a polytechnic school was opened with European professors, introducing science and the western languages. Carpets, shoes, hats, and linen goods are manufactured. Teherân was unimportant until made the capital of Persia by Aga Mohammed Khan about 1796. Population 250,000.

Tehuantepec (*ta-wän-tà-pĕk'*), an isthmus of Mexico, between the bay of Campeachy on the gulf of Mexico and the bay of Tehuantepec on the Pacific ocean. Its narrowest part is 130 miles wide. It contains some lakes and lagoons, and two rivers, the Coatzacoalcos and the Tehuantepec. One of the several plans to join the Atlantic and Pacific by a ship canal proposed crossing this peninsula in part, by deepening and widening the Coatzacoalcos river.

Tekeli, Emeric, Count, a celebrated Hungarian patriot, was born in Zips county, Hungary, in 1656. His father had taken part in a plot to free Hungary, and after his death, Tekeli was forced to flee to Poland. Unable to get possession of his estates, he invaded Hungary, when but twenty-two years old, at the head of 20,000 men, furnished by the prince of Transylvania. He was joined by crowds of his dissatisfied countrymen, made inroads into Austria, Styria, and Moravia, and forced the Austrian emperor, Leopold I., to make promises which gained over part of his followers. But Tekeli would not trust the emperor and refused to disarm. He was supported by the Turks, who crowned him king of Upper Hungary, and took part in the famous raid of Kara Mustapha into Austria. Soon many of his partisans deserted him and his friends, the Turks, imprisoned him, but again in 1690 he was at the head of a Turkish force with which he burst into Transylvania, routed the Austrians, and roused the Hungarians to renewed efforts for freedom. But several Austrian victories over the Turks forced them to sign a treaty agreeing no longer to support the Hungarian rebels. As a result, Count Tekeli was driven from the country for whose deliverance he had risked everything, and died at Constantinople in 1705. His wife, Helena, was a noted beauty, but more noted for her gallant defense of her castle, Mongatz, against an army of Austrians.

Tel'egraph, an instrument for transmitting signals to a distance. Unless otherwise specified the word is generally used to mean the electric telegraph, which is the only one we shall here discuss.

Electric signals appear first to have been transmitted on a commercial scale by Wheatstone and Cooke in England in 1837. At each end of the "line," which consisted of five insulated metallic wires, they placed five galvanometers. Different combinations of deflections to the right and left indicated different letters. (See GALVANOMETER.) Later a single galvanometer was used, different combinations of deflections indicating as before different letters. About the same time, 1837, Morse, in America, succeeded in perfecting a receiver in which the signals could not only be seen and heard, but were automatically recorded. This is the instrument which was in universal use in the United States until operators learned to read the message by the click of the instrument. Accordingly, for ordinary work a telegraph line is provided at each end with a *battery* for producing an electric current, a *key* for opening and closing the circuit, and a small electromagnet, with pivoted armature, the so-called *sounder* or *receiver*. More recently the Wheatstone bridge has been applied to the telegraph line in such a way that two messages may be sent over a line in opposite directions at the same time. This is called the *duplex telegraph*. Edison has invented a method for sending two messages over the same line in the same direction at the same time. This is known as the *diplex telegraph*. By combining these two, four simultaneous messages may be sent. This system is called the *quadruplex telegraph*. Various plans have been suggested for sending even more than four messages at once. This is called the *multiplex telegraph*. Rowland has recently (1900) perfected a system which will not only transmit six or eight simultaneous messages, but will deliver them printed on a typewriter; and not only so, but the sending

instrument of the Rowland telegraph is merely the ordinary keyboard of a typewriter. For details concerning these various systems and concerning the important subject of submarine telegraph, first worked out by Lord Kelvin, the student is referred to the larger treatises.

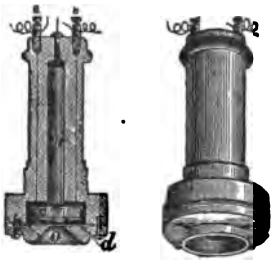
Telemachus (*te-lem'a-kus*), in Greek mythology, the son, by Penelope, of Odysseus or Ulysses, king of Ithaca, and hero in the Trojan war, who was noted for his exploits and wanderings. In search of his father, Telemachus, attended by Athene, in the guise of Mentor, goes to Pylos and elsewhere, endeavoring to find him. He at last discovers him, in the guise of a beggar, when Telemachus was lodging in the house of a shepherd. There is related to the king how his faithful wife, Penelope, is annoyed by innumerable suitors, and, returning to Ithaca, both father and son, aided by Athene (Minerva), succeed in slaying these suitors, after which the touching meeting takes place between Odysseus and Penelope. See under ULYSSES.

Telem'eter, an instrument for finding the distance of an inaccessible object. In military circles this instrument is generally called a "range finder." Nearly all telemeters are based upon one of two general principles, namely, (1) that the image of a distant object, produced by a lens, is geometrically similar to the object itself and depends for its size upon the distance of the object, or (2) that, having chosen a convenient base line of known length, it is possible by measuring the angle between this base and the direction of the distant object (first at one end of the base line and then at the other), to compute the distance of the object.

A very great variety of these instruments have been invented, some adapted to infantry in the field and therefore compact and less accurate, others adapted to naval operations in which much larger base lines and hence much greater accuracy can be obtained.

A similar process when employed by surveyors is called "stadia measurement."

Tel'ephone, an instrument for reproducing speech at a distance from its source. Perhaps the simplest solution of this problem is to connect two stretched membranes by a stretched string. The pulsations of the human voice near one membrane will set it into vibration; while the string will transmit these vibrations to the second membrane, which by its vibrations reproduces the original sound for a listening ear. This is the so-called "mechanical" or "acoustic" telephone; but it is limited to such short distances — less than a mile — that we shall not here discuss it.



BELL TELEPHONE.

The first electric telephone was undoubtedly invented by Philip Reis in Germany in 1861. To him we owe also the word "telephone."

Reis' instrument, like all others of this class, consisted of three parts, namely, one which transmitted the message, the "line" or wire over which the message was carried, and a "receiver" which finally transformed the message into sound waves for the listening ear. His transmitter was very simple, being merely a diaphragm carrying a metallic point which alternately made and broke an electric current when the diaphragm was set in vibration by the human voice. The line was an ordinary metallic wire. The receiver was an electro-magnet mounted on a sounding box. As the iron core of the magnet was alternately magnetized and demagnetized, it emitted a sound — the well-known "Page Effect," discovered by an American, Dr. Page, in 1837. In this manner Reis was able to transmit the proper *pitch* and *intensity;* but he was totally unable to convey the correct *quality*. (See ACOUSTICS for the three distinguishing features of a sound.) The proper method of transmitting the true quality of a note is the joint discovery of the late Elisha Gray and of Graham Bell.

The essential point in the solution — and, therefore, the essential discovery of these gentlemen — is the use of *continuous* electric currents instead of the *interrupted* ones employed by Reis.

The instrument which Bell patented and perfected, and which is in universal use to-day as a receiver, consists of a soft iron diaphragm, held by its periphery, in front of an electro-magnet. When an electric current, even a very minute one, is passed through the coil of the electro-magnet, the iron disk is attracted. If the current is a pulsating one, the disk is set into forced vibration, accurately following the variations of the current.

FIG. 1.

In figure 1 the diaphragm is shown at D and the electro-magnet at A. The line wires which convey the message to the receiver are attached at E.

For a transmitter, a microphone of the carbon type is almost universally employed. Two forms are in very common use: one, the Blake transmitter, is made up of a piece of gas carbon resting against a platinum pin; the other, devised by Hunning, consists of a layer of hard carbon granules. The accompanying diagram, figure 2, shows at D the diaphragm which is set in vibration by the human voice; between the carbon blocks, B and E, are placed the carbon granules which act as a microphone. See MICROPHONE.

As to telephone lines, their construction is essentially different from those of telegraph and elecric light lines. For this large subject, however, the reader is referred to a

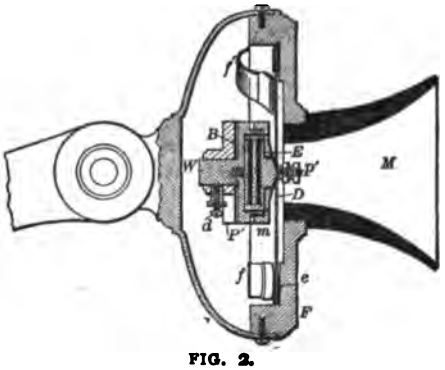


FIG. 2.

special treatise. The attention of the student is called, however, to the recent improvements introduced into submarine telephony by Professor Pupin of Columbia college. Hitherto the maximum working distance of the telephone for under-water lines has been about 25 miles. Dr. Pupin has succeeded in extending this to something like ten times the distance. For Pupin's account, see *Transactions of the American Institute of Electric Engineers*, Vol. XV. (1899) and succeeding volumes.

Telescope, an instrument for viewing distant objects, was invented, apparently, by Franz Lippershey, a Dutch spectacle maker at Middelburg, in 1608. Shortly after this date, Galileo heard of Lippershey's instrument and proceeded to make one for himself. It was with this instrument that he discovered four satellites of Jupiter, and the variable phases of Venus, thus completely establishing the heliocentric views of Copernicus.

The telescope employed by Galileo was essentially an opera glass, consisting of a small double concave (or negative) lens immediately in front of the eye, combined with a double convex (or positive) lens at some distance in front of the eye. See OPERA GLASS. But there are two reasons why the Galilean telescope is no longer used: (1) It has a very limited field, *i. e.*, no large extent of the object can be viewed with it at one time, and (2) One cannot use a micrometer eye-piece with it. See MICROMETER.

The telescope almost universally employed in modern times is the astronomical telescope which is made up of two converging lenses, as shown in Fig. 1. Let it be borne in mind that the purpose of the telescope is twofold. (1) To gather a large amount of light into a small bundle of rays, so that these can all enter the pupil of the eye, and thus make any luminous point appear much brighter than it would to the unaided eye, and (2) To magnify the angle subtended by two luminous points and thus make them appear farther apart than when seen by the naked eye. How this first

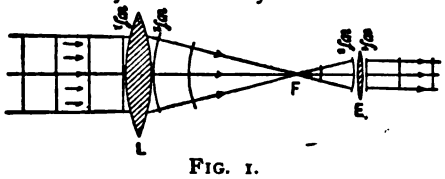

FIG. 1.

purpose is acomplished will be evident from Fig. 1., where wf_1 indicates the plane wave-front of the light coming from a distant star. The effect of the object lens, L, is to convert this parallel bundle, of rays into a conical bundle, having its apex, or focus, at F. The light leaving F is collected by the eye lens, E, and converted again into a parallel beam, wf_4, which is small enough, say $\frac{1}{2}$ of an inch, to enter the pupil of the eye. In this way nearly all the light which falls on the objective is made to enter the eye, making the star appear much brighter through the telescope than without it. How the second purpose of the telescope is accomplished will be clear from Fig. 2, which is the same as Fig. 1, except

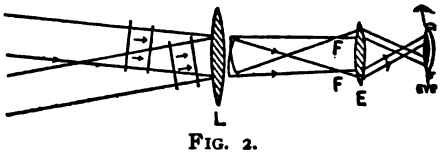

FIG. 2.

that it shows light coming from two distant stars, say a double star. Each star will send a beam of parallel rays to the objective, L. But the two beams of parallel rays which emerge from the eye lens make with each other a much larger angle than do the two beams of parallel rays which enter the objective. The telescope thus magnifies the angular distance between two stars. And since the human eye cannot distinguish two points as separate unless they subtend an angle of two minutes, the telescope enables us to recognize many stars as double when to the naked eye they appear as single.

The magnifying power of a telescope is numerically equal to the ratio of the diameters of the incident and emergent beams.

The best specimens of the astronomical telescope in existence are the 36-inch glass of the Lick observatory and the 40-inch glass of the Yerkes observatory, both made by the late Alvan G. Clark. On good nights these instruments permit the use of a magnifying power of from 2,000 to 3,000.

The reflecting telescope is little used and can therefore not be discussed within the limits of this article. Since, however, the reflector is interesting from a historical point of view, the student will do well to consult chapter vi. of Miss Clerke's *History of Astronomy*.

Teleutospore (*te-lū'to-spōr*), (in plants), a peculiar asexual spore which is developed

by the rusts, which are parasitic fungi. Wheat rust is a common example. The name refers to the fact that these spores are the last spores of the season which appear on the mycelium. As they must endure through the winter, they have very heavy walls, and hence they are usually very dark to completely black. Often they are called "winter spores." In the wheat rust, the teleutospores form the so-called "black rust" which appears on the stubble. See ÆCIDIOMYCETES.

Tell, William, according to Swiss story, was a patriot who in the 14th century rescued his native district from the tyranny of Austria. Albert I. of Austria was trying to annex the Waldstâdte, and was represented there by his bailiff, Gessler, whose rule was very cruel. Among other acts of tyranny, Gessler placed the ducal hat of Austria on top of a long pole in the market place of Altdorf, and gave orders that no one should pass without uncovering his head. Tell and his little boy one day took no notice of the hat and were dragged before the bailiff. Knowing Tell's reputation as a crossbowman, Gessler ordered him to shoot an apple from his son's head, and told him if he missed it he should die. To the wonder of all, he hit the apple without injuring the boy. But Gessler noticed a second arrow in the bowman's girdle and asked what he had meant to do with it. "To have shot you, had I killed my son," was the answer. He was at once seized, but escaped on his way to prison, and soon after shot Gessler through the heart. Then followed the great war of the Swiss against Austria, lasting from 1307 to 1499. Tell is said to have been drowned in 1350 while trying to save a friend during a great flood in the Schächen river. In 1387, Tell's chapel was built in his memory. How much of this famous story of Tell is true is not known. Schiller used the story in his *William Tell.*

Tel'ler, Henry Moore, United States senator, lawyer, and Republican politician, was born at Granger, Allegany county, N. Y., May 23, 1830, and educated at Rushford academy and Alfred university (LL.D. 1886). On studying law and being admitted to the bar, he practiced in Illinois, then removed to Colorado, where he was elected to the United States senate, and was secretary of the interior in President Arthur's cabinet (1882–85). Since 1885, he has continued to represent his state in the United States senate, but is now politically an Independent Silver Republican, having in 1896 withdrawn from the national Republican convention, at St. Louis, in that year in consequence of the financial plank in its platform adverse to free silver.

Tempe (*tem'pe*), **Vale of,** a narrow valley or gorge, about four and a half miles long, in the northeast of Thessaly, between Mount Olympus and Mount Ossa. The river Peneus flows through it. The classic poets praise it for its matchless beauty, and travelers to-day speak of the wild grandeur of its scenery.

Tem'perance. See TOTAL ABSTINENCE.

Tem'perature. The following statements, taken from Maxwell's classical volume on the *Theory of Heat,* put the matter as clearly and concisely as, perhaps, is possible.

"Definition of Temperature.— *The temperature of a body is its thermal state considered with reference to its power of communicating heat to other bodies.*

"Definition of Higher and Lower Temperature.— *If when two bodies are placed in thermal communication one of the bodies loses heat, and the other gains heat, that body which gives out heat is said to have a higher temperature than that which receives heat from it.*

"Corollary.— *If when two bodies are placed in thermal communication neither of them loses or gains heat, the two bodies are said to have equal temperatures or the same temperature.*

"Law of Equal Temperatures.— *Bodies whose temperatures are equal to that of the same body have themselves equal temperatures.*" See THERMOMETER.

Tem'plars, Knights, a celebrated religious and military order, founded at Jerusalem in the beginning of the 12th century by Hugues de Paganes, Geoffrey St. Omer, and seven other French knights, for the protection of the Holy Sepulchre and the pilgrims who visited it. Baldwin II., king of Jerusalem, gave them their first home; and another building was obtained from the abbot of the church and convent of the temple, because of which they were called Templars. Each Templar was allowed three horses and an esquire. They obeyed strict rules, and at first were proud of their poverty. When the Saracens captured Jerusalem, the Templars spread over Europe; their bravery became everywhere celebrated; money and lands were showered on them; and members of the greatest families were proud to be enrolled in their number. In every country where they were they had their governor, called the master of the temple.

The Templars at first were all laymen and of noble birth. Pope Alexander III., however, in 1162, had chaplains taken into the order, who did not adopt the military vows; and laymen not of noble birth afterward joined as serving brothers, some attending the knights and some working at trades in the houses and on the lands of the order. Many also joined merely to gain the protection afforded them. As the Templars grew in power they became luxurious, proud, and independent of law and authority. Philip IV., of France, seized and imprisoned all the members of the order on whom he could lay his hands, confiscated their lands, and put many of them to death for supposed crimes. The English Templars were treated by

Edward II. in much the same manner, except that their punishment was confined to the loss of their possessions to the king. In 1312, the order was finally suppressed by the council of Vienne, the greater part of their property being bestowed on the Knights of St. John.

The Templars' uniform was white, with a red maltese cross on the left shoulder. Their banner was white with black stripes, and was called *beauséant*, the name then given to a horse marked with black and white. Beauséant became also their battle cry. See Addison's *History of the Knights Templars*.

Ten'dril, an organ developed by many climbing plants as a holdfast. Tendrils may be modified branches, or leaves, or parts of leaves. In every case they are very sensitive, and have the power of rapid coiling or contraction when they come in contact with a support. In the grape vine, when the tendrils reach a support they coil about it, and growing unequally are thrown into spirals, thus drawing the vine toward the support. Sometimes a tendril has a sucker-like disk at its tip. When the disk becomes fastened to a support, the straight tendril becomes a spiral, and the plant is drawn toward the support. The stimulus which calls forth this response of the tendril is known as the "contact stimulus."

Ten'eriffe'. See CANARIES.

Teniers (*ten'yerz*), **David,** The Younger, was born at Antwerp in 1610. His father, also a well-known painter, gave him his first lessons in art. He soon showed a genius greater than his father's, but in the same line, as a colorist and painter of the scenes and incidents of ordinary country life. He became the most popular of Flemish painters, and was kept busy to meet the demand for his pictures. The governor of the Spanish Netherlands made him gentleman of his bedchamber, and the king of Spain set apart a special gallery for his works. In spite of the number of his paintings — over 1,000 — they bring very high prices. Among them are *The Village Wedding*, *The Bagpipe Player*, and *The Misers*. Teniers died near Brussels, April 25, 1690.

Ten'nessee', the third state admitted into the Union after the adoption of the constitution. Its greatest length is 432 miles, its greatest breadth 109 miles, and it covers 42,050 square miles. West Tennessee reaches from the Mississippi, the western boundary, to the Tennessee river; middle Tennessee stretches on eastward to the middle of the Cumberland plateau; and east Tennessee covers the rest of the state. The Mississippi bottoms, covering 1,000 square miles, are bordered on the east by a table-land covering 9,000 square miles and reaching to the Tennessee valley. In middle Tennessee, beyond the river valley, lies the garden of Tennessee, a rich plain of 5,450 square miles, like the bed of a drained lake, surrounded by a rim 300 feet high, filled with grain, cotton, and tobacco fields, and the largest red cedar forests in America. Eastward of the garden is the great Cumberland plateau, 1,000 feet above the Tennessee, rich in coal and limestone. The east Tennessee valley separates the plateau from the Alleghanies, a belt seven to 28 miles wide, including the Chilhowe, Great Smoky, Bald, and Unaka ranges. The highest peak is Clingman's Dome (6,660 feet). Among the Cumberland mountains are great caverns many miles long, in which are powerful underground streams and bones of extinct animals. Elsewhere in Tennessee are the mysterious sink holes, through which the waters drain down into the underground streams. The chief rivers are the Tennessee, which twice crosses the state, the Cumberland, the Holston, the French Broad, and the Big Hatchie.

The leading crops of the state are corn, tobacco, hay, wheat, cotton, oats, and potatoes. In tobacco Tennessee stood fifth among the states in 1889. Iron has begun to be largely mined, and the pig-iron product has greatly increased within the last ten years. The coal field covers 5,000 square miles of the Cumberland plateau. There are also lead and zinc mines, marble, kaolin, limestone, and granite quarries. Manufactures amount to over $75,000,000 yearly; cotton, wool, iron, and steel, cotton-seed oil, lumber, and leather are in the lead. The first railroad was the Memphis railroad, chartered in 1831, when there were only 50 miles in the country; in 1900 there were 3,189 miles, mostly built since the war.

In 1900, there was an attendance of 384,643 white children and 100,750 colored children in the public schools, making a total enrollment of 485,393. The University of Tennessee at Knoxville, opened in 1807; the University of Nashville, at Nashville; Grant university at Chattanooga; the University of the South at Sewanee; Vanderbilt university at Nashville, endowed with $1,000,000 by Commodore Vanderbilt; and Fisk university at Nashville, for colored students, are among the many colleges of Tennessee.

De Soto was probably the first white man to enter Tennessee. A settlement of North Carolinians, made in 1754, was broken up by the Indians. Two years later Fort London was built on the Tennessee, thirty miles from the site of Knoxville. The massacre of the garrison in 1760 was followed within a year by the defeat of the Indians and a treaty allowing settlements to be made. At first a territory of North Carolina, the dissatisfied frontiersmen organized the state of Franklin, which lasted from 1785 to 1788, when it was put down by North Carolina. Tennessee was admitted as a state in 1796. The different capitals have been Knoxville, Kingston, Murfreesboro, and Nashville, the present capital.

Tennessee seceded June 8, 1861, and was readmitted in 1866. Many of the hardest fought engagements of the war took place on Tennessee soil, as at Forts Henry and Donelson, Island No. 10, Murfreesboro, Chickamauga, Lookout Mountain, Franklin, and Nashville. Population 2,020,616. See J. B. Kellebrew's *The Resources of Tennessee.*

Ten'nessee', a river of Tennessee, is one of the largest branches of the Ohio, which it enters at Paducah, Ky. The Clinch and Holston rivers rise in southwest Virginia, and in eastern Tennessee unite to form the Tennessee river. The river flows first south, going 300 miles in Alabama, turns north, and crosses Tennessee and Kentucky. It is 800 miles to the junction of the two rivers at Kingston, Tenn., but 1,100 miles to the source of the Holston, its longest branch.

Ten'nyson, Alfred, an English poet, was born at Somersby, in Lincolnshire, England, in 1809. At Trinity college, Cambridge, where he studied, he gained a medal for a poem called *Timbuctoo.* His first publication, *Poems by Two Brothers*, was written in connection with his brother Charles, and so great an authority as Coleridge pronounced only the poems marked "C. T." to have marks of poetical genius. A volume containing the *May Queen*, *Mariana*, *A Dream of Fair Women*, and *The Lotus Eaters*, was followed by another collection which included, besides, *Locksley Hall*, *Morte d'Arthur*, *St. Simon Stylites*, and *Ulysses*, and from that time Tennyson easily held his place as the first of modern English poets. His great work, *In Memoriam*, is a series of poems on death, immortality, etc., suggested by the loss of his friend, Arthur Hallam. It was first published without Tennyson's name in 1850. The *Ode on the Death of the Duke of Wellington* and the *Charge of the Light Brigade*, one of his most popular poems, were written as poet-laureate, a position in which he succeeded Wordsworth in November, 1850. *Maud*, published in 1855, was longer in winning public favor than most of Tennyson's work, but the *Idylls of the King* met with an enthusiastic reception. The first series consists of four stories in verse, *Enid*, *Vivien*, *Elaine*, and *Guinevere*, to which a second series was added which included *The Holy Grail*, *Gareth and Lynette*, *Peleas and Etarre*, *The Last Tournament*, and *The Passing of Arthur.* They are the consummate form in which one of the greatest poets of the century has wrought those Arthurian legends which have been haunting English romance for 700 years; *Enoch Arden* appeared in 1864; *Queen Mary. a Drama*, in 1875; *Harold*, in 1876; *Becket*, in 1884; and *Demeter and other Poems*, in 1889. Tennyson lived a retired life, spending a large part of his time at his place on the Isle of Wight. He wrote carefully, altering and improving his poems, until they attained the perfect form in which they were given to the public. He received large sums of money for his later work, in some instances being paid as much as $50 a line. His poems have been translated into German and Spanish. In 1883, he was made a peer. He died at Aldworth, in Surrey, England, Oct: 6, 1892. One of his last poems, *The Crossing of the Bar*, was used in the services at his burial in the poets' corner of Westminster Abbey. See *Victorian Poets*, by Stedman; also *Tennyson, Ruskin, Mill, and other Literary Estimates*, by Frederic Harrison.

LORD TENNYSON.

Terence (*ter'ens*), **Publius Terentius Afer,** a Latin poet, was born at Carthage about 195 B. C. He was a freed slave, and was educated by his master, a Roman senator. His first play, the *Andria*, was brought out in 166 B. C., and was so successful that he had the best young men of Rome for friends. When in Greece he translated 108 of Menander's comedies, and his death is commonly thought to have been due to grief at the loss of his translations. He has left six comedies, *The Woman of Andros* (Andria), *The Stepmother*, *The Self Tormentor*, *The Eunuch*, *The Brothers*, and *Phormio.* The most popular is *The Eunuch.* They have been translated into most European languages. He died when only 36, in 159 B. C.

Terhune (*ter-hūn'*), **Mary Virginia,** American novelist, familiarly known by her pen name of "Marion Harland," was born in Amelia county, Va., Dec. 21, 1831. Her maiden name was Hawes, and in 1856 she married the Rev. Ed. Payson Terhune. At an early age she began to write for the magazines, conducting *The Home Maker*, *Babyhood*, and contributing to *Wide Awake* and *St. Nicholas.* Subsequently she resided in Massachusetts, but finally settled in New Jersey, where she has long been an untiring

"MARION HARLAND."

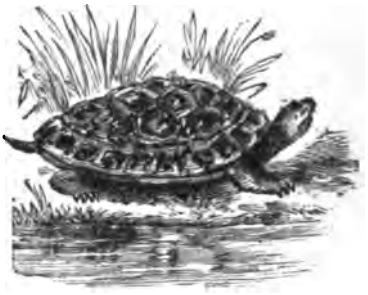
and helpful writer on themes connected with cooking, household management, etc. Among her works are, *The Story of Mary Washington*, *Alone*, *Moss Side*, *The Hidden Path*, *Common Sense in the Household*, *Common Sense in the Nursery*, *The Dinner Yearbook*, *The Cottage Kitchen*, *Breakfast, Luncheon, and Tea*, *Miriam*, *Helen Gardner's Wedding-day*, *Judith*, *Some Colonial Homesteads*, *At Last*, *Jessamine*, *Literary Hearthstones*, etc.

Tern, a water bird with forked tail, related to the gulls. These beautiful birds, usually with gray and white plumage, are common in harbors. They are most graceful birds, and it is to be regretted that of late years they have been killed in immense numbers for trimming ladies' hats. There are about fifty known species of terns. They are coast birds rather than open sea birds, like the gulls. The common tern, or sea swallow, is abundant on the Atlantic coast. It is about fifteen inches long. There is in the inland waters of North America a small black tern and a similar form in Europe.

Ter'ra Cot'ta, unglazed earthen ware, made of clay and hardened by burning. It is generally a dull red or buff in color. In England, the materials used are clay, fine quartz sand, and finely pulverized old pottery. It is used for statues, fonts, fountains, drain tiles, and ornaments for houses. The Greeks, Romans, Assyrians, and Babylonians made use of it, manufacturing molds, statuary, vases, and lamps. The articles were often ornamented with designs of men, animals, fruits, or flowers.

Terra del Fuego (*tĕr'ra del fwā'gō*), "Land of Fire," is a cluster of islands at the southern end of South America, with the straits of Magellan between them and the mainland. They are small, mountainous islands, with many peaks over 5,000 feet high, covered with perpetual snow, while the lower slopes bear forests of beech. The island proper is Terra del Fuego, 300 miles long. Cape Horn is the southern end of a small island of the group. The natives belong to the Patagonian race, build their cone-shaped huts of branches of trees stuck in the ground, with a hole for a door, dress in sealskins, and feed largely on shellfish. The climate is very variable, with storms, wind, rain, and snow in close succession. The islands were discovered by Magalhaes (Magellan) in 1520 and were named from the fires seen at night along the shores. They are nominally divided between the Argentine Republic and Chile.

Ter'rapin, the name broadly applied to small turtles belonging to a family of pond turtles (*Emydidæ*). It is frequently restricted to the salt-marsh terrapin, or diamond-back turtle, of the Atlantic coast which is highly prized as food. The region whence the diamond-back terrapin is chiefly taken is Maryland, although it is captured from New York to Texas. It is caught in great numbers in the summer and kept in pens for winter.



TERRAPIN.

It is about eight inches long; it swims well and runs well on land. The red-bellied terrapin, ranging from New York to Virginia, is often substituted for it, but the flesh of the latter is of inferior quality.

Terre Haute (*tĕr'e-hōt'*), Vigo county, Ind., is situated upon the east bank of the Wabash river on Fort Harrison prairie. It is seventy-three miles west of Indianapolis and almost equidistant (175 miles) from Cincinnati, Chicago, and St. Louis. The town was laid out in 1816 and has had a steady growth since, the population by the last census (1900) being 36,673. Its principal buildings are the Indiana State Normal school, with over 1,000 students, the Rose Polytechnic, and the Terre Haute high school, with 700 students. There are 20 public school buildings, two of which, recently built, are models, costing over $35,000 each, also two commercial colleges well attended. There are 180 teachers and about 7,000 children attending school.

There are several miles of paved streets and 15 miles of electric car line. The streets are well lighted by electricity, and many fine business blocks and private residences line the avenues.

The manufacture of glass is one of the principal industries. The great coal beds underneath furnish a quality of coal from which producer gas is made, which is cheaper and better than natural gas for manufacturing purposes. Among many other industries may be named rolling mills, stamping works, car shops, wagon, tool, brick, and tile works, hominy and flour mills, and several distilleries, which are among the largest in the country.

Ter'ry, Alfred Howe, an American soldier and general, was born at Hartford, Conn., Nov. 10, 1827, and died at New Haven, Conn., Dec. 16, 1890. After studying and practicing law he became colonel of a militia regiment in Connecticut, and on the outbreak of the Civil war his regiment was mustered into the United States service, and took part in the first battle

of Bull Run. Colonel Terry was present at the capture of Port Royal, at the siege of Fort Pulaski, and in the operations against Charleston. He was promoted to brigadier-general and shared in the capture of Fort Wagner, and acted in Virginia in 1864 as division and corps commander. He served at Drury's Bluff, at Bermuda Hundred, was at the siege of Petersburg, but his chief achievement as a soldier was his assault and capture of Fort Fisher (Jan. 15, 1865). After this he served under Sherman as corps commander and was at the capture of Wilmington. He was brevetted major-general in the regular army in 1865 and commanded the departments of Dakota and the south, and was in a charge of successful expeditions against Sitting Bull and the Sioux.

GEN. A. H. TERRY.

Ter'ry, Ellen (Alice) [Mrs. E. A. Wardell], an English actress, was born at Coventry, England, Feb. 27, 1848, and made her first appearance on the stage with Charles Kean's Shakespearean revivals, in 1858, in *The Winter's Tale*, and as "Prince Arthur" in *King John*. She subsequently joined a Bristol company, of which Mrs. Kendal was a member, and appeared in London in 1863 as "Gertrude" in *The Little Treasure*, as "Hero" in *Much Ado about Nothing*, and as "Mary Meredith" in *Our American Cousin*. After her marriage she retired from the stage for a while, but in 1867 reappeared, and later joined Mr. and Mrs. Bancroft's company, acting the part of "Portia," and touring with Sir Henry Irving as leading lady of his troupe. Her personations include "Viola" in *Twelfth Night*, "Ruth Meadows" in *Eugene Aram*, "Henrietta Maria" in *Charles I.*, "Marguerite" in W. G. Will's play of *Faust*, "Rosamonde" in *Becket*, "Lucy Ashton" in *Ravenswood*, "Lady Macbeth" in Shakespeare's tragedy of *Macbeth*, etc. In her repeated American tours she has won deserved praise, and is a welcome favorite of the modern stage.

ELLEN TERRY.

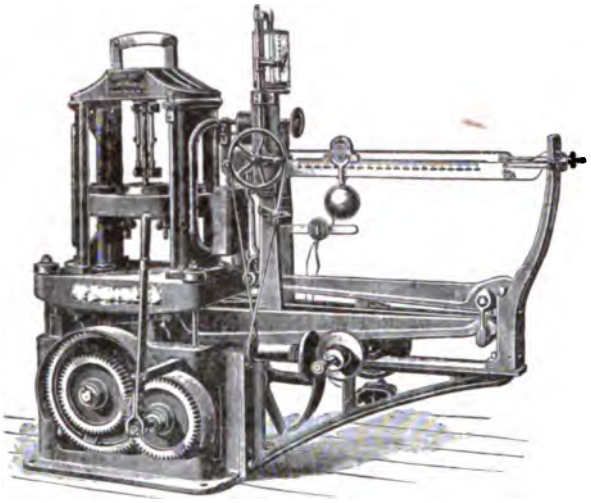
Tes'la, Nikola, electrician, physicist, and inventor, was born in Austria-Hungary in 1857, and studied at the polytechnic school at Gratz, the capital of Styria, and was for a time in the government telegraph engineering service, and in 1881 was employed at Paris in one of the large electric lighting companies of that city. In these employments he devoted himself to experiments in electricity and magnetism. On coming to the United States, in 1884, he was for a time in the Edison works at Orange, N. J., but afterward became electrician in the Tesla Electric Light company, and established at New York a laboratory for independent electrical research. He is the inventor of the modern principle of the rotary magnetic field embodied in the apparatus used in the transmission of power from Niagara Falls; also of new forms of dynamos, transformers, induction coils, condensers, arc, and incandescent lamps; and of the oscillator combining steam engine and dynamo. His researches in electrical oscillation have created a new field of electrical investigation; while he has made many startling innovations and inventions in using currents of high tension. He continues to be a resident of New York.

NIKOLA TESLA.

Tes'ta, the seed coat, which is usually hard and bony. The testa is developed by the tissue of the integument of the ovule. Sometimes it develops into two very distinct layers, an outer fleshy layer and an inner hard one. Often it is variously marked and sculptured on the surface, so as to enable one to recognize the plant from which it has come. In fact, the color and markings of the testa are very important guides in the classification of many plants. It is the testa also which develops the various tufts of hairs and wings often found on seeds, and which are aids to their dispersal by the wind. It sometimes develops hooks and spines, as grappling appendages, to aid in dispersal by animals.

Test'ing Machine, a machine for testing materials. Testing machines are arranged so as to apply measured forces to a sample of the material, and to observe the corresponding deformation or breaking of the sample. The common tests are stretching, crushing, bending, and tension. It is usual to apply the force either by a system of levers or by means of a hydraulic press. The forces are usually measured by a scale beam. When large samples are to be tested, such as long heavy beams, the machine must be very large. The

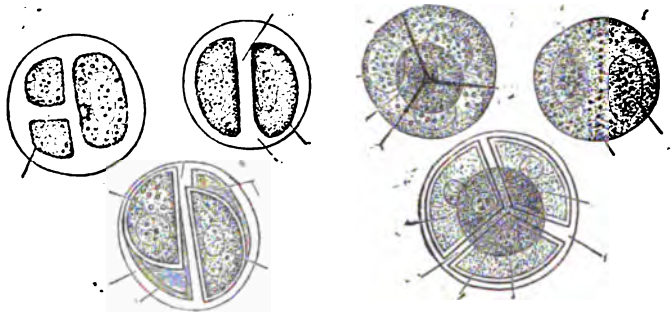
largest and finest testing machine ever constructed is that at the Watertown arsenal, belonging to the United States government. It can exert a force of 450 tons, and yet it is extremely sensitive. At the time of its trial, a rod of iron five inches in diameter was



AN AMERICAN TESTING MACHINE.

broken with a measured force of 722,000 pounds and immediately afterward a horse hair was broken with a measured force of one pound. For loads of 200 pounds it is sensitive to less than one two-millionth of the whole. Testing machines have so many special forms and appliances that special treatises must be consulted for details. See Unwin's *Materials of Construction.*

Tetrad (*tĕt'răd*) (in plants). In most of the higher plants each mother cell organizes four asexual spores within itself. This group of four is called a "tetrad." These four sister



A MOTHER CELL ORGANIZING WITHIN ITSELF FOUR SPORES (A TETRAD).

spores cling together for a time, and sometimes always, but generally they soon separate from one another. For example, if a very young anther be sectioned and examined under the microscope, each spore-bearing cell (mother cell) within it will be seen to contain just four forming pollen grains. This tetrad formation of asexual spores is almost without exception from mosses to seed plants.

Tet'raspore (in plants), the asexual spore of red algæ. It is so named because each sporangium produces just four pores. See RHODOPHYCEÆ.

Teu'tons, a tribe of ancient Germany, living on the Baltic sea. They were a powerful tribe, and with their neighbors, the Cimbri, invaded the Roman republic near the close of the 2d century B. C., and were almost destroyed by Marius (102 B. C.) The name is now given to all ancient German races.

Tex'as, the largest state in the Union, is four times as large as New England, larger than France, Germany, or Austria, and equal to six New Yorks or seven Ohios. Its greatest length is 825 miles; its greatest breadth is 740 miles; and it covers 265,780 square miles. If the whole population of the republic were to be carried to Texas, it would be no more densely settled than Massachusetts is now. Population 3,048,710. The coast is 375 miles long, in the shape of a crescent, fronted by lines of long islands of white sand, with the gulf of Mexico on one side, and on the other deep and navigable bayous and lagoons, reaching up among the cotton and sugar plantations. There are only four harbors with lighthouses in this long stretch of coast; the United States government has spent many millions in building jetties at Galveston, Sabine Pass, Aransas Pass, and other places. In the southwest, Padre island runs northward from the mouth of the Rio Grande for a hundred miles; and inside it (between Padre island and the Texas coast) is the Laguna de Madre, ninety miles long and eight miles wide. This lagoon is so salt that fish die on entering it, and on its shores lie the deposits which furnish most of the salt used in Texas. Most of the Texan rivers fall into the gulf of Mexico, among them the Rio Grande, Brazos, Colorado, Sabine, Trinity, Nueces, San Antonio, and Guadalupe. Three rivers form parts of the state line, the Rio Grande, Red, and Sabine. The main branch of the Rio Grande is the Pecos. Inland from the coast plains stretch the midlands, some 200 miles wide. The region called eastern Texas, from 96° to

Louisiana, covers 50,000 miles, with great forests of pine, oak, cypress, magnolia, etc., and with sugar, cotton, and stock farms. The rich black prairies reach from Laredo to Denison, a belt from thirty to sixty miles wide. Here wheat, cotton, and corn grow side by side. Western Texas lies between the Colorado and Nueces rivers, a bare rolling prairie of 50,000 square miles, mainly occupied by cattle and sheep ranches. Much like it is southwestern Texas, a tract of 30,000 square miles, between the Nueces, the Rio Grande, and the Rio Pecos. The Pan Handle lies between Indian territory and New Mexico, mainly north of Prairie-Dog-Town river, with 27,000 square miles of land. It is a plain from 2,500 to 4,000 feet high, with some good soil but little water. The staked plain, which enters from New Mexico, is a waterless, grassy table-land. Between the Rio Pecos and the Rio Grande are the Guadalupe, Charrote, and other mountains, in whose valleys the rivers die and vanish and the bitter salt lakes are the only water.

Two-thirds of the people are engaged in farming or ranching. Beef, cotton, wool, cotton seed, hides, corn, oats, wheat, and sugar are the chief products. Mining is mainly done in eastern Texas, where there is much iron ore. There are famous gold and silver mines beyond the Pecos, and coal, lignite, copper, salt, gypsum, soapstone, and marble are found. The manufactures of Texas are still young, but there are over 5,000 specified manufacturing industries reported, including cigar and tobacco factories, and grain and fruit distilleries. In 1900, Texas led all the states in the production of cotton.

The governor and other state officers are chosen every two years; the legislature is made up of the senate and house of representatives. The state capitol at Austin is the largest in the Union. The land office still controls 5,000,000 acres of public lands. Its school fund is worth $100,000,000, and in 1895 574,900 white children and 170,900 colored children attended the public schools. There are 112 high schools and academies, and several colleges, the most important being the University of Texas at Austin, which has an endowment of $5,000,000; Henry college at Campbell; Fort Worth university at Fort Worth; Baylor university at Waco, founded by the Baptists in 1845; and the Agricultural and Mechanical College of Texas at Bryan, endowed by the United States government. Texas had 400 miles of railroad in 1861; in 1900 the total mileage was 10,078. The chief cities of the state are San Antonio (population 53,321), Houston (population 44,633), Dallas (population 42,638), Galveston (population 37,789), and Fort Worth (population 26,688). Galveston, the chief seaport, was visited by a most destructive hurricane on Sept. 8, 1900. The loss of life entailed by the hurricane was close upon 3,000, while property to the value of about $25,000,000 was destroyed.

The Spaniards explored Texas at a very early date. La Salle in 1685 founded Fort St. Louis on the Lavaca river. But sickness and the Indian tomahawk blotted out the settlement, and the country was claimed and held by the Spaniards, who founded the missions of Dolores, San Antonio, and San Agostino. Indian raids and rebellions, followed by massacres, made Texas a desert, and to people it, Mexico invited American colonists in 1820, and within a few years 20,000 had settled there. The many annoying acts of the officials of Coahuila, of which Texas was a part, resulted in the Americans sending General Austin to ask that Texas be admitted as a state of the Mexican Union. He was thrown into prison, and troops sent to Texas. In 1835, the Texans rose in a mass, drove out the Mexicans after hard fighting, and proclaimed a republic. The cruel massacre of the garrison of the Alamo by President Santa Anna was followed by his overwhelming defeat at San Jacinto by General Houston. The independence of Texas was acknowledged by the United States in 1839. In 1845, it was annexed to the Union. At once there arose a dispute with Mexico over the southern boundary, Mexico claiming to the Nueces, the United States to the Rio Grande. The result of the Mexican war fixed the southern boundary at the Rio Grande, and the sale by Texas to the United States of lands to the north and west for $10,000,000 settled the detail of the state line as it is to-day. It was also given the right to divide into five states, if its future growth should require it. The state seceded in February, 1861, and was readmitted to the Union in 1870. The name Texas means "friends" and was that of the Indians first living there, whom the Spaniards called *Tejas* or *Tecas*. The nickname, "The Lone Star State," comes from the flag of the republic of Texas, a white ground with an azure star. See Bancroft's *History of Texas*.

Thack'eray, William Makepeace, was born at Calcutta in 1811. His father was in the civil service of the East India company, and dying young left his son a fortune of $100,000. When William was seven years old he was sent to England and placed in the noted Charterhouse school, often mentioned in his books. He next went to Cambridge, and in 1831 was at Weimar, where he saw Goethe. His ambition was to become an artist, and he traveled over most of Europe,

WILLIAM MAKEPEACE THACKERAY.

studying at Paris and at Rome. His drawings were quaint, picturesque, and truthful; his art may be seen in the illustrations of his novels, which, as he expressed it, were "illuminated by the author's own candles." However, his success in this line did not satisfy him and he tried his hand at writing, much to the delight of all English readers then and now. He first wrote for *Fraser's Magazine*, in which appeared *The Great Hoggarty Diamond* and *Barry Lyndon*. Most of his capital had been spent in foreign travel and losing investments; he now adopted literature as a profession. His *Snob Papers* and *Jeames's Diary* in *Punch* made him known, but his reputation as one of the greatest of English novelists was made by *Vanity Fair* (1846–48), which disputes the first place among English stories with such books as *Ivanhoe*, *Adam Bede*, *Tom Jones*, and *David Copperfield*. In 1849, he published *Pendennis*, one of the best of his books, which tells his own story. His lectures on *English Humorists* and on *The Four Georges* were delivered in America as well as in England. In 1852–55, appeared *Henry Esmond* and *The Newcomes*, which critics consider his finest works. In 1859, he became the first editor of *Cornhill Magazine*. Thackeray was tall and powerfully built, with massive head, and, as he aged, silvery white hair. He died at London, Dec. 24, 1863. See *Life*, by Trollope.

Thales (*thā'lēz*), Greek sage and philosopher, was born at Miletus, Asia Minor, about 640 B. C., and died about 546. One of the seven wise men of Greece, he was noted especially as an astronomer and geometer, and the earliest of the Ionian natural philosophers, regarding water as the principle of all things. A remarkable fact concerning Thales is his predicting, so early in the history of astronomical science, an eclipse of the sun, which is alleged to have occurred, May 28, 585 B. C., though doubted on the ground that, in Thales' era, certain astronomical facts necessary to predict an eclipse with any chance of success were not then known. Some modern astronomers have, however, stated that the prediction of Thales did come true on the date given, and the date agrees with that given by Pliny the Elder, in his *Natural History*.

Thallium (*thăl'li-um*), a metal discovered in London in 1861, by the use of the spectrum. It is found in certain iron and copper pyrites, of which it forms about a four-thousandth part, and some in mica. It is generally obtained from the fine dust of pyrites burners. It resembles lead in appearance, is very soft, can be hammered into leaves, tarnishes quickly, gives a green color to a flame, and forms many compounds.

Thallophytes (*thăl'lo-fits*), the lowest of the four great divisions of the plant kingdom. The name means "thallus plants," the thallus being the characteristic plant body, which is usually prostrate and has no differentiation of nutritive organs, as the roots, stems, and leaves of higher plants. All parts of this body are practically alike. There are two great general divisions of the group: (1) Algæ, which contain chlorophyll and hence can manufacture their own food and live independent of any other organisms; and (2) Fungi, which do not contain chlorophyll and hence are dependent upon other organisms for their food. Besides the ordinary algæ and fungi, the Thallophytes contain many forms which are not classified easily, as slime-moulds, bacteria, diatoms, etc. The group is an immense one, and contains the minutest of living forms, as well as some which are very bulky, as some of the seaweeds. Thallophytes are of special interest as representing the beginnings of the plant kingdom, the group from which all the higher forms have been derived.

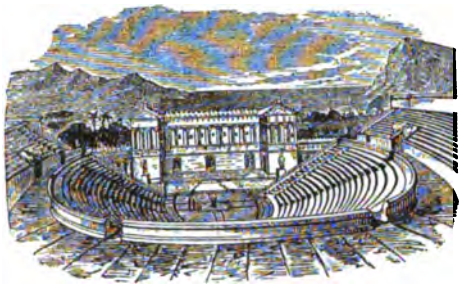
Thal'lus, the characteristic plant body of the Thallophytes, which see. The thallus body is also characteristic of the liverworts and of the gametophyte of ferns.

Thames (*temz*), a river of England rising in the Cotswold hills and flowing to the North sea. It is about 220 miles long, and as far as London, which is sixty miles from its mouth, is navigable for large vessels. It is eighteen miles wide at its mouth, and the tide flows up it for seventy-two miles. The largest river of England, it is also the most important, having as large a traffic probably as any river in the world. Its bridges and tunnels at London, its great docks and embankments, are a part of the sights of the city. Canals connect it with the Avon and the Severn rivers, the Sussex coast, and the canal system of central England.

Thanks'giving Day, a religious festival peculiar to the United States, resembling the Hebrew feast of ingathering. The Plymouth colony celebrated the first thanksgiving day after the harvest in 1621, four young men being sent out hunting to make provision for the feast. Such days were appointed after this at different intervals, and for various objects in New England and New York. Congress recommended a thanksgiving day yearly during the Revolutionary war, but from 1784–89, there was no national appointment of the festival. In 1784, a day of thanksgiving for the adoption of the constitution was recommended, and one in 1795, because of the suppression of a riot. For years the festival was almost exclusively a New England institution, celebrated by religious services in the churches, the sermon being often a political address, and by the gathering at the old home of the scattered members of the family. The day gradually became a custom in the western and some of the southern states, each state appointing its own day. During the Civil

war, proclamations for public thanksgiving were issued in 1862, 1863, and 1864, and since that time the day has been regularly appointed by the President of the United States. It is usually observed on the last Thursday in November.

The'atre. The first theatre in Greece, the birthplace of the drama, is said to have been



THEATRE OF SEGESTA, SICILY — RESTORED.

a wagon. The plays of Æschylus were represented on a wooden scaffold. About 500 B. C., one of these scaffolds gave way, and the inventive Athenians at once set about building the famous stone theatre of Dionysus. Like theatres were built in every Greek city and the ruins of many of them may be seen to-day. The largest is at Ephesus, and was 660 feet across. These theatres were built with seats in semi-circular rows rising one behind and above the other, and were often cut out of solid rock. In the center, at the lowest point, stood the orchestra, in front of the proscenium or stage, back of which was a solid wall, called the scene, ornamented with pillars and cornices. There was no roof, but an awning kept off the sun's rays, for the plays were always given in daytime. The Romans, who took from the Greeks the best of everything they had, built similar theatres of the greatest magnificence, besides their huge amphitheatres (which see). In both Athens and Rome the theatres were built large enough to seat almost all the citizens, who generally attended in a mass, at the expense of the government, for from the time of Pericles plays were made free to all. To enable these vast audiences of 80,000 to 100,000 or more to hear, the actors wore masks with mouthpieces which answered the purpose of speaking trumpets. Female characters were represented by boys, and it was not till the 17th century that actresses were allowed on the French and English stages. In the middle ages the miracles plays (which see) were played in cathedrals.

The modern theatre dates from the 16th century, the first ones being built at Vicenza and Venice. The famous Palais Royal at Paris was built by Cardinal Richelieu in 1639. The first English play house was the London theatre, built in 1576. About the same time were built the Curtain, Blackfriars, and Whitefriars. The first theatre in America was opened at Williamsburg, Va., in 1752. The largest and finest theatre in the world is the Grand Opera House of Paris. In China and Japan, every little village has its theatre. See DRAMA.

Thebes (*thēbz*), a celebrated Egyptian city, stands on the Nile, and was formerly the capital of upper Egypt. Its great ruins fill nine townships. The Nile flows through the city and divides it into four quarters. Thebes was at its height from 1500 to 1000 B. C., when it had supplanted Memphis, the ancient capital of the Pharaohs. This "City-of-a-Hundred-Gates," as Homer called it, sent out 20,000 war chariots, was filled with palaces and temples, and contained the cemeteries of the Theban monarchs. Later, the capital was moved to Sais, and Memphis, and the Persian Cambyses plundered it of $10,000,000. Alexandria was founded, and so its splendor departed. There are now only a few Arab families of Fellaheen, who gain a living by guiding travelers about the ruins or by selling articles rifled from the tombs. The ruins of Thebes are the most famous in Egypt. Among them are the temple of Karnak, a mass of obelisks, courts, and halls; the Memnonium, built by Rameses II., with a broken colossal statue, the largest in Egypt, of that king, weighing 887½ tons; the vocal statue of King Memnon, supposed in early times to make a sound at sunrise; the cemeteries of the sacred apes; and the Valley of the Tombs of the Queens. See Rawlinson's *Story of Ancient Egypt*.

Thebes, the chief city of Bœotia, in Greece, stood on a mountain slope between two streams in the southern part of the country. It is said to have been founded by a colony of Phœnicians under Cadmus, after whom the city was called Cadmea, a name afterward applied only to the citadel. Nothing certain is known of the place till its unsuccessful war with Athens in the 6th century B. C. During the Persian war Thebes sided with Xerxes against the other Greek cities, and for this desertion Athens wished to deprive it of its leadership of the Bœotian towns, but it was saved by the interference of jealous Sparta. It sided with Sparta in the Peloponnesian war, but soon afterward, fearful of Sparta's great power, befriended the Athenians, who fled from the oppression of the Thirty Tyrants, and sent a force of its citizens with Trasybulus and his fellow patriots to deliver Athens. Thebes became the formost power in Greece after the long war (379–362 B. C.) in which, under the leadership of Epaminondas, she triumphed over Sparta. Demosthenes induced Athens and Thebes to join hands against the encroachments of Philip of Macedon; but it was too late, and in 338 the battle of Chæronea crushed the liberties of Greece; a second rising was put down by Alexander, who razed Thebes to the ground, and sold the whole

body of citizens, men, women, and children, into slavery. Rebuilt in 315 by Cassander, it was destroyed by the Romans; was again a thriving town in the 11th and 12th centuries, but now has only about 5,000 inhabitants.

Theiss (*tīs*), an important branch of the Danube, and the chief river of Hungary, is formed by two streams, the Black Theiss and the White Theiss, in the Carpathian mountains on the borders of Galicia. It flows through a mountain pass, then in a zigzag course past Tokay and Szolnok, and for 300 miles is parallel with the Danube. It is navigable for large vessels to Szolnok, and is 828 miles long.

Themis (*thē'mis*), in Greek story, was the daughter of Uranos and Gæa (Heaven and Earth), the wife of Zeus, and mother of the hours and fates, and of equity, justice, and peace. In modern art Themis is represented as justice with her eyes bandaged, holding a pair of evenly balanced scales in one hand, with a sword in the other.

Themistocles (*the-mis'to-klēz*), a great Athenian general and statesman, was born about 514 B. C. In politics he became the rival of Aristides "The Just," who was ostracized in 483 B. C., leaving Themistocles the foremost citizen of Athens. To get ready for the coming Persian invasion Themistocles persuaded the Athenians to set apart the proceeds of the government silver mines for building a navy, believing that the only chance of victory was on the sea. The naval victories of Artemisium and Salamis (480) were won from the Persians chiefly through the efforts of Themistocles, though he allowed the standing claim of Sparta to the chief command, which was given to Eurybiades. The victory at Salamis (which see) raised his reputation to the highest point. But his popularity lasted only till 471, when he was ostracized for bribery. The rest of his life was spent at the Persian court of Artaxerxes, where he was greatly honored. See Fyffe's *Primer of Greek History*.

Theocritus (*thē-ŏk'ri-tus*), a famous Greek poet, a native of Syracuse, who flourished about 272 B. C. About the close of the reign of Ptolemy Soter, he visited Alexandria, where his first verses were written. Here Ptolemy Philadelphius became his patron, but later we find him back at the court of Hiero II., of Syracuse. For some reason he became dissatisfied with court life, and turning his attention to the scenes and life of the country, he wrote his thirty unexampled idyls of the everyday life of the Sicilian peasantry, which keep their charms of freshness and nature even to the present day. Besides the idyls, a few lines of a poem called *Berenice* and some epigrams are all that are left of his writings.

Theodoric (*thē-ŏd'ō-rik*), the founder of the kingdom of the Ostrogoths, which embraced Italy, Sicily, southeastern Gaul, Rætia, Noricum, Pannonia, and Dalmatia, was born on the Neusiedler sea, south of Vienna, in 455 A. D. His father, Theodemir, and two uncles had freed their nation from the yoke of the Huns on the death of Attila; part of the Goths had gone to Italy and Gaul, and Theodemir was left sole king of the Ostrogoths in Pannonia. Theodoric spent his boyhood as a hostage at the court of Constantinople, where he was brought up together with the emperor's children. After proving himself an able warrior, Theodoric become king of his people in 475. Two wars were now waged against the Emperor Zeno, who, to save his capital from the Ostrogoths, urged Theodoric to conquer Italy, then ruled by the usurper Odoacer. So in 488 the young king led the whole nation, some 200,000, across the Alps, won four pitched battles, shut up Odoacer in Ravenna, and after a three years' siege, captured both usurper and city. Once king of Italy, he governed the peninsula as well as it had ever been ruled under the Roman empire. He protected the Visigoths, checked the Franks, and gained Provence. Near the end of his prosperous reign a conspiracy was discovered in which his favorite, Boëthius, the philosopher, seemed to be mixed up. After the supposed traitor had been put to death, his innocence was proven, and Theodoric's remorse undoubtedly hastened his death in 526. See GOTHS.

Theodosius (*the-o-dō'-shi-us*) **I, the Great,** was of Spanish descent, and was born about 346 A. D. His father was the able general Theodosius, who freed South Britain from the Savage Caledonians. Theodosius accompanied his father in his British campaigns, but after his murder retired to his estate in Spain. From this retreat he was summoned by the emperor Gratianus, who made him his fellow-ruler, and intrusted him with the government of Thrace, Dacia, Macedonia, Egypt, and the east. Here he found himself face to face with the dreaded Goths, whom his army dared not confront in the open field, yet by bribes and promises he succeeded in making peace with them; and the magnificent funeral honors paid to their king, Athanaric, who died at Constantinople, so pleased the Goths that many served in his armies. On behalf of his brother-in-law, Valentinian II., he conquered the usurper Maximus, and in 392, when Valentinian was strangled by his general, Argobastes, Theodosius a second time marched on Rome, defeated Argobastes and became master of the whole Roman world. He had hardly won this vast power, when he died, at Milan, Jan. 17, 395.

Theophrastus (*thē-ō-fras'tus*), a Greek philosopher, born at Eresus, Lesbos, about 372 B. C. and died in 288 B. C. He was the disciple of and successor to Aristotle, and for thirty-five years presided over the Peripatetic school, or teaching and disputing school of logicians, who perambulated as they talked along the

walks of the Lyceum at Athens. Theophrastus was noted for his observational and scientific habits, and for his early contributions to botanical science. Though a member of the Platonic circle at Athens, he specially interested himself in researches about plant life, and has left us a *History of Plants* and the remains of a work dealing with the *Principles of Vegetable Life*. He also wrote a series of sketches of character, which have been taken as models by modern writers.

Theresa (*te-rē'sa*) or **Teresa** (*ta-rā'sā*), **St.,** was born at Avila, Spain, March 28, 1515. She was noted for her piety when a child, and when only seven years old, with her little brother she ran away from home to gain the crown of martyrdom among the Moors. She entered a Carmelite convent at twenty, and later founded the order of Barefooted Carmelites. Her reform had the support of the pope, and during her life twenty-nine convents of the reformed order were opened. Theresa was made a saint by Gregory XV., and her feast day is Oct. 15. Her letters and treatises, besides being considered by Catholics as among the most precious of their writings, have also gained a place among Spanish classics. St. Theresa died Oct. 4, 1582. See her *Life*, by Dalton.

Thermom'eter, an instrument for measuring temperature. See TEMPERATURE. There exists a great variety of thermometers based upon a great variety of principles But those which are most frequently used are dependent upon the fact that the volume of a fluid changes when its temperature changes. For ordinary temperatures, the most important thermometers are those which employ mercury or some gas (generally air or nitrogen) as the expanding fluid. For the measurement of high temperatures, see PYROMETER.

THE MERCURY THERMOMETER.

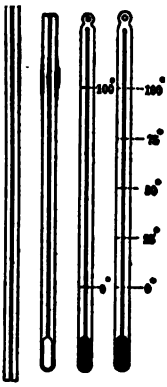
The principle of the mercury thermometer is that mercury when heated expands more than glass. If, therefore, a glass tube having a bulb blown at one end be partially filled with mercury and immersed in a bath at a higher temperature than its own, the mercury will rise in the tube. If the bath have a lower temperature the mercury will fall. And if the mercury neither rises nor falls we may fairly conclude that the mercury and the bath are each at the same temperature. The essential features of a good thermometer are the following:

1. It must be easily portable.
2. It must be permanent.
3. It must always give the same reading when subjected to the same temperature.
4. It must be possible for the user to test the correctness of its graduation, and to determine any errors in its graduation.
5. It must be relatively small, so that when placed in contact with a second body the temperature of the second body will not be seriously affected.

In making a thermometer which will satisfy these conditions, the peculiar advantages of mercury are:

1. It is easily prepared in a pure state.
2. It does not wet glass or stick to it.
3. It expands rapidly with changes of temperature, so that its changes in volume are easily read.
4. To each particular volume corresponds a definite temperature, which is not the case with water.
5. It does not freeze except at temperatures comparatively low, and does not boil except at temperatures comparatively high.

The accompanying figure illustrates the four principal steps in the manufacture of an ordinary mercury thermometer. First of all, a piece of thick-walled capillary tubing of uniform bore is selected; a bulb is then blown on one end of this tube, after which the bulb is filled with mercury. It is then highly heated and "sealed off." The last step is the graduation of the tube of the thermometer.



Showing four stages in the manufacture of a mercurial thermometer.

Now it happens that there are two temperatures which are easily reproduced in the laboratory. These are the temperatures of melting ice and boiling water. On the centigrade scale the first of these is called "0°" and the second "100°." The apparent change of volume between these two points is divided into 100 equal parts, each indicating *one degree.*

On the Fahrenheit scale the interval between melting ice and boiling water is divided into 180°, the lower temperature being called "32°" and the higher temperature "212°." For the *gas thermometer* the student is referred to Preston's *Theory of Heat*, Sec. II.

Thermopylæ (*ther-mŏp'i-lē*), a famous pass leading from northern to central Greece, between Mt. Œta and an impassable marsh on the edge of the Maliac gulf. The pass narrowed at each end to the width of a single wheel track, forming the eastern and western gates. Here the Spartan King Leonidas made his famous stand against the mighty army of Xerxes in 480 B. C. Learning that a Thessalian had betrayed to the Persians a path over the mountains to his rear, he sent away all his troops, which numbered some 7,000, except 300 Spartans, 700 Thespians, and 400 Thebans. This chosen band made a sally and perished to a man. Only one Spartan, who was too sick to fight, escaped, only to meet the scorn of his countrymen on his return home.

Thermotropism (*thĕr-mŏt'ro-pĭz'm*), the sensitiveness of a plant to heat coming from one side, in response to which the rate of growth is so unequally affected as to cause the part to bend toward or away from the source of heat, *e. g.*, corn seedlings and hyacinth leaves bend toward a warm iron plate (30°C.) placed near them; cress seedlings turn away from it. See IRRITABILITY and GROWTH.

Theseus (*thē'sē-us*), a famous Greek hero, said to have been the son of Ægeus, king of Athens. His most noted exploit was his offering himself as one of the youths yearly delivered to the Cretan Minotaur, for the purpose of killing that monster. Ariadne, daughter of King Miros of Crete, fell in love with him and gave him a sword and a clue of thread with which he killed the Minotaur and escaped from the famous Labyrinth. The fatal ship which carried the tribute youths, always carried black sails, and Theseus had promised his father to hoist white sails if he was successful in his undertaking. This was forgotten, and the king, thinking his son killed, threw himself into the sea. Theseus was now king. He is said to have waged war against the Amazons and the Centaurs, to have been one of the Argonauts, to have taken part in the Calydonian hunt, and to have carried off Helen from Sparta when she was only nine years old. For this he was attacked by Castor and Pollux, was driven from his throne by a revolt of the Athenians, and was killed by treachery.

Thes'saloni'ca. See SALONI'CA.

Thes'saly, the largest state of ancient Greece, reaching from Thermopylæ to the Cambunian mountains, and from Mt. Pindus to the Ægean sea. But often the name was applied only to the Thessalian plain, which was surrounded by mountains, and was the most fertile part of Greece. The plain was divided into two parts, Upper Thessaly, the chief city of which was Pharsalus, and Lower Thessaly, having as its main city, Larissa. The Thessalians were said to have emigrated from Epirus. There were three classes in the country, the rich land owners, Achæans and other conquered tribes, and serfs, who were probably the first dwellers in the land. In early times wars were carried on with the Phocians. About 400 B. C., under the tyrants Lycophron, Jason, and Alexander, Pheræ became the foremost city and brought all Thessaly under its rule. Thessaly fell successively into the hands of the Macedonians, Romans, and Turks. A part of it now belongs to Greece. See Grote's *History of Greece*, and Fyffe's *Primer of Greek History*.

The'tis. See ACHIL'LES.

The West'ern, a college for women located at Oxford, O., was established in 1853 as "The Western Female Seminary." In 1894, the name was changed to "The Western," a college and seminary for women.

Thiers (*te-ĕr'*), **Louis Adolphe,** a French statesman, was born at Marseilles, April 16, 1797, the son of a locksmith. After attending the lyceum at Marseilles, he studied law at Aix. He then went to Paris to seek his fortune, and after a hard struggle with poverty, became a newspaper writer and was soon widely known. But it was his popular *History of the French Revolution* which carried him from his garret in an out of the way alley to fame, both as a writer and in politics. In 1830, he established a new democratic paper, *The National*, which greatly helped to bring about the revolution of 1830. Thiers at once became one of the ablest debaters in the chamber of deputies. He was minister of the interior in 1832, later, was minister of commerce and agriculture, and in 1836, prime minister. A disagreement with the king, in regard to the fortification of Paris, led to his resignation and gave him the opportunity to begin his *History of the Consulate and of the Empire*, adding to his material by visiting England and personally inspecting the battlefields of Germany, Italy, and Spain. He was still an acknowledged leader in politics, and protested against French union with England in her objections to the annexation of Texas, being unwilling, he said, to act against "the great American nation, the harbinger of French liberty." After the revolution of 1848, he became prominent in the assembly, supporting Louis Napoleon as president, but warning the nation in vain of the danger of a new empire, thus causing his imprisonment and exile at its establishment. His return to the assembly was marked by his great speech against the enormous outlay in the Italian war and the expedition to Mexico, and in improving the city. In 1870, he prophesied defeat in the Prussian war, and, as chief of the executive, was successful in procuring a treaty of peace, in crushing the commune, and in carrying out a national loan for paying the German indemnity. He was given the title of president, Aug. 31, 1871, and succeeded in obtaining the withdrawal of German troops from French soil, but resigned in 1872. He was gathering material for a history of art, and was writing his memoirs, when he died, near Paris, Sept. 3, 1877.

LOUIS ADOLPHE THIERS.

Thirty Years' War (1618–48), a terrible continental struggle in Central Europe, partly religious, and partly political, which involved

Germany and Austria, Bohemia, Denmark, Sweden, and France. The war had its origin in 1618 in Bohemia, which from being an elective monarchy, and since the days of Huss and Jerome of Prague strongly Protestant, had come into the possession of the Catholic house of Austria, which ruled it despotically. In 1609, Rudolph, king of Bohemia, and son of the emperor Maximilian II., was forced, though under the influence of the court of Spain, to grant religious freedom to the Bohemian Protestants; but having in 1611 been intrigued against by his brother Matthias and displaced by him from the throne, the latter violated the concession made by Rudolph, and the Bohemians retorted by throwing the imperial commissioners out of a window in the Hall of Regents and insisted on their rights as Protestants and proceeded to fight for their religious privileges. The forces then arrayed against Protestantism were those of the House of Austria, which feared to lose its territories by the conflict impending, and those of the Catholic league, at whose head was the duke of Bavaria, and whose country was in the war that followed ravaged by the Swedes and French. In 1619, the emperor Matthias died, and was succeeded by Ferdinand II; him, however, the Bohemians would not accept, but chose a rival in the person of Frederick V., elector of the Palatinate, son-in-law of James I. of England. This action dispelled all hope of reconciliation between Bohemia and Austria, and the war, aided by the duke of Savoy, was proceeded with under Thurn and Mansfield; but though Bohemia at first met with some successes, its forces were hard pressed by those under Count Tilly, who commanded the troops of the Catholic league, and who, in November, 1620, met the elector's army at White Mountain, outside the walls of Prague, and there defeated and routed it, the elector barely escaping capture. Frederick, though he found refuge at The Hague, was deposed and lost his dominions; but Mansfield and the Protestant party in Bohemia continued the war; which was now (1625) joined by Christian IV. of Denmark, who became for the time leader of the Protestant rising in northern Germany. He, however, met with defeat at the hands of Count Tilly at Lutter, in Brunswick (Aug. 27, 1626); Mansfield also suffering defeat, in the previous April, by the imperialist general, Wallenstein, at the bridge of Dessau, in Anhalt. After this the whole of Silesia was dominated by the forces of the league, while Tilly and Wallenstein, joining their armies, pursued the Danes to the far north; and presently the whole of Schleswig and Jutland, save a few fortified towns, fell into their hands. Of these, the northern seaports of Stralsund and Glückstadt heroically held out against their Catholic besiegers; but Denmark, having had enough of the war, concluded with Ferdinand II. the peace of Lübeck (May 22, 1629), Christian receiving back all his hereditary possessions and resigning all claim to the bishopric, held by his family within the empire. In the following year, Wallenstein was dismissed by his master, owing to repugnance at the excesses of his soldiery, complained of at a meeting of the electors of the empire at Ratisbon.

At this juncture, a new period of the Thirty Years' war is entered upon, by the intervention of Sweden and the appearance on the scene of the great Swedish king and soldier, Gustavus Adolphus, of the royal house of Vasa. Gustavus at this time had just concluded an armistice with Poland, through the mediation of Richelieu, and being loyal to the principles of the Reformation, he ardently intervened in the struggle between Catholicism and Protestantism. Unfortunately his career was a short one, for he fell at Lützen (Nov. 16, 1632), though not before his Swedes were victorious over Wallenstein (who had been reinstated in command), and he had beaten Tilly at Breitenfeld, with frightful loss to the Austrians. Despite the death of the Swedish king, the war went on, Bernhard of Weimar, the companion of Gustavus, leading the Protestants, and Wallenstein commanding the imperial troops. With the religious objects of Ferdinand II. and the Catholic league, Wallenstein, however, had little sympathy; his object was rather that of selfish aggrandizement. Seeing that to be the case, a conspiracy was formed against him, which led to his assassination, inspired by Spanish gold. This occurred Feb. 25, 1634, and Wallenstein's removal marks a turning point in the war, for it now ceased to be a purely German and Protestant struggle. "In the course of years the German contest had come to involve in itself all the rivalries and enmities which then agitated Europe; the quarrels of Sweden and Poland, the jealousy of Denmark against its northern neighbor, the struggle of Spain to reduce the Dutch into subjection; and, above all, the enmity between France and Spain, which dated back to the time of Charles V. It was these foreign interests that prolonged the war for the next thirteen years."

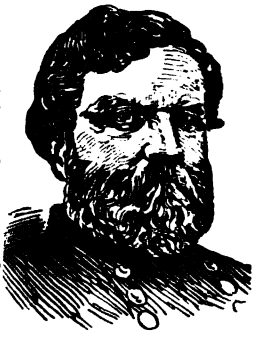
At this juncture, France comes upon the scene; and, curiously enough, we find her taking the side of the Protestant powers of Germany, at the very period when she was persecuting her own Protestant subjects. The reason of this, however, was not only her desire to crush the power of the house of Hapsburg, ascendant then in both Spain and Austria; but among other objects to secure possession of Alsace and Lorraine for France and the empire. This was the motive and ambition of Richelieu, who coveted the Rhine provinces. Meanwhile, though the war had been maintained in the Protestant interest by Bernhard of Saxe-Weimar, the latter met with a sanguinary defeat (Aug. 27, 1634) at Nördlingen, in Bavaria; and by the following spring the whole of south Germany was in the hands of the Imperialists. In spite of

this check, Bernard and the Swedes continued the struggle, and four years later he defeated the Imperialists at Rheinfelden, and captured Breisach. While these events were happening, Ferdinand II. died and was succeeded by Ferdinand III. who pursued the same ultramontane policy; and Bernhard himself also died, at Neuenburg, on the Rhine (July 18, 1639). France and Sweden, meanwhile, prosecuted the terms of their alliance, the French invading the Spanish Netherlands; while the Dutch destroyed a Spanish fleet, and Portugal, taking advantage of an insurrection in Spain, regained her independence. The end now came in sight, for France on the Rhine had at the head of her armies the great fighters, Condé and Turenne, and Mazarin had succeeded Richelieu as French prime minister. Condé defeated the Spanish at Rocroi, near the Belgian frontier, and at Allerheim, near to Nördlingen, he routed the Imperialists, under the Bavarian field-marshal, Baron Mercy, who was killed (Aug. 3, 1645). Turenne, on the other hand, effecting a junction with the Swedish army, with it invaded Bavaria and overthrew Maximilian, who had been one of the chief organizers of the Catholic League. The war terminated with the peace of Westphalia (Oct. 24, 1648), and the occupation by the Protestant army of Prague, where the struggle had had its commencement. The gains of the war fell chiefly to France and Sweden; while Lutherans, Calvinists, and Catholics alike were accorded religious freedom. Calamitous were the burdens of the struggle to Germany. G. M. A.

Thistle (*this'l*), the name of species of certain genera of the composite family, popularly characterized by being stout and spiny. The genus to which the common thistles belong is *Cnicus*. Some of them are among our worst weeds, and their seed-like fruits (akenes) with plumy tufts of soft hairs, are wafted everywhere on currents of air. The well-known Canada thistle (*C. arvensis*) is wrongly named, as it is a noxious weed from Europe.

Thom'as a Kem'pis. See KEMPIS.

Thom'as, George Henry, an American general, was born in Southampton county Va., July 31, 1816. After studying at West Point and seeing service in the Mexican and Seminole wars, he was appointed a professor at West Point. For six years he was in service in California and Texas. He began during the Civil war as a cavalry colonel in the Shenandoah valley. As commander of a division of the army of the Ohio, and afterward of a corps in the army of the Cumberland, he fought in Alabama, Tennessee, and Kentucky under Grant. In Rosecrans' campaign he was at the battle of Murfreesboro, and at Chickamauga saved the Union army from destruction. He was made a major-general of volunteers in 1862, and in 1863 brigadier-general of the regular army and put in command of the army of the Cumberland. His army decided the battle of Missionary Ridge. The army of the Cumberland, under Thomas, was in constant service in Sherman's Atlanta compaign, and in October, 1864, it was sent to Nashville to drive back General Hood, who was defeated at Nashville, Dec. 16, 1864. This service was rewarded with the rank of major-general in the regular army, and a gold medal from the state of Tennessee. After the war, General Thomas was in charge of several military districts. He declined the rank of lieutenant-general which was offered him, saying he had done nothing since the war to merit promotion. He died at San Francisco, March 28, 1870.



GEN. G. H. THOMAS.

Thom'as, Saint, one of the twelve disciples of Christ, is rarely mentioned in the New Testament. He is called "doubting Thomas," as he refused to believe in the resurrection of Jesus until he had seen and touched him. According to various accounts he preached either in Parthia, Egypt, Ethiopia, or India.

Thom'as, Theodore, American orchestra leader, and conductor of the Chicago orchestra, was born at Esens, Hanover, Germany, Oct. 11, 1835, and came to the United States as a youth ten years later. He studied music assiduously and made his début as a solo violinist, afterward taking part in concerts and on tours in various parts of the country. In 1864, he inaugurated orchestral concerts, and three years later organized the Thomas orchestra. He subsequently became conductor of the Brooklyn and of the New York Philharmonic societies, and on his removal in 1891 to Chicago, he became conductor there of an orchestra, and was musical director of the World's Columbian exposition. He has conducted notable musical festivals at Cincinnati, in successive years, as well as at New York and Chicago, and has done much to further the interest of music in America and develop public taste for it.

Thomp'son, Sir **Benjamin,** better known as Count Rumford, a brilliant engineer, statesman, and soldier, born at Woburn, in Massachusetts, 1753; died at Auteuil, a suburb of Paris, in 1814. He appears to have been well educated in spite of the fact that he was largely self-educated. Being an English sympathizer, he went to England at the outbreak of the American Revolution. Here he

was rapidly advanced in the state department. In 1779, he was elected fellow of the Royal society. At the invitation of a Bavarian prince, he went to Munich in 1783, where he remained for the next eleven years as minister of war and minister of police. During this period, while superintending the construction of cannon at the arsenal, he made a series of experiments which led him to think that heat was not an imponderable fluid, but a form of energy. He is therefore justly called one of the founders of the mechanical theory of heat. While at Munich he was made Count Rumford. He and Sir Joseph Banks took part in the establishment of the Royal institution in London. Rumford's second wife was the widow of the distinguished chemist, Lavoisier.

Thomp'son, Joseph Parrish, an American clergyman, was born at Philadelphia, Aug. 7, 1819. He studied at Yale college and Andover seminary, and was pastor of Congregational churches at New Haven and New York. In New Haven he helped to found the *New Englander*, a Congregational periodical, and also the *Independent*, a New York religious weekly. He gave much time to oriental studies, after his visits in Palestine and Egypt, and contributed the results in magazine articles. He published a large number of religious works, as *Life of Christ*, *Man in Genesis and Geology*, *The Holy Comforter*, and several memoirs. He died at Berlin, Sept. 20, 1879.

Thomp'son, Launt, an American sculptor, was born in Ireland in 1833, but was brought up in Albany, N. Y. He was nine years in Palmer's studio in Albany, where his bust of *Little Nell* made him well known. A statue of General Winfield Scott, at the soldiers' home near Washington, a soldier's monument at Pittsfield, Mass., a colossal statue of Napoleon, and a statue of the first president of Yale, on the college grounds, are some of his larger works. He died at Middletown, N. Y., Sept. 26, 1894.

Thomp'son, Richard Wigginton, an American politician and ex-secretary of the United States navy, was born in Culpeper county, Va., June 9, 1809, and died at Terre Haute, Ind., Feb. 9, 1900. When a young man he was a clerk in Louisville, Ky., but afterward moved to Lawrence county, Ind., where he studied law and was admitted to the bar. In 1834, he became member of the state legislature and later of the senate, acting for a time as president of the senate and lieutenant-governor. In 1841, he was returned member for congress, serving for several terms, and for a time was judge of the fifth Indiana circuit. In 1877, he entered Hayes' cabinet as secretary of the navy, and became chairman of the American committee of the Panama Canal company. He is the author of a *History of the Tariff*, *The Papacy and the Civil Power*, *Footprints of the Jesuits*, and *Personal Recollections of Sixteen Presidents*.

Thom'son, James, a British poet, was born in Roxburghshire, Scotland, Sept. 11, 1700. He studied six years at Edinburgh. His fame rests upon his poems on the seasons, the first of which, *Winter*, appeared in 1726, followed by *Summer*, *Spring*, and *Autumn*. He wrote several dramas, *Agamemnon*, *Edward, and Eleonora*, and *Tancred and Sigismunda*. The *Castle of Indolence*, next to the *Seasons* his best-known work, was written in 1748. The song *Rule Britannia* is found in a masque, *Alfred*, written by Thomson in connection with Mallet. He died near Richmond, England, Aug. 27, 1748.

Thom'son, Joseph John, a brilliant young English physicist, who has occupied since 1884 the most important chair of physics in Great Britain, namely, that of *Experimental Physics* at Cambridge university. He was born near Manchester, Dec. 18, 1856; was educated at Owens college and at Trinity college, Cambridge, where he graduated Second Wrangler, and Second Smith's Prizeman in 1880. His work has all been of a very profound character. Aside from numerous contributions to periodical literature, the following list of works will give some idea of his prodigious activity. *Treatise on Vortex Motion*, 1884; *Application of Dynamics to Physics and Chemistry*, 1896; *Recent Researches in Electricity and Magnetism*, 1892. His most recent (1899) achievement is the division of the hydrogen atom. By a very clear and logically connected series of experiments, he has succeeded in splitting off from the hydrogen atom a small part, which he calls a "corpuscle," and which has a mass of only one-thousandth of that of the hydrogen atom. For a popular account of this work, see the *Astrophysical Journal*, Vol. XI., pp. 170–4 (1900).

Thom'son, Sir William. See KELVIN, LORD.

Thor (*thôr* or *tor*), in Scandinavian myth, was the oldest son of Odin and Frigga, and was the god of thunder. He ruled winds, seasons, and agriculture. The *Eddas* speak of him as the champion of gods and men, hurling his thunderbolts at his enemies, the monsters and giants. His weapon was an enormous hammer, which, after it was thrown, came back into his hand. He never grew weary, for no matter how much strength he spent in battle, it was renewed by a magic belt which he wore around his waist. Thursday is named from Thor.

Thoreau (*thō'rō*), **Henry David,** was born at Concord, Mass., July 12, 1817. He was graduated at Harvard college in 1837, and became a surveyor. He lived the simplest of lives, spending most of his time in long

tramps through the woods, in the study of nature, and in writing. Emerson says of him: "He was bred to no profession; he never married; he lived alone; he never went to church; he never voted; he refused to pay a tax to the state; he ate no flesh; he drank no wine; he never knew the use of tobacco; and, though a naturalist, he used neither trap nor gun." This "poet naturalist" built with his own hands a small cabin on the banks of Walden pond, near Concord, and lived there by himself for two years. His expenses during these years were nine cents a day, and he gave an account of his experiences in perhaps his finest book, *Walden*, published in 1854. Others were *Cape Cod*, *The Maine Woods*, and *A Yankee in Canada*. No one else has lived so close to nature or so written of it. He died at Concord, May 6, 1862. See *Thoreau, the Poet Naturalist*, by Channing.

Thorn, a conspicuous rigid and sharp structure of plants. Thorns may be transformed leaves or branches, and are most extensively developed by plants of the arid regions.

Thorwaldsen (*tor'wäld-sen*), **Albert Bertel,** one of the greatest of modern sculptors, was born probably at Copenhagen, Nov. 15, 1770. When asked where he was born he said, "I don't know; but I arrived at Rome on March 8, 1797," thus dating his birth, as it were, from the beginning of his career as an artist. He was a son of a poor ship carpenter, and first carved figureheads in the shipyard where his father worked. He had little schooling, and was always a poor writer and speller, but by 1793 he had gained a gold medal for a design, and with it a chance to study abroad for three years. Only after long and hard study did he at last gain recognition by his *Jason*, but from this time, 1803, he prospered. His return to Denmark, in 1819, was triumphal and his reception almost royal. But a year later found him back at Rome, which he made his home. Thorwaldsen died March 24, 1844, leaving to his country most of his great works and the bulk of his fortune, with which to build a museum where they should be kept. Of his many busts, that of Byron is one of the finest. His famous *Christ and the Twelve Apostles* is in the cathedral of Copenhagen. See his *Life*, by Plon.

Thrace (*thrās*), in early times the name of a country bounded by the Danube, Euxine, and Ægean seas, Macedonia, and Illyria. Roughly speaking, ancient Thrace, before the rise of the Macedonian power, embraced the territory now divided into Rumelia and Bulgaria. Under the Romans it only included the part south of the Hæmus or Balkan mountains, while the northern part was called Mœsia. It was a mountainous country, the chief range being the Hæmus, or, as it is now called, the Balkans, the highest peaks of which are over 8,000 feet above the sea. It was marshy and undrained, covered with deep forests of fir, oak, chestnut, etc., but parts of it, as the great plain of Adrianople, was very fertile; cattle, sheep, horses, and swine were kept; and the chief products were wheat, millet, hemp, and wine. Its gold and silver mines led to its conquest by Philip of Macedon. Who the early Thracians were is not known. They were not Greeks, and they lived by robbery and war. The Greeks first heard of them through their coast colonies, the chief of which was Byzantium. But the interior of Thrace kept its independence, except for a short time when conquered by the Persian general Megabazus, until its conquest by Macedonia under Philip and Lysimachus. In 168 B. C., it became Roman territory, was colonized by Sarmatians and Goths, overrun by Attila and Alaric, and conquered by the Turk Amurath in 1353.

Thrush, the common name for any bird belonging to the genus *Turdus*. Thrushes

SONG THRUSH.

occupy the highest rank in the class of birds. They belong to a large family which embraces about 300 species found in most parts of the world. They are usually fine singers. The Eastern hemisphere has a larger number of varieties than the Western. There are five true thrushes common in the eastern United States. Of these the wood thrush is the best known. It is a bird about eight and one-half inches long, cinnamon brown above, with a whitish breast spotted with very distinct dusky spots. As its name indicates, it is a bird fond of woods, but will perch and sing in maples and elms on quiet village streets. Its voice is flute-like and its song lively and engaging. It corresponds to the song thrush of Europe, which is a little larger but other-

wise like our wood thrush. The hermit thrush is a northern bird smaller than the wood thrush. It seldom nests south of Vermont or northern Michigan, and extends northward to the Arctic regions. Wilson's thrush, or the veery, ranges between the two in nesting habits, not extending so far north as the hermit, nor so far south as the wood thrush. It seldom nests south of the parallel of 40°. The common robin is a thrush.

Thucydides (*thū-sid'i-dēz*), the great historian of the Peloponnesian war, was an Athenian, born probably in 471 B. C. He owned gold mines in Thrace, and was one of the few who recovered from the terrible plague at Athens. He was in command of an Athenian squadron in 424, and when summoned to Amphipolis to save it from falling into the hands of the Spartans, arrived the evening of the day on which the place surrendered. For this failure Thucydides was exiled. According to his own account this exile lasted twenty years. It seems certain that he died a violent death, but when or how, is not known. Hardly any literary work has received higher praise than the great work of Thucydides. It is remarkable for its truthfulness, and for the short, simple, and realistic way in which he has recorded facts that must have taken months to gather, sift, and decide upon. See Fyffe's *Primer of Greek History*.

THUCYDIDES.

Thug, meaning a "cheat," is the name of a religious brotherhood in India, which in honor of the goddess Kali, commits murders and lives chiefly from the plunder got from its victims. The Thugs usually band together in gangs of from ten to fifty or more, and travel, if wealthy enough, on horseback with tents, under the guise of traders. Each gang has its jemadar, or leader; its guru, or teacher; its sothas, or entrappers; its bhuttotes, or stranglers, and its lughaees, or grave diggers. They inveigle travelers to join them on the plea of safety, or lie in wait for them. When the victim is strangled and robbed, his body is buried in an out of the way place, and is sometimes mutilated. The Thugs also invest the rivers of India. They are very superstitious, and never commit murder unless all the omens are favorable. It was not till 1831 that energetic measures were taken to stop these practices, but thuggee, as it is called, has not yet wholly disappeared.

Thur'man, Allen Granbery, an American statesman, was born at Lynchburg, Va., Nov. 13, 1813. When six years old his family moved to Ohio. He became a lawyer and was chosen a representative in the 29th congress. In 1851, he was made judge of the supreme court of Ohio, serving as chief-justice from 1854 to 1856. He ran for governor of Ohio in 1867. During his two terms as United States senator (1869–81) he was one of the ablest and most prominent members of that body. In 1888, Thurman ran for Vice-president on the Democratic ticket with Cleveland. He died Dec. 12, 1895.

Thyrsus (*thĕr'sŭs*), a compound raceme or panicle in which a compact pyramidal cluster of flowers is formed, as in the lilac or a bunch of grapes. See INFLORESCENCE.

Ti'ber, a famous Italian river, rises in the Apennines, passes through the city of Rome, and falls into the Mediterranean by two mouths near Ostia, after a course of 230 miles. Between Lodi and Passo del Forello are rapids, and here the river runs through a narrow gorge for several miles. The Tiber is navigable for ships to Rome, 18 miles from its mouth, where it is 500 feet wide, and for boats of light draught to the mouth of the Neva, 72 miles further up. The Tiber has always been noted for its yellow color, which comes from the yellow clay through which it passes. Besides Rome the chief city on its banks is Perugia. Steps have been taken to deepen and otherwise improve the Tiber's course.

Tiberius (*ti-bē'ri-us*), emperor of Rome, was born Nov. 16, 42 B. C. As the stepson of Augustus he was adopted by that emperor, and saw service at the head of the legions on the outposts of the empire. He was popular with Augustus, the soldiers, and the people, and was married to the emperor's daughter Julia. He ascended the throne in 14 A. D., but as soon as the scepter was firmly in his grasp he became the most suspicious and cruel of tyrants. However, his mother, Livia, was the real ruling power till her death in 29 A. D. Her power then fell into the hands of Ælius Sejanus, a Roman knight and a commander of the Prætorian guards, a man of ability. Sejanus ruled well, though he murdered leading citizens whom he disliked, right and left, gaining the power to do so by pouring tales of conspiracy into the suspicious ears of Tiberius, who, meanwhile, was leading a careless life of pleasure on the island of Capri. But Sejanus could not hide his ambition to become emperor in name as well as fact, and fell in 31 A. D. Under the next favorite, Macro, a man of little talent, things went from bad to worse. It was in the reign of Tiberius that Christ was crucified at Jerusalem. The emperor died March 16, 37 A. D., his death being hastened either by poison or smothering.

Tibet or **Thibet** (*tĭ-bet'*), the southeast portion of the great central Asiatic plain, with an average height of 15,000 feet. The Himalayas shut in Tibet on the south; on the north are the Kuen-Lun mountains and ranges; uniting, these two systems separate

Tibet from Kashmir. The Tibetan plain, thus fringed with mountains, is not level, but dotted with mountain peaks and spurs, twenty mountain tops being higher than the loftiest Andes. The Karakorum range shuts in a valley which is drained by the headwaters of the Indus and the Sanpu. The basin of the Sanpu is known as Tibet proper, that of the Indus as Ladak and Bultistan. Further east, the tract drained by the Yang-tze-Kiang is known as Khan. North of the Karakorum range is a large desert, called Khor in the west and Katchi in the east. Lastly in the northeast where the Hoang-ho rises is the hill country of Lake Ko-ko-nor. Owing to its great elevation, Tibet, which has about the same latitude as Naples, has almost arctic winters, and its mountains and great plains rob the air of moisture, in its long passage from the sea, making it very dry. Timber never rots, but becomes brittle, and meat never spoils, but dries until it can be powdered. There are great glaciers in the mountain region, one being thirty-two miles long, four times as large as the Mer de Glace. The plains are like the steppes of Central Asia, and are used for grazing, while the fertile valleys bear fruits and grains. Irrigation is necessary, and terraces are built along the slopes to retain the water. Silver, copper, tin, salt, sulphur, borax, and niter abound, and gold in considerable quantities, but the want of fuel makes the development of the mineral wealth very slow. Tibet is almost entirely under Chinese rule, though the government is in the hands of the Buddhists, the chief priest called the Dalai-lama, and the second called the Bogdo-lama, having charge, one of spiritual matters, and the other of temporal affairs. Chinese soldiers are in all the towns, under Chinese generals, who direct in the most important matters. The language of the Tibetans belongs to the Chinese class of languages, and the religion is Buddhism. The people are skillful, industrious, and intelligent. They are ingenious jewelers, and make fine fabrics of wool and goat hair, and carry on a large trade with China, Turkestan, and India.

About the time of the Christian era, Sakya, the last great teacher of the Buddhists, settled at H'lassa, in Tibet, where he is thought to be still living in the person of the grand lama. In 821, Tibet paid tribute to China, and western Tibet was overrun by the Turks, until driven out by Aurungzebe, in the 17th century. Western Tibet is now under British supervision. Population 6,000,000.

Tick, a kind of mite having the mouth in the form of a sharp beak. They are very common in warm countries and are parasites on cattle. The so-called sheep ticks are insects with six legs, while all true ticks have eight legs, like the spiders. They live on plants and will attach themselves to the skin of man as well as to animals. Those of South Africa and Brazil are dreadful pests. In South America they cling in clusters of hundreds to slender twigs, and transfer themselves to horses and cattle. They bury their heads under the skin and suck blood, becoming as large as a horse bean. Herds of cattle are sometimes killed by the exhaustion produced by these parasites. Wet weather is fatal to them, and infested animals are often freed from them by swimming a river.

Tick'nor, George, an American author, was born at Boston, Aug. 1, 1791. He was graduated at Dartmouth college when but sixteen years old and studied law. In 1820, Ticknor became professor of French and Spanish in Harvard college. His *History of Spanish Literature* was published in 1849, and at once took high rank, and was translated into Spanish, German, and French. His *Life of Prescott* is considered one of the finest biographies ever written. Ticknor died Jan. 26, 1871. See *Life*, by Hilliard.

Ticonderoga (*ti-kŏn-der-ō'ga*), a village of New York, on the outlet of Lake George, 88 miles northeast of Albany. Population 1,911. The French in 1755 built here Fort Carillon, afterward called Fort Ticonderoga, to command Lake Champlain. Two years later, Montcalm led his force of 9,000 men from this fort and captured Fort William Henry, which had been built by Sir William Johnson, at the south end of Lake George. In 1758, General Abercrombie was defeated by its garrison with a loss of 2,000 men; but the next year General Amherst forced the French to dismantle and abandon it. After the battle of Lexington, Col. Ethan Allen stormed Ticonderoga, May 10, 1775. The next year Burgoyne, by planting a battery on Mount Defiance, forced the American garrison to leave Fort Ticonderoga, which the British held until Burgoyne's surrender, though it was attacked by General Lincoln. The British also held it a short time in 1780. Parts of the walls are still standing. See Joseph Cook's *History of Ticonderoga.*

Tides, the periodic rising and falling of the waters of the sea along coasts and inlets. The rising is called the *flood*, and when highest is called *high water;* the falling is called the *ebb*, and at its lowest is known as *low water.* The short lull between tides is called *slack water.* Flood tide and ebb tide each last for approximately six hours, there being two high tides and two low tides daily. Each day high water occurs fifty-two minutes later than the day before, as the average time between two high or low tides is twelve hours and twenty-six minutes. Sir Isaac Newton first discovered the cause of the tides by applying to them his newly discovered law of gravitation, showing that the rising of the waters was due to the difference between the attraction of the moon and of the sun upon the earth as it revolved. As the particles of

water are free to move while the particles of land are not, this attraction draws them toward the moon, forming a swell in the ocean's waters. This swell draws toward it waters from both sides, leaving on the coasts a depression, or low water. Gravitation acts on the solid mass of the earth as if this mass were concentrated at the center of the globe. So on the side of the earth opposite that of the moon the waters are less attracted than the land, being at a greater distance, and are, as it were, left somewhat behind, thus forming another swell, just opposite to the one in the other hemisphere. By the rotation of the earth this system of swells and troughs travels from east to west over every part of the ocean. The attraction of the sun also causes two daily tides, but these solar tides are much smaller than the lunar tides. As the moon and sun are rarely in the same relative positions, their high tides do not usually occur at the same time. But at new moon and full moon they are in line with the earth and their attractions act together, causing especially high water, known as the *spring tides*. At the time of the first and third quarter of the moon, it is at right angles with the sun, and their attractions act against one another, lessening the height of the high water. These are the *neap tides*.

A complete explanation of the tides cannot be given in this place. For this the student is advised to read first of all Sir Robert Ball's *Time and Tide* ("Romance of Science" series: London), then articles 464–84 in Young's *General Astronomy;* next Darwin's *Tides*, a course of popular lectures delivered before the Lowell institute; and lastly Darwin's masterly article on *Tides*, in the *Encyclopædia Britannica*.

In the references just given the tides are treated as a wave motion which they really are and which is the only point of view from which they can be satisfactorily considered. See WAVE MOTION.

Tien-Tsin (*tē-ĕn'tsĕn*), a large city of China, is on the Pei-ho river, thirty-eight miles from its mouth, and eighty miles southeast of Pekin. The old mud and dried-brick houses have been replaced in part by well-built dwellings. The Pei-ho is generally frozen from the middle of December to the middle of March, and the business at other times, carried on by means of boats and junks, is then done by sledges which swarm on the river. Tien-Tsin is an open port; it exports large quantities of cotton, peas, and dates, and imports cotton goods, needles, window glass, sugar, paper, etc. Population 1,000,000.

Tiff'in, a city of Ohio, is thirty-four miles by rail southwest of Sandusky, on the Sandusky river. It is the seat of Heidelberg college, founded in 1850. There are also two daily and four weekly newspapers, a courthouse, three banks, sixteen churches, a convent, and several schools. It manufactures carriages, stoves, furniture, tiles, farming implements, and woolen goods. Population 10,989.

Tiflis (*tif-lēs'*), an important Russian city on the Kur river, 165 miles east of the Black sea. It is the capital of the Russian government of the same name in Trans-Caucasia, and is on the military railroad which joins the Black and Caspian seas. It has a large trade with Persia, and manufactures woolen and linen cloth, carpets, and arms. It is noted for its warm spring baths. Population 160,645.

Ti'ger, the largest and most powerful member of the cat family. The lion appears larger on account of its immense hairy head and mane, but the royal Bengal tigers reach a length of eleven feet and are able to overcome the lion in combat. They have a tawny ground color, with black stripes on the body and limbs, the tail being ringed with black. The common tiger is about eight feet in length.

TIGER.

It is abundant in Hindustan, and does great damage to herds of cattle, and occasionally attacks man. A cattle-eating tiger will kill an ox about every five days, or from sixty to seventy in a year. The hunt of the tiger from the backs of elephants is dangerous and exciting. The range of the tiger is greater than was at first supposed. Starting with India as its chief locality, it ranges west through Persia, east through Burma to Sumatra and Java, and north through China to Manchuria, and even into Siberia. It is absent from Ceylon and Borneo.

Tig'lath Pile'ser. See ASSYRIA.

Ti'gris, a large river of Asiatic Turkey, rises south of Lake Goljik, in the Kurdish mountains, is joined at Til by the Bitlis, unites with its sister stream, the Euphrates, at Korna, and from this point to the Persian gulf the river is known as the Shat-el-Arab. Its whole course is some 1,500 miles long. In its upper part it is a very swift stream. The Tigris was in ancient times the great river of Assyria, and formed the eastern border of Mesopotamia. Nineveh, Seleucia, and Ctes-

iphon stood on its banks. Its chief cities now are Bagdad, Mosul, and Diarbekir. It is navigable for steamers at all seasons below Mosul.

Til'den, Samuel Jones, was born at New Lebanon, N. Y., Feb. 9, 1814. He went to Yale college and the University of New York, and became a lawyer. As a member of the New York assembly in 1846 he was much interested in the state canals, and became one of the leading Democrats of the state. In 1874, Tilden was elected governor of New York by 50,000 majority, and his home popularity, thus shown, gave him the Democratic nomination for the presidency in 1876. The Hayes-Tilden campaign was one of the hardest fought and closest in our history, and the disputed election was given to General Hayes by the electoral commission of fifteen appointed by congress to canvass the votes. Tilden was also a prominent lawyer of New York city. He was one of the organizers of the bar association, and was leading counsel in many large cases. He died near Yonkers, N. Y., Aug. 4, 1886, leaving the bulk of his fortune to found a free library for New York city.

Till'man, Samuel Escue, American soldier and educator, astronomer and chemist, was born near Shelbyville, Tenn., Oct. 2, 1847, and graduated at West Point, entering the army first as an artilleryman and afterward was transferred to the corps of engineers. In 1870, he was appointed assistant-professor of chemistry, and ten years later became professor of chemistry, geology, and mineralogy at West Point; was assistant astronomer of the United States expedition to Tasmania to record the transit of Venus, and has acted on several survey commissions and explorations for the United States government. He is the author of a number of text-books in his branch of science, notably a work on *Descriptive General Chemistry*, and elementary treatises on mineralogy, on the principles of chemistry, and lessons in heat.

Till'y, Johann Tserclaes, Count of, one of the greatest captains of the 17th century, was born in 1559, in Brabant. A pupil of the Jesuits and an officer under the duke of Alba, he developed into a soldier of great sternness. After fighting against the Turks, he was made commander of the Catholic army on the outbreak of the Thirty Years' war, and together with Maximilian of Bavaria gained the important battle of Prague. During the course of this war by his masterly tactics he separated the armies of Mansfield and of the Markgraf of Baden, beat the latter at Wimpfen, and drove Christian of Brunswick from the Palatinate, defeating him at Höcht in 1622, and again the next year in a desperate three days' battle at Stadtlohn. Now made a count of the empire, he defeated the king of Denmark at Lutter, and together with Wallenstein forced him to sign the treaty of Lübeck in 1629. Two years later, he succeeded Wallenstein as commander-in-chief of the imperial troops, took Magdeburg by storm, and allowed his Croats and Walloons to pillage and massacre at pleasure. A few months later he met his match in Gustavus Adolphus, who defeated him at Breitenfeld, and the next spring forced him to retreat behind the Lech river in Bavaria, and crossed it himself in the face of his army. In this last battle, Tilly was mortally wounded and died April 30, 1632. Tilly was temperate, despised luxury and wealth, and his able support of the Catholic party in the war was not due in the slightest to self-interest, but wholly to his devotion to the church.

Timbuktu (*tim-buk'tō*), a city on the southern edge of the Sahara, in central Africa, some nine miles from the Niger. It is about three miles around, and was formerly surrounded by a clay wall. Timbuktu has a large caravan trade, gold dust being the most important export. The people are negroes, Tuaregs, Mandingoes, Arabs, Fulahs, etc. The city was founded in the 12th century, but was first seen by a white man in 1826. Timbuktu now belongs to France, and a railroad is proposed to connect Algiers, Timbuktu, and Senegambia. Population 12,000, greatly increased during the trading season from November to January.

Time, like space, is one of the conditions under which all things are perceived. Time may be defined as *duration*, but it is doubtful whether anything is, thereby, added to the clear idea which every one already has as to the nature of time. Our notion of time as a quantity is derived from the observance of some regularly recurring event, such, for instance, as the vibration of a pendulum. In such a case we say that the "amount of time" elapsing between two events is proportional to the number of vibrations which the pendulum has made between the two events. The unit of time employed by the whole world is the *average* time which elapses between two successive transits of the sun across the meridian. This unit is called the *mean solar day*, and is divided into 86,400 parts called *seconds*, which are the units most frequently employed in measuring small intervals of time. The sun does not move through the sky at a uniform rate; but we can imagine one which does, and which makes the same number of revolutions per year as the actual sun. Such a sun is called the *mean sun*. The instant at which the mean sun crosses any meridian is called *noon* for that meridian, or *local noon*. Time which is measured from a local meridian is called *local time*.

Since 1883 in the United States we have employed time which is counted from Greenwich noon, and which is called *standard* time. Thus the inhabitants of Labrador and Nova Scotia employ time which differs from that at

Greenwich by *exactly four hours;* this is called colonial time. In the extreme east of the United States, neighboring on each side of the seventy-fifth meridian, all correct watches and clocks differ exactly five hours from Greenwich time; this is called *eastern time.* In the Mississippi valley, the time is six hours earlier than Greenwich, and is called *central time.* Fifteen degrees west we have *mountain time;* and along the Pacific coast the time is eight hours earlier than Greenwich, and is known as *Pacific time.*

In like manner *Middle European time* is one hour slower and *Eastern European time* is two hours slower than Greenwich. Recently the Australian colonies have adopted Greenwich time—or, what amounts to the same thing, they use time which differs exactly eight, nine, ten, and eleven hours from Greenwich.

Tim'othy, a disciple and companion of St. Paul. He was the son of a Greek and a Jewess, and his home was either at Derbe, or Lystra in Lycaonia. Paul set him apart as a minister of the new gospel, and after preaching in Macedonia and Achaia, he went, at Paul's request to Ephesus, and accompanied the apostle to Jerusalem. It was to him that the two epistles to Timothy were addressed by the apostle Paul. According to tradition, Timothy suffered martyrdom under Domitian.

Timour (*tē-mör'*), **Timur,** or **Tamerlane,** was the second of the great conquerors whom central Asia sent forth in the middle ages, and was born at Kesh, about forty miles southeast of Samarkand, April 9, 1333. His father was a Turkish chieftain and his mother claimed descent from the great Genghis Khan. When he became tribal chieftain, Timour helped the Amir Hussein to drive out the Kalmucks. Turkestan was thereupon divided between them, but soon war broke out between the two chiefs, and the death of Hussein in battle made Timour master of all Turkestan. He now began his career of conquest, overcoming the Getes, Khiva, and Khorassan, after storming Herat. His ever-widening circle of possessions soon embraced Persia, Mesopotamia, Georgia, and the Mongol state, Kiptchak. He threatened Moscow, burned Azoo, captured Delhi, overran Syria, and stormed Bagdad, which had revolted. At last, July 20, 1402, Timour met the Sultan Bajazet on the plains of Angora, captured him and routed his army, thus becoming master of the Turkish empire. He took but a short rest at his capital, Samarkand, and in his eagerness to conquer China, led his army of 200,000 across the Jaxartes on the ice, and pushed rapidly on for 300 miles, when his death, Feb. 18, 1405, saved the independence of China. In his reign of thirty-five years, this chief of a small tribe, dependent on the Kalmucks, became the ruler of the vast territory stretching from Moscow to the Ganges. A number of writings said to have been written by Timour have been preserved in Persian, one of which, the *Institutions,* has been translated into English. Timour is made the hero of Marlowe's *Tamburlaine,* the first play in which blank verse appeared on the stage.

Tin, a silvery-white metal, with a tinge of yellowish blue, and a high luster. It is softer than gold and can be rolled or beaten out into very thin sheets called tinfoil. It is ductile at 212°, when it can be drawn out into wire which is not very tenacious; it melts at 455°, and volatilizes at a white heat. Air and moisture act on tin very slightly. The peculiar properties of tin, especially its malleability, its brilliancy, and the slowness with which it rusts make it very serviceable. With other metals it forms valuable alloys, as bronze, gun metal, bell metal, pewter, and solder. Tin is very largely used in covering sheet iron, thus forming tin plate.

Tin must have been one of the metals earliest known, as it enters into bronze of which the oldest metallic weapons and tools are made. The largest tin mines of Europe are found in Cornwall in England, which once supplied Tyre and Sidon. There are very large tin deposits in the island of Banca and on the Malay Peninsula, as well as in Australia. Some tin is found also in Bolivia and Peru. Small deposits of tin ore have been found in the United States, but we are wholly dependent upon foreign sources for our supply of this metal. Dioxide of tin is the only important ore; when pure it is made up of seventy-eight parts tin and twenty-two parts oxygen. This ore is gray, yellow, red, and black, and strikes fire with steel. In Cornwall, tin ore is found in veins running through granite and slate, or scattered in crystals through their mass. The dressing of the ore is a hard and delicate operation. It only yields from ten to eighty-four pounds of tin oxide to a ton of material and is so scattered through the mass that it has to be stamped to a fine powder to separate it. It is then repeatedly washed by machinery to get rid of impurities and passed through a furnace to separate the sulphur and arsenic, and is then ready for smelting.

Tintoretto, Il (*el tin-to-rĕt'to*), a great Venetian historical painter, was born in 1512. His real name was Jacopo Robusti, but he was called Tintoretto from the Venetian word meaning dyer, which was his father's trade. He was self-taught except for a few lessons from Titian. He took as his motto: "The design of Michael Angelo and the coloring of Titian." He sketched so fast that he was called the "madman." Among his famous pictures are *Belshazzar's Feast,* a fresco, *The Last Supper, The Last Judgment, The Slaughter of the Innocents,* and *Paradise.* He died at the age of eighty-two.

Tippecanoe (*tip'e-ka-nō'*), a river of Indiana, which rises in Lake Tippecanoe in the northern part of the state, flows southwest 200 miles, and falls into the Wabash, nine miles above Lafayette. On its banks was fought the battle of Tippecanoe, Nov. 7, 1811, in which the Indians under Tecumseh's brother, the prophet, were routed by General Harrison.

Tippoo Sahib (*tip-ō' sä'hib*), sultan of Mysore, and son of Hyder Ali, was born in 1749. He was brought up a Mohammedan, excelled as an athlete, and learned military tactics from the French officers in his father's service. He proved his prowess by routing the British at Perimbakum in 1780 and on the Kolerun river in Tanjore in 1782. After being crowned he returned at once to the head of the army and captured Bednore in 1783. In his second war with the English (1790–92) he laid waste the Carnatic almost to the gates of Madras, but was at last forced to give up a part of his dominions and make peace. The English again attacked Tippoo in 1799, and while bravely defending his capital, Seringapatam, he was killed (May 4, 1799). Tippoo was very popular among his people, who looked upon him as a martyr to the Mohammedan cause.

Tirlemont (*tēr'lmon'*), a city of Belgium. Population 16,157. Here the French general Dumouriez routed the Austrians March 16, 1793, thus winning a most important battle.

Tiryns (*tī'rinz*), one of the very oldest cities of Greece, was in Argolis in the Peloponnesus. According to the account handed down, it was founded by Prœtus, a king of Argolis, and its walls were built by the Cyclopes. Here Hercules passed his boyhood. Probably about 468 B. C. the city was destroyed by the Argives. The ruins of Tiryns are one of the finest specimens of what is called cyclopean architecture, and with those of the neighboring city of Mycenæ are the grandest of all in Greece. The walls were over twenty feet thick, formed of unknown stones of enormous size.

Tissot (*tē-sō'*), **James Joseph Jacques,** an eminent French genre painter, famous for his series of pictures representing the life of Christ on earth, painted during a ten years' visit to the Holy Land, was born at Nantes, France, Oct. 15, 1836. He was educated at the École des Beaux Arts, in Paris, and under such masters in art as Lamothe and Flandrin. He made his first appearance in the Paris *Salon* in 1859, with a number of fine water colors, etchings, etc., and in 1861 he painted his *Rencontre de Faust et de Marguerite*, now in the Luxembourg, Paris. His other notable canvases include *Return of the Infant Prodigal*, *Confidence*, *A Widow*, *An Interesting Story*, *The Captain's Daughter*, *On the Thames*, *A Young Girl in a Boat*, and *A Young Woman in Church*. M. Tissot then turned his attention to his series of religious subjects illustrating the *Life of Christ*, for which a firm of French publishers, it is said, has paid him over a million francs. The series, 365 in number, were painted each on the spot traditionally associated with its subject, and were exhibited in London and Paris, where they won fame for the distinguished artist.

Titans (*tī'tanz*), **The,** in Greek story, were the sons of Uranus (Heaven) and Gæa (Earth). Urged by their mother, the Titans, headed by Kronos, rose against their father, dethroned him, and set free from Tartarus their brothers the Hekatoncheires (hundred-handed) and the Cyclopes. The Titan Kronos now made himself king, and for fear he should be dethroned by one of his children, as it was foretold he would be, swallowed each as soon as it was born. The only son to escape was Zeus, who was saved by his mother causing Kronos to swallow a stone wrapped in a cloth, believing it to be his child. Zeus at the end of a ten years' war conquered the Titans and hurled them down into a dungeon below Tartarus, surrounded by a brazen wall, and guarded by the hundred-handed.

Titian (*tish'an*) or **Tiziano, Vecelli,** one of the greatest of painters, was born at Capo del Cadore, in the Alps, in 1477. His father sent him to Venice to study painting when he was ten years old. He was very quick at reproducing the special features of any artist's work, and sometimes beat his masters. The completion for the Venetian senate of a picture begun by Bellini, who was one of his teachers, gained him fame and an office worth 300 crowns a year. He became acquainted with the duke of Ferrara and the poet Ariosto, whose portraits he painted, and on his return to Venice painted one of his grandest pictures, the *Assumption of the Virgin*. Pope Leo X. and Raphael invited him to Rome, and Francis I. to France. He painted the portrait of Charles V., and spent three years in Spain. There is no complete catalogue of Titian's works, but over 600 of his pictures are known. Far beyond his power as a designer, and beyond his gifts of imagination, is the splendor, boldness, and truth of his coloring. See his *Life*, by Northcote. He died at Venice in 1576.

Titicaca (*tē-tē-kä'kä*), a South American lake, 1,200 feet above the sea. It lies partly in Bolivia and partly in Peru, and is 100 miles long, and about 35 miles broad. Some very remarkable ruins are found on its small islands, which seem to belong to a higher civilization than was found in the country when it was conquered by the Spaniards. There are pyramids covering several acres, and doorways, pillars, and statues sculptured in a peculiar style. On the cornice of a doorway is a human figure with a crown of rays and crested serpents. The statues were all

on a large scale, and the whole region is strewn with the great sculptured blocks. Two steamers ply on the lake, having been carried in pieces across the Andes in 1871, and a railroad from Arequipa to the lake has been built, which opens the country, with its rich stores of silver, copper, and timber, and its products of chocolate, coffee, and alpaca wool.

Tit'lark, a class of small birds, coming between the larks and the wagtails. They live in all parts of the world, building their nests on the ground, of dry grass, lined with hair. The American titlark is a little over six inches long, olive brown, shading to a yellowish brown and white, with black bill and feet. In the fields or prairies it is often found in flocks of tens or hundreds running on the ground. The Missouri titlark is the American bird which is most like the skylark of Europe.

Tit'mouse, the common name of a number of small birds related to the warblers. There are about seventy-five species, found chiefly in the Old World. Four species inhabit the eastern United States. The commonest of these is the well-known black-capped chickadee, which is a winter as well as a summer resident in the southern part of its range. This bird is about five inches long, gray above and white below washed with brown. The crown and throat are black and the cheeks white. Its familiar call is *chickadee*, and it has besides this, a high, sweet whistle of two or more notes. It ranges from Labrador south to Indiana and Virginia. In the south it is replaced by a smaller southern chickadee. The tufted titmouse is the largest of the American species, being about six and one-fourth inches long. All these birds of America are dull colored, but some of the true Tits of the Old World, are among the brightest birds of the northern hemisphere. For example, the azure tit of Siberia is white and sky blue, and the blue tit of Europe is blue, white, and yellow.

BLUE TITMOUSE, MALE AND FEMALE.

Ti'tus, mentioned in the Bible as a companion of Paul, was a Greek sent from Antioch to Jerusalem to confer with the apostles. He traveled with Paul, going with him to Jerusalem, was sent by him to Corinth, and left at Crete, where, according to tradition, he was made the first bishop of Crete.

Ti'tus Fla'vius Sabi'nus Vespa'sianus, emperor of Rome, was the eldest son of Vespasian, and was born at Rome, Dec. 30, 40 A. D. Brought up at the court of Nero, he became well trained in manly exercises and a good scholar. He saw service as military tribune in Germany and Britain, and as commander of a legion in Judæa under his father. When Vespasian became emperor, Titus was left to carry on the Jewish war, which he brought to a close by the capture of Jerusalem in 70 A. D. after a long siege. On his triumphal return to Rome he was received with joy by the citizens, and made a fellow-ruler of the empire by his father. He speedily lost the good will of the people, however, by many acts of tyranny and by a life of pleasure, and on his becoming sole emperor, at his father's death in 79, Rome looked forward to having a second Nero reign over them. But he at once put a stop to prosecutions for acts of disrespect to the emperor: had informers scourged, and banished or sold as slaves; built the colosseum and the Baths of Titus, and delighted the people with public games which lasted 100 days. In 79, when the great eruption of Vesuvius took place, which buried Herculaneum and Pompeii, in 80 when a three days' fire laid waste Rome, and during the plague that followed it, he despoiled his palaces to aid the sufferers. In this way Titus became one of the most popular of Roman emperors, but in the third year of his reign he suddenly died, perhaps poisoned by his younger brother, Domitian, Sept. 13, 81 A. D.

Tivoli (*tiv'o-lē* or *tē'vo-lē*), a city of Italy, eighteen miles east of Rome, stands on the slope of Monte Ripoli, one of the Apennines. It is a walled town, with a fortress, steep, narrow streets, and a cathedral, which was once a temple of Hercules, where Augustus held his court. Since the time of Pliny, its vineyards have been noted for their fine-flavored grapes, and the travertino stone, of which a great part of Rome is built, comes from Tivoli. Near the city is the temple of Vesta, built in 76 B. C., the remains of the villas of Hadrian and Mæcenas, and the ruins of early Roman mausoleums, baths, aqueducts, etc. Tivoli was called in Roman times Tibur, is mentioned in 446 B. C., and is said to be older than Rome. It is one of the few towns of Latium still on their old sites. It was also a noted suburb of Rome, Scipio, Marius, Horace, and many other prominent Romans having their Tiburtine villas. Population 10,400.

Toad, an amphibian animal related to the frog, having a similar structure and life history. The skin of the toad is covered with warts, but the milky secretion of the skin is harmless. Toads are more terrestrial than frogs; after they become mature they return to water only to lay eggs, while frogs always remain near the water. Their eggs can be distinguished from those of frogs from the circumstance that they are laid in long strings of gelatinous substance, instead of masses of the same, as with the frog. The toad is now often used for making nature observations in

schools. The Surinam toad carries its eggs and young upon its back in small, rounded depressions of the skin.

Toad'stool. See BASIDIOMYCETES.

Tobac'co, species of *Nicotiana*, a genus of the nightshade family. *N. tabacum* is the best-known species, but *N. rustica* is also much cultivated. Tobacco was introduced to the civilized world by the discovery of America, where the natives were found using it. The valuable properties are found in the leaves, which are dried and cured. More tobacco is produced in the United States than in any other country, and it is said to supply one-half of the tobacco of commerce. It is grown as a commercial product in almost every state of the Union, Kentucky very far exceeding all other states in acreage under cultivation. The next states in order are Virginia, North Carolina, Tennessee, and Ohio. Outside of the United States the cultivation of tobacco is chiefly in tropical and semi-tropical countries, a certain rich plain in Cuba (Vuelta del Abajo) producing the finest grades.

VIRGINIAN TOBACCO.

Tobac'co Worm. See CATERPILLAR.

To'cantins', a river of Brazil, 1,000 miles long, from the junction of the Almas and Maranhao rivers to the Rio Para, into which it falls. Its branches are the Araguaya, Paraman, Great Somno, Tucahunas, and Theresa. The Tocantins is eight miles wide at its mouth, and the tide ascends the river for 300 miles.

Tocqueville (*tōk'vil*), **Alexis Charles Henri Clerel de,** was born at Paris, July 29, 1805. He studied law and became a judge at Versailles in 1826. Five years later, the French government sent him to the United States to examine the penitentiary system. This mission gave him the chance to study American institutions, and resulted in his writing his masterpiece, *Democracy in America*, one of the very ablest of the many books on America by foreigners, and which is still of the highest authority. His other chief work was *The Ancient Regime and the Revolution*. De Tocqueville was in politics from 1839, when he was chosen deputy, till his release from a short imprisonment at the time of Napoleon III.'s seizure of power in 1851. For five months in 1849 he was minister of foreign affairs. He died at Cannes, April 16, 1859.

Todleben (*tōt'lā-bĕn*), **Franz Eduard,** General, was born at Mitau, in Courland, Russia, May 20, 1818. He attended the school of engineers at St. Petersburg. From 1848 to 1851 he was with the Russian army in the Caucasus fighting the native leader Shamyl (whom see). In the Crimean war he became known throughout the world for his defense of Sebastopol (which see). After strengthening the fortifications of Cronstadt and Nikolaiev, he was made chief of engineering in the war office in 1860. He took a prominent part in the last Russo-Turkish war. General Todleben wrote a history of the defense of Sebastopol, which has been translated into English and other languages. He died near Frankfort, July 1, 1884.

Tokat (*to-kät'*), a city of Asiatic Turkey, sixty miles south of the Black sea. It is shut in by mountains on three sides, and so suffers a furnace-heat in summer. There are large gardens and vineyards, copper is smelted, and cotton is manufactured. There is now only a small trade, though Tokat was once an important business center. Population about 10,000.

Tokay (*to-kā'*), a wine made from vines growing in the neighborhood of the town of Tokay, Hungary. The Tokay wine district covers about 15,000 acres. Great care is taken in assorting the grapes and in preparing the wine, which is brownish yellow while new, changing to a greenish hue as it grows older. The yearly yield is about 1,550,000 gallons. The wine gathering is celebrated by a national festival.

Tokio or **Tokyo** (*to'kī-o*), meaning "eastern capital," formerly called Yeddo, is the

capital of Japan, and stands in the eastern part of the main island, Honshiu, at the head of Yeddo bay. The city covers nearly sixty square miles, and is divided into thickly built and inhabited districts, separated by large

gardens and groves, and cut by canals and moats. In the center is the fortress guarded by stone walls, and a moat, beyond which another wall shuts in about three square miles, while a third wall incloses about five square miles. Wide clean streets, lighted by gas, brick and stone buildings, and western merchandise in the stores gives Tokio the look of a European city. Shinto shrines and Buddhist temples stand in the cemeteries, and there are four Christian churches. The Imperial University of Tokio, supported by the government, has over 100 foreign teachers. There are banks, newspapers, steam factories, carriages, jinrikishas (which see), theatres, telegraph connection with other cities, and railroads to Yokohama and Saikyo. The famous general and statesman, Iyeyasu, fixed his seat of government at Yeddo, the "port," in 1600, and here his descendants reigned until 1868, when as a result of the revolution against the Shogun, the Mikado established his court here, and changed the name of the city to Tokio. The city has suffered greatly by fires, and by earthquake shocks in 1656 and 1854. Yeddo was thrown open to settlement by foreigners as the result of the treaty made by Commodore Perry between the United States and the Shogun of Japan in 1854. Population 1,440,121.

Tole'do, a famous Spanish city, formerly the capital of the country, stands on the Tagus, which surrounds it on three sides, fifty-five miles southwest of Madrid. It is built on a number of hills 2,400 feet above the sea. The Tagus is its fortress, rushing around it between high and rocky banks, and leaving only one approach on the land side, which is defended by an inner wall built by the Gothic King Wamba in the 7th century, and by an outer wall built by Alfonso VI., in 1109, both remarkable for the number and beauty of their towers and gates. In the middle of the city rises the high cathedral, surrounded by many churches and convents. This superb cathedral, built in 1492 on the site of a Moorish mosque, though plundered in 1521 and 1808, is still remarkable for its stained glass, sculptured choir, and gilded metal pulpits. The famous Toledo blades known in the time of Livy, who wrote about them, were so perfectly tempered that they were sometimes curled up like watch springs and packed in boxes. The Moors captured Toledo in 714; it became a part of Castile in 1085. In the heyday of its career it is said to have sheltered 200,000 people. Population 21,000.

Toledo, a city of Ohio, was organized in the year 1833 by the union of the villages of Port Lawrence and Manhattan. It is situated on both sides of the Maumee river, near its mouth, and covers an area of nearly 28 square miles.

There are points in and about Toledo that are of great historic interest. Gen. Anthony Wayne, Gen. Wm. H. Harrison, Commodore Perry, General Proctor, and the Indian chiefs Pontiac, Little Turtle, and Tecumseh have made Toledo and the Maumee valley of great interest to students of history.

According to the census of 1900, there are only twenty-five cities in the United States with a larger population. Toledo ranks third in population in Ohio and is destined to become a great commercial center. It is located at the southwestern extremity of Lake Erie, and is, therefore, the natural lake port for the trade and commerce of the Ohio and Mississippi valley region, including the greatest corn-growing belt in the world, the oil and coal fields of Ohio and Indiana, the salt, lumber, and iron of Michigan. The Ford Plate Glass works, the Libby Glass factory, the National Malleable Castings company, the oil refineries, the Automobile factory of the American Bicycle company, and the Craig ship yards, are some of Toledo's leading industries.

Toledo is a city of beautiful homes. It has a fine system of parks and boulevards; its street-car system, twenty-six railroads, steamboat, and electric lines give rapid transit to all parts of the country. Its modern school system is among the best in the United States. It was organized in 1898 upon the federal plan of government. The city supports a fine public library, the Toledo university, two high schools, a city normal school, manual training schools for high school and elementary departments, 40 primary and grammar schools, enrolls 22,000 pupils and employs about 500 teachers. Population 131,822.

Tolstoi (*tol'stoi*), Count **Leo** (or **Lyof**) **Nikolaivitch,** an eminent Russian novelist and social reformer, was born at Yasnaia Poliana, in the government of Tula, Russia, Aug. 28, 1828, and was educated at the University of Kasan (Russia in Europe). Early in life he was a soldier, and served in the army in the Caucasus and in the Crimea, where he was present at the battle of the Tchernaya, and at the storming, by the allied forces, of Sebastopol. This experience enabled him to write with such graphic force not only his narrative on *Sebastopol*, but his tale of Napoleon's invasion of Russia, entitled *War and Peace*. *Anna Karénina*, a tale of guilty passion, placed him among the masters of fiction. This was followed by a number of works which have earned for him the title of

COUNT LEO TOLSTOI.

"the prophet of renunciation," and led him to lead the life of an anchorite, toiling on his land with his own hands, sharing his crust with the humblest, in rigid obedience to Christian precept. He is an uncompromising opponent of coercive government and a bitter arraigner of modern society. His other writings embrace *My Religion*, *Resurrection*, the *Kreutzer Sonata*, *Master and Man*, *My Life*, *My Confession*, *Patriotism and Christianity*, *The Christian Teaching*, *The Kingdom of God within Us*, and *The Four Gospels Harmonized and Translated*.

Toltecs. See MEXICO.

Tomat'o Worm. See CATERPILLAR.

Tombig'bee, a river of Mississippi and Alabama, which rises in the northeastern corner of Mississippi, receives the Black Warrior, and by its junction with the Alabama, forms the Mobile river, about 45 miles above Mobile. It is about 450 miles long and is navigable for large steamboats to Columbus, Miss., 366 miles from Mobile bay.

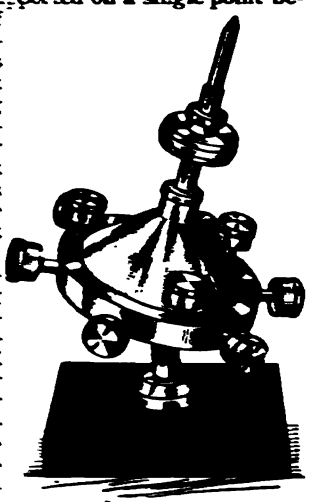
Tongue (*lingua*), a muscular organ, reaching from the hyoid, or tongue bone, backward and downward, and in front to the teeth. The upper surface, borders, and front third of the lower surface are free; while the remaining parts are fixed to neighboring parts by the covering of mucous membrane. At certain points, this membrane, on leaving the tongue, forms folds containing fibers, which act as ligaments to the tongue. The largest of these folds is called the frenum, or bridle of the tongue, and joins its free front end to the lower jaw. This bridle limits the backward movement of the tip of the tongue. In rare cases it reaches to the tip, so as to interfere with speech and chewing, and the child is said to be tongue-tied. The upper surface is divided into two parts by a middle, lengthwise furrow. For the little hills on the top of the tongue, see TASTE. At the back of the surface are mucous glands, reaching into frog canals and helping to secrete the fluid that moistens the tongue. The furrow on the under surface is deeper with veins running forward on each side of it. The base of the tongue becomes wider before being fixed in the tongue bone, which, together with the ligaments, is the tongue's framework. There are two sets of muscles, the extrinsic or outside muscles, which fasten the tongue to certain parts and move it to them and in various ways; and the intrinsic muscles, which pass from one part of the tongue to another, make up its chief bulk, and move it in itself. By the action of the various muscles the whole tongue may be drawn back, its upper surface be hollowed or bowed, or pressed against the roof of the mouth; its tip may be thrust straight out or sideways, forward and downward, or into a hollow back where food might lodge. See TASTE.

Tonk'a Beans. See VANILLA.

Tonquin'. See COCHIN-CHINA.

Toombs, Robert, American politician, member of the Confederate congress (1861), and Confederate secretary of state, was born in Wilkes county, Ga., July 2, 1810, and died at Washington, Ga., Dec. 15, 1885. After graduating at Union college, and studying law at the University of Virginia, he was returned a member of congress in 1844, and in 1850 contributed to the passing of the compromise measures. From 1853 to 1861 he was a member of the United States senate, a southern Extremist and leading Disunionist. In 1861, he became secretary of state in the Confederate government, but resigned this to accept the commission of brigadier-general, and to serve in the war on the Southern side. He was present at the second battle of Bull Run, was at Antietam in 1862, and in 1864 commanded the militia of Georgia. After the war he lived abroad till 1867, denouncing strongly the reconstruction measures of congress, and on his return to the South he refused to take the oath of allegiance to the United States government.

Top, the ordinary spinning top is a rapidly rotating solid supported on a single point below the center of gravity. Suspended in this way the weight of the top acting through its center of gravity exerts a moment of force which tends to tilt the top. The result is that the top "precesses," instead of falling over this exhibiting those phenomena so well known to every boy of ten. For a detailed explanation of the dynamics of the top, see WORTHINGTON'S *Dynamics of Rotation*, chap. xiii., or PERRY'S *Spinning Tops*: Society for the Promotion of Christian Knowledge: London. Clerk Maxwell devised a top having more or less the shape of a bell, so that the point of support could be placed at, above, or below the center of gravity. It is provided also with adjusting screws as shown in the accompanying figure, so that its mass can be distributed in various ways about the axis of rotation. The chief interest attaching this particular form of top, besides the fact that it illustrates most beautifully the general prin-



MAXWELL'S DYNAMICAL TOP.

ciples of rotation, lies in the fact that it simulates very accurately the motion of our earth on its axis, demonstrating on a small scale the phenomena of precession, nutation, variation of latitude, dynamic and static instability, etc. See Maxwell's original account in his *Scientific Papers*, Vol. I., pp. 248–68; also a detailed and popular account in the *Physical Review*, Vol. VI., March, 1898. See GYROSCOPE.

To'paz, a mineral and a gem, the finer varieties of which are much valued for their luster and the beauty of their colors. It is made up chiefly of alumina, silica, and fluorine. It is usually found in very old rocks and in most parts of the world. Fine topazes are found in Ceylon, but those most prized come from Brazil. Topaz is either colorless or in many shades of red, blue, green, or yellow; it is translucent or almost transparent on the edges, and is harder than quartz. When cut or set, topazes are easily mistaken for diamonds or rubies, but they are not as hard as either of these gems.

Tope'ka, the capital of Kansas, is built on both sides of the Kansas river, and is 300 miles west of St. Louis. The surrounding country is a rich, rolling prairie. It is a large milling center, and has manufactures with a yearly output of $10,000,000. It is also an important railroad and distributing point. It has electric street railroads, broad streets, and handsome churches and buildings. Among the public buildings are the capitol, United States government building, and the state asylum for the insane. The free public library has 10,000 volumes, the Kansas Historical Society library 40,000 volumes, and the state library 28,000 volumes. Its schools of higher learning are Washburn college, founded in 1865, having 250 students; an Episcopal college for women; and a Roman Catholic seminary. Topeka was settled in 1854, and became the state capital in 1861. Population 33,608.

Top'lady, Augustus Montague, was born at Farnham, Surrey, England, Nov. 4, 1740. He went to Westminster school and Trinity college, Dublin, became a clergyman, and preached in Devonshire and in London. He was for a time editor of a religious magazine, and published several religious books. He is remembered as a hymn writer, especially as the author of *Rock of Ages*. Toplady died at London, Aug. 11, 1778.

Torna'do. See STORM.

Toron'to, the second city of Canada, and capital of Ontario, is on Lake Ontario, near the river Don, thirty-six miles northeast of Hamilton. The town covers about 15,000 acres, part of it in large parks. The government house, customhouse, city hall, two fine opera houses, and the legislative halls are among the finest buildings. It is well supplied with schools, including the normal school, college of technology, Toronto university, University college, Upper Canada college, Knox college, Trinity university, and St. Michael's college. Among its charitable institutions are the city hospital, insane asylum, orphan asylum, and boys', girls', newsboys', and servants' homes. The water that supplies the city is taken from the lake, filtered by its passage through the sand of the island that forms the bay in front of the city, then carried in sunken pipes across the bay, and pumped into reservoirs. The city has a large trade, and manufactures boots and shoes, furniture, cars, ale, and whiskey. Toronto was the capital of Upper Canada from 1794 until 1841. After the union of Upper and Lower Canada, the seat of government was at Toronto and Quebec alternately. Since 1867, it has been the capital of Ontario. Toronto, known as York until 1834, was taken by the Americans in 1813. Population 207,971.

Torpe'do, the popular name for electrical fishes closely related to the skates and rays. They are capable of giving electrical shocks, and are also called cramp fishes. There are fifteen or twenty species inhabiting mainly the warmer seas, but one species is found on the Atlantic coast from Cape Cod south. It has a broad disk-shaped body with a stout tail and reaches a length of three to five feet. It is black above and whitish below. The electrical organs in all these fishes consist of two clusters of six-sided prisms, one on each side between the head and the broadly expanded pectoral fin. There are about 500 prisms in a single organ. The latter is richly provided with nerve fibers, and the discharge is under the control of the fish.

Torpe'do, an apparatus or machine designed to destroy ships by blowing them up with an explosive. Torpedoes are either stationary, floating, or moving. Stationary and floating torpedoes are used in defensive operations, as in harbors or rivers. They are placed in the harbor, either being anchored or allowed to drift within certain limits, and so arranged that they explode by contact with a ship or can be exploded by an electrical contact from some convenient point. Moving torpedoes are projected through the water, either on or below the surface, and explode upon coming in contact with a ship. They may depend for motion wholly upon the original force of projection, or they may be supplied with some motive power by which they move themselves. When they are projected, they are usually discharged by compressed air from a long tube called a torpedo tube. Many war-ships are fitted with these torpedo tubes, but special boats called torpedo boats are more often used for the purpose. A torpedo boat is a small fast steamer, fitted with appliances for launching torpedoes. Some navies have somewhat larger steamers which

have great speed, and are equipped with fast-firing guns for protecting the large cruisers and battleships from torpedo boats. Such boats are called torpedo destroyers. Torpedo destroyers are also supplied with torpedoes and torpedo tubes for offensive operations. The use of torpedoes in warfare dates back to the 16th century, when floating torpedoes were used to blow up bridges, etc. During the American Revolution floating torpedoes were tried with little success against Lord Howe's ships, both in New York harbor and on the Delaware river. Col. Samuel Colt, of Hartford, Conn., made numbers of experiments for the United States government about 1840. These experiments were in many ways successful, but did not lead to the general use of torpedoes. During the American Civil war, the Confederates made large use of torpedoes as a means of defending their ports, and twenty-four United States war vessels and transports were destroyed by torpedoes. Torpedoes were used successfully by the Germans in 1870–71, in keeping off the French war-ships, and again by the Russians in the Russo-Turkish war in keeping the Turkish ships out of the Danube. During the Spanish-American war, the Cuban harbors were mined, and so kept out the United States war-ships, but no ships were destroyed by torpedoes on either side. Within recent years much study has been given to submarine boats for torpedo warfare. The "Holland" submarine boat has been successfully experimented on by the United States. The French are also reported to have numbers of successful submarine boats for torpedo warfare. The study of this science is carried on with great secrecy by the different nations. The American naval school for this work is at Willet's Point, in New York harbor.

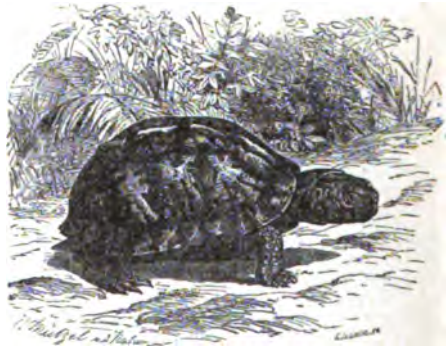
Torpe'do-boat. See TORPEDO.

Torquemada (*tor-kā-mä'thä*), **Tomas de,** a Spanish monk, was born at Torquemada, Spain, about 1420. He was a Dominican friar, and was made inquisitor-general for Spain in 1483. He is famous as the organizer of the Inquisition, with its tribunals at Seville, Cordova, and Toledo. He was too zealous even for the persecuting spirit of the age, and Pope Alexander VI. appointed four colleagues to hold him in check. He obtained the expulsion from Spain of the Jews and Moors. He died at Avila, Sept. 16, 1498.

Tor'rey, John, an American botanist, was born at New York, Aug. 15, 1796. While studying medicine in New York, he founded the Lyceum of Natural History. He was professor of natural sciences at West Point for three years, of chemistry at Princeton, and also had the same chair in the medical college at New York. His reputation as a chemist brought him the position of United States assayer, which he held for nearly twenty years. The results of his work on the state geological survey of New York and on several United States exploring expeditions are found in several publications: *Catalogue of Plants Growing within Thirty Miles of New York*, *Flora of the State of New York*, *Flora of the Northern and Middle States* (one volume), etc. His fine botanical library and the collections of forty years he gave to Columbia college, New York. He died March 10, 1873.

Torricelli (*tor-rē-chel'lē*), **Evangelista,** an Italian physicist, especially remembered as the inventor of the mercury barometer. He was born at Faenza, Oct. 15, 1608, and died at Florence, Oct. 25, 1647. His work was largely inspired by the writings of Galileo, whose pupil and private secretary he was during the last three months of Galileo's life. Torricelli substituted mercury for water in the barometer and found that it rose only 30 inches instead of 33 feet in a closed tube. This led him to the conclusion that the cause of the ascent was, in each case, the pressure of the earth's atmosphere. This conclusion was shortly afterward clinched by Pascal, who carried a barometer to a mountain top and found that the mercury fell as he ascended. Besides two important theorems in the mechanics of solids, Torricelli enunciated the theorem that a liquid flows from an orifice with the same speed that it would have acquired in falling freely from the surface of the liquid to the level of the orifice. See BAROMETER.

Tortoise (*tôr'tis*), a name loosely applied to any turtle, but more correctly restricted to



BOX TORTOISE.

particular members of the turtle family. The true tortoises are land turtles, represented in the United States by the wood tortoise, the box tortoise, and the burrowing turtles of the southern states. They feed upon plants and fungi. Their shell is usually highly arched, with the hard plates showing concentric markings. Their nearest relatives are fresh-water species like the painted and speckled turtles, which are also sometimes, incorrectly, called tortoises. The so-called tortoise shell comes from a salt-water turtle, called the hawksbill. See TURTLE, TERRAPIN.

Tortug'as. See DRY TORTUGAS.

Tor'ture, a means of extorting confession of guilt by inflicting severe pain. It was used at first on slaves, and with the Romans on those who were not Roman citizens. Paul protested against the use of it, saying: "Is it lawful to scourge a man that is a Roman uncondemned?" Under the emperors the use of it became general, extended through Europe, and reached its severest form in the tribunals of the Inquisition. The scourge; the rack, which stretched the whole body, sometimes until the joints were dislocated; the boot, rings of iron around the legs with wedges driven in until the flesh was mashed to a jelly, and the thumb screw, were among the many hideous instruments used. Judicial torture in England was inflicted only by order of the sovereign, and the last use of it was in 1640. France abolished it in 1786, and Russia in 1801; Austria, Prussia, and Saxony about the middle of the 18th century.

To'rus (in plants), the same as "receptacle." See FLOWER.

To'tal Ab'stinence or **Tem'perance.** The abuse of intoxicating liquors early led to the formation of temperance societies to influence public opinion on the subject, and to help those who were endeavoring to overcome the appetite for strong drink. The first temperance society in the United States was formed at Litchfield, Conn., in 1789, by 200 farmers who pledged themselves not to use liquors in carrying on their farm work. Early in the nineteenth century the temperance movement became organized, and the churches, especially the Methodist and Presbyterian, were active in the work. The Massachusetts Temperance society was formed in 1813, and the American Temperance union in 1826. The early societies were strictly temperance societies and not total abstinence organizations. They did not oppose the use of wine, cider, or malt liquors, a brewery being built in Boston by the temperance reformers. The first national temperance convention met in Philadelphia in 1833, and formed a national temperance union, with twenty-three state societies and over 7,000 other societies. "Total abstinence from all that intoxicates" was first insisted on in 1833 by the Massachusetts society.

The Washingtonian Temperance society was formed by six reformed drunkards, at Baltimore, in 1840, and was very successful in its special work of reforming hard drinkers. The Sons of Temperance was another society which numbered in 1850 about 240,000 members. The Good Templars, another temperance order, founded in 1852, is a secret society with passwords, grips, etc., with a membership of about 750,000. The most remarkable movement in the temperance cause, perhaps, is what is known as the *Crusade*, which began in Washington Court House, O., in 1873. It was a crusade of women against saloons, and the weapons used were prayer, persuasion, and persistence. The movement spread rapidly and was the means of closing many saloons, in some places all that were in operation. The Woman's Christian Temperance union is the successor to this temperance crusade. It has organizations in every state and territory of the United States, in Great Britain, Canada, Australia, New Zealand, India, Japan, Madagascar, South Africa, and the Hawaiian islands. It has been active in distributing temperance literature, in securing the study of temperance science in the public schools, in the establishment of homes for girls, and in securing laws forbidding the sale of tobacco to children. The badge is a bow of white ribbon. The headquarters are at Chicago, where the society has built the Woman's Temperance temple, one of the finest buildings in Chicago.

The first laws against the use of liquor were made in Massachusetts, in 1639, and about the same time in Connecticut. In 1756, a duty was imposed on imported liquors in Pennsylvania, and in 1774 the first continental congress proposed to the different states the passage of laws to stop the distilling of liquors. The ration of grog in the army was changed to coffee in 1832. License laws were passed in some states, but met with strong opposition. After the supreme court had decided in favor of prohibitory laws, in 1847, Maine was the first state to make use of the power. Delaware, Rhode Island, Vermont, New Hampshire, Massachusetts, Michigan, Iowa, Indiana, and Kansas have all passed laws prohibiting the sale of liquors, but the law has been repealed in most of the states, and license laws substituted. The Prohibition party has grown up from the effort to induce congress to favor national prohibition.

The temperance movement in Great Britain began in Scotland in 1828. Under Father Mathew 1,800,000 persons joined the total abstinence societies, and the amount of whiskey used in Ireland diminished one-half in three years. The National Temperance league, British Temperance league, Irish Temperance league, Scottish Temperance league, and North of England Temperance league are among the principal temperance organizations in Great Britain.

Toucan (*tō'kan*), the name for birds with enormous bright-colored bills, inhabiting South America and ranging as far north as Mexico. The bills are light as they are filled with air cavities. These birds feed on bananas, insects, and reptiles. They frequent lofty trees. They are sometimes confused with the horn bills of Africa, birds with greatly enlarged bills, but belonging to a different family.

Touch (*tŭch*), that one of the five senses by which contact, or pressure, is perceived. It is also usually made to include the senses of temperature and pain. It is possessed

more or less acutely by all parts of the free surface of the body, walls of the mouth, and nasal passages. Its delicacy depends upon the number of particular touch-organs in a square inch, and also on education. The blind, for example, can be taught to read by passing their fingers over raised letters, and physicians and some artisans acquire an educated touch of remarkable acuteness. Touch is most accurate in the tip of the tongue, the palm of the forefinger stands next, and the back is the least sensitive to contact. The whiskers of cats and other similar organs increase the efficiency of this sense. As regards the temperature of sense, it has been shown that there are distinct hot and cold spots lying close together on the surface of the skin.

Toulon (*tō-lon'*), a city of France, on the Mediterranean, thirty miles southeast of Marseilles. It is on a double bay, sheltered by mountains, and has the largest military port on the Mediterranean, covering 240 acres, with large buildings, arsenals, floating docks, etc. The cathedral, town hall, military and naval schools, and theatre are among its finest buildings. Shipbuilding and the trade connected with the military and naval works are the principal industries of the city. Toulon was used as a harbor by the Romans. The fine fortifications built to protect the city from pirates withstood an attack of the English and Dutch fleets in 1707. The English captured the city in 1793, but were driven out by Napoleon. Population 95,276.

Toulouse (*tō-lōz'*), a French city on the Garonne river, 130 miles southeast of Bordeaux. The beautiful church of St. Sernin, the cathedral, a very fine museum of art, a public library, an observatory, and an arsenal, are among its attractions. It has manufactures of woolen and cotton goods, cutlery, and hardware. Toulouse was the capital of the Visigoths, in the 5th century. From the 8th to the 13th centuries it was governed by counts or dukes, and was then attached to the French crown. The battle of Toulouse, in which Wellington was victorious over the French under Soult, was fought April 10, 1814. Population 149,963.

Tourgee (*tōr-zhā'*) **Albion W.**, an American author, was born at Williamsfield, O., May 2, 1838. He studied at the University of Rochester, N. Y.; enlisted as a private in the 27th New York volunteers; was wounded at Bull Run and again at Perryville; and was held a prisoner for four months. He moved to North Carolina, where he was prominent in the reconstruction of the state, drawing up the constitution, and aiding in the revision of the laws of the state. His writings, besides legal works, include *Toinette*, *Figs and Thistles*, *A Fool's Errand*, and *Bricks without Straw*. In 1897, he was appointed consul to Bordeaux, France.

Tourmaline (*tōr'malin*), the name of a mineral found in granite, gneiss, and sometimes in sandstone. The color varies according to the materials they are made of. The blue, pink, and green ones have little iron in them, while the black ones are probably colored by iron. Silica, boric acid, alumina, lithia, soda, lime, magnesia, etc., enter into their composition. Tourmaline is found in Maine, Massachusetts, New Hampshire, and Vermont, in red, green, and blue crystals, while brown ones are found in New York, and very fine black ones in California. In the Ural mountains, the island of Elba, and the St. Gothard mountains fine specimens are found. See *The Tourmaline*, by Hamlin.

Tournament (*tōr'na-ment*), a military festival or contest. They were usually contests between knights on horseback, and the name came from the skill needed in turning their horses. If only two knights contended it was called a joust, while several combatants made it a tournament. Invitations to a tournament were given by princes or nobles by heralds, and the attending knights came with large retinues and gay banners, while crowds of gaily dressed spectators filled the seats around the place of contest. The rules of the tournament prescribed the kinds of weapons to be used, the mode of warfare, and the rank of those who might enter the lists. The prizes awarded by judges were given by the ladies. The early tournaments were like the gladiatorial shows in Rome, often resulting in the death of the combatants, and were for a time forbidden in England, and opposed by the church, but during the crusades they came into favor, and flourished as court pageants until Henry II. of France received a fatal wound, when they were abolished in Europe. See *Ivanhoe*, by Scott.

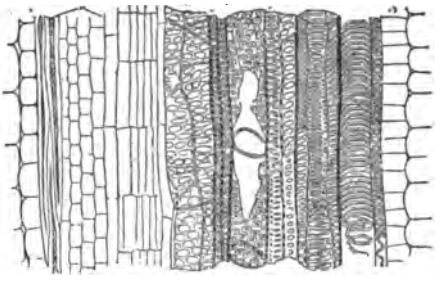
Tours (*tōr*), a French city, at the junction of the Loire and Cher rivers. The finest bridge in France crosses the Loire. There are two towers standing of the famous Church of St. Martin of Tours. Tours is known for its silk manufactures, being the first place to introduce the trade, which was so extensive that it had 80,000 inhabitants when the repeal of the Edict of Nantes drove away its best artisans. The states-general of France met in Tours at different times during the 15th and 16th centuries. It was occupied by the Germans in 1871. Population 63,267.

Toussaint (*tō-san'*), **Francois Dominique**, called also "L'Ouverture," the black chieftain of Haiti, was born of slave parents near Cape François, Haiti, in 1743. In 1791, the mulattoes and blacks of the island made a struggle for their rights, and Toussaint, after helping his master to escape with his family to Baltimore, joined the army, and soon became a general, capturing the white army without bloodshed. The black leaders at first

accepted the help of the Spaniards, but when the English invaded the island, where French and Spanish and colored troops were all contending, Toussaint declared for France, which had proclaimed freedom for the slaves. He joined the French leader, drove the English and Spanish from the island, and was made commander-in-chief of St. Domingo. The civil war between the mulattoes and blacks ended in the whole island becoming subject to Toussaint, who governed it under the French. He selected a council of nine members, composed of eight white citizens and one mulatto, which chose him president for life. The constitution adopted was sent to France; but Napoleon, the first consul, said: "He is a revolted slave whom we must punish." A fleet of 30,000 men and 66 war vessels was sent to Haiti to re-establish slavery, and after ineffectual efforts to conquer the island, offers of peace were made, promising with solemn oaths the liberty of the people and that Toussaint should be retained in power. He signed the treaty of peace on these conditions, but was seized treacherously, with his family, and sent to France, where he was imprisoned without trial or accusation, in a cold underground dungeon at Besançon. He sent appeals for trials and his defense to Napoleon, but got no answer. At last worn out with cold and left four days without food or drink, he was found dead in his cell, April 27, 1803. Whittier and Wordsworth have embalmed the name of Toussaint L'Ouverture in their poems.

Tower of Lon'don, a famous ancient citadel erected by William the Conqueror about 1078 A. D. to dominate the city of London, situate in the oldest part of the British metropolis, on the north bank of the Thames, about a mile below London bridge. It is surmounted by a keep, known locally as the White tower, — the council chamber of the early English kings. The tower is historically notable for the many distinguished persons — traitors and others — who have been confined within its walls as prisoners of state, or who have met death on the scaffold or at the headsman's block on the adjoining Tower hill. In modern days, it has become the repository of the national arms; and since the restoration, the regalia or crown jewels have been kept in the Tower on exhibition.

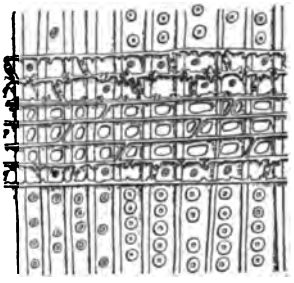
Trachea (*tra'kē-ă*), (in plants), the characteristic element of wood or xylem, the tracheæ together constituting the tracheary tissue. A trachea is a vessel composed of a single elongated cell or of several cells set end to end. The cells are usually of large caliber, with very heavy walls, which are variously thickened. In some cases the thickening consists of a spiral band, in others of distinct encircling rings. Frequently the thickening of the walls leaves definite thin spots, called "dots" or "pits." In this way the spiral, annular, and dotted ducts or vessels are formed. The tracheary tissue is chiefly concerned in the conduction of water from the roots to the



Vertical section of stem from the epidermis (at the left) to the pith (at the right), the vessels or tracheæ being recognized by their large size and by their pits and spirals.

leaves; and frequently it is an important or even the chief mechanical support of the body.

Tracheid (*tra'kē-id*), (in plants), a single cell with all the wall features of a trachea, but which does not unite with others to form a vessel. It is more or less elongated and taper-pointed, like a fiber. Tracheids form the characteristic soft and straight-grained wood of pines and other conifers. In these forms, as in all gymnosperms, the walls of the tracheids contain "bordered pits," that is, pits which appear to have a double border about them. This type of pit is a constant feature in gymnosperms, so that the group may be recognized even by a single wood fiber.



Vertical section of pine wood, showing the pitted tracheids crossed by a pith ray.

Trade Mark, the name or device used to distinguish the merchandise of a firm from that of others. Tradé marks are protected by law in nearly all countries, in order to protect buyers from frauds and to enable a merchant or manufacturer to profit by the superiority of his goods. In the United States, a merchant or firm registers its trade mark in the patent office and is entitled to its use for thirty years, and to renew it for thirty years more.

Trade Winds. See WIND.

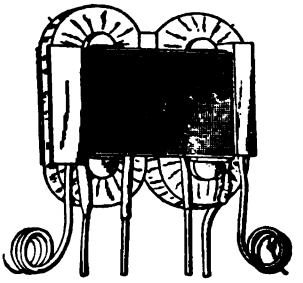
Trafalgar (*traf-al-gar'*), **Cape,** on the south coast of Spain, is celebrated for the great naval battle gained off its shores, Oct. 21, 1805, by the British fleet under Nelson over the combined fleets of France and Spain. The British had 27 sail of the line and 4 frigates, the French and Spaniards 33 sail of

the line and 5 frigates. The British were victorious, capturing nineteen of the enemies' ships. As Nelson bore down on the French he hoisted the famous signal, "England expects every man to do his duty." At the height of the action the famous sea captain was shot, but was told of the victory before he died. In a storm that night, all but four of the prizes were lost or destroyed, a disaster which would not have happened had the dying admiral's order to anchor been obeyed.

Traill, Henry Duff, D. C. L., an English man of letters and editor of *Literature*, was born at Blackheath, London, Aug. 14, 1842, and died at London, Feb. 21, 1900. He was educated at the Merchant Taylors' school, London, and at St. John's college, Oxford, and in 1873 joined the staffs of the *Pall Mall Gazette*, the *Saturday Review*, and *The Observer*, and afterward became editor of *Social England* and of *Literature*. His writings include, besides *Lives* of Sir John Franklin, Lord Cromer, and Lord Salisbury, a work on *Central Government*, *William III.* ("Twelve English Statesmen" series) *Strafford* ("English Men of Action" series), *Sterne*, and *Coleridge* ("English Men of Letters" series), *Shaftesbury* ("English Worthies" series), *The New Lucian*, *Saturday Songs*, and *The New Fiction, and other Essays on Literary Subjects.*

Tra'jan, Marcus Ulpius, Roman emperor, was born at Italica, near Seville, Spain, Sept. 18, 52 A. D. He was a successful commander in the wars against the Parthians and Germans under Titus and Domitian. In 91 A. D., his prestige gained him the consulship, and six years later Nero adopted him as his fellow-ruler and successor. In 98, he became emperor, and celebrated the event by the gift of large sums to the soldiers, and also to the citizens and their children. He also had the state pay the expenses of bringing up the children of poor freemen in Rome and other Italian towns. In 101, Rome for the first time saw its emperor leading forth his legions in person, when Trajan set out on his first campaign against the Dacians. The conquest of the brave people, who had been paid tribute by the Romans since Domitian's reign, was not finished till 105. After going back to Rome to celebrate this conquest, the first since the time of Augustus, he started to wage war in the east. Armenia and Parthia, Mesopotamia, North Syria, and Arabia, were conquered, or reconquered, and Trajan was the first Roman general to sail down the Persian gulf. Trajan's government was of the best. Under his rule, the laws were carried out with justice, and the governors were held to strict account. Military roads, canals, bridges, and towns were built. Trajan's wall, a line of earthworks from the Danube to the Black sea, was raised, and Rome was beautified; among the improvements were Trajan's forum, and the famous Trajan's column, whose bas-reliefs still tell the story of his military achievements. He died in August, 117 A. D.

Transfor'mer, an apparatus for converting the energy of an electric current into the energy of a secondary electric current. There are two kinds of transformers in commercial use, the static or alternating current transformer, and the rotary transformer. The A. C. transformer converts a primary A. C. into a secondary A. C., but so that the product of the current and pressure or potential (amperes x volts) of the primary current is practically equal to the corresponding product of the secondary current. Thus, an ordinary electric lighting transformer transforms 1 ampere at 1,000 volts into 10 amperes at 100 volts, etc. This is a "step-down" transformer. In a "step-up" transformer the voltage or pressure of the secondary current is higher than that of the primary current. Transformers are used on account of economy of distribution of electric energy. It requires a much smaller wire to transmit economically a given amount of electrical energy at 1,000 volts pressure than to transmit the same amount of energy at 100 volts. But the higher voltage cannot be well and safely used for many purposes, as for incandescent lamps, so that the current is transmitted on the main wires at the higher pressure and transformed down to the lower pressure by an A. C. transformer just before passing into the house where it is to be used. Previous to 1883, practically all the electric lighting from central stations was done by direct current, but the successful application of the A. C. transformer by Gaulard & Gibbs, Stanley, and others, reduced the cost of the transmission lines so much, that within a few years practically all the central station incandescent lighting was done by the A. C. systems. The A. C. transformer is simply a form of the induction coil (which see) but has an alternating current in the primary coil instead of a make and break device. It consists of two separate coils of insulated wire, having a laminated iron core common to both coils. The primary A. C. current is sent through one coil and this induces a secondary current in the other coil and its circuit. The ratio of conversion is that of the number of turns on the two coils. Thus, to transform from 1,000 volts to 100 volts (a ratio of 10 to 1), the primary coil has 10 turns for every one turn on the secondary coil. Step-up transformers are



COILS AND CORE OF AN A. C. TRANSFORMER.

used on long-distance electric power lines. Thus, in a California transmission line, the generators can safely generate currents at only 5,000 volts, and 60,000 volts is used on the lines. Here a step-up transformer is used at the dynamo having the conversion ratio of 1 to 12, and proper step-down transformers are used at the other end of the line to reduce the voltage for power and lighting applications. The efficiency of the A. C. transformers depends on the quality of the iron in the core, and upon the proper proportioning of the parts. In good commercial transformers an efficiency of 98 to 99 per cent. on full load is commonly attained.

In a rotary transformer, an alternating current is transformed into a direct current, or vice versa. A rotary transformer is a form of dynamo machine having field magnets and armature similar to an A. C. dynamo, but having a D. C. commutator on end of armature shaft, and A. C. collector rings on the other end. Such a machine is used in central electric plants, where it is desired to generate and transmit A. C., but it is necessary to use D. C. for street car motors, or for electrochemical processes. See INDUCTION COIL.

A. P. CARMAN.

Tran'sit means, in astronomy, the passage of a planet across the disk of the sun, or of a satellite across the disk of its primary, that is, the planet about which it revolves. Mercury and Venus have orbits which lie within the orbit of the earth, and so their transit can be observed. The transits of Venus are of great importance, as they are one of the means used to determine the sun's distance. Other methods had been tried without giving accurate results, until Halley, in 1716, proposed a method of employing the transits of Venus. Accordingly, the transits of 1761 and 1769 were observed in various places, and in 1824 Encke from these observations reached a generally accepted result. A transit can take place only when the planet is in a line between the earth and the sun. There are always two transits of Venus eight years apart, and then a lapse of 105 or 122 years, when another pair of transits occur, with eight years between them. The transit of 1874 was followed by that of 1882, but there will not be another until 2004. Mercury is nearer the sun, thus having a shorter orbit and year, and therefore more frequent transits.

Transmis'sion of Pow'er, a branch of mechanical engineering treating of the means of transmitting power from a point where it is generated to the point where it is to be used. For short distances, as in a machine shop, shafting and belting are commonly used. For longer distances four systems have been used, the wire rope, the pneumatic, the hydraulic, and the electric. The above division does not include the indirect method of carrying gas to the point where it is to be used, in a gas engine or otherwise, nor the method of carrying live steam to considerable distances from the boiler, a method which is only resorted to in extreme cases. The question of transmitting energy is not only one of engineering possibility, but also involves economical questions. Some of the questions that have to be considered are: the losses along the line of transmission due to friction (mechanical or electrical) or other causes, the deterioration of the installation, interest on the investment, the cost of attendance, the number of horse-power to be transmitted, the number of hours in the year of full load, the cost of power at the two ends of the line, besides questions of convenience, etc.

In wire rope transmission, the power is transmitted by a wire cable carried over pulleys between the two stations. It is used in street car systems (see CABLE ROADS), in manufactories, in mines, etc., and for distances up to three miles is commercially efficient provided the load is large and continuous. Beyond that the efficiency decreases very rapidly owing to the cost of installation, and the dead weight of cable to be carried. In hydraulic transmission, water is carried under pressure in pipes or conduits and hydraulic motors of some form used. The losses in the pipes are decreased by decreasing the velocity of flow and increasing the pressure, but these conditions require large and strong pipes, items adding to the cost of installation, and therefore to the interest charges. The efficiency of hydraulic transmission is always low, 50 per cent. or less, but it is well adapted for short distances where great forces are required, as in lifting large loads and exerting great pressures. In pneumatic transmission, the power is transmitted by compressed air in pipes to pneumatic engines and tools. It is a system used largely in mining where pneumatic drills are used, and within a few years its use in connection with many machine tools has greatly extended. Pneumatic tools, such as riveting machines, drills, presses, etc., are usually very convenient in operation, and although the mechanical efficiency of the whole system is low owing to the thermal losses in compressing the air, yet the use of pneumatic transmission for short distances is increasing, owing to the convenience of operation, flexibility and portability of tools. In mining and tunneling, it has the great additional advantage of furnishing necessary ventilation along with power. For efficiency, flexibility, economy of operation, and cost of operation no system of power transmission can compete with electrical transmission for longer distances. For longer distances, such as twenty-five to one hundred miles, it is the only system by which power transmission is possible, and even for short distances, as in machine shops, it is competing with belts and shafts. Many shops and factories are to-day putting in motors for each machine, and thus doing away with belts and shafting. Long-distance power transmission by electricity is the most

notable engineering achievement of recent years. It began in the experimental plant of Marcel Deprez at the Munich exposition of 1882. The line was from Miesbach to Munich, a distance of 37 miles, the power transmitted was ½ H. P. and the pressure was 1,350 volts. The dynamos and generators were similar Gramme machines. This plant was of small magnitude, but it established the possibility of long-distance transmission. During the next few years power transmission was developed largely in the way of stationary motors operated on central station lines, and especially in electric railways. (See ELECTRIC RAILWAYS.) Economical transmission of electric energy for long distances requires high voltages, and high voltages cannot be handled easily except in alternating current apparatus (see TRANSFORMER), so that long-distance transmission was not fully developed until the invention of the successful A. C. motor, the polyphase induction motor. (See ELECTRIC MOTOR.) In 1891, an experimental line from Lauffen to Frankfort-on-the-Main, was shown at the Frankfort Electrical exhibition, in which over 100 H. P. was efficiently transmitted 110 miles at 20,000 volts by the use of three-phase A. C. apparatus. Since then, numbers of large commercial plants have been installed, transmitting thousands of H. P. from three to 35 miles. The Fresno, Cal., the Folsom-Sacramento, and the Niagara Falls plants are probably as notable as any of these plants; but the plants at the Lachine Rapids, Montreal, at Portland, Ore., that of the Standard Electric company of California, and several plants in Switzerland and Italy are equally interesting to the engineer. In the Fresno plant, 1,000 H. P. is transmitted 35 miles by a three-phase system from a water plant in the Sierras to the city of Fresno. The city of Sacramento, Cal., is supplied by a similar system, with about 4,000 H. P. from the falls at Folsom, 23 miles away. At Niagara Falls, 50,000 H. P. is generated by ten dynamos, run by turbines, and the power is distributed as far as Buffalo, 27 miles away. The Standard Electric company lines bring electric power into San Francisco and San José from a point in the Sierra Nevada mountains. The electric cars and lighting of San José are supplied by electric currents generated 83 miles away. All these long-distance lines have been built to transmit the power from water-power, but it is one of the plans of the future to establish generating plants at the mouth of coal mines and transmit the power instead of the coal to cities within a radius of from two or three hundred miles.

A. P. CARMAN.

Transpira'tion (in plants), the loss of water by evaporation from a plant. Since 50 to 98 per cent. of the plant body is water, it loses water whenever the air contains less moisture in proportion to its capacity than the plant. Transpiration is therefore unavoidable under the conditions of most land plants. To reduce this unavoidable loss, the larger land plants make the outer tissues of the aërial parts nearly waterproof. But the air passages (see AËRATION) permit evaporation from the cells bounding them; hence the moisture diffuses through the stomata (which see) to the outer air. Were evaporation prevented by waterproofing these cells also, the absorption of gases for food making and respiration would be nearly impossible. The amount of transpiration varies greatly in different plants according to their structure and contents; in the same plant it varies with age and the varying external conditions, such as temperature, light, moisture, etc. Therefore, only a very general idea can be given of the amount of water transpired. On a hot summer day a plant with five square meters (about six square yards) of foliage (such as a thrifty sunflower as high as a man might have) will evaporate about 1.2 liters (2.5 pints) of water. A birch forty feet high, with perhaps 200,000 leaves, will give off on a hot day 300 to 400 liters of water (about 2.5 barrels). But these rates would not be kept up as an average through the growing season. The evaporation from a leaf surface is 2 to 7 times less than that from an equal area of water.

Transvaal (*trans'väl*) **Colony** (Transvaal meaning "beyond the Vaal" [river]), formerly known as the South African Republic, under the presidency of S. J. Paul Kruger; but since the British occupation, in consequence of the Boer war and its annexation to the crown, now known as the Transvaal colony. Its area is 119,139 square miles, while its population (before the war of 1899–1901) was 1,094,156, of which about 250,000 were whites, chiefly Dutch burghers engaged in stock rearing and farming. The colony lies north of the Vaal and south of the Limpopo rivers; it is bounded on the west by Bechuanaland, on the north by Rhodesia, on the east by Portuguese, East Africa, and Zululand, and on the south by Natal and the Orange River colony. Swaziland, on the southeast, was formerly a protectorate of the late republic. The country was first occupied by the Boers, who left Cape Colony in 1836–37; but since the discovery of gold, in 1886, in what is known as the Witwatersrand range of hills, about 70 per cent. of the population are or rather were "Uitlanders." Pretoria is the capital; but Johannesburg, the center of the gold fields, is the most populous. For the history of the events which led to the overthrow of the South African Republic and the annexation of the Transvaal to the British crown, see BOER WAR.

Transylva'nia, a grand duchy of the Austro-Hungarian empire, on the southeast of Hungary, separated from Rumania by the Transylvanian Alps, in which are found peaks 8,000 feet high. Other ranges cross the country, and divide it from Hungary proper. Gold, silver, quicksilver, copper, lead, iron,

tin, coal, alum, and salt, with such precious stones as garnets, agates, amethysts, carnelians, and jaspers are found. A bed of rock salt from sixty to eighty miles wide extends through the whole country. The valleys are very fertile and raise large crops of corn, hemp, flax, and tobacco. Woolen and silk goods, paper, gunpowder, glass, soap, and furniture are among the more important manufactures. The people are made up of various races, such as Magyars, Saxons, Rumans, Armenians, Greeks, Jews, Bulgarians, and Gypsies, the Rumans numbering about three-fifths of the whole. There is a university at Klansenberg, opened in 1872. Transylvania belonged to Dacia in the time of the Roman Empire, and after being overrun by Huns, Goths, Lombards, Bulgarians, etc., was finally conquered by the Hungarians in the 10th and 11th centuries. It was independent in the early part of the 16th century, but in 1713 was annexed to Austria. Area 21,512 square miles. Population 2,284,048.

Trap, a class of igneous rocks, that is, those rocks which owe their origin to fire, called "trappa," meaning a stair, because they break up in columnar forms, producing cliffs that stand out in great steps on the sides of hills and mountains. They are made chiefly of feldspar and hyroxene. Trap rocks when freshly broken usually have a green color, some being a very light green and others nearly black; the weathered surfaces are usually rusty in color. Some trap is very compact, looking like flint. Basalt is a dark, heavy variety of trap rock. The Palisades on the Hudson river just above New York city are cliffs of trap rock.

Treas'ury, Depart'ment of. See UNITED STATES.

Trebizond (*treb'i-zond*), a Turkish seaport on the Black sea. It is surrounded by hills, which take in many gardens, as well as the town, and is defended by forts and a citadel. There are mosques and Greek churches, copper foundries, dye works, etc. Its large trade with eastern Europe and Central Asia make it, next to Smyrna, the chief commercial city in Asia Minor. Trebizond was a flourishing town when Xenophon reached it on his retreat from Persia. After it was conquered by the Romans, it rose in importance, Trajan giving it a larger and better harbor. When the Crusaders took Constantinople, in 1204, Alexius I., one of the imperial family, founded the empire of Trebizond, till then a province of the Byzantine empire. It remained independent till captured by the Turks in 1461. Population 35,000.

Tree, the climax form of vegetation. There is no line of separation between shrubs and trees, but when a woody plant rises from the ground as a single shaft which is higher than a man, there is general consent to call it a tree. The ordinary trees of temperate regions not only continuously increase in height, but their trunks and branches increase in diameter. As a rule, during each growing season a cylinder of new wood is laid down around the old wood. In a cross-section these successive cylinders appear as concentric rings, and by counting the rings the approximate age of a tree is obtained. This habit of adding new wood each year, which increases the conducting capacity of the stem just so much, enables the tree to increase its display of branches and foliage each year. Such a habit is found only among the gymnosperms and dicotyledons. In the former group, the leaves are mostly persistent, the trees being commonly called evergreens; while the dicotyledonous trees of temperate regions are mostly deciduous. The palms are common illustrations of monocotyledonous trees, in which there is no diameter increase, hence no branching worthy the name, and no annual increase of foliage display. The tallest trees, species of the Australian genus *Eucalyptus*, do not quite reach 500 feet. The largest trunks in girth range from 80 to 100 feet, and are developed by such forms as eucalyptus species, the sequoia, bald cypress, and the baobab-trees of Senegal. A Mexican bald cypress is on record with a girth of 112 feet. See FORESTS.

Trench, Richard Chenevix, an Irish clergyman and writer, was born at Dublin, Sept. 9, 1807. He studied at Cambridge, and, after traveling a few years, became a country curate; then a theological professor in King's college, London; next, dean of Westminster; and finally, archbishop of Dublin. His principal writings are, *Notes on the Miracles*, *Notes on the Parables*, *Lessons in Proverbs*, *Synonyms of the New Testament*, *Deficiencies in our English Dictionaries*, and *The Study of Words*. He died at London, March 28, 1886.

Tren'ton, the capital of New Jersey on the Delaware river, twenty-eight miles northeast of Philadelphia. The state buildings include the capitol, post office, lunatic asylum, a normal school, state library, and near by a soldiers' orphans' home. The most important industry is the manufacture of pottery. There are also foundries, breweries, paper mills, woolen mills, rubber works, etc., employing in all 14,984 hands. Trenton was named in 1720 after Col. William Trent, who owned the site. It was made the capital of New Jersey in 1790. It is known as the scene of a battle in the Revolutionary war, when, Dec. 26, 1776, Washington, with his forces, crossed the Delaware and surprised the Hessian troops at Trenton, taking over 1,000 prisoners. Population 73,307.

Triangula'tion, a branch of surveying and geodesy, in which the position of points on the earth's surface are determined by measur-

ing with great accuracy a base line and then constructing triangles on this. By measuring the angles, and knowing the base line, the other distances become a matter of trigonometrical calculation. In connection with the survey of the United States being made by the coast and geodetic survey, a series of such triangles extending across the country has been fixed with great accuracy. The exact shape of the earth is determined from such triangulation in connection with astronomical observations of latitude and longitude.

Trichogyne (*trik'o-jin*), (in plants), a tubular, hair-like process developed from the female organ (*carpogonium*) of the red seaweeds. See RHODOPHYCEÆ.

Trichome (*trik'ōm*), (in plants), a general term applied to outgrowths from the epidermis, chief among which are hairs. See HAIR.

Trichina (*tri-kī'na*), a minute worm parasitic in the muscles of swine and some other animals, and very dangerous, since it can be transferred to man. The transformation comes by eating lean or imperfectly cooked pork. This worm (*Trichina spiralis*) was discovered in 1835 by Richard Owen. It is about one-twentyfifth of an inch long, and, when in a quiet condition, lies coiled in a capsule or cyst within the muscles of the infected animal. When infected meat is eaten by man, the capsules are dissolved within the stomach and the worms set free. An immense number of new and very minute worms are soon produced — each female being able to supply 1,500 to 2,000 eggs. The newly hatched worms bore through the walls of the intestine, and get into the blood vessels and lymph passages, and are thus carried all over the body. They make their way from the blood vessels into the muscles, and there become full-grown and inclosed in capsules. From that time they are quiet, and, if the patient can survive the period of migration, he recovers. The connection of this worm with the disease was made known about 1860 by Leuckart, Virchow, and others. It is difficult to say how the pigs become infested, but the worm is found in the rat, and as these are about slaughter houses and sometimes eaten by pigs, the infection may come in that way.

Trieste (*tre-est'*), a seaport of Austria, at the head of the gulf of Trieste, on the Adriatic sea, seventy miles northeast of Venice. There is an old town, with narrow streets and black walls, built on the slope of a hill and surmounted by a castle. Its cathedral has stones with Roman inscriptions built into its walls, and a tower resting, it is said, on the foundation of a temple of Jupiter. The new town, on the plain toward the sea, is a handsome city with a fine harbor. There are extensive manufactures for making soap, rope, white lead, wax, and leather. The people are Germans, Americans, Italians, Greeks, Jews, and Dalmatians, but the majority speak Italian. Trieste, as Tergeste or Tergestum, was plundered by neighboring tribes as early as 51 B. C. In 1382, it passed into the hands of Austria. Population 158,344.

Trinidad (*trin-i-dad'*), the most southern of the West Indies, lies off the coast of Venezuela, nearly opposite the mouth of the Orinoco river. It is fifty miles long and from thirty to sixty miles wide, and includes 1,754 square miles. The two channels to the harbor are called the "Dragon's Mouth" and the "Serpent's Mouth." On the northern coast are forest-covered mountains, one with two peaks, called Tamana, while the rest of the island abounds in fertile valleys and plains. There are some good-sized rivers and several fine harbors. A lake, with pitch floating on its surface, is one of the curiosities of the island. The most important products are cocoa, sugar, rum, molasses, coffee, cotton, cocoanuts, and oil. There are 204 public schools, with 24,866 pupils, many private schools, and a Queen's Royal college, and a Roman Catholic college, with a total of 299 students. The chief town, Port of Spain, originally built of wood, was burned down in 1808. The new town, built of stone, is one of the finest in the West Indies. The island was discovered by Columbus in 1498 and named by him Trinidad, because he first saw three mountain summits from his ship. In 1797, it was taken by the British from the Spanish, and in 1889 Tobago was annexed to it. Population 260,517.

Tripoli (*trip'o-li*), one of the Barbary states of Northern Africa, lying between the desert and the Mediterranean. It covers 398,900 square miles. The Atlas mountains, which end here, run parallel to the coast, and are lower than in the other Barbary states, being not more than 4,000 feet high. There are no rivers and very little rainfall, and vegetation must depend on the heavy dews. In the coast regions, which are very fertile, cotton, grain, and tropical fruits grow, while in the interior, senna, dates, and carrots are grown, and the lotus flourishes. Sheep and cattle are raised in large numbers, and the horses and mules of the country are celebrated. Tripoli is a dependency of the Turkish empire, its governor being appointed by the sultan. The trade, once considerable, has declined since the new routes through Central Africa have been opened, and since the abolition of the slave trade. Tripoli belonged to the Carthaginians, and was taken from them by the Romans; then, with the rest of Northern Africa, passed into the hands of the Arabs and became Mohammedan; and finally was taken by the Turks in 1552. Population 800,000.

Trip'oli, a city of Africa and capital of the state of Tripoli, is on a point of rocky land projecting into the Mediterranean. It is the

principal seaport of the country, and is built with high walls and bastions, mosques, synagogues, and Christian churches. It has some important manufactures, such as leather, carpets, and scarfs. It is the starting point for caravans for the Sudan, which gives it a large trade, though somewhat decreasing of late years. The people are nearly all Mohammedan, but the business is mostly in the hands of the Jews and Christians. Population 40,000.

Tri'reme, the name given anciently to a galley or vessel with three banks of oars. The oars were arranged in banks or rows, one above the other. The oars of the lowest rank were the shortest, and the rowers had the easiest work and the least pay. There was a small sail also that could be used with a good wind. The crew consisted of 200 men, and often they moved the vessel as swiftly as a modern steamboat. The crew was usually composed of convicts and of slaves, taken in war, and could hope for no release save that of death. The triremes were used in the Persian and Peloponnesian wars, but later the galleys were made with five banks of oars and called quinqueremes.

Triumvirate (*trī-um'vi-rāt*), the name of an office among the Romans, filled by three persons. There were triumvirates for the regulation of public affairs, mentioned near the end of the republic. The government, under Julius Cæsar, Pompey, and Crassus, in 60 B. C., is called the first triumvirate, but the title was never formally given to them. The first triumvirate was that of Octavius, Antony, and Lepidus, in 43 B. C., though usually called the second. They held office for ten years. One set of triumvirs in Rome had charge of the night police and another of the prisons.

Trollope (*trŏl'up*), **Anthony,** an English novelist, was born in 1815. He was for thirty-three years in the British postal service, and visited the United States, Austria, and the West Indies in the interests of the service. Some of his histories appeared first in *St. Paul's Magazine*, of which he was editor. His novels include *Orley Farm*, *The Bertrams*, *The Small House at Allington*, *Barchester Towers*, *The Last Chronicle of Barset*, and many others, as he was a most prolific writer. He also wrote a *Life of Cicero*, a *Life of Thackeray*, and works on *North America* and *South Africa*. He died Dec. 6, 1862.

Trom'bone, a musical instrument, a form of the trumpet. The name is from the Italian, and means a great trumpet. It is a brass wind instrument, made in two parts, so that by sliding one part into the other, or drawing it out, the tube through which the air passes can be lengthened or shortened, and the depth and power of the tone changed. Three kinds of trombones are used, called alto, tenor, and bass trombrones, according to the pitch. The tone of the trombone is grander and more powerful than that of the trumpet, making it a very effective instrument in an orchestra.

Tromp, Martin Harpertzoon van, a Dutch admiral, was born at the Briel, Holland, in 1597. He was captured at sea when a boy, in a fight on the coast of Guinea, in which his father, a Dutch commander, was killed. He served as cabin boy for his captors for more than two years. In 1624, he was in command of a frigate, and in 1637 was at the head of a squadron of eleven ships. His first victories were over the Spanish fleet, taking in one battle, Oct. 21, 1639, thirteen ships. In November, 1652, he encountered the English fleet under Admiral Blake, in the strait of Dover, and drove them before him, sailing up the channel with a broom at his masthead, to denote that he had swept his enemies from the seas. He was defeated by the English in February, 1653, after a terrible three days' fight; and again in June of the same year, when he lost seventeen vessels. In July, 1653, the struggle between the Dutch and English was renewed off the coast of Holland, the Dutch losing thirty men-of-war and their great Admiral van Tromp. He was buried at Delft.

Trop'ic Bird, the name for three species of sea birds that are commonly seen in the tropics far from shore. During the breeding season they frequent rocky shores and cliffs, but build no nests. The more common variety, sometimes seen on the coast of Florida, is about the size of a partridge. It has white plumage with fine black markings above and black bands on its wings. These birds have the two central tail feathers greatly prolonged, and are, therefore, called marlinspike and boatswain birds by sailors. Those of the Pacific ocean are rose colored.

Trop'ics, the two lines of latitude parallel to the equator, drawn, one through the winter, and the other through the summer, solstice. They are equally distant from the equator, being about 23° 28′ north and south of it, and include between them all those points of the earth's surface where the sun is ever vertical or directly overhead. The northern line is called the tropic of Cancer, because the sun, which is directly over this tropic at the summer solstice, enters then the constellation of Cancer; the southern line is called the tropic of Capricorn, because the sun when vertically over it, enters the constellation of Capricorn. The country between the two tropics is called the torrid or hot zone, and the temperature is known as tropical. The word tropic comes from a Greek word meaning a turning, and indicates that the sun turns back at these lines.

Troubadour (*trō'ba-dōr*), the name given in southern France, Spain, and Italy, to a class of poets who were distinguished from the minstrels and strolling musicians by the fact that they indulged in verse making for the love of it, and not for money. In northern France, they were called trouvères. They were often attached to the courts, and were attended by minstrels or "jongleurs," who accompanied them on musical instruments, as it was usually considered beneath the dignity of a troubadour to be his own fiddler. The troubadour poetry consisted mostly of love songs, though they sometimes touched upon the wars of the period or ventured to upbraid the evil customs of the times. At court festivals there were often several troubadours, who engaged in verse contests on subjects suggested by the ladies of the court. They flourished for about 200 years, from 1090–1290. Among the best-known troubadours are Richard the Lion-hearted, Pierre D'Auvergne, and Pierre Vidal, while the counts of Provence and of Toulouse, the kings of Aragon and of Castile, King Richard, and Eleanor, queen of Henry II., are among their most illustrious patrons.

Trout, the name for a number of fresh-water fishes belonging to the same family as

TROUT.

the salmon. The latter is also usually embraced under the name trout. They live in cold, clear streams and lakes, and are among our best food fishes. They are naturally inhabitants of the northern hemisphere, but have been introduced into New Zealand and Australia. The common river and lake trout of Europe are black-spotted varieties, and reach a larger size than the American river trout. Two kinds found in the United States are worthy of especial mention, the lake trout and the brook trout. The former is also called Mackinaw trout. It inhabits the Great Lakes, and other lakes from New Brunswick to Montana, and north to British Columbia and Alaska. It reaches a length of three feet or more. The brook trout, with its minute scales and beautiful red spots, is one of the most exquisite fish in appearance to be found anywhere, and it is unsurpassed as a food fish. It ranges from Maine to Dakota, always in cold streams. Its length is from five to twenty inches and it reaches an extreme weight of eleven or twelve pounds. The trout west of the Rocky mountains embrace the only black-spotted trout native to the country. Some of them live in warmer streams than their eastern relatives. The rainbow trout is black-spotted and approaches nearly to the European river trout. The latter, with some other forms, have been introduced into the waters of the United States.

Trow'bridge, John Townsend, American novelist, poet, and editor, was born at Ogden, N. Y., Sept. 18, 1827, and was partly educated at a classical school at Lockport, N. Y. Early in life, he lived on a farm and occasionally taught school, and in 1847 he went to New York and began to write for the press. He removed to Boston and there contributed to magazines and journals and took actively to authorship. His chief works are *Neighbor Jackwood*, *Cudjo's Cave*, *Farnell's Folly*, *Neighbor's Wives*, *The South and Its Battlefields*, *Three Scouts*, *Jack Hazard* series (6 vols.), *The Silver Medal* series (6 vols.), *The Drummer Boy*, *The Tide Mill* series (6 vols.), and the *Toby Trafford* series, and *Start in Life* series. He has also published, besides his popular stories, some volumes of verse, viz., *The Vagabonds, and Other Poems; The Book of Gold, and Other Poems; The Emigrant's Story, and Other Poems.*

Troy, a famous city of Asia Minor, the seat of the Trojan war, which forms the subject of Homer's great poem, the *Iliad*. It was situated, according to the poem, at the foot of Mt. Ida, in the northwestern part of Asia Minor, with a plain in front stretching for nine miles, called the Plain of Troy. The city was also called Ilium. Paris, the son of King Priam of Troy, carried off Helen, the wife of the king of Sparta, and the most beautiful woman of her age. The Greeks, after spending ten years in collecting a fleet of 1,186 ships, and an army of 100,000 men led by Agamemnon, drove the Trojans into their city, and after a siege of ten years the city was destroyed. In the tenth year of the siege, occurred the quarrel between Agamemnon and Achilles which is the subject of Homer's poem, and which so weakened the Greeks that they were driven back to the sea. Virgil, in his *Æneid*, tells the story of the wooden horse filled with warriors, left before the walls of Troy by the apparently retiring Greek army, which was drawn into the city. The warriors, thus introduced, opened the city gates to the returning army, and Troy was taken by stratagem about 1184 B. C. After the fall of Troy a new city sprang up, called New Ilium, which occupied the site of

Hissarlik, about four miles from the mouth of the river Mendereh, now believed to be the Scamander river of the *Iliad*. This spot has been excavated by Dr. Schliemann and the remains of a great city found, thought to be those of ancient Troy. See SCHLIEMANN. See *Troy and Its Remains*, by Henry Schliemann.

Troy, a city of New York on the Hudson river, six miles north of Albany, is at the head of the steamboat navigation of the river. There is a large dam across the Hudson, which, with two small streams coming from the hills back of the city in a series of falls, furnishes a large water-power. It is connected with lakes Champlain, Ontario, and Erie, by canals. Among its public buildings are the city hall, orphan asylums, Earl crematory, athenæum, and the union station, one of the finest in the country. The city annually expends the sum of $144,220 on its public schools, which have a force of 211 teachers, and an attendance of 6,357 pupils. Troy Female seminary, established in 1821, was one of the first institutions of the kind in the country, and is still successfully maintained. The Ranssalaer Polytechnic institute and St. Joseph's Theological seminary are among its schools. The principal manufactures are of iron, its factories and furnaces being the largest in the eastern part of the Union. It manufactures bar iron, railway spikes, nails, screws and bolts, stoves, furnaces, hollow ware, and machinery. It has the largest factory of mathematical instruments in the country, and the shirt and collar factories are very extensive. The old Vanderheyden house, built in 1752, was the first house on the site of Troy, and the place was known as Vanderheyden's Ferry and Ferryhook until 1789, when it was named Troy. It has been almost destroyed by fire three times. Population 60,651.

Truf'fles, the common name of certain edible fungi, belonging chiefly to the genus *Tuber*. They are nearly all subterranean and appear as tuber-like bodies developed on a mycelium. Truffles are among the most prized of the edible fungi and are chiefly cultivated in Europe. See ÆCIDIOMYCETES.

Trum'bull, John, an American painter, was born at Lebanon, Conn., June 6, 1756. He graduated at Harvard college, and studied his art at Boston. He served in the army during the Revolutionary war as adjutant of the first Connecticut regiment, aid-de-camp to Washington, major, and colonel, resigning in 1777. While studying painting in London, in 1780, he was imprisoned for eight months during the excitement produced by the execution of André. His first American historical pictures were *Battle of Bunker Hill*, and the *Death of Montgomery*. He painted portraits of Washington and other Revolutionary characters. In 1817, he was employed by congress to paint four pictures for the rotunda of the capitol, and chose for his subjects, *Declaration of Independence*, *Surrender of Burgoyne*, *Surrender of Cornwallis*, and *Resignation of Washington*. His historical paintings, numbering fifty-seven, were given by him to Yale college, and are valuable as collections of portraits of the prominent actors of the period. He died at New York, Nov. 10, 1843. See *Autobiography*.

Trum'bull, Jonathan, an American statesman, was born at Lebanon, Conn., Oct. 12, 1710. A graduate of Harvard college and a theological student, he was turned aside into business by the death of his elder brother. He became a member of the general assembly of Connecticut in 1733, speaker in 1739, and assistant in 1740, being re-elected twenty-two times. He was chief judge of the superior court for three years, and governor of the colony for fourteen years. He was prominent in the opposition to England before the Revolutionary war, refusing to take the oath to support the Stamp Act, and his advice was sought by Washington, who looked upon him as one "of his main pillars of support." The name "Brother Jonathan," given to the United States, is attributed to Washington's frequent remark, alluding to Trumbull, "Let us hear what Brother Jonathan says." He died at Lebanon, Conn., Aug. 17, 1785. See *Life*, by Stuart.

Trum'bull, Lyman, American jurist and senator, was born at Colchester, Conn., Oct. 12, 1813, and died at Chicago, June 25, 1896. He studied law in Georgia and was admitted to the bar, and settled in Belleville, Ill., where he was elected to the state legislature, became secretary of state, and in 1848 was elevated to the bench of the Illinois supreme court. In 1854, he was elected to congress, and in the following year he became a member of the United States senate. During and after the Civil war he was a prominent Republican, acting earnestly with that party, favoring the abolition of slavery and opposing the impeachment of President Johnson. He subsequently supported the Democratic party, and in 1880 was Democratic candidate for the governorship of Illinois.

Trum'pet, a musical wind instrument, of great antiquity. In its modern form it is a tube eight feet long having a bell-shaped end and doubled up in a long curve, about three feet long, and is played from a mouthpiece. It has a range of over two octaves. It has been used in war, and is a common instrument in military bands.

THE EAR TRUMPET is an instrument which collects the waves of sound and carries them to the ear, thus enabling a deaf person to hear better. The small end is placed at the ear and the large end is open to the air or placed at the mouth of the person speaking.

THE SPEAKING TRUMPET is a straight tube with a mouthpiece, which collects the sound waves, so that the voice of a person speaking into it is louder, and the sound is carried farther.

Trum'pet Flower, a popular name for a vine with a woody stem and clusters of scarlet flowers shaped like a trumpet. It grows to a great height and very rapidly, and is found in the central and southern states of the Union, where it is often called trumpet creeper. Other varieties from China, Japan, Australia, and South America are cultivated in gardens and greenhouses.

Tsad or **Tchad** (*chad*), a lake in central Africa, about 150 miles long and 120 miles wide. Two large rivers flow into it, but it seems to have no outlet, though there are signs of an ancient river bed, bordered by trees, in which the Arabs say water flowed for one hundred miles during a flood in 1870. There are populous villages on the shores, and the many islands in the lake are densely peopled by Pagan tribes, dark brown or black, with regular features, wearing cotton garments, and cultivating cotton and corn.

Tschaikovsky (*chī-kof'skī*), **Peter Ilitch,** a distinguished Russian composer, was born at Votkinsk, province of Vyatka, April 25, 1840, and died at St. Petersburg, Nov. 7, 1893. Early in life, he held a government post in the Russian service, but this he abandoned in 1862 to study music in the conservatory of music at St. Petersburg, where he was instructed in harmony and counterpoint by Zaremba, and in composition by Rubenstein. After graduating he was for a number of years professor at the conservatory of music at Moscow, where he composed many melodies gathered from the airs of the folk-songs of his native country and characterized by weird and plaintive music. Among his compositions are overtures, symphonies, concertos, marches, and operas, many of which are of great sweetness and beauty. In 1889–90, he visited London, appearing there at Philharmonic concerts, and in 1891 he came to New York, at the invitation of the New York Symphony society, where he gave renderings at the Carnegie Music hall of many of his own compositions.

Tset'se, a two-winged insect slightly larger than the common fly inhabiting some portions of South Africa. Its bite is usually fatal to the ox, horse, and dog, but harmless to man, the goat, and wild animals living in that region. It lives by sucking blood, but its bite is not immediately fatal, the bitten animals sometimes lingering for weeks and months. It is so local in its distribution, that it is sometimes seen in swarms on one side of a river, while cattle are grazing undisturbed on the other.

Tu'ber, a form of underground stem, which is much thickened by food storage, as the common potato. It usually shows its stem nature by bearing minute leaves (scales) or buds, as the "eyes" of the potato. Also the name of the genus of Fungi to which the truffles belong.

Tube'rose, a plant which belongs to the same family as the amaryllis, having a bulbous root, long slender leaves, and a cluster of very fragrant white wax-like flowers, growing at the end of a stalk two or three feet long. The bulbs were brought at first from Holland and Italy, but are now raised in the United States, those grown in Georgia and Florida being larger than the imported ones. It is a tropical plant, probably a native of the East Indies or Mexico.

Tu'bingen. See UNIVER'SITY OF.

Tuck'er, John Randolph, American lawyer and statesman, son of Henry St. George Tucker, was born at Winchester, Va., Dec. 24, 1823, and died at Lexington, Va., Feb. 13, 1897. He was educated at the University of Virginia, studied law, and was admitted to the bar in 1845, and from 1857 to 1863 was attorney-general for his native state. The Civil war dispossessed him of this post, but he was appointed to the chair of equity and public law in Washington and Lee university and held that office four years (1870–74). From 1874 to 1887 he was member of congress, and acted frequently as chairman of the judiciary committee and of the committee on ways and means, and took an active part in the congressional debates on the tariff. His oratory was frequently listened to in the house on many other important topics and themes of legislative import.

Tuck'ermann, Henry Theodore, an American writer, was born at Boston, April 20, 1813. He spent several years in Italy in the study of art and literature. His works appeared mostly as contributions to periodicals. They include *The Italian Sketchbook; Sicily, a Pilgrimage; Thoughts on the Poets*, translated into German; *Artist Life, or Sketches of American Painters; Book of American Artists;* a volume of poems; and several volumes of essays. He died at New York, where he resided for many years, on Dec. 17, 1871.

Tucson (*tū-sōn'*), the largest city in the territory of Arizona, is about sixty miles north of Mexico. It is 2,520 feet above the sea, in the valley of the Santa Cruz river. The old part of the town looks like a Mexican city, with plazas, narrow streets, and adobe houses, but the newer parts are American. The climate, mild in winter, is very hot in summer, and the yearly rainfall is only seven inches. The church of St. Xavier, built more than a hundred years ago by Catholic missionaries, is near the city, and the university of the territory is situated

here. The city is supplied with gas and water, and has a large trade with Mexico and in supplying the Indian reservations. Tucson was a Mexican military post, and came into the possession of the United States by the "Gadsden purchase," in 1853. Population 7,531.

Tu'dor, the name of one of the royal families of England, reigning from 1485–1603. The family came from Owen Tudor, at one time a brewer in Anglesey, who fought at Agincourt, and so pleased Catharine, widow of Henry V., by his dancing at a court pageant, that she married him privately. The queen took refuge in a convent and Tudor was sent to prison to escape the popular fury when their marriage became known. Tudor escaped and was protected by the young king, Henry VI. The oldest son of this marriage was made earl of Richmond, and married Margaret Beaufort, who was a descendant of John of Gaunt. Their son Henry became Henry VII. of England, and by marrying the daughter of Edward IV. united the houses of York and Lancaster, and ended the Wars of the Roses (1455–85). There were five Tudor sovereigns—Henry VII., Henry VIII., Edward VI., Mary, and Elizabeth. See *Early Tudors*, by Moberly; *History of England* (*1529–88*), by Froude.

Tufts College, a college controlled by the Universalist denomination, is located four miles from Boston. It comprises the college of letters, divinity school, medical school, and dental school. It has 120 instructors and 800 students.

Tuileries (*twē'le-riz*), **Palace of the,** a famous domicile of French royalty, now destroyed, in Paris, on the right bank of the Seine, and adjoining the Louvre. The site was originally a tile field, whence the origin of the name (the word *Tuilerie* signifying a tile kiln). The palace was commenced in 1654 as a residence for Catherine de Medici, and was enlarged by Henry IV. and by Louis XIV.—the grounds attached being converted into ornamental gardens. When the palace of Versailles was erected, the Tuileries ceased to some extent to be used by the French kings. In the revolution of 1792, it was stormed and sacked by the frenzied Paris mob, and became for a time the seat of the national convention, which governed France after abolishing monarchy. The Tuileries were also attacked and taken in the insurrections of 1830 and 1848, and during the Commune, in 1871, the buildings were burned, the ruins not being removed till twelve years later. Nothing of the palace now remains, except the pavilions which flanked it, and which, in their restored order, terminate the two galleries or extended arms of the Louvre.

Tu'la, a city in Russia, on the Upa river, 110 miles south of Moscow. It has a large cannon factory and manufactory of arms, founded by Peter the Great, and nearly 800 other factories which supply the Russian army with arms. Cutlery, locks, tea urns, and bells are made in large quantities, and the preparation of bristles for market is a large industry. Population 111,048.

Tu'lip, species of *Tulipa*, a genus of the lily family, and native to Central Asia. They are extensively cultivated for their beautiful flowers, and over 1,000 garden varieties have been catalogued. Haarlem, in Holland, is the chief source for tulip bulbs. In the 17th century the cultivation of tulips became a mania in Holland, and enormous prices were often paid for single bulbs of some rare variety.

Tu'lip Tree, the well-known *Liriodendron Tulipifera*, a member of the magnolia family, and most commonly but wrongly known as poplar. It is one of the most magnificent forest trees of the United States, with a noble shaft, great crown, broad and lobed leaves, and tulip-like flowers. It is the source of the so-called "poplar" lumber of commerce.

Tulloch (*tul'ok*), **John,** D. D., a Scottish theologian and author, and principal of St. Andrews university, was born in Perthshire, June 1, 1823, and died at Torquay, Devon, Feb. 13, 1886. He was educated at Edinburgh and in Germany, and was one of the leaders of liberal thought in theology in his time. His writings embrace a Burnett prize essay entitled *Theism, the Witness of Reason and Nature to an All-Wise and Beneficent Creator; Leaders of the Reformation; English Puritanism and its Leaders; Rational Theology and Christian Philosophy in England in the 17th Century; The Christ of the Gospels and the Christ of Modern Criticism; Modern Theories in Philosophy and Religion; Movements in Religious Thought in Britain in the 19th Century;* besides several volumes of sermons and an inspiring book for young people, entitled *Beginning Life*. He visited the United States in 1874. See *Memoirs*, by Mrs. Oliphant.

Tum'bleweed, the popular name of various annual plants which have a bushy branching habit and become more or less globular in outline by the curving of the branches. Being shallow-rooted, in light soil they are caught by the wind and tumbled along, sometimes being carried for many miles, and scattering their seeds by the way. They belong to the prairies and great plains of this and other countries. One of the most common of the tumbleweeds has recently been imported into this country under the misleading name of "Russian thistle." It is not a thistle, but a prickly member of the goosefoot family (*Salsola kali tragus*). It first appeared on the plains of Dakota and has spread extensively.

Tu'nicates, an interesting group of marine animals, surrounded by a tunic from which their name is derived. They embrace animals called sea squirts on account of their ejecting little jets of water from their terminal openings when irritated. They were formerly classified with worms, or between the worms and the mollusks. In 1866, however, Kovalevsky, by observing their development, showed that in early stages they came near to the structure of the tadpole or a frog. Moreover, the steps in their development were shown to agree fully with those of the lowest recognized vertebrate, Amphioxus. The adult animals are fixed or sessile. The larvæ are free swimming, and in some particulars on a higher plane than the adults. They have, for example, a gristly rod, or notochord, in the back of the body, and above this a nerve cord in the same position as in vertebrated animals. They also possess gill clefts. The notochord and dorsal nerve cord disappear in the adult, but their presence in the larva makes it necessary to advance the tunicates into the vertebrated group, and it is now recognized that the possession of a notochord, a dorsal nerve cord, and gill clefts mark the vertebrated animals and distinguish them from all others. The work of Kovalevsky was epoch-making, because it broke down the barrier that was supposed to exist between vertebrates and invertebrates, and opened the way for considering their affinities in an unbiased spirit. The tunicates are ovoid, or barrel-shaped, animals attached at one end to stones, weeds, or other objects. The free end has two openings through one of which water enters and, after circulating through the gills, passes out of the other. They afford an illustration of degeneration in development. When free swimming in their youth, they are on a higher level but soon become attached and, losing some of their organs, undergo retrograde development.

Tu'nis, one of the Barbary states in northern Africa, a French Protectorate, is on the Mediterranean between Algiers and Tripoli. It is 440 miles long and 115 miles broad, covering 50,840 square miles. The coast line is irregular, and there is one river, the Mejerdah. Cape Blanco and cape Bon on its northern coast are the most northern points in Africa. The northwestern part of the country is mountainous, some of the peaks being 4,000 or 5,000 feet high. The country is very fertile, and wheat, barley, corn, oranges, olives, figs, etc., are produced abundantly, olives being especially cultivated for the oil. The sheep are famous for their wool, and the horses and dromedaries are celebrated, while great herds of cattle feed on the plains. There are fine mineral springs, and silver, lead, copper, and salt are found. The trade of the country is mainly with the interior of Africa, from which are brought gums, ostrich feathers, gold, and ivory for European countries. The people are Arabs, with a mixture of Turks, Moors, Jews, and Christians. The religion is Mohammedanism. Under the Romans, the region of Tunis was about the same as that of ancient Carthage. It was conquered by the Vandals in the 5th century, by the Greeks in the 6th century, and by the Arabs in the 7th century; was invaded by France in 1270 and by Charles V. of the empire in 1535; became subject to Turkey in 1575; and, since 1691, has been ruled by beys, the descendants of Ben Ali Turki, a vassal of the Porte. The rule of the bey is only nominal, however; for a treaty made with the French in 1881 placed the country under the protectorate of France. In 1898, there were 117 French schools and 613 Mohammedan schools, besides private institutions, and a Mohammedan university. Piracy was very common until 1816. The later rulers have suppressed the slave trade and burdensome taxes, established courts of justice, and provided a city government for the capital. Population 1,900,000.

Tu'nis, the capital of the state of Tunis, in Africa, is near the mouth of the river Mejerdah, about three miles from the ruins of Carthage. It has a wall five miles around and a strong castle. The streets are narrow and dirty, and the houses of one storey, with no windows on the outside. The bey's palace and some of the mosques are very fine buildings, and the bazaars are attractive. There is a Moorish college, a Roman Catholic church, a Greek church, an Italian theatre, and large barracks. By means of a canal, opened in 1893, Tunis is accessible to ocean commerce. The manufactures are of silk, wool, leather, soap, wax, and olive oil. Population 153,000.

Tun'nel, an underground passage dug out without removing the earth above it. Tunnels are dug under bodies of water, and through mountains when the passage over or around would be less economical or less convenient. They may also be made under roads and streets for convenience of passage. The digging or boring of tunnels presents many different problems, depending on the character of the soil. In a mountainous country the operation usually involves drilling and blasting rock. Water is nearly always met with, particularly under rivers and lakes, and the methods of the pneumatic caisson have to be used. Most tunnels have to be lined with timber or masonry arches, to keep the roof and sides from caving in, and a common method is to carry forward with the digging a steel tube as lining for the excavation. The cost of tunneling has decreased greatly within a few years, owing to the introduction of special machinery for drilling and excavating. The number of large tunnels is now so great that it is impossible even to list them. The most notable ones in Europe are the Mt. Cenis, eight miles long, costing $15,000,000; the St.

Gothard, nine miles long, cost $12,000,000; and the Simplon tunnel, 12.3 miles long, cost $14,000,000. The Hoosac tunnel, on the railroad from Boston, Mass., to Troy, New York, is 4¾ miles long. It was seventeen years in construction, and cost $11,000,000. Other notable American tunnels are the Grand Trunk railroad tunnel at Port Huron, Mich., under the St. Claire river, the Chicago water supply tunnel, four miles out under Lake Michigan, the Sutro tunnel at the Comstock mines, Nevada. The Hudson river tunnel planned to connect Jersey City and New York city has been abandoned for lack of funds, after about half the distance had been bored. Among the notable recent tunnels are those bored by the Southern Pacific railroad at Santa Margarita, Cal., so as to extend their railroad along the coast from San Francisco to Los Angeles.

Tun'ny, a fish of the mackerel family, found in the Atlantic ocean, and especially in the Mediterranean sea. It is a very large fish, from nine to twenty feet long, and weighing sometimes 1,000 pounds. It is thicker than the mackerel, dark blue, with silvery spots. The European variety is highly esteemed for food, and is caught in nets shaped like a funnel, the fish entering the wide mouth and being driven to the narrow end, where they are killed with lances and harpoons. Near Constantinople it appears in shoals so crowded that they are often taken by hand. The best tunny fisheries are in Spain, Italy, and Sardinia. The American tunny, found on the Atlantic coasts from New York to Nova Scotia, is black above and white below, and is used largely for oil, one fish sometimes yielding twenty gallons.

Tup'per, Sir **Charles,** G. C. M. G., Canadian statesman, was born at Amherst, Nova Scotia, July 2, 1821, and was educated at Edinburgh, Scotland, for the medical profession. From 1857 to 1860, having entered politics, he was a member of the executive council and provincial secretary of Nova Scotia, and from 1864 until Confederation he was prime minister. He was a strong advocate of Canadian Confederation, and in 1870 joined the Dominion cabinet, in which he held various portfolios and was one of the leaders of the Conservative party. As minister of railways and canals, he advocated the construction of the Canadian Pacific railroad, was for a time finance minister, was Canadian representative at the Fisheries conference at Washington, D. C. (1887), and in 1896 became prime minister of the Canadian Dominion. From 1883 to 1887, he was high commissioner for Canada in England. In the general election of 1896, his administration was defeated on the question of the Manitoba School Bill, and he was succeeded by the Liberal government formed by the Hon. (now Sir) Wilfred Laurier. Mr. Tupper was knighted in 1879, and created a baronet in 1888, and is now leader of the (Conservative) opposition in the Dominion house of commons. His son, Sir C. Hibbert Tupper, born in 1855, was minister of justice and attorney-general for Canada, 1895–96. He is a member of the Canadian house of commons, representing Pictou, Nova Scotia. In 1892, he was created a K. C. M. G. for services rendered as agent of H. B. M. at the Paris Tribunal of Arbitration.

SIR C. TUPPER.

Tup'per, Martin Farquhar, an English author, was born at London, July 17, 1810. He was a graduate of Oxford, and was admitted to the bar. In 1838 he published his *Proverbial Philosophy*, which was very popular with the people, though ridiculed by the critics, and has passed through forty editions. His numerous works include *Crock of Gold; Hymns for All Nations, in Thirty Languages; Stephen Langton; Three Hundred Sonnets*, etc., none of which have at all equaled his first work in popularity. He died Nov. 29, 1889.

Tura'nians, one of the large divisions of the human race. It includes the Hungarians, Bulgarians, Lapps, and Finns, with other tribes in Europe; the Samoyeds, living in the northern part of Asia; the Turks or Tartars, forming the largest division; the Mongols, divided into east Mongols and Buriats; and the Mantchus, the principal race of the Tungusian branch, the present ruling people in China. Of these various tribes, those living in Europe are the most advanced in languages and customs, and those in northern Asia are the lowest of the race. The name Turanian, usually given to these related tribes, is taken from the Persians, who, calling their own country Iran, named the countries north of it Turan. They are sometimes called Mongolian, Scythian, or Tartaric races. The Turanian languages do not present the same unmistakable family likeness as the Aryan and Semitic groups, and scholars differ in regard to them, some including the Dravidian dialects of southern India, and others considering the Mongol and Mantchu dialects to be distinct languages. The Finnic branch of languages is superior to the others, having some national literature, such as the legendary and popular songs of the Finns and Hungarians. See *Science of Language*, by Max Müller.

Tur'bot, one of the flatfishes found in almost all European seas. It ranges from the Mediterranean to the coast of Scandinavia. It is

highly esteemed as food, being the best of all the flatfishes in that regard. It is a large fish, sometimes reaching a weight of seventy pounds, but that weight is very exceptional. It feeds on crabs, small fishes, sea urchins, and fish eggs. The true turbot does not occur on the American coast. An entirely different flatfish, of smaller size, is incorrectly called turbot in the United States. See FLATFISH.

Turenne (*tu-rĕn'*), **Henri de la Tour D'Auvergne,** Vicomte de, a great French soldier, was born at Sedan, France, Sept. 11, 1611. He was sent to Holland to study the art of war under his uncle, the celebrated Maurice. He joined the French army, serving in Germany, where he relieved Mainz, besieged by the emperor's army. He then was attached to the Swedish army under Bernhard of Saxe-Weimar, where he captured several towns, and later defeated the Austrians and Spaniards at Casale, and took Turin. After his conquest of Roussillon, in 1642, he was made a marshal of France and given chief command on the Rhine, when he defeated the Bavarians at Rottweil, but was himself defeated by their general, Mercy, at Marienthal. With Condé, he avenged this defeat at Nördlingen, where Mercy was slain. Turenne finished the war by conquering the electorate of Treves, and with the help of the Swedes, Bavaria, and conducted a successful campaign in Flanders. In the civil wars in France, the two greatest generals of the period, Condé and Turenne, were on opposite sides, and Turenne with inferior forces was uniformly victorious, finally driving Condé from France. He then conquered much of the Spanish Netherlands. Louis XIV. made him marshal-general of France, and only his Protestantism prevented his being appointed constable. Bossuet's celebrated *Exposition of the Christian Doctrine* was written at the king's suggestion to effect the conversion of Turenne to Catholicism, and aided by the king's solicitations was successful. In the campaign in Holland, in 1672, he compelled the elector of Brandenburg to beg for peace. His last campaign is disfigured by the devastation of the Palatinate, where he burned thirty towns. His desire to retire could not be gratified as he was the only general that could successfully oppose Montecuculi, the great Austrian general, and for nearly half a year their strategy was the admiration of Europe. Having forced his antagonist to a battle at Sasbach, Turenne was viewing the preparations for the attack, when he was killed by a stray ball, July 27, 1675. He was buried by order of the king at St. Denis, the place of the royal sepulchres. His monument was injured during the revolution, but was finally placed beside that of Napoleon in the Hotel des Invalides, in Paris. See *Life*, by Cockayne.

Turgenieff (*tŏr-gān'yef*), **Ivan,** a Russian writer, was born at Orel, Russia, in November, 1818. After studying at Moscow, St. Petersburg, and Berlin, he obtained a position in the department of the interior at St. Petersburg. On account of his Liberal ideas he was banished for a period, but was finally allowed to return to Russia. His home, however, was for the most part at Paris and at Baden. His works were many of them written in French, and have been translated into English and German. Among his best known novels are *Fathers and Sons*, *Liza*, *Smoke*, *Dimitri Rudin*, *Journal of a Useless Man*, and *Virgin Soil*. He died Sept. 3, 1883.

Tur'gor (in plants), the state of a cell when its wall is stretched by pressure of the water within it. Every active cell is normally turgid if adequately supplied with water, because the absorption of water by the protoplasm goes on until the elastic resistance of the wall balances the force (osmotic pressure) which determines the entrance of the water. The turgor varies from time to time, and in different plants, but is ordinarily equal to 3 to 6 atmospheres, and in special conditions may rise much higher.

Turgot (*tŭr-gō'*), **Anne Robert Jacques,** a French statesman, was born at Paris, May 10, 1727. He was educated for the church, and was prior of the Sorbonne in 1749. In 1752, he studied law and became councilor in parliament. He was given charge of the province of Limonsin in 1761, where he introduced many reforms, such as abolishing the method of mending the roads by the compulsory labor of the poor. He introduced the cultivation of the potato and other means of subsistence for the people. Under Louis XVI., he was put in charge of the finances of the country, which were in a terrible state of disorder. His reforms included free trade in corn in the interior of the kingdom, the doing away with the obligation to labor for the state, and substituting for general taxes a single tax on land. He reduced the expenses of the government, and introduced exactness and faithfulness into the service. If his plans had been received with favor by the nobility and statesmen, France might have been spared the horrors of the Revolution. But the combination against him was so strong that the king yielded, and Turgot retired after twenty months of service. Among his writings are, *Reflections upon the Formation and Distribution of Riches*, and a work on *Usury*. In writings on the American war, his views of the nature of colonies have since been generally adopted. His Latin inscription for the portrait of Franklin is celebrated, "*Eripuit coelo fulmen, sceptrumque tyrannis*" (He snatched the thunderbolt from heaven, and the scepter from tyrants). Turgot died at Paris, March 20, 1781. See *Life*, by Say.

Turin (*tu'rin*), a city in northern Italy, once the capital of the kingdom, is seventy-

five miles southwest of Milan on the Po river. It is one of the handsomest cities in Europe, famed for its beautiful squares, fine bridges, and pleasant promenades. Among the squares are the piazza San Carlo, with a statue of Emanuel Philibert of Savoy; the piazza Vittorio Emanuele (Victor Emmanuel), the finest square in Europe; and the piazza Castello, in which is the royal palace, with its fine library and armory, the old palace of the dukes of Savoy, the military academy, and the theatre. There is a fine five-arched bridge across the Po, begun by Napoleon with money obtained from the offerings at the cathedral, and finished by the kings of Sardinia, and a beautiful single arched one over the Dora. The cathedral, built in the 7th century, is the oldest church, and that of San Filippo the handsomest. The university, founded in 1404, has 68 teachers and 2,551 students, and has a large library, including that of Cavour, which was bequeathed to it. The Academy of Science has the finest Egyptian museum in Europe The manufactures are woolen and silk goods, jewelry, paper, pottery, pianos, and carriages.

Turin was settled by the Taurini, a Ligurian tribe. Hannibal sacked the city after crossing the Alps. In 166 B. C., it became a Roman colony, and on the fall of the empire went to the Lombards. Charlemagne made it the residence of the duke of Susa; and in 1032 it became the possession of the house of Savoy. The French held it for sixty years from 1506, and again in 1640, and in 1800 it was united to the French empire. In 1815, it was restored to Savoy, and was the capital of Sardinia until 1860, and of Italy until 1865. Population 359,295.

Turkestan (*tŏr-kĭs-tăn'*), (the country of the Turks), is a country in Central Asia, lying between the Russian dominions on the north and Persia and Afghanistan on the south. It is divided into western and eastern Turkestan by the table-land of Pamir, called the "roof of the world," which is about 15,000 feet high. Western Turkestan, once called Independent Tartary, consists of the great plain of the Caspian and Aral seas and the hilly districts on its eastern border, formed by the western branches of the Hindu Kush mountains. Eastern Turkestan, called also Chinese Tartary, includes the country east of the table-land, reaching to the desert plains of the Gobi. The Oxus, Jaxartes, and Zerafshan rivers flow westward from the Pamir table-land, while the Yarkand and Kashgar are the most important rivers flowing eastward. The higher mountain districts give fine summer pasturage for flocks, and the upper valleys and plains are fertile and highly cultivated; but toward the Aral and Caspian seas there are large regions of sandy and trackless wastes, many of them lower than the sea, where the wells are salt, and both salt and sulphur are found. The portion of eastern Turkestan near the Pamir table-land is mountainous, and the center is a great plain, with fertile belts along the streams, but most of the country is a desert, except where it is irrigated. Gold, silver, iron, copper, niter, sulphur, asbestos, agate, and jasper are found; while the field products are cotton, rice, wheat, hemp, flax, barley, corn, tobacco, and most of the common fruits. The great article of export is cattle. Manufactures of silk and cotton goods, sabers, and knives exist. In western Turkestan the people are Turks or Tartars, and Tajiks or Aryans. They are also divided into the settled population and the nomad or wandering tribes. The religion is Mohammedanism. The people are jealous of foreigners, so that the country has been very difficult of access by Europeans. The inhabitants of eastern Turkestan are varied, the Turanian element being the most prominent. The villages are a collection of walled inclosures, surrounding houses and gardens.

Turkestan has had an important part in Asiatic history. Most of the western part belonged to the Persian empire, and many of its large cities were built by the Persians. It went with Persia into the hands of the Macedonians, part of it becoming a Greek province. In the 8th century, the Arabs had possession, and it was finally overrun by the Mongol hordes of Genghis Khan. Under Timur it was the center of a great empire, stretching from Moscow to the Ganges and from Hellespont to China; its cities were adorned by the spoils of victory, and colonies of learned men and skilled artisans were brought to the country. The empire was split into fragments on the death of Timur's youngest son, and various independent states were formed out of what is now Turkestan. In 1792, the present Uzbeck dynasty obtained the throne. The later history of Turkestan is a series of wars between Bokhara, Khiva, and Khokan, of raids of the Turkomans along the Persian border, and of the progress of Russian conquest from the north and west. The Pamir table-land separates the acquisitions of Russia and England in Asia, and both countries have been contending for Turkestan, but so far Russia has succeeded in obtaining control of the larger part of the country, thus forming the Russian general government of Turkestan, with an area of 257,134 square miles and a population of 3,898,076. Population of the whole country 4,478,000.

Tur'key, a large bird related to the pheasants, and originally inhabiting the New World. There are three species known, the North American bird, the Mexican, and that of Central America. The common wild turkey of North America ranges from southern Canada to Florida and Mexico. It is about four feet long, with a glossy copper-colored plumage; a beard-like tuft hangs from the neck of the male. The Mexican turkey is

slightly different. It was domesticated by the Indians before the discovery of that country, and is the original from which the domesticated birds are descended. It was introduced into Europe in the 16th century. The turkey of Central America excels all others in variety and splendor of plumage, which combines metallic, green, blue, black, yellow, and red. It lives in the open forest and the open country, rather than in the deep forests, like the wild turkey of North America. The male has no tuft on the neck.

Tur'key Buzzard, a bird belonging to the group of the New World vultures. It is abundant in the warmer parts of North and South America, and ranges throughout the United States, except in New England. This bird is about twenty-seven to thirty inches long. It has a dark plumage, with a violet and greenish luster on the upper parts. The bill is white, and the head and upper parts of the neck, which are destitute of feathers, are reddish. It feeds on carrion. See VULTURE.

Tur'key or **The Ot'toman Empire,** consists of those countries in Europe, Asia, and Africa under the control of the sultan, though it is usually limited to Turkey in Europe and Turkey in Asia, called Turkey proper. Including all subject states, it covers 1,579,982 square miles, and has a population of 39,900,913. Turkey in Europe has been reduced to a territory stretching from the Black sea to the Adriatic, from the Ægean sea and Greece on the south to the Balkan mountains, and north of them to about 43° north latitude, covering 65,752 square miles, with a population of 6,086,300, made up mainly of Turks, Greeks, Bulgarians, and Albanians. Turkey in Asia covers 650,394 square miles, with a population of 17,545,300, consisting of some 4,000,000 Arabs, besides Turks, Greeks, Kurds, Circassians, Armenians, and Jews. It stretches from the Black sea to Arabia and the Mediterranean sea, and from the Ægean sea to Persia. A part of Bulgaria, Samos, Tripoli, and Egypt are Turkish dependencies. Turkey proper has a great extent of coast line, broken by bays, gulfs, and islands, with many fine harbors. The Dead sea in Palestine and Lake Van in Armenia are among its many large salt lakes. The Balkan mountains, the Taurus and Anti-Taurus ranges, and the Syrian mountains are among its principal ranges, while a large part of European Turkey is mountainous, and in Asiatic Turkey elevated plains abound.

The winters are cold in the mountainous districts, but warm in the sheltered valleys, and the summers very hot, especially in Syria and Asia Minor. Very little rain falls from April to September, and many plains need irrigation to be cultivated. The highest peaks reach the region of perpetual snow. The minerals of the country are copper, lead, alum, silver, emery, niter, iron, and coal, though much of the mineral resources are still undeveloped. In European Turkey, the rose is extensively cultivated, and the attar is an article of commerce. The trees of Asiatic Turkey, the cedar, cyprus, sycamore, mulberry, olive, fig, citron, orange, and pomegranate, differ from the fir, pine, almond, walnut, chestnut, peach, and plum trees most abundant in European Turkey. There are 250 species of birds, and many wild animals. It is a rich country with great resources, but still undeveloped. The religion of Turkey is Mohammedan, and the Koran is the law. The sultan or head of the government is looked upon as the successor of Mahomet; and his will is absolute, in so far as it is not in opposition to the Koran or the Multeka, the writings of Mahomet and his immediate successors. There are 2,120 mosques in the empire, of which 379 are in Constantinople alone. Four wives are allowed by the Koran, but most of the people are too poor to support more than one wife. The Christians of Turkey, found in the Greek, Armenian, and Catholic churches, and the Protestants and Jews, are all tolerated as independent sects by the government, though often bitterly opposed to each other. The Koran and Multeka encourage public education, so that public schools have long been established in most of the prominent towns, while colleges with public libraries are attached to the principal mosques. At Constantinople there is the Great National school (Greek), founded in 1870, a university founded in 1900, an imperial art school, law, military, and engineering schools, and a naval school on an island in the sea of Marmora. The Christian communities have good institutions, among them Robert college at Constantinople, and the Syrian Protestant college at Beirut. Turkey is governed by the sultan, with two chief officers appointed by him, the grand vizier, the head of temporal affairs, and the "Sheik-al-Islam," the head of the church. There is a council, which corresponds to the British cabinet. The divisions of the country are called vilayets, sanjaks, and kazas. The present sultan is Abdul-Hamid II., of the house of Othman, and the twenty-eighth sultan since the conquest of Constantinople. All children born in the royal harem are considered heirs to the throne, whether the children of free women or of slaves, and the crown passes to the male descendants of Othman according to age. The standing army numbers about 700,000 men, and military service is required of all able-bodied Mohammedans, while all others pay an exemption tax. The navy has about fifty vessels, including eighteen iron-clad ships.

The Ottoman empire is the successor of the Byzantine empire, and was founded by Othman or Osman who conquered Nicæa and other districts, and succeeded to the power of the Seljuk sultans. Adrianople was taken in 1361 by his grandson. Mohammed II. after a siege of fifty-three days, took Constanti-

nople and ended the Byzantine kingdom, May 29, 1453. Solyman the Magnificent continued the conquests of his predecessors and brought Turkey to its highest military power. During his son's reign the Turks lost the battle of Lepanto, and, under his successors, the Turkish power was reduced by such generals as Montecuculi, Sobieski, and Prince Eugene. The loss of the Crimea and the regions north of the Black sea, the conquest of Egypt by Bonaparte, and its resulting war with France, increased the troubles of the country. The revolt of the janizaries ended with a terrible struggle and massacre in 1826. At Navarino, Oct. 20, 1827, the Turkish fleet was destroyed, and in 1829 Greece became independent. In 1840, Turkey was admitted into the political system of European states, and since that time her power has been strengthened by the alliance of other nations, as by England, France, and Sardinia, in 1854 in the Crimean war against Russia, and by the French and English in the conflicts between the Druses and Maronites at Damascus and in the Lebanon. In 1875, Bosnia and Herzegovina revolted against Turkish misrule, and a year later there were uprisings in Bulgaria, followed by horrible massacres of men, women, and children by Turkish soldiers. These atrocities aroused all Europe. On account of them, England could not now befriend Turkey, and Russia having secured the neutrality of Austria by giving her permission to occupy Bosnia and Herzegovina on certain conditions, declared war against Turkey in 1877. After a bloody contest, Plevna, the Turkish stronghold, fell before her, and the Russo-Turkish war was ended by the peace of 1878. This changed the map of European Turkey greatly. Rumania, Montenegro, Servia, and Bulgaria, north of the Balkans, becoming independent; South Bulgaria, called East Rumelia, was left to Turkey, but in 1885 it was united to North Bulgaria, while Bosnia and Herzegovina came under Austrian control. Beginning with 1885, the Armenians were subjected to the most terrible oppression by their Turkish masters, who feared an uprising to revive the ancient Armenian monarchy, and who were also determined to crush out the Armenian faith. These oppressive measures were resisted by their victims, who were at once punished by torture and death. In 1894, 1895, and 1896 a systematic massacre of the Armenians was carried out by the Turks, in which over 2,500 villages were obliterated, about 21,000 people were murdered, while thousands were left starving and shelterless. It is believed that the sultan had tacitly consented to the extermination of his Armenian subjects, which would doubtless have followed, save for the warning interposition of the Powers, compelled by the outraged public opinion of the Christian nations. The chief towns are Constantinople (population 1,125,000), Salonica (population 105,000), Adrianople (population 81,000), Smyrna (population 201,000), Bagdad (population 145,000), and Damascus (population 140,500). See *History of the Ottoman Turks*, by Creasy, and *Modern Turkey*, by Farley.

Turks, a race of people belonging to the Turanian family, who appeared first in Asia among the Tartar tribes. In the 6th century, around Turkestan grew up a Turkish empire, which was overthrown by another Turkish tribe, the Uigurs, who were the first of the Turks to possess a written language. They were driven westward by the Chinese, with whom they had been contending for centuries, and their kingdom in Central Asia was entirely overthrown by Genghis Khan. But they had already established themselves in the west of Asia, where under the Seljuks, another tribe of Turks, their possessions reached from Persia to India, between the 10th and 12th centuries. The Ottoman empire was founded in the 14th century by Othman, and the present inhabitants of Turkey are called Osmanli or Ottoman Turks. The Turkomans ("like the Turks") are the descendants of the old Seljuks, and are found in Turkestan. The Ottoman Turks, found in the Turkish empire, are more like Europeans than the other Turkish tribes, which have the broad face, high cheek-bones, and yellow skin of the Mongolians. The different tribes speak nearly the same language, and are usually Mohammedans, though the Turks on the borders of China are Buddhists, and those of Siberia, Greek Christians. See SELJUKS, and TURANIANS.

Turks and Cai'cos Islands, two groups of British islands, over thirty in all, southeast of the Bahamas and under the government of Jamaica. The largest, Grand Caicos, covers 112 square miles; and Grand Turk, 14 miles square, is the seat of government, in telegraphic communication with Jamaica and Bermuda, and has 1,883 inhabitants. The only important industry is salt raking, about 2,000,000 bushels being exported annually. Population 4,744.

Tur'meric, a name given to the roots of a plant of the ginger family. The roots, or root stocks are yellow, marked with wrinkles, and a darker yellow, or reddish brown inside, and when chewed make a yellow stain; they smell like ginger, and have a somewhat similar taste. They are used somewhat in dyeing, in coloring varnishes, and in curry-powder and pickles. Paper colored by turmeric is extensively used by chemists as a test for alkalies and for boric acid.

Tur'ner, Rt. Hon. Sir **George,** P. C., G. C. M. G., premier and treasurer of Victoria, and treasurer in the new Barton (Australian commonwealth) cabinet, was born at Melbourne, Victoria, in 1851, and educated at Melbourne university. In 1887, he entered politics and has held office in a number of ad-

ministrations, including the ministership of customs, of defense, of health, and has been solicitor-general. Has been a member of the Australian National Federation convention, and chairman and president of the federal Council. Address: Melbourne, and St. Kilda, Victoria.

Tur'ner, Joseph Mallord William, an English painter, was born at London in 1775. His first art work was coloring prints for an engraver. He was indebted to a Dr. Monro for encouragement in his early work by giving him the opportunity to see his fine collection of water-colors, and by buying his sketches. He studied at the Royal academy, where he exhibited his pictures, and in 1802 was elected a member, being already recognized as the first landscape painter of his time. His style was afterward changed by travel in Europe, and in the last few years of his life, as some physicians believe, by a change in his eyes, which cast the blue mist, so characteristic of his later works. He contributed 259 pictures to the Royal academy, and over 19,000 drawings and sketches were mounted and arranged by Ruskin. His illustrations of the poems of Rogers, Byron, Scott, etc., are well known. Among his paintings are, *Dutch Boats in a Gale*, *Falls of the Clyde*, *Sun Rising through a Mist*, *Building of Carthage*, *Bay of Baiæ*, and *Childe Harold, or Modern Italy*. His most famous drawings are, *Rivers of France*, *Rivers of England*, *Scenery of the Southern Coast*, etc. They were carefully prepared by him for engraving, and all his pictures were engraved during his lifetime. Ruskin, in his *Modern Painters*, did much to raise Turner to the high position he holds among English painters. He was very eccentric, traveling alone, and hiding himself for months under an assumed name, and had a strong passion for money. He died Dec. 19, 1851, at Chelsea, leaving to the nation his collection of pictures, which have been placed in the National gallery, London. His large fortune was left to found a home for needy artists, but some defect in the will prevented the carrying out of his wishes. He was buried beside Sir Joshua Reynolds in St. Paul's. See *Life*, by Thornbury, and *Life*, by Hamerton; *Modern Painters*, by Ruskin.

Tur'ner, Sharon, an English historian, was born at London, Sept. 24, 1768. He was an attorney by profession, but continued his literary studies, and published a *History of the Anglo-Saxons*, in three volumes. This work was the result of years of patient collection of materials and research, and has given its author a permanent place in English literature. His other works are a *History of England from the Earliest Period to the Death of Elizabeth*, and a *Sacred History of the World as Displayed in the Creation*. He died at London, Feb. 13, 1847.

Tur'pentine, a gum or resin which is found in various species of pine, and some other trees. American or common turpentine is obtained from the long-leaved pine, and is brought in the largest quantities from North Carolina. Venice turpentine, which is considered the best kind, is from the larch tree. The German turpentine comes from the Scotch fir, Strasburg turpentine from the silver fir, and Canada turpentine from the balsam or balm of Gilead fir. Turpentine is obtained by making a cut in the tree and catching the sap, which looks much like honey. The oil of turpentine is made from this sap by distilling, and the hard part that is left is the common yellow resin, used in making soap, etc. Turpentine hardens in the air, burns easily, and can be dissolved by alcohol or ether. The oil of turpentine is used in medicine, and in making varnishes and paints. The name comes from the terebinth tree, from which the Greeks obtained it.

Turquoise (*tur-koiz'*), one of the precious stones, is a mineral, found mostly in Persia. It is a phosphate of alumina colored by copper. It is hard and of a greenish-blue color, the finest blue being the most valuable. It is used in the east for ornamenting swords and charms and girdles, and is thought to protect its owner against disease. The finest specimens of turquoise are supposed to belong to the shah of Persia, as only the inferior varieties are allowed to be sent out of the kingdom.

Tur'tle, a general name for all those reptiles having the body inclosed between an upper shield (carapax) and a lower shield (plastron). Names like tortoise (which see), and terrapin (which see), apply to particular kinds of turtles, but the general name embraces the green turtle, famous for making soups, the loggerhead turtle, soft-shelled turtle, snapping turtle, pond turtle, terrapin, tortoise, and others. They inhabit both fresh and salt water, and some forms are terrestrial. Many kinds are sought for food. Tortoise shell is derived from the plates of the hawks-bill turtle, which inhabits the tropical Atlantic and Indian oceans.

Tur'tledove, an Old World dove represented by twenty-five or thirty species. The common turtledove, so abundant in Europe, is both wild and tamed. It is noted for its affectionate and peaceful disposition. It is a migratory pigeon of moderate size. Like other members of the group, it feeds on seeds and various kinds of grain and makes a platform of twigs as a nest. The mourning dove of the United States is also called the turtledove. It belongs, however, to a different genus from the European dove. It is about thirteen inches long, including its long tail. It is brownish olive, glossed with blue and wine colors. The plumage shows metallic reflections. It feeds upon the ground. This bird

is widely known, on account of its long mournful note, even to those who have not seen it.

Tuscaloo'sa, a city of Alabama, is on the Black Warrior river, ninety miles northwest of Montgomery. The insane asylum, with fine buildings and grounds, a college for women, and the state university, are situated here. The university endowment includes 500 acres and $300,000 from lands granted by congress. The buildings were burned in 1865 by the Federal troops, but there are now four new buildings, with Clark hall, containing the library. Tuscaloosa is in the cotton planting and also in the mineral region of Alabama, which makes it the center of a large trade. It has flour mills, cotton, shoe, and leather factories. The name of the town and river is from the Indian chief, Tuscaloosa ("Black Warrior"), who fought with De Soto. Population 5,094.

Tus'cany, a division of central Italy, formerly a grand duchy. It lies south and west of the Apennines, on the Mediterranean, covering 9,304 square miles. The northern part is mountainous, and the remainder of the state is hilly and undulating, except the coasts, which are flat and marshy. The principal rivers are the Arno, Cecina, and Ambrone, which flow into the Mediterranean. The main crops are corn, wheat, rye, and barley; cattle, sheep, and mules are raised in great numbers; olive oil, wine, woolen, silk, and straw goods are manufactured. Leghorn is the principal seaport, and Florence, the chief city, was for centuries the center of Italian literature and art, and is famous for the beauty of its situation and environs, and for its fine art collections.

Tuscany was a part of ancient Etruria (which see). With the fall of the Roman empire it went to the Lombards, and was governed by counts, under Charlemagne and other German emperors, until the latter part of the 12th century. Florence, Pisa, Siena, and Lucca were the principal of the little states into which Tuscany was divided during the struggles of the next centuries. Modern Tuscany was formed in 1569, when Cosmo de Medici became grand duke of Tuscany. Napoleon formed the kingdom of Etruria in 1801, and in 1808 made his sister, Elisa, grand duchess of Tuscany. In 1860, it became a part of the kingdom of Italy. Population 2,346,770. See *Tuscany in 1849 and 1859*, by Mrs. Trollope.

Tuscaro'ras, a tribe of American Indians, one of the Six Nations of the Iroquois family, found in North Carolina at its settlement. After difficulties with the whites, in which many of the Indians were killed or taken prisoners, a part of the tribe fled to New York, where they settled on lake Oneida, and still have a reservation in that state. In 1829, North Carolina bought the lands still held in that state by the Tuscaroras. The name means a "shirt wearer."

Tweed, the most famous river in Scotland, rises in Peebleshire, flows for about twenty miles northeast, and then in an easterly direction, emptying into the North sea at Berwick, in England. It is 95 miles long, but navigable only a few miles from its mouth. It owes its fame to its beautiful scenery, and to the historical associations. Crossing the heart of the "Borders" between England and Scotland, it has been the scene of many a deadly struggle, and its name is frequent in ballad and story.

Tweed, William Marcy, an American politician, was born at New York, April 3, 1823. He held the different offices of alderman, congressman, supervisor of the city of New York, school and street commissioner, and state senator. While commissioner of public works, in 1870, he and his followers constituting the famous "Tweed Ring," used large amounts of public funds for their own purposes. After several trials, Tweed was convicted of fraud and sentenced to twelve years' imprisonment and the payment of $12,550 as a fine. He was confined at Blackwell's Island, but his imprisonment was declared illegal by the court of appeals. Several other suits had been brought against him, and he was again imprisoned, for want of the $3,000,000 of bail required. He escaped to Spain, but was recaptured, and died in jail in New York city, April 12, 1878.

Twickenham (*twik'en-am*), a village in Middlesex, England, on the Thames river opposite Richmond. It is known as the residence of Pope, whose grotto is still to be seen and whose monument is in the Parish church. Strawberry Hill, famous as the home of Walpole, is near by, and the Orleans house, used by Louis Philippe while in England and still belonging to his family, is in the town.

Twi'light is the faint light before sunrise and after sunset, which is produced by the reflection by the atmosphere of the sun's rays when it is still below the horizon. If we had no atmosphere, we should have no light until the exact moment when the sun would rise, and no light after the sun had set. The sun must be approximately 18° below the horizon at any place before the twilight will entirely cease; so in the polar region where the sun is nearer the horizon than 18° there will be twilight all night, or rather there will be no complete night. Just what there is in the earth's atmosphere that reflects the sunlight is yet unknown. It may be dust particles, it may be minute crystals of ice, and it may be pure air itself.

Twi'ner, a plant which climbs by coiling its body in an ascending spiral about a support, as the morning-glory, hop vine, etc. In their younger parts twiners are sensitive to contact,

so that when they touch a support they curve sharply about it. The twining habit, as the climbing habit in general, is most extensively developed in the tropics. See CLIMBING PLANTS.

Ty'ler, John, tenth President of the United States, was born at Greenway, Charles City county, Va., March 29, 1790. He graduated at William and Mary college in 1807, studied law, and had a large practice soon after he was admitted to the bar. He was elected five times to the state legislature, and three times to congress. He sympathized with the states' rights party, and opposed the United States bank, protection, and all limitations of slavery. In 1825 he was chosen governor of Virginia, and in 1827 he became United States senator and was again elected in 1833. From this time he acted with the Whig party, being an active partisan of Henry Clay, and in 1840 was elected by that party Vice-president of the United States, with General Harrison as President. The death of President Harrison, a month after his inauguration, made Tyler President in 1841. His administration, at first favorable to the Whigs, was soon displeasing to them. He vetoed the bill for a United States bank, at that time a favorite project of the party. Several members of the cabinet resigned, and finally John C. Calhoun, the great Democratic statesman, was made secretary of state. The annexation of Texas in 1845, and the passing of a protective tariff law in 1842, were among the important acts of Tyler's administration. In 1861, he was president of the peace convention which met at Washington to effect a compromise between the North and South. He afterward joined the Confederate cause, and was a member of the Confederate congress at his death, which occurred at Richmond, Va., Jan. 17, 1862.

JOHN TYLER.

Ty'ler, Moses Coit, an American *littérateur*, and professor of American history at Cornell university since 1881, was born at Griswold, Conn., Aug. 2, 1835, and graduated at Yale in 1853. From 1867 to 1881 he was professor of English at the University of Michigan, and for a time was literary editor of *The Christian Union*. In 1881, he accepted the chair of American history at Cornell, and has written a *Manual of English Literature*, a *History of American Literatuer during the Colonial Period (1606–1765)*, *The Literary History of the American Revolution*, *Glimpses of England*, and a *Life of Patrick Henry*.

Ty'ler, William Seymour, an American scholar, was born at Hartfort, Penn., Sept. 2, 1810. The gift of a Greek grammar by a young minister started the boy on his career as a scholar and teacher. He graduated at Amherst college, and studied theology, but accepted the professorship of Latin and Greek in Amherst college in 1836. Besides his work in the college for more than fifty years, where he became celebrated as a teacher of languages, he is well known from his editions of Greek authors, such as *The Germania and Agricola*, of Tacitus; Plato's *Apology* and *Crito*, and Demosthenes' *De Corona;* and from his other writings on *The Theology of the Greek Poets*, *The History of Amherst College*, etc.

Ty'lor, Edward B., D. C. L., a distinguished English scholar, and professor of anthropology at the University of Oxford, was born at London, Oct. 2, 1832, and educated at the Friends' school, Grove House, Twickenham. In 1856, he took a scientific journey through Mexico, and has written the following works: *Anahuac, Mexico and the Mexicans; Researches into the Early History of Mankind; Primitive Culture;* and *Anthropology*.

Tyn'dale, William, an English reformer, was born in Gloucestershire, England, about 1484. He studied at Oxford and Cambridge, then began his translation of the New Testament in London; but his sympathy with the Reformation becoming known by his bold speech, he had to flee, going to Hamburg for a year. The first ten sheets of his New Testament were printed at Cologne, and in 1525, at Worms, two editions were published without his name. This was the first English printed copy of the New Testament. There was a great demand for it, in spite of the prohibition of the clergy and the abuse of such men as Sir Thomas More, who wrote seven books against Tyndale. The fifth edition was published in 1529, and in 1534 a revised edition came out with Tyndale's acknowledgment of his work. He also brought out a translation of the Pentateuch, or first five books of the Bible, and wrote *The Obedience of a Christian Man*. Various plots had been made to arrest him, after the first issue of his Testament, by the English government, which at last succeeded in having him taken at Antwerp, where he was imprisoned for eighteen months and then executed, by strangling and burning, at Vilvorde, near Brussels, Oct. 6, 1536. In November, 1866, a memorial to him was erected at his birthplace in Gloucestershire. The common English Testament is based on this translation of Tyndale's. See *Life*, by Demans.

Tyn'dall, John, an eminent British scientist, was born at Leighlin Bridge, Carlow, Ireland, Aug. 21, 1820; and died in Surrey, England, Dec. 4, 1893. He was educated in the public schools until he was nineteen years of age when he entered the employ of the ordnance survey. After a short teaching experience, he went to the University of Marburg in 1848, where he spent two years and took his doctor's degree. In 1851, he went to Berlin, where he made the valuable acquaintance of Magnus, Clausius, Wiedemann, and others. Returning to London in 1852, he was elected fellow of the Royal society, and in the year following was appointed professor of natural philosophy in the Royal institution, succeeding Faraday, a position which he held until 1887, when he was succeeded by Lord Rayleigh. Tyndall's earliest investigations were made at Marburg on *The Magneto-Optic Properties of Crystals.* In 1859, he began an important study of *Radiant Heat*, resulting in a classical volume published on the subject in 1872. His investigations of glacier motion were reported to the Royal society in 1856, and later recorded in several interesting popular volumes. As a skillful and brilliant lecturer on science, he has perhaps never been surpassed. Every one should read his *Heat as a Mode of Motion*, and his *Forms of Water.*

PROFESSOR TYNDALL.

Tyng, Stephen Higginson, an American clergyman, was born at Newburyport, Mass., March 1, 1800. He was a graduate of Harvard college and a prominent clergyman of the Episcopal church, successively occupying parishes at Georgetown, D. C., at Philadelphia, and at New York. Besides his great influence in the pulpit and in church work, he was editor for some time of the *Episcopal Recorder* and *Protestant Churchman*, and wrote *Lectures on the Law and the Gospel; Christ Is All; The Captive Orphan; Esther, Queen of Persia; The Prayer Book Illustrated by the Bible; Forty Years' Experience in Sunday Schools;* and *The Feast Enjoyed.* He died in 1885.

Type, the name of the metal letters used in printing. They are usually made of an alloy, called type metal, made up of lead, antimony, and tin, copper sometimes being added. The antimony gives hardness and the tin toughness to the soft lead, which is the principal metal used. A copper face is sometimes put on the type by the electrotype battery, which makes it last longer. Types were formerly made by hand, but now type-casting machines do the work. The types must be made very accurately in order to fit so exactly when placed together that they will form a solid body. To do this they are made in molds, into which the hot metal is injected. The letter to be made is cut on the end of a bar of soft steel, and then pressed into a piece of copper by the blow of a hammer, and the copper impression is fitted into the end of the mold and the metal poured in it, filling up the impression of the letter and the rest of the mold. Types are all of the same height, but of different widths, according to the letter. A full set of types is called a font, or fount, and has the letters in different proportions, as sixty of e, forty-five of t, and forty of a, i, o, u, etc. Large and small capitals, large and small italics, small letters, figures, and punctuation marks are found in a font. Types are of different sizes, called by printers nonpareil, minion, brevier, bourgeois, long primer, pica, etc. Some of the names came from the first maker of the type, and others from the first book printed with that particular kind of type, as brevier from breviary, and pica from the service of the mass called pica or pic. According to an inscription on a tablet to his memory in Mentz, Gutenberg is credited with making the first printing letters in brass, in place of the wooden types first used in printing. The first type founder in America was Christopher Saur, who cast the type used by him in printing a German Bible about 1735. A page of a daily newspaper will sometimes require 150,000 types.

Type'setting Machines. The closing years of the past century have contributed much to facilitate and advance the art of printing. Many machines have been invented to take the place of the slow, laborious, and expensive process of hand typesetting, by mechanical devices which both set and cast the type, the operator simply fingering a keyboard, somewhat as in the typewriter. The most successful of these is what is known as the linotype machine, constructed by Otto Merganthaler, of Baltimore, Md., which is now largely used by the daily newspapers of this country and of England. This machine makes the type it uses, casting the letters selected by the operator, properly "justified" with spaces between the words, in solid bars of the length of line required. "Brass matrices are dislodged by the operator instead of types, and these are automatically arranged over the mold that forms the line. When this line is full another automatic device thrusts wedges between the words and spaces out the line. At the same instant a jet of fluid metal, kept fluid by gas jets under the machine, is injected and thrown out of the mold as soon as it is cool enough, without delaying the work of the operator. The brass matrices are immediately returned to their proper receptacles for subsequent use. The performance of the machine is limited

only by the ability of the operator." The capacity of the machine is from 8,000 to 10,000 ems per hour. When each line leaves the machine it is ready to go into the page form, and casts from it may be duplicated as often as desired. Leads between the lines are inserted at the pleasure of the maker-up of the forms. With these linotypes, there is no need for distributing the type after use, in the old way, as each line of type, when it has served its purpose, is simply melted down. Other machines are patented and in use, such as the Lanston, but this casts the type it uses, not in lines, as the Mergenthaler does, but in isolated characters. For fine bookwork, especially where a variety of type, italics, small capitals, accents, etc., are required, the old method of setting up the type by hand is retained. Other more or less successful machines for typesetting are those covered by the Thorne, Rogers, Frasier, and McMillan patents.

Type'writers, machines for writing by movable types instead of the pen. In 1714, a patent was granted in England for a writing machine, and one was invented in France about 1784. The first writing machine patented in America was the Thurber machine in 1843, which worked too slowly to be of general use. Other machines followed, each one introducing improvements and new principles, until in 1873 the Remington was put into practical use. It was the result of experiments made by two printers, Sholes and Souli, whose attention was called to an article in the *Scientific American* describing a writing machine which had been invented by John Pratt, of Alabama. The first machine was finished in 1867, and was used for letter writing. One of these letters brought the new enterprise a friend, Mr. Densmore, of Pennsylvania, who joined with Sholes in perfecting the machine, until in 1873 it passed into the hands of the firm of Remington and Sons, of Ilion, N. Y. It was first used by professional men and its great advantages for business houses was not thought of until 1882, since which time it has been almost universally adopted, and many different kinds have been introduced. The types are placed on steel arms or bars, each marked with a letter, which are moved by the fingers of the operator, as are the notes of a piano. The paper is carried through by rollers and moved one space with each impression of a letter. The use of the typewriter instead of the pen is estimated to save forty minutes an hour, or over five hours in a day. It will write at the rate of thirteen letters a second, some operators writing more than a hundred words a minute. Typewriting has become a profession, and there are free classes of instruction in many public institutions in the United States.

Typhoon. See STORMS.

Tyre (*tir*), a city of ancient Phœnicia, on the Mediterranean sea. There were two towns of Tyre, one on the mainland of what is now Syria, and the other on an island opposite. It was situated in a fertile region, with magnificent scenery, and was a rich city in the days of Solomon, when Hiram, its king, furnished him with cedar trees, fir trees, and gold. It was a naval city at that time also, as it is recorded that Hiram sent to Solomon "shipmen that had knowledge of the sea," and its harbors were among the finest of the period. Carthage was founded by the people of Tyre about 813 B. C., the new colony seeming to have so weakened the old city that it disappears from history, until Shalmaneser, or Sargon, according to some writers, king of Assyria, conquers it after a long siege, and Nebuchadnezzar after a thirteen years' siege by water and by land, reduced it to only a partial submission, leaving its ruler on the throne, and its wealth untouched. The city fell before Alexander the Great in 332 B. C., who put in a new colony, under whom the city soon regained its prosperity. When under the Roman power, Tyre was given to Cleopatra by Antony. In the 7th century it came into the hands of the Saracens, until taken by the Crusaders. Its wealth, made by its trade and manufactures, especially that of the renowned Tyrian purple dye, made it a prosperous city until 1516, when the newly discovered route to Asia by the Cape of Good Hope put an end to its commerce. Its site is now occupied by an unimportant town, called Sur, with about 5,000 inhabitants, under the Turkish government of Beirût. Many of the ruins of ancient Tyre have been covered by the sea, but there are tombs found cut in the rocks, and the remains of a Christian cathedral built in 324.

Tyrol (*tir'ol*), an Austrian province in the western part of the empire, lies north of Italy and east of Switzerland. It covers 11,325 square miles, and is divided into three large valleys separated by mountain ranges — the Tyrolese or German Alps on the north, the Rhætian Alps in the center, and the Trent Alps on the south. The loftiest peaks in Austria, many of them in the region of perpetual snow, are in the Tyrol. The Brenner pass, the lowest of the great passes of the Alps, is near the center of the province and on the line of travel between Italy and Germany. The Inn, the Adige, and the Rhine on its borders, are the principal rivers. About one-third of the land can be cultivated, the rest being in forest, or in the land of snows. The crops are corn and other grains, and fruit. Goats and sheep are raised, and chamois, marmots, and eagles abound. Gold, iron, copper, and coal are found. There is a university at Innsbruck, and other schools in the country. The people are divided into the German Tyrolese in the north and the Italian Tyrolese in the south, and are nearly all Catholics. They are very patriotic, and are noted for their love of home and their national songs.

Tyrol under the Romans was a part of Rhætia. It passed back and forth from Bavaria to Austria until 1814, when Austria finally claimed it. In 1809, the insurrection under Andreas Hofer took place, in which men and women fought side by side until hundreds were killed, because their country had been given to Bavaria. Population 928,769. See *Tyrol and the Tyrolese*, by Grohman; *The Valleys of Tyrol*, by Busk.

Tzarskoge, Selo or **Sofia,** a town in Russia, fifteen miles south of St. Petersburg. It is the summer residence of the czar, and was originally a country house of Peter the Great. The palace was built in 1744. The main building is 800 feet long, with large wings in addition. The rooms are very magnificent, finished in gold, amber, lapis lazuli, and other precious materials. There is a Gothic castle, an arsenal, a smaller palace built by Alexander I., and a triumphal arch in memory of the Russian victories over Napoleon. It is eighteen miles around the grounds, and it keeps 600 persons busy to care for them. Population of the town 14,603.

U

Uganda (*ū-gän'da*), a British protectorate in East Africa, extending inland and covering the region about the Equatorial lakes, Victoria Nyanza, Albert Nyanza, Albert Edward, Rudolf, Kiogo, Baringo, etc. Area estimated at 140,000 square miles, with a native population of about 3,000,000, of whom about a third belong to the civilized and Christianized Baganda race, speaking the Bantu tongue. The trade of the protectorate is in the hands of German and British trading firms, carried on by British Indians, Persians, and Arabs. The region is fertile, with a rich fauna and flora; while iron, copper, and even gold abound. The Uganda government railroad now extends for 450 miles from the coast, and is at present within 100 miles from Lake Victoria. The protectorate is divided for administrative purposes into six provinces (Eastern, Rudolf, Nile, Central, Uganda, and Western), over which order is maintained by a force of Sudenese, consisting of Uganda Rifles, an armed constabulary, and native levies to the number, in all, of 4,000 men. The territory came under British influence in 1890, and four years later it was erected into a British protectorate. It has some high mountain elevations, from 10,000 to 19,000 feet, with snow-covered peaks, glaciers, and volcanoes.

Uhland (*ō'länt*), **Johann Ludwig**, a German poet, was born at Tübingen, in Würtemburg, April 26, 1787. He studied and practiced law at Tübingen, was a professor of the German language and literature in the university there, a leader in the diet, and a member of the Frankfort parliament. His writings consist of the dramas, *Ernest of Swabia* and *Louis the Bavarian*, works upon early German and Norse literature and mythology, and the songs and ballads for which he is famous. The first collection of poems, made in 1815, were patriotic songs, called forth by the war against Napoleon, and more than fifty editions have been published. *The Castle by the Sea* and *The Black Knight*, found among Longfellow's poems, are translations from Uhland, and there have been various translations of his songs and ballads. He died at Tübingen, Nov. 13, 1862.

Uhlans (*ū'länz*), a name given to the light cavalry of the Tartars, who were brought into Europe by their colonies in Poland. They were mounted on Tartar horses, and carried only light arms, such as the saber, lance, and later the pistol. In the Prussian army, all the light cavalry are called uhlans. They were conspicuous in the Franco-German war for their bravery and agility.

Ujiji (*ō-jē'jē*), a country in central Africa on Lake Tanganyika. It is a fertile country, raising groundnuts, peas, beans, plantains, sweet potatoes, egg plants, and yams. Sugar cane, tobacco, and cotton are cultivated to some extent. The people, called the Wajiji, are large and strong, with flat feet, woolly hair, and dark skins. In the town of Ujiji, a collection of huts with a bazaar where the Arabs trade, Stanley found Livingstone in November, 1871. See *How I Found Livingstone*, by Stanley.

Ulfilas (*ūl'fi-las*), a bishop of the Goths, was born about 310, and is thought to have come from a family of Christians from Cappadocia, taken prisoners by the Goths. He was learned in the Gothic, Greek, and Hebrew languages, and made a Gothic alphabet of twenty-four characters, modeled after the Greek. He translated the Bible, all but the books of Kings, into Gothic, and his Bible was in constant use among their cities. It is the earliest specimen of the Teutonic language. He became bishop of the Goths in 341, and settled with the Christian part of the nation near Nicopolis, persuading them to practice agriculture and the arts of civilized life. He died at Constantinople in 381. See *Ulfilas, Apostle of the Goths*, by Scott.

Ulm, a city of Würtemburg, is on the Danube river, forty-five miles southeast of Stuttgart. It has one of the largest Protestant churches in Germany, one of the earliest libraries, with a remarkable collection of antiquities, and strong fortifications. Its pipe bowls are noted, and with fine flour make a large part of its trade. Ulm was an imperial city of Swabia, and in the 15th century had within its walls and in the surrounding region belonging to it, nearly 100,000 inhabitants. It suffered in nearly all the great German wars, and is the site of the defeat of the Austrian general, Mack, by Napoleon, Oct. 17, 1805. Population 39,303.

Ulysses (*u-lis'sēz*) or **Odysseus** (*o-dys'-seus* or *o-dys'seus*), a Greek hero. He was ruler of Ithaca, and feigned insanity to avoid taking part in the siege of Troy. To show that he was crazy he plowed the sand on the seashore, but Polamedes exposed his deception by placing his infant son in the furrow, when he quickly turned the plowshare aside. Unsuccessful in his mission to demand the return of Helen, he joined in the ten years' siege, being one of the most prominent of the Greek leaders. He fought with Ajax for the prize of Achilles' armor, which he gained, and was one of the Greeks hid in the wooden horse, who captured the city. On the island of the Cyclops, when six of his companions were eaten by the giant, he put out the giant's one eye, and escaped by tying himself and his companions under the bodies of the sheep, which carried them with

them when let loose from the cave. At the island of Æolus, that god gave Ulysses a bag containing the favorable winds, but the bag was opened by his followers and the winds escaping the ships were driven back to the island. Circe, the sorceress, changed part of his followers into swine, but he overcame her spells with the help of Mercury. He passed safely the island of the Sirens by filling the ears of his followers with wax and tying himself to the mast. At Trinacria, his followers, while he slept, killed some of the cattle of Helios, which they had been warned not to touch, whereupon a great storm arose, the ship was wrecked, and all on board were drowned but Ulysses. He lived seven years on the island of Ogygia with the nymph Calypso, returned at last to Ithaca after twenty years' wandering, and slew the suitors of his wife, Penelope, with the help of Minerva and of Telemachus, his son. The *Odyssey* gives the story of his wanderings.

Um'bel, a cluster of flowers in which the pedicels arise in a cycle from a common level, resulting in a flat-topped cluster. Often umbels are compound, each branch of the main cycle terminating in a cycle of pedicels bearing flowers. A cluster characteristic of the great family umbelliferæ. See INFLORESCENCE.

Umbria, a country of ancient Italy, lying between the Adriatic sea and Etruria, or Tuscany. The Tiber and the Rubicon were among the principal rivers. It was one of the most powerful states in central Italy, but was conquered by the Romans in 308 B. C. The name is given now to Perugia, a province of the kingdom of Italy.

Unalas'ka, one of the Aleutian islands, the extension seaward of the Alaskan peninsula, which separates the Pacific ocean from Bering sea. The island lies at the passageway for steamers from San Francisco, Portland, Ore., and Victoria, B. C., proceeding to St. Michaels, the mouths of the Yukon, and to Cape Nome. The chief village of the island is adjacent to Dutch harbor, and is named Unalaska, the population of which by the recent twelfth census was 428. The islanders are principally Aleuts, who support themselves by fishing; there are also a few Russians and Americans. Captain's bay, a naval rendezvous, is the sheltered waterway in front of Unalaska town. It is about 2,060 miles distant from Portland, Ore., and 2,344 miles from San Francisco.

Un'cas, an Indian chief of the Mohegan tribe, in Connecticut. The Mohegans were a band of Indians collected by Uncas after he had left the Pequot tribe, to which he belonged. He sided with the English in the war against the Pequots, and was so friendly with them that the Indians turned against him. In the wars which took place, Uncas captured and killed the chief of the Narragansetts. Several tribes made war against him, and the Narragansetts would have starved him out of his stronghold had not the English sent him supplies by night. He was called a cruel, wicked old man, but was faithful to his English allies. He died when very old, in 1682.

Ungulates (*ŭn'gu-lāts*), the name for an order of hoofed mammals. The larger proportion of mammals belong to this interesting order, which embraces the species useful to man, as the horse, ox, sheep, camel, pig, deer, etc. They all walk, so to speak, on the tips of their toes, each toe at the end being incased in a horny hoof. They are naturally divided into two groups, the odd-toed and the even-toed mammals. The former includes the horses with a single hoof, the rhinoceroses, with three toes on each foot, and the tapirs with three toes on the hind feet, and four (one of which is not used) on the fore feet. The odd-toed mammals (*Perissodactyla*) have had a long geological history, and many modifications can be traced through those found in the rocks. The horse, for example, sprang from ancestors with five toes, and between those remote ancestors and the modern horse with a single toe lies more than two and one-half million years (see EVOLUTION). The even-toed forms (*Artiodactyla*) include all those with cloven hoofs, as the cattle, deer, sheep, goats, swine, and the like. The hippopotamus has four toes on each foot. The swine has four toes, but the two outer are lifted above the ground and not of use in progression, and the cud-chewers have the toes reduced to two. These even-toed mammals have likewise a long history, and in the rocks are forms which lead up to those now existing.

U'nicorn, a legendary animal described by ancient authors as possessing the body of a horse, and a single long horn issuing from the forehead, and projecting forward. It was supposed to inhabit India. This fabulous creature became a sign in heraldry. A somewhat similar animal with cloven hoof and beard of a goat is depicted on the coat-of-arms of England. The word translated "unicorn" in the Bible refers to some horned creature. It is supposed by some scholars that the buffalo is indicated.

U'nio, the name for a number of fresh-water mussels very abundant in the United States. Their name would indicate a single shell, but they are bivalves. For their structure, see CLAM. Some forms, especially in the streams of Wisconsin, Ohio, and New Jersey, contain pearls. These animals are gathered in great numbers, but the pearls are of infrequent occurence and mostly small. Occasionally, however, those valued as high as $500 to $2,000 have been found. The shells are used for making pearl buttons.

U'nit. See MEASUREMENT.

Uni'ted States of Amer'ica, a republic of North America, lying between the Atlantic and Pacific oceans, and reaching from British America to the gulf of Mexico and Mexico. It covers 3,507,640 square miles; its longest line from east to west being nearly 2,800 miles, and the length from north to south 1,600 miles. Two great mountain ranges cross the country from north to south. The Appalachian range, comprising the White and Green mountains, Blue Ridge, Alleghanies, Adirondacks, Catskills, and Highlands, is the most eastern, running nearly parallel with the Atlantic coast from New Hampshire to Georgia, and from twenty to one hundred miles inland. This mountainous country, with peaks over 6,000 feet high, is about one hundred miles wide, forming a barrier which is broken only by the Hudson and Mohawk rivers. Mt. Washington in New Hampshire, and the Black Dome, in North Carolina, are the highest points. The Rocky mountains, the second great range, are 300 miles wide, with a much greater width at some points, and reach from Canada to Mexico, with peaks over 14,000 feet high. The Sierra Nevada, in California, the Cascade range in Oregon and Washington, and the Coast range are parts of the Rocky mountain range. Mt. Whitney, in the Sierra Nevada range, is 14,887 feet in height, and nearly as high are Mt. Hood, Mt. Shasta, Pike's Peak, Long's Peak, and others.

The Atlantic slope, between the Appalachian system and the ocean, has in general low coasts, sloping inward to the hilly regions at the base of the mountains. There are many large bays and inlets, the Penobscot, Massachusetts, Cape Cod, Narragansett, New York, Delaware, and Chesapeake bays, and Long Island, Albemarle, and Pamlico sounds being the most important. The rivers flowing into the Atlantic are many of them navigable, the larger ones being more than 300 miles long, such as Penobscot, Kennebec, Hudson, Connecticut, Delaware, Susquehanna, Potomac, James, Cape Fear, Neuse, Roanoke, etc. The Atlantic coast line is 2,349 miles long, not including the indentations of the land.

The great central plain stretching from the Alleghanies to the Rockies, and watered by the Mississippi and its branches, is one of the most fertile regions in the world. Its hills are covered with forests, and its prairies and plains produce the great crops of grain and cotton that feed and clothe the world. The eastern part of this central region is hilly, covered still in east Tennessee and West Virginia with heavy forests; the central part is prairie, merging in the west into the great plains covered with wild grass, sage brush, and cactus, with little rainfall and depending on irrigation to make it profitable to cultivate. The great rivers of this region are the Mississippi and its branches, the Ohio, Wisconsin, Illinois, Yazoo, Missouri, Minnesota, Arkansas, and Red rivers, extending many of them from 1,000 to 2,000 miles. This region is bordered by the five Great Lakes, the largest bodies of fresh water on the globe, while New York, Wisconsin, Michigan, and Minnesota are noted for their numerous small lakes and Utah for its Great Salt lake.

The Pacific slope has bold and rocky coasts, stretching for 2,281 miles, with bays at San Diego, Monterey, San Francisco, strait of Juan de Fuca, Puget sound, and the numerous bays and sounds of Alaska. It is the most varied part of the country, broken by the Sierra Nevada, Cascade, and Coast Range mountains; with heavy forests in the northern parts; great plains and high mountain valleys, 10,000 feet above the sea, descending by great steps to the lower levels; its great cañons or river beds, thousands of feet deep; its dry plains, and the great basin region, with no drainage to the sea. The rivers of this slope are the Columbia and its branches, the Sacramento, San Joaquin, and the Colorado of the West. On the southern border of the United States is the gulf of Mexico, and flowing into it are the Mississippi, Appalachicola, Mobile, Pearl, Rio Grande, and Colorado rivers, while on the northern border, connecting the Great Lakes with the ocean, is the St. Lawrence river. The total coast line of the United States, including bays and gulfs and sounds, is 22,609 miles.

Among the many interesting natural features of the country may be mentioned the Niagara and Yosemite falls; the falls of St. Anthony on the Mississippi, and those of the Missouri and Snake rivers in Montana and Idaho; Mammoth Cave in Kentucky; the Natural Bridge in Virginia; the pictured rocks on Lake Superior; the passages on the Hudson through the Highlands, of the Potomac at Harper's Ferry, of the Missouri through the Rocky mountains, and of the Columbia river through the Cascade range; the natural parks of the Yosemite and the Yellowstone; the mammoth trees of California, and the geysers.

The climate of the United States, a country stretching through twenty-five degrees of latitude, and changing from low plains to high mountains, is, of course, varied. In most parts of the land it is very changeable, with a great difference between winter and summer. The Atlantic states are colder than the same regions in Europe, while California has as mild a climate as Italy. The rainfall is abundant except in some parts of the west, and distributed throughout the year, except on the Pacific coast, where it occurs in the winter and spring. There is also every variety of soil, including the prairie lands covered with rich mould, sometimes twenty-five feet deep, and the dry, sterile plains of the Utah basin.

The minerals of the country include gold, silver, iron, lead, copper, zinc, nickel, coal,

marble, and slate, to which must be added petroleum and natural gas. In the production of quicksilver, iron, copper, and lead, the United States holds the second place among the nations of the world, while in producing gold, coal, and steel it has the first rank. In 1899, the product of gold was 3,437,210 ounces; of silver, 54,764,500 ounces; of coal, 225,835,304 tons; of iron, 13,620,703 tons; and of lead, 209,240 tons. Much of its great wealth is still undeveloped, especially in the southern states. The agricultural products of the country are enormous, and form the bulk of the exports; while nearly one-half of the laborers are engaged in agriculture. In 1899, there were produced 2,078,143,933 bushels of corn, 547,303,846 bushels of wheat, and 796,177,713 bushels of oats; and in 1900 the cotton crop of the south amounted to 4,757,062,942 pounds. Manufactures of all kinds are increasing, the eastern states particularly having become almost exclusively manufacturing states. The cheapness and abundance of fuel and of the raw material used in manufactures, and the fine water-power found so abundantly, contribute to the success of almost all manufacturing enterprises, the high price of labor being the only unfavorable condition.

The United States of America is composed of forty-five states, three territories, the District of Columbia, Indian Territory, and Alaska, besides the Hawaiian Islands, Porto Rico, the Philippine Islands the island of Guam, and the small islands Tutuila, Manua and Anu, of the Samoan group. The original states numbered thirteen, the others having been admitted into the Union since the adoption of the constitution. Each state has its own government, with a governor and legislature, making its own laws, so that the laws vary in different states. The territories are governed by a governor appointed by the President of the United States, and a legislature chosen by the people. When populous enough they become states, by vote of congress. Indian Territory, Alaska, and the District of Columbia are not territories, but districts. The District of Columbia is governed by congress; the Indian Territory by a council of delegates from the different Indian tribes; and Alaska by a governor and a United States district attorney appointed by the President, but it has no legislature and no representation in congress. The Hawaiian Islands which were annexed to the United States in 1898, were in 1900 constituted as the Territory of Hawaii. The government of Porto Rico and the Philippine Islands is administered by civil governors appointed by the President. Guam and Tutuila are practically naval stations, in charge of officers of the navy, assigned by the President.

The government of the United States is in three branches, the legislative, executive, and judicial. It is founded upon the constitution which was adopted by the thirteen original states, in 1788, and which can be altered by a vote of the people. The President is the head of the government, and with the Vice-president is elected for a four years' term, by what is called the electoral college, made up of as many electors from each state as that state has members of congress. The President is commander-in-chief of the army and navy, though never appearing at the head of the army, and appoints the heads of departments, ambassadors, judges of the supreme court, and almost all the higher officers of the government, in all about 100,000 persons. He has the right to veto a measure passed by congress, which, however, by a two-thirds vote can pass a measure over the President's veto. His salary is $50,000 a year, and he resides in the White House at Washington, D. C. To be eligible for election to the presidency, a man must be a native of the United States and thirty-five years old. Congress, the legislative or lawmaking body of the United States, is made up of two bodies, the senate and house of representatives. Each state legislature chooses two members of the senate, who serve for six years. The house of representatives is composed of 332 members, divided among the different states according to their population, and elected by the people for the term of two years. Congress has the power to make any laws that affect the whole country, but cannot change the laws of a state.

The heads of the different departments of the government are called: secretary of state, secretary of the interior, secretary of the treasury, secretary of war, secretary of the navy, secretary of agriculture, attorney-general, and postmaster-general; they are appointed by the President with the approval of the senate, and form his cabinet, or body of advisers. The supreme court of the United States sits in Washington, with nine judges appointed by the President and holding office for life. There are, besides, nine circuit courts, fifty-five district courts, and one court of appeals. The army of the United States numbers 65,000 men, with an organized militia of 106,339. They occupy 104 garrison posts. The military academy is at West Point, N. Y. The navy numbers 20,000 men, including apprentices, and is to be further expanded to 22,800 men. There are ninety-eight vessels, ten navy yards, four naval stations, and a naval academy at Annapolis, Md.

The education of the people of the United States is provided for largely by the states, each of which has its system of public schools, open to all children of school age. The national government has, however, appropriated more than 75,000,000 acres of land for schools and universities, including about 8,000,000 acres given to establish agricultural colleges in the different states. In 1898, there were 15,138,705 children in the public schools, which cost the different states $197,281,603. There were 484 universities and colleges, of which 344 were coeducational, 140 for men

only, with a total enrollment of 77,415 students; besides schools of art, music, law, medicine, theology, and mechanical arts. There is no state church, all denominations and all sects being perfectly free to worship in their own way, except where the religious rites or customs are opposed to the constitution of the country, as is the practice of polygamy by the Mormon church.

The population of the United States is 76,295,220 and has more than doubled since 1860. The original inhabitants of the country were Indians, of whom there are now 262,965 on the various reservations. The negroes or colored people were brought into the country by slavery, and now number over 8,000,000. The foreign-born population is estimated at 9,249,547, made up of almost every known nationality, immigrants numbering 18,770,307 having come to the United States. About one-third of the immigration is from Germany, one-third from Great Britain (largely Irish), one-tenth from Canada, and one-tenth from Sweden and Norway, with a small proportion of Hungarians, Russians, Bohemians, and Italians. The Chinese are the only people excluded as a nation, but convicts, lunatics, idiots, and all persons likely to become a public burden, are forbidden the country by the act of congress of 1882.

The United States obtained its vast domain of 2,308,866,560 acres by settlement, purchase, and conquest. The Norsemen are thought by some historians to have made settlements in Massachusetts and Rhode Island as early as the 10th and 11th centuries, but the continent was still unknown to Europe when Columbus sailed with his little fleet to the west, and found the western islands in 1492. Then the Cabots sailed along the coasts from Labrador to Virginia in 1498. Spain entered the region now belonging to the United States at St. Augustine in 1565, and at Santa Fé in 1598. The French occupied the Mississippi valley and the northwest, and Holland and Sweden had their colonies on the Hudson and the Delaware. The English, who were to possess the land, settled at Jamestown, in Virginia, in 1607, and at Plymouth, Mass., in 1620. The English settlers followed the Atlantic coast and westward toward the interior, gradually driving before them Indians, Spaniards, Dutch, and French. In 1803, by the Louisiana Purchase (which see) for $15,000,000, the French gave up their claims to the great country west of the Mississippi to the Rocky mountains, and from Texas to British America. In 1819, Spain ceded Florida, receiving six and a-half million dollars. The Mexican war added Texas, New Mexico, California, Nevada, Utah, and Arizona to the country, the United States paying $15,000,000 for the first cession of land, and $10,000,000 for the final yielding up of a part of Arizona, known as the "Gadsden purchase." In 1867, Alaska was bought of Russia, the price paid being $7,200,000. Washington and Oregon were preserved to the Union by the treaty of 1846 with Great Britain, which settled the northern boundary at 49° of latitude. The lands of the Indians have been obtained by war and purchase, large reservations still belonging to the Indian tribes. More than a billion acres of land have been sold for cash by the government, or given to schools, railroads, and settlers.

Besides the early Indian wars, and the struggles with other settlers, the country has carried on five wars. The War of the Revolution was brought about by the heavy taxation of the colonies by the English government to repay the expenses of the French war, by which it had obtained possession of Canada. It lasted from 1775 to 1783, when the independence of the colonies was recognized by Great Britain in a treaty of peace signed at Paris, Sept. 3, 1783. The Declaration of Independence was adopted by the vote of twelve colonies July 4, 1776, and the country was first called the "United States of America" in that document. The first battle of the Revolution took place at Lexington, Mass., April 19, 1775, and the struggle was continued for seven years, the surrender of Cornwallis' army at Yorktown, Oct. 19, 1781, practically ending the war. Great Britain sent to America in this war about 112,000 soldiers and 22,000 seamen, and lost 25,000 men, while the United States brought into the field 232,000 regular soldiers, and 56,000 militia, besides the French troops sent to her assistance.

The second war between the United States and Great Britain, called the War of 1812, arose from the seizure of American vessels at sea by the British, and their claim to the right of searching American ships for deserters from their navy. Nine hundred ships were searched and 5,000 sailors taken from them before war was declared, June 18, 1812, and began with an unsuccessful invasion of Canada. The naval battles were more successful, resulting in the capture in the first year of nearly 300 vessels. During the war, carried on for three years by land and sea, a British army landed in the Chesapeake, and captured the city of Washington, burning the public buildings. A treaty of peace, signed at Ghent, Dec. 24, 1814, ended the war, though the battle of New Orleans was fought Jan. 8, 1815, before the news of the treaty had crossed the ocean. The Mexican war, from 1846 to 1848, was brought about by the annexation, in 1845, of Texas, which had revolted from Mexico, and was ended in a treaty of peace, Feb. 2, 1848, which made the Rio Grande the boundary line between the countries, and gave New Mexico and California to the United States.

The question of the extension of slavery, which had been introduced into the country now forming the United States, as early as

Queen Victoria died Jan. 22, 1901.
Edward VII. King.

1619, was the cause of the differences between the northern and southern states, which resulted in the withdrawal, in 1861, of eleven states from the Union and the formation of the southern Confederacy, called the Confederate States of America. This brought on the Civil war of 1861–65, in which 2,780,000 Union troops and 690,000 Confederate soldiers contended. It cost the lives of 500,000 men, left the southern states almost ruined, and encumbered the nation with a debt of $2,800,000,000. The first gun was fired at Fort Sumter, April 12, 1861, and the surrender of Lee, which closed the war, took place at Appomattox Court House, Va., April 9, 1865. The proclamation of freedom to the slaves was issued Jan. 1, 1863, and in 1870 the fifteenth amendment to the constitution was passed, which provides that "the right of citizens of the United States to vote shall not be denied or abridged by the United States on account of race, color, or previous condition of servitude." The debt has been reduced nearly one-half, in spite of the enormous amount paid out every year in pensions to the survivors of the war. The south has entered upon a new era of prosperity, with the development of its mineral resources, the increased production of cotton and tropical fruits, and the promotion of other industries by the introduction of northern capital. The city of Washington, in the District of Columbia, is the capital of the United States. On the 16th of February, 1898, the nation, which had long been in sympathy with the struggles of Cuba for freedom from the oppression of Spanish rule, was roused to action by the explosion of the battleship *Maine*, probably through treachery, in the harbor of Havana. War with Spain followed, lasting from April 20, 1898 to April 11, 1899, and resulting in the independence of Cuba, and the cession of Porto Rico and the Philippine islands to the United States. See SPANISH-AMERICAN WAR, SLAVERY, CONFEDERATE STATES, STAMP ACT, etc. See histories of the United States by Von Holst, Bancroft, MacMaster, Higginson, etc.

Uni'ted States, Depart'ments of. There are eight departments of the executive branch of the government of the United States, of which the President is the head. The heads of the departments, known as secretaries, are appointed by the President, subject to confirmation by the senate. They have a salary of $8,000 a year, have no seats in congress, and form the President's cabinet or board of advisers. The heads of the departments are the secretary of state, secretary of the treasury, secretary of war, secretary of the navy, secretary of the interior, secretary of agriculture, postmaster-general, and attorney-general. The department of state, called the department of foreign affairs when it was formed in 1789, has charge of all the relations and business of the United States with foreign nations. The divisions, or bureaus as they are called, are the diplomatic bureau, consular bureau, bureaus of statistics, accounts, etc. There are three classes of ministers sent to foreign countries to represent the United States: ministers plenipotentiary, of which there are thirteen, ministers resident, and "chargés d'affaires" (persons in charge of affairs). In the principal foreign cities, consuls or government agents are stationed, who look after the interests of Americans, residents or travelers, and especially American seamen.

The principal officers of the state department, besides the secretary, are three assistant secretaries, seven heads of bureaus, one solicitor, and one chief clerk.

The largest and most important department is that of the treasury, which was formed in 1789. The secretary of the treasury has to superintend the collection of revenue, to grant warrants for money used in carrying out the appropriations of congress, to oversee the public debt, national banks, and coinage, internal revenue, etc. There are three assistant secretaries, eight division chiefs, two comptrollers, and six auditors. There is also a treasurer of the United States, who has charge of all public money, and pays it out only on orders from the secretary of the treasury; a register of the treasury, who keeps the accounts; commissioner of internal revenue; director of the mint; chiefs of the bureaus of engraving, statistics, and navigation; inspectors of the marine hospital, life-saving service, and steamboats; superintendent of the coast survey; and the supervising architect. The director of the mint holds his place for five years, and has charge of the mints and assay offices. The chief of the bureau of engraving has the oversight of the printing and engraving of all United States bonds, bank notes, etc. The internal revenue bureau has charge of the collecting of government taxes; the coast survey, of preparing maps and charts of the islands, capes, harbors, etc., of the coasts of the country; the life-saving service, of the appliances for the saving of life and property on the sea or lake coasts; the steamboat inspectors, of all boats used on the rivers, lakes, and oceans; and the architect, of all buildings, repairs, construction, etc. Full reports are required of all the officers of the treasury.

The President is commander-in-chief of the army, but never acts in that capacity, and makes all communications to it through the secretary of war. The army is directly under the commanding general, known as the lieutenant-general, and there are 20 general officers. (See ARMY.) The war department, through its secretary, reports on the state of the army, the necessary expenses, etc., and also has charge of the improvements of rivers and harbors. The adjutant-general, with the charge of the recruiting and mustering of soldiers, and records of the army; inspector-general, who examines arms and equipments

and the drill and discipline of the army; the judge-advocate-general in charge of the bureau of military justice; the signal officer, in charge of the signal service, which oversees the seacoast service; the quartermaster-general, with the duty of providing the army supplies; the commissary-general, who sees to the rations or food of the army; the paymaster, who keeps accounts, and the surgeon-general, are important officers of the department. There is also an ordnance department, an engineer corps, the chief of ordnance and the chief of engineers being very prominent and important officers. There is also a record and pension officer. See PENSIONS.

The navy has one admiral and eighteen rear-admirals. The navy department was not formed until 1798, and has eight bureaus of yards and docks, navigation, ordnance, construction and repairs, equipment and recruiting, provisions and clothing, steam engineering, medicine and surgery. The duties of the heads of these departments, who rank as commodores, are similar to those of the war department, and are sufficiently indicated by the name of the bureau. The post office department, permanently established in 1794, has, besides the postmaster-general, four assistant postmasters, each with a corps of superintendents and assistants. The first assistant postmaster has charge of the money-order system and the dead-letter office, where all unclaimed mail matter is sent, the free delivery system, and the location of new offices. The second assistant arranges the mail service, making contracts, furnishing bags, locks, etc. The third assistant postmaster has charge of the making and distributing of postage stamps, postal cards, wrappers, the collection of revenue from post offices and other financial operations. The fourth assistant postmaster has charge of post office inspectors, receives applications for postmasters, and issues their commissions, investigates losses by mail, etc. There are nearly 50,000 postmasters and 60,000 clerks in the United States under the post office department.

The department of the interior was formed in 1849 and has charge of public lands, Indians, pensions, patents, education, the census, and geological survey. There are two assistant secretaries; a commissioner of public lands; a commissioner of pensions, with the oversight of seventeen pension agencies, which, in the year 1900, paid an aggregate of $140,877,316 to about one million pensioners; the commissioner of Indian affairs, with a board of ten commissioners and seventy agents, who look after the interests of 262,965 Indians; the commissioner of patents, of education, of railroads, of fish and fisheries, and of the census and publication bureaus.

The agricultural department is the latest formed, dating only from 1889, and having charge of experimental stations where new plants are tested, of the distribution of rare seeds and plants, the collection of statistics, the study of animal diseases and insect pests, weather observations, etc.

The attorney-general presides over the department of justice, as it is called, and has four assistant attorney-generals and a solicitor-general, with the charge of the law business of the country, such as conducting suits for the United States, overseeing the United States attorneys, United States marshals, etc. It is distinct from the supreme court, which is the law-making body of the country.

Univer'sity, a higher educational institution, having the right to give degrees in several departments of learning, and with a body of teachers or faculty in each of the different schools or colleges connected with it. The word *universitas*, meaning a collection of persons or things, was first used to indicate any society, whatever its object, as the universities of priests, musicians, bakers, etc., in Rome. The schools of Plato and Isocrates at Athens and the museum at Alexandria resembled the later universities in their organization and objects. The modern university, dating back to the 12th or 13th century, is thought to be the outgrowth of the schools connected with the convents and monasteries throughout Europe. When some popular teacher, such as Abelard or Peter Lombard, drew crowds of students, these usually formed themselves into a corporation to which was given the name *universitas*. Some of the early universities, as that of Paris, were formed by a body of teachers, while again, as at Bologna, they were corporations of students. The faculties of a university are the teachers in particular departments, as the faculty of law, faculty of arts, etc. The two highest officers of a university have usually been the rector and chancellor. A degree is given by the university when a student has passed through a certain part of the course of study. The degree of doctor or master at first entitled the person who received it to teach in the university giving the degree. Pope Nicholas I., near the end of the 13th century, granted the University of Paris the right to endow its graduates with the power to teach anywhere. The degree of "bachelor," borrowed from the terms used in knighthood and indicating an imperfect or partial graduate, that is, one who had finished only the lowest stage of university work, was first introduced at the University of Paris in the 13th century. The colleges, as the different schools connected with a university are called, were at first mere boarding halls, which later were appropriated to the faculties of different departments.

Europe has about 100 universities, the oldest being the University of Paris, which was organized in the 12th century, but was not called a university until the 13th century. It had two chancellors, and gave degrees,

those of doctor and master at first being the same, but afterward the degree of master was given to those who were qualified to teach the arts, and that of doctor to those who could teach theology, law, or medicine. The Sorbonne was the theological school of this university, which was suppressed by the convention in 1793, but was revived by Napoleon I. as the University of France, which has charge of all public instruction. The "Academy" of Paris has five faculties, those of law, medicine, theology, science, and letters. It usually has 8,000 students. The University of Bologna, with its charter given by Frederick Barbarossa in 1158, was especially celebrated for its law schools and that of Salerno, of the 12th century, for its instruction in medicine. Women were admitted to both these schools, and graduates of Salerno practiced as "lady physicians" in the 12th and 13th centuries. Italy has now twenty-one universities; Germany, twenty-one; England, six; Ireland, two; Scotland, four; and there are about thirty in all the other countries of Europe. The oldest universities in Germany are at Heidelberg, Leipsic, Tübingen, Jena, and Halle. The German universities are governed by the professors, presided over by a rector, or chancellor. There are three grades of professors, called ordinary professors, extraordinary professors, and "privat-docents." The ordinary professors are the highest class, and are elected by government from candidates chosen by the faculty, and give lectures on the subject which they are selected to teach. The extraordinary professors have smaller salaries, and can lecture on any subject they please, as may also the privat-docent. The student attends any lectures he chooses, but cannot practice any profession without a certain course of university study. Göttingen university, founded in 1734, by Baron Munchausen, under the auspices of George II., king of England and elector of Hanover, was one of the most famous in Europe, having over 3,000 students, until that at Berlin was founded in 1810. The University of Tübingen, dating back to 1478, with seven faculties, is noted as the seat of what is called the Tübingen school of theology founded by Baur. The universities of Berlin and Bonn are among the most prominent in Germany, that at Berlin having about 5,000 students and 414 professors. Heidelberg university has a professorship of English literature, established in 1873, the first of the kind in Germany. The German universities are under the control of the government, and most of them are dependent upon state appropriations. The universities of Switzerland, Holland, Belgium, Russia, and Austria are on the German model. That of Prague, founded in 1348, is the oldest in central Europe. Louvain, founded in 1425, was once very famous, as was also the University of Leyden, founded by William of Orange. Spain has nine universities, and Portugal one. The University of Salamanca, established in 1415, had at one time 10,000 students, and 28 colleges. The oldest Scandinavian university is at Upsal, in Sweden, and there is one at Christiana, in Norway, and another at Copenhagen, in Denmark.

Of the four English universities, Oxford and Cambridge are the oldest, dating back to the 13th century. Those of Durham and London are modern, being founded in the 19th century. The University of London has no colleges directly connected with it, but confers degrees upon examination to students of nearly all the institutions of learning in the country. Oxford has twenty-three colleges and Cambridge eighteen colleges. This college system distinguishes the universities of England from those of the continent. A student must connect himself with a college before he becomes a member of the university. The teaching in these colleges is done almost entirely by tutors, and the professors of the university only deliver lectures on special subjects once or twice a week. Degrees are dependent upon examinations, and fellowships are provided, by means of which promising students can continue their advance studies for years. The Scottish universities are at Edinburgh, Glasgow, Aberdeen, and St. Andrews, that of St. Andrews being the oldest. They were patterned more after the German universities than those of England. The students were divided into four nations, named from the parts of Scotland from which they came. The University of Edinburgh has but one college, but that has all the powers of a university. The University of Dublin has only one college, Trinity college, but several faculties, including those of oriental and modern languages, mining, and civil engineering. Queen's university has three colleges, at Belfast, Cork, and Galway, each called Queen's college, and the governing body of the university holds its meetings at Dublin.

In the United States, the term university is loosely applied to many institutions which are strictly only colleges, just as the term college includes many academies and high schools. In its strictest sense, it is limited to institutions having several schools, as those of law, theology, arts, etc., in addition to the regular college course, where graduate work is carried on, that is, work done in the higher branches after graduation in a college. Harvard university, the oldest college in the country, is now one of the best equipped universities. It includes Harvard college, the Divinity school, the Law school, Lawrence Scientific school, Dental school (at Boston), the school of Agriculture, school of Veterinary Medicine, and the graduate department. It has 411 instructors and about 4,000 students. There is also an institution for the instruction of women by the Harvard professors, called the Harvard annex. The Agassiz museum and the Peabody museum hold its well-known collections.

The finest building is Memorial hall, built in honor of the alumni who fell in the Civil war. It is situated at Cambridge, near Boston.

Yale university, known as Yale college until 1887, is at New Haven, Conn., and takes rank with Harvard as one of the best institutions in the country. It was founded in 1701, and has recently celebrated its bicentennial. It includes, besides the college or academical course, schools of law, theology, medicine, philosophy, and arts. The school of fine arts, with its gallery of Italian pictures, and the Trumbull collection of fifty-four pictures, the Peabody museum, the Sheffield Scientific school buildings, Marquand chapel, Osborn hall, Vanderbilt hall, the Bicentennial buildings of 1901, and the library are among the noticeable structures. There are 270 instructors and about 2,500 students. Johns Hopkins university, founded in 1876, at Baltimore, Md., resembles the German universities in its methods. The work is largely graduate work, and the teaching is mainly by lectures. It was endowed by Johns Hopkins with a fund of $3,500,000. Higher mathematics and history are among the subjects in which special work is done. Clark university, at Worcester, Mass., founded in 1888, is an institution for graduate work only.

The state institutions are all called universities, but in only a few cases is the university system fully developed. The University of Michigan, at Ann Arbor, is one of the largest, ranking next to Harvard in the number of students. It has departments of law and medicine. Chicago university, with an endowment of $6,000,000, though a new institution, opening in 1892, already ranks among the great universities of the country. Its courses are so arranged that students can be admitted at any time, as there is instruction during the whole year. It has 209 instructors, selected from the best institutions in America and in Europe, and about 2,500 students. Many institutions of learning bearing the name of university in the United States are founded and carried on by the different religious denominations, such as the Wesleyan universities at Delaware, O., and at Middletown, Conn., De Pauw university at Green Castle, Ind., all under the direction of the Methodists; while Brown university at Providence, R. I., belongs to the Baptist denomination, as also the University of Rochester, and Dennison university. Most of the universities, both of Europe and of the United States, are mentioned under the name of the place where they are situated, but a full account of the numerous institutions called universities has not been attempted. See COLLEGES, OXFORD, CAMBRIDGE, ETC.

Univer'sity of Chicago, located at Chicago, was incorporated in 1890. It was founded by John D. Rockefeller, who contributed an aggregate of $10,000,000 for its establishment and endowment. About $3,000,000 additional has been donated by Marshall Field, S. A. Kent, Martin A. Ryerson, Miss Helen Culver, Mrs. Emmons Blaine, and others of Chicago. Mr. Charles Yerkes contributed $300,000 for the erection of the observatory at Lake Geneva, Wis., and for placing in it the largest telescope in the world. The buildings and grounds occupy a tract of land fronting on Midway Plaisance, between Washington and Jackson parks. The university opened its doors to students on Oct. 1, 1892. The university is organized into five divisions: the schools, colleges, and academies; the university extension; the university libraries, laboratories, and museums; the university press; and the university affiliations. The schools are those departments in which graduate work is done, and include schools of divinity, education, law, medicine, engineering, technology, fine arts, and music. There are colleges of liberal arts, literature, science, commerce and administration, and university college. The university extension division directs the work done by students who are unable to attend the daily exercises at the university. There are 291 instructors in the university, and the students in attendance number 3,520.

Univer'sity of Colorado, a state institution, is located at Boulder, and was first opened in 1877. Its organization comprises a college of liberal arts, school of applied science, school of medicine, school of law, college of dental surgery, and school of music. It also provides graduate courses. It is open to students of both sexes. The faculty numbers 80, and the number of students in attendance is 789, including the preparatory school.

Univer'sity of Illinois, located at Champaign, Ill., was founded by the state of Illinois, upon the donation by the national government of scrip for 480,000 acres of land. On account of this grant the state pays the university interest at the rate of five per cent. on about $495,000. The university was incorporated in 1867, as the Illinois Industrial university, and was opened to students in 1868. In 1885, the legislature changed the name of the institution to the University of Illinois. It includes the following schools: college of literature and arts, college of engineering, college of science, college of agriculture, graduate school, school of library science, school of music, college of law, college of medicine, school of pharmacy. The present value of the entire property and assets of the university is estimated at $1,600,000. It has nearly 200 instructors, and the number of students in attendance in 1901 was 2,044.

Univer'sity of Kansas, located at Lawrence, was established by act of legislature in 1864,

and is an integral part of the public school system of the state. The university embraces a graduate school, school of arts, schools of engineering, law, fine arts, medicine, and pharmacy. The faculty numbers 70, and the students in attendance 1,150.

Univer'sity of Minnesota, located at Minneapolis, is a state institution and was first organized in 1851, but dates its actual beginning from its reorganization in 1868. The university comprises the graduate department, college of science, literature, and the arts, college of engineering and the mechanic arts, school of mines, college of agriculture, college of law, department of medicine. It also has charge of the experiment station and geological and natural history survey. Students of both sexes are admitted, and the total enrollment, exclusive of summer schools, is 2,847. The faculty and instructors number 243.

Univer'sity of Missouri was established at Columbia in 1840, where academic work was begun in 1841. A normal department was organized in 1867. A college of agriculture was added in 1870, and also a school of mines and metallurgy, which is located at Rolla. Departments of law, medicine, and engineering have since been organized, and also a graduate department, which was opened in 1896. The faculty numbers sixty-five, with over 1,200 students enrolled.

Univer'sity of Nebraska, located at Lincoln, the capital of the state, is a part of the public school system of the state. It was founded by act of legislature in 1869, and is supported chiefly by a state tax, together with income from land sales and leases under act of congress of 1862, the annual revenue being about $270,000. It comprises the following colleges and schools: graduate school, colleges of literature, science, and arts, industrial college, college of law, school of fine arts, affiliated school of music. The faculty numbers 105, with 1,750 students in attendance, exclusive of the summer and preparatory schools. E. Benjamin Andrews, LL.D., is chancellor.

Univer'sity of Notre Dame, located two miles from South Bend, Ind., was founded by the Very Rev. Edward Sorin in 1842. It provides courses in the departments of arts and letters, science, architecture, civil, mechanical, and electric engineering, law, and pharmacy. The faculty number 56, and the students about 800.

Univer'sity of Oregon, is located at Eugene, 125 miles south of Portland. It is a part of the public school system of the state. The organization comprises colleges of literature, arts, science, and engineering, and schools of mines and mining, medicine, law, and music. It has 83 instructors, and 320 students.

Univer'sity of Pennsylvania, located at Philadelphia, is a state institution, the governor of the state being *ex officio* president of the institution. It grew out of an academy which was established in 1751, and was chartered under its present name in 1791. The university comprehends the college, including the school of arts and the Towne scientific school, the departments of philosophy (graduate school), law, medicine, dentistry, veterinary medicine, physical education, and astronomical observatory. It ranks among the older and better equipped institutions of the country. The instructors number 265, and the students 2,573.

Univer'sity of Vermont and State Agricultural college, located at Burlington. It has a faculty of 45, and 450 students.

Univer'sity of Wisconsin. See WISCONSIN.

U'pas, a tree belonging to the mulberry family, found in Java. It grows over 100 feet high, with a straight trunk and oval leaves covered with down, and a purple fruit, something like a small, rather long plum. It was long called the "deadly upas," and believed to be very poisonous, so that all animals going near it were killed, and even other trees and plants—travelers finding it growing solitary in a barren waste, with the bones of its victims around it. But instead it is found growing in the forests, and animals do not seem to avoid it. Many specimens have been collected without injury, and the tree is now in the principal botanical gardens of Europe. Its poison is similar in its effects to the poison ivy, and is found in the juice of the tree, and used by the natives on the points of their arrows. They also make a cloth from the inner bark of the tree, which, if it gets wet, produces a disagreeable itching. Bags are made from the tough bark of one species of upas.

Upsal' or **Upsala** (*up-sä'lä*), a city in Sweden, on the Sala river, forty miles northeast of Stockholm. It is situated in a fertile plain with fine buildings and parks. The cathedral, begun in the 13th century, is the most celebrated in Sweden. The university, founded in 1474 and richly endowed by Gustavus Adolphus, has fine buildings, over 70 instructors, and 1,386 students. There are also connected with it a botanic garden, a mineralogical collection, a museum, and an observatory.

U'ral, a river of Russia, separating Europe from Asia. It rises in the Ural mountains, flowing south and southeast for 1,100 miles, and emptying into the Caspian sea. There is very little navigation. Its banks have been fortified by a line of forts, and its fisheries are very valuable.

U'ral Mountains form a part of the boundary between Europe and Asia, separating European Russia from Siberia. The chain is made up of a series of parallel ridges in the southern part, running toward the northwest, the highest summit being 4,680 feet. Farther north there are several low ridges, with peaks reaching 5,115 feet, while one low ridge in the extreme north completes the range. The middle part of the range is very rich in minerals, having mines of gold, copper, platinum, and iron; precious stones, such as the emerald, beryl, topaz, amethyst, and diamond, are also found. The population inhabiting the mountains and supported by the mines is 242,487.

U'ranus, in Grecian mythology, is sometimes the son, but generally the husband, of Gæa, the earth, by whom he became the father of Oceanus, Saturn, the Cyclops, and others. He hated all his children, and confined them in Tartarus; but Cronus, at the instance of his mother, overthrew and dethroned him.

U'ranus. See PLANETS.

Ur'ban, the name of eight popes, of whom the following deserve special mention:—

Ur'ban II., a Frenchman by birth and originally a monk of Cluny, was elected in a council held at Terracina in the year 1088. His name was Otho, and soon after his election he resumed possession of Rome, the fortresses of which had been held by the anti-pope Guibert, styled Clement III., whom he compelled to withdraw. A great council was held in Piancenza in 1095, in which the anti-pope and his adherents were excommunicated; and at the same council the crusade was proclaimed. Urban died in the year 1099, just at the time when the crusade which he had organized terminated in the occupation of Jerusalem.

Ur'ban V. (originally William de Grimoard) was the last of the popes who resided at Avignon, and the one by whom the papal seat was retransferred to Rome. He was elected pope on the death of Innocent VI. in 1362, and died in 1370, leaving behind him the reputation of great piety and zeal for religion and good morals.

Ur'ban VI., whose name was Bartolommeo Prignani, was the pope under whom the great western schism had its origin. On the death of Gregory XI., in 1378, Prignani was elected in a conclave held at Rome under circumstances of great excitement, owing to the apprehensions of the populace that a French pope would be elected and Rome again abandoned. Prignani was crowned under the title of Urban VI., but immediately afterward twelve French cardinals assembled at Anagni and revoked his election, declaring that they had voted for him under fear of violence. They were joined by three Italian cardinals, and then proceeded to elect the cardinal bishop of Cambray pope, under the title of Clement VII. Clement took up his residence at Avignon, but Urban remained at Rome, where he appointed a number of new cardinals, and excommunicated Clement and his adherents. The result was that Urban was recognized as lawful pope by one portion of the church and Clement by the other, each maintaining his claim by extreme measures. Urban was besieged by Charles, king of Naples, at Novara, whence he withdrew to Genoa, taking with him, as prisoners, the cardinals of his party with whom he had quarreled, several of whom he is said to have put to death. He died in 1389, from injuries sustained in a fall from his horse.

Ur'ban VIII., the successor of Gregory XV., whose family name was Maffeo Barberini, was born at Florence, in 1568, and, after many years of service in various capacities, was elected pope in September, 1623. His memory has suffered through the imputation of nepotism; but his pontificate was, on the whole, vigorous and enlightened. He was the founder of the celebrated College of the Propaganda, and to him Rome is indebted for many public works, including large and important additions to the Vatican library. His pontificate was also distinguished by the acquisition of the duchy of Urbino to the Holy See in the year 1626. He died in 1644, and was succeeded by Innocent X.

Urban'a, a town in Champaign county, Illinois, noted as the seat of the University of Illinois, a thoroughly equipped institution of learning, with a large corps of professors and instructors and about 2,000 students in its various departments. Population 5,728.

Urbino (*ŏr-bē'no*), in central Italy, is situated between the rivers Metauro and Foglia, twenty miles southwest of Pesaro. It has a magnificent palace, once the residence of the dukes of Urbino, where was the famous library of the Della Rovere family, afterward removed to the Vatican. Another handsome palace is that of the Albini, a family who gave a pope to the church, under the name of Clement XI. Urbino is the birthplace of Raphael, and became a part of the kingdom of Italy in 1860. Population 8,000.

U'rim and Thum'mim, a mysterious contrivance on the breastplate of the Jewish high priest, either consisting of the four rows of precious stones upon which the names of the twelve tribes were engraved, or of two images personifying — most probably — "Truth" and "Revelation." Others assert that the words personified by these images were "Light"

and "Perfection," and still others that they were "Doctrine" and "Judgment." The consulting of the Urim and Thummim as an oracle was a very solemn ceremony with the Jews, but it is never mentioned after Solomon's time.

Ur'sa Ma'jor. See BEAR, GREATER AND LESSER.

Ur'sa Mi'nor. See BEAR, GREATER AND LESSER.

Ur'sula, St., a female saint and martyr, especially honored in Germany and Cologne, the place of her reputed martyrdom, who is variously assigned to the third, the fourth, and the fifth centuries. According to the legend, she was the daughter of Deonatus, a British king, and on account of her beauty was sought in marriage by the son of a pagan prince. Fearing that she might bring ruin upon her father by a refusal, she consented to marry the prince, but made it a condition that she should be allowed three years, during which she proposed to make a pious pilgrimage in company with her ten maidens, each being accompanied by a thousand other maidens, making 11,000 in all. The maidens were accordingly collected from all parts of the world, and the expedition set sail from the British coast. Arriving at the mouth of the Rhine, they sailed up the river to Cologne, and thence to Basel, where, leaving their galleys, they proceeded by land to visit the tombs of the Apostles at Rome. This pilgrimage accomplished, they returned down the river to Cologne, which had meanwhile fallen into the hands of an army of Huns, under the leadership of a chief, who, although not named, is plainly the Attila of history. Landing at Cologne, in ignorant security, the pious virgins fell into the hands of these barbarians, by whom they were all seized and put to death. A host of angel warriors, however, interposed and smote the cruel Huns; and in gratitude to their martyred intercessors the citizens erected a church on the site now occupied by the Church of St. Ursula.

Ur'sulines, a religious order of females in the Roman Catholic church, taking their name from the saint and martyr who forms the subject of the above article. They take their origin from Angela Merici, who, early in the 16th century, formed at Brescia an association of young women who fully devoted themselves to the care of the sick, the instruction of children, and the relief of the poor. In the year 1565, a house was opened at Cremona and the order spread over several dioceses in Italy. Soon afterward it was established in France, where one of its members was the celebrated sister Madeline St. Beuve. It was in France that the sisters added to their vows the instruction of female children, which has since formed the most marked characteristic of their order.

Uruguay (*ör'ö-gwā*) is a small republic in South America, bounded on the north and northeast by Brazil, on the east and southeast by the Atlantic, on the south by the Rio de la Plata and the Atlantic ocean, and on the west by the Argentine Republic, from which it is separated by the Uruguay river. Its greatest length and greatest breadth are each a little over 300 miles, the total area being 72,210 square miles. The interior of Uruguay is very imperfectly known. In the south the country is a sort of terraced upland, with a treeless coast line possessing some excellent harborage, while the shores facing the Atlantic are low and sandy. The climate is mild; rain falls quite copiously in winter, but is very rare in summer. Agriculture, long in a backward state in spite of the natural richness of the soil, is said to have advanced recently; wheat, maize, tobacco, grapes, and olives being raised. The wealth of the country consists mainly in its pasturage, which supports large herds of cattle, horses, and sheep, the wool of Uruguayan sheep being of a superior quality. Primary education is obligatory. In 1898, there were 887 elementary public and private schools, with 1,959 teachers and 72,242 pupils. The capital, Montevideo, has a university and a national library of over 27,000 volumes. Its population numbers about 266,000. Uruguay was originally settled by Spanish colonists from Buenos Ayres on the other side of the La Plata; but the territory which forms the natural limit of Brazil on the south was claimed by Portugal, and a war ensued between the two nations for its possession, which terminated in favor of Spain. The independence of Uruguay was secured by treaty in the year 1828, but, like most South American republics, it has suffered incessantly from internal discords. Population 895,364.

U'ruguay, a river of South America, rises in southern Brazil, flows westward a little less than 100 miles, and then southward, forming a boundary line between the Argentine Republic on the west, and Brazil and Uruguay on the east, and unites with the Parana to form the La Plata in 34° S. latitude, its total length being about 1,000 miles. Its chief branch is the Rio Negro.

Urumiah (*ö-rö-mē'a*), a town of Persia, situated ten miles west of Lake Urumiah, in a wide and fertile plain, is surrounded with a mud wall, but has no gates. Extensive fruit and vegetable gardens are situated both within and without the walls. The houses of the richer classes are lofty and spacious, and many of those of the poor are adorned with flowers and vines. The city is the seat of a Nestorian bishop and of an American Presbyterian mission, which is in a very prosperous condition. The city is said to have been the birthplace of Zoroaster, founder of the religion of ancient Persia, and has a population of 25,000.

Urumi'ah, the principal lake of Persia, is about 4,000 feet above the level of the sea, and nowhere exceeds 20 or 25 feet in depth. It is about 80 miles in length, with an average width of about 25 miles. Its waters are largely impregnated with salt, and are so heavy as to be little ruffled by the strongest wind. No fish are found in it, although several rivers empty into the lake. Its average depth is only about 12 feet, and it is fast drying up, leaving a gradually widening beach of salty crust, which supplies the whole of Kurdestan with salt.

U'sury. This word originally meant anything charged by the lender of money for its use; but it now refers to any charge above the legal rate. In most, if not all, civilized nations there are laws limiting the rate which lenders of money may charge for its use, with greater or lesser penalties for all charges which go above this limit. In the United States, the laws of the states vary somewhat in this respect, although in all of them a legal rate is established for cases where there is no express contract — six per cent. in nearly all the states — and another limit prescribed — generally eight or ten per cent. — within which contracts may be made by the parties, and beyond which contracts are rendered void, or at least cannot be enforced by law.

U'tah, a state of the United States, bounded on the north by Idaho and Wyoming, on the east by Colorado, on the south by Arizona, and on the west by Nevada. Its greatest length from north to south is a little over 300 miles, and its greatest breadth from east to west is a little less than 300, the total area being about 84,000 square miles. Utah is an immense basin from 4,000 to 5,000 feet above the level of the sea, surrounded by mountains which at some points reach the height of 10,000 or 12,000 feet. This great valley, which includes the state of Nevada, is formed by a branch of the Rocky mountains on the east and the Sierra Nevada on the west. The surface is greatly diversified, containing high mountains, broad valleys of greater or lesser dimensions, and desert plateaus. Near the middle of the northern boundary the Wahsatch mountains enter the territory and extend southward, thus dividing the state into two parts. This is the principal mountain range of the state, and constitutes a sort of watershed from which the streams flow off eastward and westward, the eastward streams to the Colorado of the west and the westward ones to the Great Basin. The surface of the Great Basin presents an alternation of broad, desert valleys and narrow, abrupt mountain ranges rising sharply from the valleys. The lowest portion of the state, which is near the southern border, is less than 3,000 feet above the sea, but there are quite a number of high mountain peaks, among which may be mentioned Mt. Nebo, 11,680 feet in height, LaMotte, 12,892 feet, and Burro, 12,834 feet. Along the northern border of the state extends eastward and westward the Uintah mountain range. South of this range and east of the Wahsatch is a region of plateaus, horizontal or slightly inclined, and receding gradually from the high mountains. The Great Basin in the western part of the state consists of a number of small basins in which the waters from the surrounding mountains sink or collect in a lake, which rises or falls according to the extent of their supply and the extent of their evaporation. The largest of these is Great Salt lake, stretching along the base of the Wahsatch range. The only other bodies of water of considerable magnitude are Bear lake and Utah lake, both fresh, and tributary to Great Salt lake.

Because of the insufficient rainfall, irrigation is resorted to in agriculture, wheat yielding the best crop. The state is rich in minerals, gold, silver, coal, and copper being mined; and many kinds of stone are quarried. The chief manufacturing industry is flour and grist mill products.

In the elementary schools of the state there were, in 1898, 70,965 pupils enrolled with 1,385 teachers; in the high schools, 941 pupils and thirty-four teachers; while the four colleges numbered fifty-nine instructors and 172 students.

The state is well supplied with railroads, the Union Pacific and Central Pacific crossing it near the northern boundary. From Ogden, a branch of the Union Pacific runs northward to Montana and another southward to Salt Lake City, thence to the southern part of the state. In addition to these, there are numerous short branches in the mountains. Utah was settled by the Mormons under Brigham Young in 1847, and was organized as a territory in 1850. From the first organization of the territory there has been some conflict between the Mormon church and the United States government, chiefly on account of polygamy, the various laws passed by congress for the suppression of that institution being either boldly defied by the Mormons, or practically nullified by Mormon officials. The Edmunds bill of 1882 was perhaps the first really efficient legislation on the subject. This measure disfranchised all polygamists, and disqualified from service on juries all persons who accepted the doctrines of the Mormon church in reference to polygamy. Another bill passed by congress annulled all acts of the territorial legislature designed in any manner for the protection of polygamy, and contained many other radical provisions for the suppression of the institution. These measures of congress, together with the constant increase of the "Gentile" population throughout the territory, give good reason to hope that the day is not far distant when this blot upon American civilization will be entirely removed. Utah was admitted to the

Union Jan. 4, 1896. Population in 1900, 276,749; that of Salt Lake City, its capital, 53,531.

U'tahs or U'tes, a tribe of Indians formerly roaming over Utah, Colorado, and New Mexico, but now occupying reservations in Utah and Colorado. Their number is about 5,000.

U'tica, an ancient city of Africa, near the bay of Carthage, and a short distance from the city of Tunis. The Tyrians are said to have founded it 287 years before Carthage was built. It was an ally of Carthage in her early wars with Rome. But in the third Punic war, Utica made an early and separate submission to Rome, and, when Carthage fell, was rewarded with a part of her territory, and the Roman governor made his residence there. In the accounts of the struggles between Sulla and Marius and between Cæsar and Pompey, it is often referred to as an important city. It had an amphitheatre, which would seat 20,000 people, and an artificial lake on which mimic sea battles were fought. Its water supplies were stored in many immense cisterns, some of which remaining are 136 feet long, 19 feet wide, and 20 or 30 feet deep. Augustus made it a free city. The Vandals conquered it in 439, then the Byzantine emperors recovered and held it till the 8th century, when the Arabs conquered and destroyed it.

U'tica, a city of New York on the Mohawk river, about 85 miles from Albany and 45 miles from Syracuse. The city is regularly and handsomely built, and rises from the south bank of the river to an elevation of 150 feet. One of the lunatic asylums of the state is located here, together with a number of other benevolent and charitable institutions. The manufactures of the city amount to several millions annually, and comprise a great variety of products. The annual cost of maintaining the public schools is $168,231; the number of teachers employed is 231; and there are 8,875 pupils enrolled. At the period of the Revolutionary war, Utica was a frontier trading post, and was also the site of Fort Schuyler, built to guard a settlement against the French and Indians. Population 56,383.

Uto'pia is the name given by Sir Thomas More to the imaginary island which he makes the scene of his work, entitled *Utopia* (from the Greek meaning "nowhere"), first published in Latin in 1516, and translated into English by Bishop Burnet. This island, which More represents as having been discovered by a companion of Amerigo Vespucci, is the abode of a happy society, free from all the cares, anxieties, and miseries of mankind. In this community all property belonged to the government, no private ownership being allowed; and the wants of all persons were supplied from the common stock. More's work, which is still published, attained a great popularity, and the epithet Utopian is still applied to all plans for the improvement of society that are deemed visionary and impracticable. A counterpart to More's work is found in a production of the present day, entitled *Looking Backward*, by the late Edward Bellamy.

Utrecht (*u'trekt*), a city of the Netherlands, capital of the province of Utrecht, is beautifully situated in a district of rich, grassy meadows, extensive orchards, flower gardens, and cultivated fields. It is favorably situated for trade, being the point from which several railroads radiate, and having excellent water communication by way of the old Rhine and the Vecht. Utrecht is one of the oldest cities of the Netherlands, and was probably founded by the Romans. It was here that the union of the northern provinces for the defense of their political and religious freedom against the tyranny of Spain was formed, Jan. 23, 1579. Population, 102,040.

U'trecht, Treaty of. The above-named city is chiefly noted for the treaty or treaties of peace concluded in the year 1713 between France and the allied powers — England, Austria, etc. — after the ten years' war relating to the Spanish succession. See Macaulay's essay reviewing Lord Mahon's *History of the War of the Succession in Spain.*

V

Vaccination (*vak'sĭ-nā'shŭn*) is the process by which the disease termed *vaccinia* or cowpox, from the Latin word *vacca*, "a cow," is introduced into the human system to protect it against the attack of the more severe disease of smallpox. In his *Inquiry into the Causes and Effects of the Variolæ Vaccinæ*, Jenner, the discoverer of this remarkable remedy, establishes the following facts: (1) That this disease when communicated to man is a sure protection from smallpox; (2) that the cowpox alone, and not other eruptions affecting the cow, which might be confounded with it, has this power of protection; (3) that the cowpox may be communicated at will from the cow to man by the hand of the surgeon; and (4) that the cowpox once ingrafted on the human subject may be transferred from person to person, giving each one the same immunity from smallpox as was enjoyed by the person infected directly from the cow.

Vacuum (*vāk'ū-ŭm*), the region in a closed vessel from which the air has been largely removed. To completely remove all gases from a closed vessel is impossible. To obtain a complete vacuum appears therefore to be a hopeless task. With an ordinary air pump, in good working condition, one may produce a vacuum in which the pressure is not more than two or three millimeters of mercury. But by means of a mercury pump one may easily exhaust a vessel until its pressure is only one-millionth that of the atmosphere. If, however, elaborate precautions are taken with a Sprengel pump, a vacuum of only one hundred-millionth that of the atmosphere may be obtained. See AIR PUMP, and read Kimball's *Physical Properties of Gases* (Houghton, Mifflin & Co., 1890), chap. v.

Valen'cia, an ancient city and seaport of Spain, and formerly its capital, stands on the shores of the Mediterranean, 300 miles by rail from Madrid. The Huerta, thirty-five square miles in extent, which surrounds the city resembles an immense orchard, and is watered by an intricate network of pipes and rivulets laid down by the Moors 800 years ago, and answering its purpose down to the present day. There are numerous picture galleries in the city, in the chief of which only the productions of the great Valencian school are to be seen. There is a museum, a botanical garden, and a fine old cathedral. The university, with its library of 50,000 volumes, has 39 professors and 1,728 students. The customhouse, dating from 1758, is now the cigar factory, which employs more than 3,000 persons and produces 120,000 pounds of tobacco yearly. Valencia is connected with Madrid by rail and is a famous summer resort of the more prosperous classes. Population 204,768.

Valen'cia, a town of Venezuela, South America, in the province of Caracas, two miles east of Lake Valencia. The city is situated in an exceedingly fertile district, in which cattle and horses are raised in great numbers. Population 40,000.

Val'entine, Basil, a celebrated German alchemist of whom so little is known that it is even disputed whether he lived in the 12th or in the 13th century. It has been maintained that he was a monk of the order of St. Benedict in St. Peter's convent at Erfurth; but his name does not appear on the Erfurth list, nor on the general lists at Rome. His works were mostly written in the old Upper-Saxon dialect, and were not printed until 1602, after which many of them were published in the form of French translations.

Val'entine or **Valenti'nus,** presbyter and martyr, according to the Roman legend, was arrested and thrown into chains at the instance of the Emperor Claudius about the year 270 A. D. He was handed over to Calphurnius, who employed one Asterius to win him back to idolatry, but instead of this, Asterius was won over to the Christian faith on account of the healing of his blind daughter by Valentine. The saint was kept in prison for a long time, but was finally beheaded. The custom of sending valentines is the survival of a practice connected with the worship of Juno on or about Feb. 14, and its association with this saint is purely accidental.

Valentin'ian I., emperor of the Western Roman empire from 364 to 375 A. D. As a military officer under Julian and Jovian, he rose to a high position, and on the death of Jovian was chosen emperor by the officers of the army at Nicæa. Soon after this he named his brother Valeus as his colleague, and the two brothers divided the empire between them, Valentinian, as emperor of the West, taking Italy, Illyricum, Spain, Britain, Gaul, and Africa. During Valentinian's reign there were wars in Africa and Germany, and Rome also came into collision with peoples of whom we now hear for the first time — Burgundians, Saxons, and Alemanni. The emperor's headquarters were at Treves during the greater portion of his reign. His general administration was wise and able, and in many respects beneficent. Although hard and exacting in the collection of taxes from his people, the money was spent in defending and improving his dominions, and not in idle show or luxury. He died in a fit of apoplexy in the year 375, and was succeeded by his two sons, Gratian and Valentinian II.

Valentin'ian II., an infant four years of age, and his half-brother Gratian, a lad of seventeen, became joint emperors of the Western Roman empire in 375 A. D. They made Milan their residence, while the empire was at least nominally divided between them, Valentinian taking Italy and a part of Africa. Gratian died in the year 383, and four years later Maximus, who had commanded a Roman army in Britain, crossed the Alps into the valley of the Po, and threatened Milan. The emperor and his mother Justina fled to Theodosius, emperor of the East, and besought his assistance, and in accordance with their request Theodosius marched into Italy with an army, defeated Maximus, and again set Valentinian on the throne. He was assassinated in 392 A. D.

Valentin'ian III., grandson of Theodosius the Great, was declared emperor of the West in the year 425 A. D. His reign of thirty years was a period of great and terrible events, associated with the names of Attila, Genseric, and Ætius, "the last of the Romans." Valentinian's usual residence was at Ravenna; but he fled to Rome in the year 452 on the approach of Attila, who, after ravaging Italy, died in the following year. In 454, Ætius, who had won the great victory over Attila at Chalons in the year 451, and who alone could have saved Rome from the destruction which hung over her, was treacherously murdered by Valentinian; and the next year the crime was avenged by the murder of the emperor himself while he was viewing some games in the Campus Martius. With the death of Valentinian the family of Theodosius became extinct.

Valenti'nus was the most important Christian theologian before Origen. He sought to combine the results of Greek philosophy with the doctrines of the Gospel, and treated the manifestation of Jesus as the keystone in the structure of thought which Greek science had reared. He may be regarded as superior to Philo in many respects, and as having surpassed Origen in delicacy of perception and vigor of style, although he was far behind him in the extent of his learning. He came to Rome from Egypt about 138 A. D., and died about 160.

Valet'ta, an important fortress and beautiful city, capital of the island of Malta. The city was founded by John Parisot de la Valette, who so gallantly defended the island of Malta against the Turkish fleet in 1565. Alone and unsupported by any of the Christian powers, La Valette held the island under circumstances of great difficulty and distress; and at the end of four months the Turks were compelled to withdraw, after suffering a loss of several thousand men. The city contains many relics of the occupation by the Knights of Malta. Population 38,000.

Valhalla (*văl-hăl'la*), in Scandinavian mythology, the "hall of the slain"—the abode of Odin in Asgard, the palace of Immortality, inhabited by the souls of heroes slain in battle. In the old Norse or Viking era, the *Eddas* relate, Odin and his chiefs dwelt in a sort of Olympus (Asgard)—the Norse Pantheon—which had two mansions, Gladsheim for the gods, and Vingolf for the goddesses. There also was Walhalla, wherein Odin placed one-half of the heroes slain in battle, the other half being received by Freija, the wife of Odin, who presided over smiling nature, sending sunshine, rain, and harvest. The roof of Valhalla was resplendent with gold; spears, shields, and armor adorned its walls. Out of this abode rode forth Valkyrs (or choosers of the slain) on invisible horses, to the battles of men on earth, and with their spears pointed out the heroes who should fall, whom they caught as they fell and bore to Valhalla in their arms. Troops of these invisible horsemen issued daily to engage in combat and return at night to be entertained with the never-ending hospitality of Odin. See the Norse prose *Edda*. Figuratively, Valhalla (or Walhalla) has come to mean a hall or temple, adorned with statues and memorials of a nation's great ones, especially its soldier heroes.

Valladolid (*văl-yă-dō-lēd'*), a famous city of Spain, at one time capital of the whole country, and still capital of the province of Valladolid, stands on the left bank of the Pisuerga, 150 miles northwest of Madrid by railway. It is 2,000 feet above the level of the sea, and has a healthful climate, the air being pure and genial and the sky generally cloudless. As Valladolid was the residence of the court prior to its removal to Madrid in the 16th century, it contains many large and decayed dwellings, although many new mansions have been erected and the streets have been paved, enlarged, and multiplied. There is a noted university, founded in 1346, a palace, and an unfinished cathedral. Here Ferdinand and Isabella were married and here Columbus died. The city communicates with the Atlantic ocean by the Douro, and with various portions of Spain by canal and railway. Population 68,746.

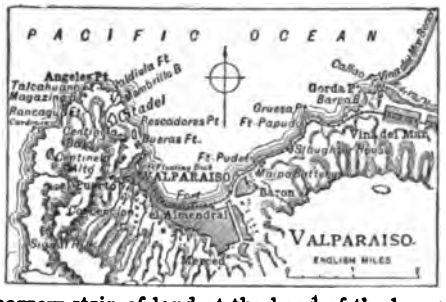
Val'ladolid', a town of Mexico, in the state of Yucatan, ninety miles southeast of Merida, stands in the midst of a highly cultivated tract of country. It is the best-constructed and healthiest town in Yucatan, and is the seat of cotton manufactures. Population 25,010.

Vallombro'sa, a celebrated abbey of Tuscany, situated among the Apennines in a valley surrounded with forests of fir, beech, and chestnut trees. Here an order of Benedictine monks was founded about the middle of the 11th century, who were called Vallombrosians, from the name of the site. This

monastery was suppressed in 1863, and its buildings used for a royal academy of forestry, but it is still much visited by artists and tourists.

Valois (*văl-wä'*), **House of,** a branch of the Capetian dynasty, which occupied the throne of France from 1328 to 1589, when it was succeeded by the house of Bourbon. It comprised the following princes: Philip VI. (1328–50), John the Good (1350–64), Charles V. (1364–80), Charles VI. (1380–1422), Charles VII. (1422–61), Louis XI. (1461–83), Charles VIII. (1483–98), Louis XII. (1498–1515), Francis I. (1515–47), Henry II. (1547–59), Francis II. (1559–60), Charles IX. (1560–74), Henry III. (1574–89). The Valois monarchs of the early line were generally able rulers, who, by valor and wise policy, resisted the invasions of the English and firmly established the royal authority over their nobility; but those of the later lines, with the single exception of Francis I., were weak and feeble princes, under whose rule the country was distracted by contests between the nobles, and by religious dissensions among the people at large, and only saved from greater calamities by the ability of the ministers of the crown, upon whom the government of the country devolved.

Valparaiso (*văl-pä-rī'sō*), the most important commercial town of Chile, South America, is situated nearly a hundred miles from Santiago, the capital, with which it is connected by railway. It is chiefly built on a



narrow strip of land at the head of the bay of Valparaiso. The town was nearly destroyed by an earthquake in 1822, and although it has been visited by a similar calamity a number of times since, its population has increased from 10,000 in 1825 to 143,022 in 1899.

Vam'bery, Arminius, a distinguished Hungarian traveler, and professor of Oriental languages at Budapest, was born in 1832. He has traveled widely in Persia and Central Asia, and published many works narrating his wanderings in Persia, in India, in Bokhara, and in Central Asia.

Vam'pire, according to a superstitious belief, which still prevails in some European countries, a ghost which comes out of the grave at night and sucks the blood of men and women. In the mythology of the ancient Greeks, beings of a similar nature existed, called the Lamias. These were beautiful women who allured youths to their embrace in order to feed on their flesh and blood. During the middle ages there was a prevailing belief that all persons who died under the ban of the church were sent forth by the devil at night to destroy other people; and it was thought that the only way to escape these vampires was by digging up their unwashed corpses and burying them.

Van, a fortified town of Turkey in Asia, stands near the southeast shore of lake Van, 140 miles from Erzrum. It is overlooked by a citadel now much dilapidated, but which from its lofty height could easily be rendered almost impregnable. The principal public buildings, in addition to the citadel, are the mosques, the Armenian churches, the caravansaries, and the bazaars. Van contains numerous ancient ruins, and cuneal inscriptions are found in which the name of Xerxes frequently occurs. Population 30,000. The lake of Van is an inland sea, 80 miles in length and 50 miles in extreme breadth. It is fed by about eight streams, and has no visible outlet. Its waters are salt, and the only fish caught are a kind of sardines, which are salted and exported throughout Asia Minor.

Van Bu'ren, Martin, eighth President of the United States, was born at Kinderhook, N. Y., Dec. 5, 1782. He commenced the practice of law at a very early age, and was elected to the New York state senate in 1812. After filling a number of other offices and taking an active part in the politics of the state, in 1821 he was chosen United States senator. He served a term of six years in that capacity, and was then chosen governor of New York. When General Jackson became President, in 1829, Mr. Van Buren was appointed secretary of state, but he resigned the office in 1831 in order to accept the position of minister to England. This appointment being made during the recess of congress, Mr. Van Buren proceeded to England, but as the senate refused to confirm the appointment he returned home soon after. This rejection by the senate probably caused his nomination and election to the office of Vice-president in 1832, General Jackson being re-elected President at the same time. In 1836, he was elected President of the United States, receiving 170 electoral votes out of 283; but although nominated for a second term by his party in 1840, he was overwhelmingly defeated by Gen.

MARTIN VAN BUREN.

William Henry Harrison, the electoral vote standing: Harrison, 234; Van Buren, 60. Mr. Van Buren was brought before the Democratic national convention of 1844 as a candidate, but his nomination was prevented by the adoption of the rule requiring a vote of two-thirds of the delegates to secure a nomination. In 1848, he was the candidate of the Free Soil party, but received no electoral votes. He died at Kinderhook, where the remainder of his life was passed, July 24, 1862.

Vancouver (*văn-kō'ver*) **Island,** a colony of Great Britain in the Pacific ocean, in lati-

tude 48°–51°. It is a little less than 300 miles in length with an average breadth of 30 to 50 miles; total area about 16,000 square miles. The main part of the island is a mountain ridge, which rises in its highest peak, Mt. Arrowsmith, to the height of 6,000 feet; but there are many undulating tracts along the coasts, thickly wooded in general, but containing here and there patches of open grassland. The shores are marked by abrupt, rocky cliffs and sheltered coves with fine harbors. There are no navigable rivers, and the streams, which are torrents in winter, are nearly dry in summer, being valuable only as power for grist and saw mills. The ocean that encircles its shores is of a remarkably low temperature throughout the year, owing to the Arctic currents that sweep along the coast, although the westerly winds blowing over the sea water modify the climate of the island considerably. Only a small portion of the island is suitable for agriculture, four-fifths being little better than barren rock. Victoria, the chief city of the island and the capital of British Columbia, has 20,821 inhabitants, while the population of the whole island is about 36,000. The western terminus of the Canadian Pacific railway is on the mainland opposite, thus bringing the island into direct communication with the Atlantic coast. Vancouver island was discovered by Spaniards in 1774, but was explored in 1792 by Captain Vancouver, an officer in the British navy, its possession secured to Great Britain by treaty in 1846, and in 1866 it was united with British Columbia. The town of Vancouver is a busy seaport, and has a population of 26,196.

Vandals, a race of European barbarians who contributed very largely to the overthrow of the Roman empire. They made their first appearance as an historic people in the 2d century A. D., and in the first part of the 5th century in company with the Suevi, Alani, and other German tribes invaded Gaul and ravaged and wasted it for three or more years. In the year 429 A. D., they crossed the strait of Gibraltar 50,000 to 80,000 strong under their leader Genseric, and carried devastation and ruin over northern Africa from the shores of the Atlantic to the frontiers of Cyrene. In 439, Genseric broke the peace which he had concluded with Valentintian III. and conquered Carthage, when a new peace was concluded which recognized the authority of the Vandals over northern Africa, and also over Sardinia, Corsica, and part of Italy. In 455, the Vandals captured Rome and plundered it for several days. The manner in which they mutilated and destroyed the works of art collected in the city has caused the term vandalism to be applied to all similar acts of barbarity. After the death of Genseric, his son Hunneric cruelly persecuted the Catholics and kept the Mediterranean in a state of almost constant alarm by his piracies. The Vandals continued to occupy northern Africa until 533, when the Emperor Justianian sent an expedition against them under the great general, Belisarius, with the result that they were completely conquered, and their chieftain, Gelimer, was captured and carried to Constantinople in triumph. Most of the Vandals were then drafted into the Roman army and "used up" in the wars with Persia, the few who remained in Africa rapidly disappearing among the natives.

Van'derbilt, Cornelius (commonly called "Commodore Vanderbilt"), was born on Staten island, May 27, 1794. At the early age of sixteen he showed signs of his genius and enterprise by running a boat of his own between New York and the island, and at twenty-three had accumulated nearly $10,000. In the year 1817, he associated himself with Thomas Gibbons in running the first steamer between New York and New Brunswick, N. J., serving as captain for several years. In 1829, he withdrew from the management of Gibbons' steamers, and for more than twenty years afterward built and operated steamers of his own from New York to various points, all of which proved very profitable. In 1851, he established a line from New York to San Francisco, which he sold to a company of which he himself became president two years later. During the Civil war he presented the government with his finest steamship, *The Vanderbilt*, which cost nearly $1,000,000, and about the close of the war withdrew his capital — amounting to many millions — from

steamships and invested it in the stock of various railroads. He soon had control of the New York Central, the Harlem, the Erie, and other roads, all of which he conducted with consummate ability and made more and more profitable. In 1873, he gave $1,000,000 to the endowment of Vanderbilt university, at Nashville, Tenn., for the education of southern youth. He died at his home in New York, Jan. 4, 1877, having bequeathed the bulk of his estate to his son, William H. Vanderbilt.

Vanderlyn (*văn'der-lin*), **John,** an American painter, was born at Kingston, N. Y., October 15, 1776, and after taking lessons in painting from Gilbert Stuart, visited Paris at the age of twenty and studied his art in that city for a number of years. He returned home in 1801, but in 1803 made another journey to Europe, where he remained till 1815. Among his works executed while in Europe were, *The Murder of Jane McCrea by the Indians* and *Marius sitting among the Ruins of Carthage.* His *Landing of Columbus* can be seen in the rotunda of the national capitol, and his portrait of *Washington* in the hall of the house of representatives. He died at Kingston, N. Y., Sept. 23, 1852.

Van Die'men's Land. See TASMAN'IA.

Van Dyke, or **Van Dyck,** Sir **Anthony,** was born at Antwerp, March 22, 1599. It is said that his talent for painting was fostered by his mother, who painted landscapes and was highly skilled in embroidery. After making considerable progress under Van Balen, he became a pupil of Rubens at the age of sixteen, who was not slow to discover his remarkable genius. In 1621, by advice of Rubens he visited Italy, remaining there five years. In 1632, he came to England on the invitation of the earl of Arundel, where a pension of $1,000 a year was settled on him. He died at London in the year 1641, leaving property to the amount of $100,000. It was only twenty years from the time when Van Dyke left the studio of Rubens until his death; and in that short period nearly 1,000 pictures of various kinds were executed by him. His best known works are representations of the crucifixion.

SIR ANTHONY VAN DYKE.

Van Dyke, The Rev'd. **Henry Jackson,** D.D., LL.D., American author and preacher, was born at Germantown, Pa., Nov. 10, 1852, and graduated at the Brooklyn Polytechnic institution, and Princeton college and Theological seminary. After taking a post graduate course at Berlin university he entered the ministry and held the charges successively of the United Congregational church at Newport, R. I., and of the Brick Presbyterian church, New York. The latter charge he resigned in 1899, to accept the Murray chair of English literature at Princeton university. In 1889 he was appointed preacher to Harvard university, and in 1893 delivered the Lyman Beecher lectures on preaching at Yale. He also delivered a memorial ode at the 150th anniversary of Princeton university, of which he is a trustee. He has been a contributor to many of the contemporary magazines and taken active part in religious work among the colleges. His writings embrace *The Poetry of Tennyson, The Reality of Religion, The Story of the Psalms, The Christ-Child in Art, Ships and Havens, The Lost Word, The Gospel for an Age of Doubt, Little Rivers, The First Christmas Tree, The Builders and Other Poems, Straight Sermons to Young Men, The Toiling of Felix and Other Poems, Fisherman's Luck and Some Other Uncertain Things,* and *The Ruling Passion.*

Vane, Sir **Henry,** was born at London in 1612, and was educated at Oxford, where he appears to have embraced the republican principles for which he became so famous. His travels in France and Switzerland strongly confirmed him in his opposition to the Church of England; and in 1635 he sailed for New England — the refuge of disaffected spirits in those days. He was chosen governor of Massachusetts, but his supposed heretical opinions soon destroyed his popularity among the Puritan settlers, and after a residence of a year or two in the new colony he returned home and entered upon a political career. When the war between Charles I. and the parliament broke out, no man was more active among the leaders of parliament than Vane. In 1646, Vane was one of the English commissioners for the preservation of peace with Scotland, and in 1648 was appointed to negotiate with Charles I. at the Isle of Wight. But he did not view with satisfaction the increasing power of Cromwell and the army, and was strongly opposed to the execution of the king. His views as to the rights and powers of parliament brought him into pretty sharp conflict with Cromwell, who is said to have exclaimed, when he dissolved his parliament in 1653, "The Lord deliver me from Sir Harry Vane!" When the restoration of Charles II. took place, Vane was one of the twenty persons exempted from the act of general amnesty; and in July, 1660, he was arrested and committed to the Tower. Two years later he was brought to trial at London, and although he defended himself with great ability and eloquence was found guilty and condemned to death. In response to a petition that Vane's life should be spared, Charles

wrote to Clarendon, declaring that he is "too dangerous a man to let live, if we can honestly put him out of the way." He was accordingly beheaded June 14, 1662.

Van Horne, Sir **Wm. Cornelius,** K. C. M. G., president of the Canadian Pacific railroad since 1888, was born in Will county, Ill., Feb. 3, 1843, and entered railway service in 1857. After filling various junior posts, he rose to be general superintendent of the Chicago and Alton, and subsequently of the Chicago, Milwaukee and St. Paul railroads. In 1884, he became general manager of the Canadian Pacific railroad, and in 1888 was elected to the presidency of the road. He was knighted in 1894.

Vanil'la, the generic as well as the common name of plants which yield the aromatic extract of commerce. The genus is a member of the orchid family, and is native to Mexico and Brazil, and is cultivated in various tropical countries. The aromatic extract is obtained from the long pods, known as vanilla beans, and their seeds.

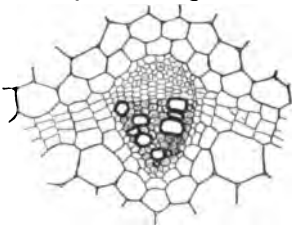
VANILLA.

Van Rensselaer (*van ren'se-ler*), **Stephen,** known as "the Patroon," an American statesman, was born at New York, Nov. 1, 1765. He was educated at Princeton and Harvard colleges, and married a daughter of Gen. Philip Schuyler, a distinguished officer of the Revolutionary war. He early gave his attention to politics, and in 1795 was elected to the New York legislature, afterward becoming lieutenant-governor and canal commissioner. At the beginning of the War of 1812, he was in command of the state militia, and led the assault on Queenston; but the refusal of a portion of his troops to cross the Niagara river enabled the British to repel the attack, and Van Rensselaer retired from the service in disgust. At his own cost he employed Professors Eaton and Hitchcock to make geological surveys of a large portion of New York and New England; he also employed Professor Eaton to deliver geological lectures throughout the state. In 1824, he established at Troy an institution for the education of teachers, with free pupils from every county in the state. About this time also he entered the lower house of congress and served several terms in that body with honor and distinction. He died at Albany, N. Y., Jan. 26, 1839.

Var'nish, a solution of some resinous material in any proper solvent, alcohol and oils being the ones chiefly employed. The solution must be of such a consistency as to be thinly and smoothly spread over the surface intended to be varnished, so that when it dries it will leave a thin resinous coating, which is either glossy or can be made so by mechanical polishing.

Var'ro, Mar'cus Teren'tius, "the most learned of the Romans," was born at the Sabine town of Reate, 116 B. C., and received his education first under Præconinus and then under Antiochus, a philosopher of the academy. He served with distinction against Mithridates, king of Pontus, and also against the Mediterranean pirates, but afterward, as legate of Pompey in Spain, he was compelled to surrender his forces to Julius Cæsar. He continued to share the fortunes of Pompey till after his defeat at Pharsalia, when he was pardoned by Cæsar, and employed by him to collect and arrange the great library designed for the public. When the second triumvirate was formed by Anthony, Lepidus, and Octavian, his name was on the list of the proscribed, but, after some time spent in concealment, he was received under the protection of Octavian, and the rest of his life was spent in the prosecution of his studies. He died in the year 28 B. C. Varro was not only the most learned of the Romans, but the most prolific Roman author. He himself confesses to have written no less than 490 books; but only two have survived, and one of these in a fragmentary state.

Vas'cular Bundles (in plants), often called "woody bundles." They form the great conducting systems of fern-plants and seed-plants, by means of which water with whatever it contains in solution passes from the roots which absorb it to the leaves which use it; and by which elaborated materials pass to points of use and storage. The movement of water from roots to leaves is commonly spoken of as the "ascent of sap" (but see Water, Ascent of). This great conducting system, composed of vascular bundles, is found only in fern-plants and seed-plants, which are often called "vascular plants," to distinguish them from moss-plants and thallus-plants, which do not possess vascular bundles. Each bundle consists of two distinct regions: (1) "xylem" or wood, that which contains the tracheæ or tracheids (see both); and (2) "phloem" or bast, that which contains the sieve vessels (which see). The xylem is concerned in the water conduction, and the phloem in food conduction. In an ordinary tree the whole wood mass is an aggregate of



A COLLATERAL VASCULAR BUNDLE.

xylem tissue, while the fibrous inner bark is the phloem tissue (see BARK). Different types of bundles are distinguished by the arrangement of their xylem and phloem masses with reference to one another. Those bundles, in which the xylem and phloem lie side by side on the same radius, the phloem always being on the outside, are called "collateral bundles," and are characteristic of the stems of seed-plants. Those in which the xylem is completely surrounded by the phloem are "concentric bundles," and are characteristic of the stems of fern-plants. Those in which the xylem and phloem alternate with each other around a common center are "radial bundles" and are characteristic of all roots.

Vas'sar College, founded by Matthew Vassar, the first well equipped institution for the higher education of women, is two miles east of Poughkeepsie, N. Y. It was incorporated in 1861 and opened in 1865. In the same year Mr. Vassar transferred to the trustees a farm of 200 acres, on which the college was to be built, and other property, the whole amounting to $400,000 in value. He increased this sum by other large gifts during his lifetime, and on his death bequeathed $400,000 more.

In accordance with the wish of Mr. Vassar, some of the instructors are men and some are women. The buildings are the main building, modeled after the Tuileries, observatory, laboratory, museum, conservatory, gate-lodge, gas works, boiler and pump houses, and farm buildings. The library contains 30,000 volumes, and the gymnasium, observatory, and laboratory are finely equipped, while the conservatory was added for assistance in the study of botany. There are 210 acres in the grounds, forming a beautiful park, with a lake for boating and skating. Besides the regular course for the degree of A.B., admission to which requires the same examinations as entrance to the leading colleges, there are schools of painting and music. In 1898, there were 60 instructors and 614 students; and the college is steadily growing in size and in influence.

Vas'sar, Matthew, American philanthropist and founder of Vassar college, was born in Norfolk county, England, April 29, 1792, and four years later accompanied his father to America, where he settled on a farm near Poughkeepsie, N. Y., his father establishing a brewery in that city. Young Vassar subsequently succeeding his father in this interest, he decided in 1845 to apply a portion of the profits derived from it to the endowment of a school for the higher education of women. This purpose he put into effect in 1861, by donating $400,000 to the institution in Poughkeepsie that became known as Vassar college. The success of the institution was gratifying and immediate. On Matthew Vassar's death, in June, 1868, he provided in his will for a further donation of $400,000 to Vassar. The institution has been since enriched by large sums donated to it by the nephews of Matthew Vassar, and to the endowing of memorial chairs, aiding the Literary and Scientific institute attached to the college, to the Vassar Brothers' hospital, and to the Home for Aged Men in Poughkeepsie. See VASSAR COLLEGE, above.

Vatican (*vat'i-kan*), the residence of the pope and the seat of the great library, museums, and collections of art, ancient and modern, which constitute one of the chief attractions of Rome for all visitors. Although the earlier popes had a residence in the Vatican, it is probable that no part of the present edifice is older than the pontificate of Nicholas V., who in the 15th century began the plan of improvement and embellishment of the Vatican which has made it the noblest of princely residences. Alexander VI., Julius II., and, above all, Leo X., pursued the same plan; and nearly all the succeeding popes have had some share in the enlarging of the building. Amid all the difficulties, financial and political, of his pontificate, Pius IX. made numerous improvements to the palace, the most striking being the great stair by which it is approached from the colonnade of St. Peter's. The building with its garden and appurtenances is said to cover a space equal to the whole area of the city of Turin, such as it was thirty years ago, with its 130,000 inhabitants. It contains several thousand separate rooms or apartments, some of them of unrivaled beauty and elegance. Among these may be specially mentioned the chapel of San Lorenzo, the Pauline chapel, the Sistine chapel, decorated in frescoes from the brush of Michael Angelo, the galleries and halls decorated by Raphael, Giulio Romano, and their scholars, the magnificent library, the galleries of antiquities, Christian and pagan, and of paintings, statuary, bronzes, medals, vases, and other objects of art.

Vat'ican, Council of, the great ecumenical council of the Catholic church in the years 1869–70, at which the doctrine of papal infallibility was formally promulgated. This council, composed of Roman Catholic prelates — some seven hundred and fifty in number — from all parts of the world, convened in the Vatican palace Dec. 8, 1869, and closed its deliberations Oct. 20, 1870, when this dogma was adopted by a practically unanimous vote. As formulated at the council, it contains the following propositions: (1) That a proper primacy or jurisdiction over the whole church was conferred on St. Peter directly, and not mediately through any delegation authorized by the church as a whole; (2) that this primacy rests by divine institution in the line of Roman pontiffs as St. Peter's successors; (3) that the pope's jurisdiction is immediate in all churches, all other bishops being merely his curates and deputies; so that not only on questions of faith and morals, but on questions of discipline and order, the entire church, both

priests and laymen, are bound to submit to his authority; (4) that it is unlawful to appeal from the pope to an ecumenical council as a higher authority; (5) that the pope, when he speaks *officially* and defines a doctrine of faith or morals to be held by the universal church, is infallible, and his utterances are not to be modified or changed.

Vaudois (*vō'dwä*). See WALDEN'SES.

Vaughan (*vawn* or *vau'un*), Cardinal **Herbert,** English Roman Catholic prelate, and the successor of Cardinal Manning as archbishop of Westminster, was born at Gloucester, England, April 15, 1832, and received his education at Stonyhurst college and at Rome. He was ordained a priest at Lucca in 1854, and returning to England he joined the Oblates of St. Charles, at Bayswater. He then became vice-president of St. Edmund's college, near Ware, and in 1869 founded and became president of St. Joseph's Foreign Missionary college, Middlesex, and three years later accompanied to Maryland a detachment of priests on a special mission to the colored people of the United States. In 1872, he was consecrated to the bishopric of Salford, and twenty years later was transferred to the see of Westminster. In 1893, he was created a cardinal of Rome, and two years later he laid the foundation stone of Westminster (R. C.) cathedral, a vast and stately edifice, in the Byzantine style, erected in London. In 1897, the cardinal took part in the celebration by the Roman Catholics of England of the 13th centenary of the landing of St. Augustine in Britain.

Vault, an arched roof, usually constructed of stone or brickwork. The simplest kind of vault is the semicircular arch extending from one end of an apartment to the other. Ordinary bridges are an example of this style of vaulting, which was commonly used by the Romans, who also built vaults with groins, that is, vaults intersecting one another. The Egyptians are also said to have been acquainted with vaulting; but the earliest remains of ancient vaults of any magnitude are among the Romans. The Roman vaults when groined were usually constructed with carefully cut stone so as to prevent the angle from chipping; but the mediæval architects had not the costly materials or skill of the Romans at command, so they formed only the groins of dressed stone, and filled in the vault with more common material. This led to the groins becoming a prominent feature in mediæval architecture, moldings and carvings being used for ornamentation. In modern architecture, vaults and arches are gradually being superseded by the use of iron constructions, both for roofs and for supporting floors, bridges, etc.

Vauxhall (*vaks-hâl'*), a famous public garden in London, established immediately after the Restoration in 1660, and continuing for nearly two centuries. It was situated in Lambeth, opposite Milbank, and near the manor called Fulke's hall, from which it derived the name of Vauxhall. The loose character of the amusements it afforded is freely sketched by the novelists and dramatists of the last century, and is further sketched in Thackeray's *Vanity Fair.*

Vec'tor is a term employed by mathematicians to denote a directed magnitude, that is, a quantity which has both direction and magnitude.

As examples of vector quantities may be mentioned, the distance between any two given points, a velocity, a force, an acceleration, angular velocity, intensity of magnetization, flux of heat.

Quantities such as a quart of water, a pound of sugar, temperature, a quantity of energy, which do not have direction, are called *Scalars.* See Maxwell's *Matter and Motion,* and **Tait's** *Newton's Laws of Motion.*

Veda (*vā'dä* or *vē'dä*), (literally, *knowledge*) is the name of those ancient Sanskrit works on which the first period of the religious belief of the Hindus is based. The oldest of these works is the *Rigveda;* next to it stand the *Yajurveda* and *Samaveda;* the fourth and latest being the *Atharvaveda.* The first three bear the collective title of *Trayi,* "the threefold," and all four are considered of divine origin. Each of these vedas consists of two distinct divisions—a *Sanhita* or collection of *mantras,* or hymns, and a portion called *Brahmana.* A *mantra* may be defined as a prayer or thanksgiving addressed to a deity in one form or another. If such a *mantra* is metrical and intended for loud recitation, it is called *Rich,* from *rich,* "praise"—whence the name *Rigveda;* if it is in prose it is called *Yajus,* from *yaj,* "sacrifice,"—therefore *Yajurveda* signifies the Veda containing such sacrifices. And if it is metrical and intended for chanting, it is termed *Saman*—hence *Samaveda* means the Veda containing such *Samans.* No special name is given to the *mantras* of the fourth Veda. Though the *mantras* and *Brahmanas* are both said to have existed from all eternity, there is abundant evidence that the *Brahmana* portion of each Veda was written some time after its *mantras,* for it refers to them, and it seems almost self-evident that both portions must have been the work of considerable time.

Ved'der, Eli'hu, an American painter, was born at New York city, Feb. 26, 1836, and after studying his art for some years both with Matteson and in Europe, opened a studio in his native city, where he won high reputation as a *genre* painter. He afterward returned to Europe and took up his residence at Rome, where he is now living. Among the pictures which rank him high as an artist may be mentioned *The Lair of the Sea-Serpent,* and *The Monk upon the Gloomy Path.*

Vega-Carpio (*vā'gä kär'pē-ō*), **Lope Felix de,** a celebrated Spanish poet, was born at Madrid, Nov. 25, 1562. From his in fancy he is said to have given promise of extraordinary talent. Like Pope, he "lisped in numbers." He was the idol of his time, and in productiveness at least surpassed all other poets, his dramas alone numbering 1,500 to 1,800, and in view of the quantity of his work its quality is no less surprising. The ease and grace of his versification are unsurpassed in the Spanish language, and his works are all instinct with life and dramatic movement. He is deficient in deep and serious qualities; but not withstanding this defect, he remains the chief ornament of the Spanish drama and a not inconsiderable figure in the dramatic literature of the world. The dramatist is generally referred to as Lope de Vega. He died at the home of his birth, Aug. 27, 1635.

Veii (*vē'yī*), an ancient city of Etruria and in early times the rival of Rome. Its very site is disputed, but it is now generally thought to be at Isola Farnese, about twelve miles from Rome. The struggle between the two cities is represented by Roman historians as commencing during the time of Romulus, and continuing under all the other kings except Numa, generally to the advantage of the Romans. At last the Romans determined to rid themselves of a rival by a siege, and persevered with great tenacity, although the city held out for ten years, and frequent attempts were made by neighboring states to relieve it. It is said to have been finally taken by means of a mine which was directed into the citadel. The citizens were massacred or sold as slaves, and the land confiscated by the conquerors. The fall of Veii took place 396 B. C., and after its fall it was gradually deserted. In later times a colony was planted there by Julius Cæsar, and afterward by Augustus, but it always remained an insignificant place.

Veins (in plants) are the extension of the vascular system into the leaves. See VENATION.

Velasquez (*vā-läs'kĕth*), **Diego Rodriguez de Silva,** one of the most famous of Spanish painters, was born at Seville in the month of June, 1599. At an early age he was placed in the studio of Francisco Herrera el Viejo, and afterward became the pupil of Francisco Pacheco, whose daughter Juana he married. In 1622, he visited Madrid, and while there painted so fine a picture of King Philip IV. that he at once became famous and secured the royal favor and patronage, which continued to the end of his life. In 1629, permission was granted Velasquez to visit Italy, where he was received with the highest honor, Pope Urban VIII. assigning him apartments in the Vatican. In the spring of 1631 he returned to Madrid, where he was cordially welcomed by his royal patron. He had a room assigned to him in the royal palace and the king would often visit him and watch him at his work. Additional honors were conferred upon him by the king from time to time until his death, which took place Aug. 7, 1660, his wife, who was passionately attached to him, surviving his loss only about a fortnight. With the possible exception of Murillo, Velasquez takes the highest rank among Spanish painters.

Velocity. See DYNAMICS.

Vel'vet, a fabric in which, besides the ordinary warp and weft, which are usually arranged as in twill weaving, there is an additional weft, consisting of short pieces of silk, cotton, or woolen thread doubled under the regular weft and brought to the surface in loops which are so close together as to conceal the regular web. The loops are afterward cut evenly, and the ends thus made constitute a covering resembling a very short fur. In silk velvets, the warp and pile threads are both of organzine silk, which is the strongest used in weaving.

Vena'tion, the arrangement of veins in leaves. The details of this arrangement are endless, but they may be reduced to two principal types. The two main types are known as closed and open venation. In the former case, while the veins branch, they always run into one another, never having free ends among the leaf cells or in the leaf margins. As a consequence, such leaves have even outlines, that is, they are not toothed or lobed. A very common form of the closed venation is that in which the main veins run parallel from base to apex, as in the grass blade, and leaves of other monocotyledons. Such leaves are called parallel-veined. In other cases of closed venation, as in palms, bananas, etc., the main veins are not parallel. The closed venation is characteristic of the monocotyledons. In "open venation," characteristic of dicotyledons, the ultimate branches end freely, either among the leaf cells, or in the leaf margins. Such leaves are said to be "net-veined," or "reticulate," and they are much inclined to become toothed, lobed, or compound. There are two forms of open venation: (1) "pinnate," or "feather-veined leaves," in which there is a main central vein or rib (midrib), from which the whole vein system arises; and (2) "palmate leaves," in which three or more main ribs rise together at the base of the leaf, and diverge upward. In the ferns the venation is open, but the veins fork repeatedly, such a venation being called "dichotomous."

Veneer', a layer of wood cut very thin for the purpose of being glued to the surface of a more common kind. Only choice kinds of hard wood are sawed into veneers, and they are usually attached to pine or some other kind of soft wood so as to give all the appear-

ance of being made solid. In this way the more costly kinds of furniture woods are economically used by the cabinet maker; for with the improvements that have been made in the process of sawing, veneers as thin as paper can be produced.

Venezuela (*vĕn'e-zwē'lă*), a republic of South America, bounded on the north by the Caribbean sea, on the east by British Guiana, on the south by Brazil, and on the west by the United States of Colombia (formerly New Granada). Area 593,943 square miles. The coast line, extending from east to west, from the delta of the Orinoco to the boundary line of Colombia, is about 1,500 miles in length. This coast line, which for the most part is low and marshy, is sometimes precipitous, the mountains rising almost like a wall from the water's edge. The great river of Venezuela is the Orinoco, which drains the greater part of the country, and whose course is almost wholly within its boundaries. The Andes mountains enter Venezuela from the west and divide into two branches, the first of which runs north toward the coast, but rises no higher than 4,000 feet, while the other, running in a northeasterly direction, terminates near the coast, and attains a greater elevation. The most mountainous districts of Venezuela lie south of the Orinoco. They form a vast, confused, and mostly unexplored region, but none of them rises to the height of the main peaks of the Andes. For the most part the soil of the country is fertile, and in the mountainous districts in the southeast there are great tracts suited for the production of grain. Agriculture is the chief pursuit, but only one-tenth of the soil is under cultivation. The inhabitants are made up of whites of Spanish extraction, Indians, negroes, and some mixed races. The religion of the mass of the people is Roman Catholic, although other forms are tolerated. In 1870, education was made free and compulsory. There are 1,450 federal and 150 state schools, besides nine barrack schools, four normal schools, over sixty colleges, and two universities. In Caracas, the capital, is the national library, with 32,000 volumes, and the national museum. It has 80,000 inhabitants. The northeast coast of Venezuela was discovered by Columbus in 1498. Ojeda and Vespucci followed in 1499, and entering Lake Maracaybo they found an Indian village constructed on piles to prevent the evil effects of inundation, and they thereupon named the place Venezuela, or Little Venice, a name which was afterward extended to the whole country. The first settlement was made at Cumana in 1520 by the Spaniards, and Venezuela remained subject to Spain till it claimed independence in 1811, was quickly subdued, but again revolted in 1813 and in 1815, and at last, forming with New Granada and Ecuador the Republic of Colombia, was declared independent in 1821. In 1831, the state separated, since which time Venezuela has maintained its separate independence. Population 2,323,527.

Venice (*ven'is*), a city of northern Italy, is built upon a crowded cluster of islets in the

lagoon of Venice, which is separated from the gulf of Venice by a long and narrow sand bank, divided into a number of small islands by narrow sea passages, six in number. Inside of this sand bank and between it and the mainland, about four miles distant, is the lagoon, in some parts of which islets have been formed firm enough to be built upon and fertile enough to be cultivated, and here the city of Venice is built. As the islands in many places afford no suitable foundations for buildings, the city is largely built upon piles or stone. In the vicinity of Venice, the ebbing tide lays bare a great plain of mud, laced by a network of narrow channels from which the sea never retires, while at high water the whole surface is covered by the sea to the depth of one or two feet. The fact that this city of marble palaces seems to rise like a vision out of the sea is sufficient to make it at all times an object of fascination, but in summer and autumn, the season of the highest tides, when the grand place of St. Marks is partially flooded, the city is indeed marvelously beautiful, and must continue to be a place of interest to travelers from all parts of the world as long as it stands. The present population of the city is 157,785. Although the many marshy islands extending along the northwestern shores of the Adriatic are known to have been used by the inhabitants of Venetia, one of the provinces into which Italy was divided by Constantine, as places of retreat from barbarian invasions as early as the 5th century, the first permanent settlement on the site of the present city of Venice cannot be traced farther back than the beginning of the 9th century. The physical conditions with which the early inhabitants had to contend could hardly have been more unfavorable to the development of a great and prosperous city.

The soil possessed no kind of mineral wealth, the thickets which diversified the surface of the barren marshes produced no valuable timber, good drinking water was hardly to be obtained; yet it was here that the Venetians by their energy, their industry, and their genius for commerce, succeeded in establishing and maintaining their independence, in making other nations their tributaries, in sending their fleets to distant shores, in controlling the destiny of empires, and in building up a naval power that is unique in the history of the world. Venice may be said to have risen out of the ruins of the Roman empire, and to have maintained its separate nationality through the middle ages and down to the year 1797, when Napoleon Bonaparte entered the city, proclaimed the republic at an end, and transferred her territory to Austria. In 1806, the city of Venice with the territory of Venetia was annexed to Italy by the treaty of Presburg, but it was again transferred to Austria in 1814, under whose dominion it remained until 1866, when it was once more incorporated in the kingdom of Italy.

Ven'ice, Gulf of, the name given to that portion of the Adriatic sea which indents the Italian province of Venetia to the extent of fifty or sixty miles.

Ve'nus, the Roman goddess of love, subsequently identified with the Greek Aphrodite. Originally, Venus does not seem to have occupied a conspicuous place in the religion of the Romans, and scarcely figures in the history of Rome under the kings; but gradually as the myth of the Trojan origin of Rome gained ground, the worship of Venus emerged into importance. Aphrodite was the mother of Æneas, and Aphrodite became Venus. Ares was Mars, and Mars was the national god of the Roman people; then, just as in Greek mythology, Aphrodite was beloved of Ares, so Venus was represented as the paramour of Mars, and thus was advanced by the poets to the dignity of the divine mother of the Roman people. Several temples were erected to her in Rome at different times and under different names, and rites were celebrated in her honor during the month of April — the springtime of the year being thought favorable to the growth of the tender emotions.

Ve'nus. See PLANETS.

Vera Cruz (*vā'rā krōs*), an important city on the east coast of Mexico, about 200 miles east of the City of Mexico, with which it has communication by railway. It is built in a semi-circle facing the sea, the streets, which are wider than is usual in tropical countries, running east and west from the harbor, with others crossing them at right angles. The town is defended by a wall six feet in height and other substantial works, as well as by the castle of St. Juan de Ulloa, which stands upon an island of the same name, about half a mile from the shore. Although Vera Cruz is the chief port of Mexico, it has no harbor worthy of the name, only an open roadstead between the castle and the town. The anchorage is bad, so that when the north gales prevail many vessels are wrecked on the adjoining shore. The chief exports are precious metals, cochineal, sugar, flour, indigo, leather, vanilla, etc., and the chief imports cotton, woolen, silk, and linen goods; brandy, iron, hardware, earthenware, etc. Population 24,085.

Vera Cruz was bombarded and taken by General Scott during the Mexican war, and again by the allied British, Spanish, and French squadrons in 1861, when they sought to set the archduke Maximilian upon the throne of Mexico.

Verazzano (*ver-rät-sä'nō*), **Giovanni,** Florentine navigator, was born at Florence, Italy, about 1480, and died, probably, about the year 1527 — being executed as a pirate, it is said, in New Castile. About the year 1505, it is known that he entered the French maritime service, made a voyage to the East Indies in a Portuguese ship in 1517, and became expert as an explorer and navigator. In 1522, he is said to have captured the rich treasure-ship in which Cortes was sending the spoils of Mexico to Charles V. of Spain. From the Madeira islands, he is further known to have sailed in 1524 on a voyage of discovery in American waters, and, on sighting Cape Fear, he coasted along until he reached what is now New York bay, continuing his explorations as far as Rhode Island and New Hampshire. It was on a second voyage to the New World (in 1527) that he was captured by Spaniards and hanged as a corsair — if that, indeed, was his fate.

Verdi (*vār'dē*), **Giuseppe,** Italian operatic composer, was born at Rancole in the duchy of Parma in 1814, and received his musical education at Milan. His first work was a musical drama, which appeared in 1839, and he has since produced a number of operas, which while they abound in melody and striking dramatic effects, are characterized by noisy orchestration. In 1861, he was elected to the Italian parliament, and in 1875 was made commander of the French Legion of Honor. He has also been decorated by the emperor of Russia and by the khedive of Egypt. *Il Trovatore* and *La Traviata* are, perhaps, his best-known operas. *Falstaff*, his latest production, was

GIUSEPPE VERDI.

first given at Milan, Feb. 9, 1893, attracting visitors from all over Europe, the seats being sold at $50 each. Verdi died at Milan, Jan. 27, 1901.

Verestchagin (*vā-rā-shä-gēn'*), **Vasili,** a Russian painter, was born at Novgorod, Russia, Oct. 26, 1842. In 1867, he was a soldier in Turkestan, and later in the Russo-Turkish war, in which he was wounded. He has produced numerous paintings, many of them scenes in East India, while others are war sketches. A collection of his pictures has been exhibited in New York, Chicago, and other American cities.

Ver'mes or **Worms,** the sub-kingdom made up of worm-like animals. Under this heading are included an immense number of animals that are so diverse in structure that the very general title of worm is justifiable only as applying to their form or shape. It embraces about a dozen classes whose relationships are imperfectly known. The interest in the group is considerable, because the worms show affinities with the higher animals, including even the vertebrates (which see). They are all animals with three cell-layers, a body cavity, and a nervous system consisting of a brain mass, on the dorsal surface, and a ventral nerve-cord divided into joints. The upper and lower parts of the nervous system are connected by a ring of nervous substance that surrounds the throat. From the central nerve-cord, nerve trunks are given off which branch profusely and terminate in minute twigs within the tissues. The digestive system is diverse, the circulatory system is imperfect, and there is usually a set of tubes or nephridia connected with excretion. The worms live in the sea and fresh water, in the earth and upon it, and as parasites within the interior of the tissues of various animals. They are divided into the jointed or *segmented* worms and the *unsegmented* worms. The former are more generally known and are mostly included under one class, called annelida. This class embraces the earthworms, the leeches, and a few forms living in the sea. The earthworm series have hair-like bristles (*setæ*) on each joint, which aid in locomotion. The leeches are not provided with bristles, but have two round suckers, one at either end of the body. Some of the leeches live on fishes, feeding on the mucus which comes from the bodies of those animals; others are bloodsuckers. The latter are provided with sharp jaws, located within the forward sucking disc, with which they cut the skin of the animals upon which they fasten. The unsegmented worms embrace the flatworms (*plathelminthes*) and the roundworms (*nemathelminthes*). Some of the former class live in the water and moist earth, and others of the same class are internal parasites, like tapeworms. The class of roundworms likewise includes forms living freely in the water and other substances as horsehair worms, vinegar and paste "eels." Examples of parasitic roundworms are the stomach worms and pinworms of children and the trichina. The latter is the most dangerous of the parasitic worms, getting into the system by eating raw or partly cooked pork. Besides the three classes mentioned, viz., annelida, flatworms, and roundworms, there is a fourth class called molluscoidea. Under this heading are grouped a few forms that have given naturalists no little trouble to classify. One division of them contains moss animals (*polyzoa*) of both salt and fresh water. They occur in branching colonies which resemble low plants in general form. The other division includes shelled-worms, called brachiopods, which were formerly included among the mollusks near the clams. See ROTIFER, and TRICHINA.

Vermil'lon, a bright scarlet color which is obtained from a native ore called cinnabar, or else made artificially from mercury and sulphur. This compound, sulphide of mercury, is thrown into tall earthen pots, and the lower parts kept red-hot. The substance volatilizes and coats the pots with cinnabar. The pots are broken and the cinnabar scraped off, ground and dried, when it is ready for use as vermilion. Cinnabar, the ore from which vermilion is obtained, is a compound of sulphur and mercury, of a blood-red color. It is simply ground fine, and then known as vermilion. The most important mines are those of Almaden in Spain, which have been worked for 3,000 years, and of New Almaden in California. There are mines in Brazil, Peru, Austria, Hungary, China, and Japan.

Vermont, a New England state, lying between New Hampshire and New York, on the Canada border. It is partly separated from New York by Lake Champlain, and from New Hampshire by the Connecticut river. It is 158 miles long, and 90 miles wide on the Canada border, tapering to 41 miles on the southern boundary. It covers 9,135 square miles. The Green mountains, running toward the southwest, divide the state into two nearly equal parts. The highest point is Mt. Mansfield, 4,389 feet high, and all the range, except the highest summits, is covered with evergreens, which give the green color from which the mountains and the state are named, Vermont meaning "green mountain." There are many small lakes, besides Lake Champlain, 118 miles long, and Lake Memphremagog, 30 miles long. These lakes abound in fine fish, and the larger ones make up to Vermont for her lack of access to the sea, 1,000 vessels entering the port of Burlington on Lake Champlain yearly. The second steamboat ever built was the *Vermont*, in 1809, which ran on Lake Champlain. The small rivers of Vermont are quite numerous, run through fertile valleys, and with the mountains and

lakes make up the beautiful scenery for which the state is noted. Though gold, silver, copper, lead, manganese, and iron are found, little effort has been made at mining, except of copper ore, which has been mined at Vershire and Corinth. The great mineral wealth of the state is in its quarries. The finest marble in the country, and three-fourths of all that is quarried in the United States, comes from Vermont. Rutland, a town in the marble region, has sidewalks, curbstones, and horse posts of white marble, finer than the celebrated marbles of Italy. There are also quarries of slate, granite, and soapstone, and mines of kaolin, talc, and manganese. Mineral springs abound, some of which are famous as summer resorts. Maple sugar is one of the special products of the state, and hay the largest crop; while the merino sheep of Vermont are exported all over the world. There are manufactures of cotton and woolen goods, tinware, scales, wagons, and machinery.

The state expends about $750,000 yearly for its public schools. In 1898, in the elementary schools, there was a force of 3,663 teachers and an enrollment of 63,260 pupils; in the high schools there were 135 teachers and 3,169 pupils. The University of Vermont, founded in 1800 at Burlington, has the state agricultural college connected with it, and departments of medicine, arts, chemistry, and engineering. Middlebury college, Norwich university, the first military school in the country, the Fletcher free library at Burlington, and the St. Johnsbury athenæum, are among the advantages for higher education. Montpelier, the capital, has a fine state house, in which are the cannon taken from the Hessians at the battle of Bennington, and the flags carried by Vermont regiments in the Civil war.

The first permanent settlement made in Vermont was in 1724 at Fort Dummer, now within the limits of Brattleboro. New Hampshire and New York both claimed the region, and titles were granted to the same lands by the governors of both states. The colonists, under Ethan Allen and Seth Warner, formed themselves into a company called the "Green Mountain Boys," and for years drove off the New York settlers. The state was finally admitted into the Union in 1791, buying off the claim of New York for $30,000. It was the first state admitted after the union of the original thirteen. In the Revolutionary war, the "Green Mountain Boys" fought the battles of Ticonderoga, Crown Point, and Bennington, and in 1812 were victorious at Plattsburg and at Lundy's Lane. The chief cities of Vermont are Burlington (population 18,640), Rutland (population 11,499), Barre (population 8,448), Montpelier (population 6,266), and St. Albans, (population 6,239). Population of the state 343,641.

Verna'tion, the arrangement of leaves in the bud, sometimes called *praefoliation.* Numerous names have been applied to various forms of vernation. Among the principal ones are "imbricate," in which the edge of a leaf overlaps its neighbor; "valvate," in which neighboring edges touch, but there is no overlapping; "conduplicate," in which the leaves are folded lengthwise; "convolute," in which the leaf is rolled from one margin; "circinate" (characteristic of ferns), in which the leaf is rolled from the apex downward.

Verne (*vĕrne*), **Jules,** a French writer, was born at Nantes, France, Feb. 8, 1814. He first wrote plays and opera pieces, and for some time was connected with a theatre. His wild and improbable stories have most of them been translated into English. The first one to make him known, published in 1863, was *Five Weeks in a Balloon.* It was based on modern science and had an air of reality. His other writings, except an illustrated geography of France, are of the same character. His works include *A Journey to the Center of the Earth, Twenty Thousand Leagues under the Sea, From the Earth to the Moon,* and *Around the World in Eighty Days.*

Vernet (*vĕr-nā'*), **Claude Joseph,** an eminent French painter, was born at Avignon, France, Aug. 17, 1714. When on a voyage to Rome, in a terrible storm, he was fastened to the mast, and the scene so impressed him that he became a painter of sea views, being considered the first marine painter in Europe. His best-known work is a series of the seaports of France, executed by royal order. His works have been extensively engraved. He died in Paris, Dec. 3, 1789.

Vernet (*ver-nā'*), **Emile J. Horace,** a French military painter, was born at Paris, June 30, 1789. His first military painting was the *Capture of a Redoubt.* His pictures of the life of Napoleon and the army, such as *The Dog of the Regiment, Soldier of Waterloo, Barrier of Clichy,* were very popular, and engravings of them could be found in nearly every cottage in France. Louis Philippe sent him to represent the French government at Rome. He traveled extensively, wrote several works on art, and made hundreds of designs for illustrated books. His fame rests on his military pictures, such as the battle pictures of Jena, Wagram, and Fontenoy, and the *Capture of the Imala.* He died at Paris, Jan. 17, 1863.

Ver'non, Edward, an English admiral, was born at London, Nov. 12, 1684. He was at the taking of Gibraltar in 1704, and was made a rear-admiral when only twenty-four years old. While a member of parliament, he declared that Porto Bello could be taken with only six ships of war, and when put in command of six vessels and sent to the West Indies, he took the city in one day, with the

loss of only seven men. The English people were wild over the victory; Vernon's birthday was celebrated in London with public illuminations, and 130 medals were struck in his honor. With a larger fleet he attacked Cartagena, but failed to take it. In the invasion of the Pretender, Vernon's fleet had command of the coasts of Kent and Sussex. On account of a quarrel with the officers of the admiralty, his name was struck from the list of English admirals. George Washington's elder brother, Lawrence, was with Vernon on his expedition against Cartagena, and afterward, in his honor, named the Washington home on the Potomac, Mt. Vernon. Admiral Vernon died in Suffolk, Oct. 29, 1757.

Vero'na, a city of northern Italy, is situated at the foot of the Tyrolese Alps, on the Adige river, sixty-two miles west of Venice. The fortifications, begun by the Romans and carried on by Charlemagne, were almost destroyed in 1801, but were rebuilt by the Austrians. The present fortifications are a circle of forts far outside the old city walls. It is a city of palaces; the Scaligeri palace, built in 1370, and those of the Canossa and Pompeii families in the 16th century are among the finest. Among the many churches are the cathedral, consecrated by Urban I. in 1187, and having Titian's *Assumption* on its walls; St. Anastasia, one of the finest Gothic churches in Italy; St. Zeno, rebuilt in the 12th century, and that of San Giorgio, with paintings by Paul Veronese. Among Roman antiquities is a ruined amphitheatre, built of marble and seating 22,000 people, much like the Colosseum at Rome. There are some fine streets and squares, many art collections, an academy of painting and sculpture, a theological seminary, a city library, and beautiful bridges across the Adige river. Its manufactures are of silk, linen, and woolen goods, and it has a trade in sumac, grain, and oil. The tomb of *Romeo and Juliet* has been destroyed, but another has been found to satisfy the curiosity of tourists. Verona was a Roman colony, its walls and gates having inscriptions dating from the 3d century. The ancient moat still remains as a canal around the old part of the city. It was taken by Constantine (312), Theodoric (489), and Charlemagne (774), and afterward became a free city. For 100 years it was ruled by the Scala family. In the 15th century it was conquered by Venice. The French took the city in 1796, and ceded it to Austria in 1797. Since 1866 it has been a part of the kingdom of Italy. Population 71,912.

Veronese (*vā-rō-nāz'ze*), **Paolo** (Paul), the name given to Paolo Cagliari, one of the great Italian painters, who was born at Verona in 1528 or 1532. His father was a sculptor and wanted to train the boy for the same profession, but his taste for painting was so decided that he was put under the teaching of an uncle, who was a painter. His first pictures were executed in the Church of St. Sebastian at Venice and were scenes from the history of Esther, *Baptism of Christ*, *Martyrdom of St. Sebastian*, and others. He was only twenty-eight at the time, but this work placed him at once in the same rank as Tintoretto, then forty-five, and Titian, then in his eightieth year. He obtained the commission for painting the ceiling of the library of St. Mark, and the work was so fine that even his rivals joined in voting him a golden chain as an honor. At Verona, his native city, he painted the *Banquet in the House of Simon the Pharisee.* His best-known work is the *Marriage at Cana*, now in the Louvre. It has about 120 figures or heads, many of them portraits, such as Queen Eleanor of France, Francis I., Queen Mary of England, Tintoretto, Titian, and Paul Veronese himself. Other pictures are *Susanna and the Elders;* the *Supper at Emmaus; St. Helena's Vision of the Cross;* the *Annunciation; Esther Presenting Herself to Ahasuerus;* and *Venice, Queen of the Sea.* He died at Venice, April 19, 1588.

Veron'ica, St. or **Bereni'ce,** according to tradition, a woman of Jerusalem who, moved with pity at the sight of Jesus bending beneath the burden of His cross on His way to Golgotha, gave Him her "kerchief" that He might wipe the drops of agony from His brow. Jesus after using it handed it back to her, with the image of His face marked upon it. With this napkin, Veronica is said to have cured Tiberius, the Roman emperor, when very sick, and so convinced him of the divinity of Christ that he sent Pilate into exile. The napkin, it is claimed, is now at St. Peter's at Rome.

Versailles (*ver-sālz'*), a city in France, eleven miles southwest of Paris, where Louis XIII. had a country villa, and where Louis XIV. built the finest palace in France, costing such an enormous sum that he destroyed the accounts. The marble court, the chapel, the halls and galleries filled with historical pictures (the collection made by Louis Philippe having five thousand works of art and costing $5,000,000), the battle gallery hung with pictures of French victories, the hall of Mercury, hall of Apollo, and galleries of war and peace, are among the many departments of this grand palace. The gardens surrounding it with their beautiful fountains and statuary attract crowds of visitors from Paris. The orangery has 1,200 orange trees, one said to be 465 years old. The grand canal, 200 feet wide and a mile long, in the time of Louis XIV., was covered with gondolas and lighted up with fireworks. The park connects with the two palaces, the Grand Trianon, a one-storied building with wings, and the Little Trianon, a pavilion with an English garden around it, the favorite residence of Marie

Antoinette. There are churches, a museum, a military hospital, and military school in Versailles, but no buildings of interest except the palaces. The treaty of peace, by which England recognized the independence of the United States, was signed at Versailles in 1783. The states-general of France met here in 1789 and bound themselves never to separate until they had given France a constitution. Louis XVI. was driven from Versailles to Paris and to prison. Louis Philippe restored the palaces at a cost of $5,000,000. During the Franco-German war it was the headquarters of the German army, and King William I. was proclaimed emperor of Germany there in 1871. It was the seat of government while the commune held Paris, and the French congress met there until 1871. Population 54,874.

Ver'tebrates, the highest sub-kingdom of animals. The difference between the backboned animals, and the lower animals without backbones, was recognized by Aristotle more than 2,000 years ago. It was not until the year 1797, however, that Lamarck founded the group vertebrata, and defined it with distinctness. For a long time the line separating the vertebrates and the invertebrates was supposed to be a very sharp one. But a more thorough study of animal structure showed that the vertebrates have many affinities with the invertebrates, and were doubtless derived from them. When the group was first founded, the distinguishing mark of vertebrated animals was supposed to be the possession of a backbone composed of bony vertebræ. But this idea has become so much modified that it is no longer used in defining the group. A Russian naturalist, Kowalevsky, showed in 1866 that the tunicates (which see) developed in the same manner as the lowest vertebrates, and, in their youth, approached very closely to the frog tadpole. This led to expanding the vertebrate group so as to include the tunicates, which were previously classed with the worms. Some other forms were later included for similar reasons. There are a number of forms, like the hagfish and lamprey, that have no bony spinal column, but are, nevertheless, true vertebrates. Therefore, the question arises, what are the marks of vertebrates that distinguish them from all other animals, and at the same time are possessed by all members of the group? There are three universally recognized features—besides some others of smaller importance. The three distinguishing features are:—

1. The possession of a nerve cord located on the dorsal surface, that of invertebrates being on the ventral side of the body. 2. A gristly rod, or notochord, that runs lengthwise through the body just below the nerve cord. This notochord is the scaffolding about which the bodies of the vertebræ are formed when they are present. 3. The possession of gill clefts. These structures are openings through the neck into the pharynx and are present in fishes throughout life. They appear, without exception, in the embryonic stages of all higher animals as hereditary survivals, but soon become closed, and disappear before the period of birth. See DEVELOPMENT OF ANIMAL LIFE.

It is not possible to trace with certainty the path along which the vertebrated animals have been developed, but they all possess some affinities (like jointed bodies and segmented kidneys) with the jointed worms, and the theory is widely accepted that vertebrates had remote ancestors that were very like the jointed worms. This is called the Annelid theory, and was founded in 1875, chiefly by Dohrn and Semper. It is to be remembered, however, that there are other rival theories, and no one claims that any living animals represent the ancestors of vertebrates. These ancestors, whatever they were, have been long extinct.

The vertebrate sub-kingdom is divided into five classes: fishes, amphibia, reptiles, birds, and mammals, all of which are further subdivided into orders, families, and smaller groups. The principal facts of importance in reference to the different classes will be found by consulting those topics.

Vespa'sian, Titus Flavius Vespianus, a Roman emperor, the tenth of the twelve Cæsars, was born in the Sabine country, 9 A. D. He held several Roman offices, as that of military tribune in Thrace, quæstor in Crete, ædile, and prætor. At the head of a legion in Britain, he conquered the Isle of Wight in 43. He was governor of Africa, the accounts of his reign there disagreeing; but whether a good or bad ruler, he was pelted with turnips by a mob. He was sent, in 67, to carry on the war in Judæa, and conquered almost the whole country, except Jerusalem, in two years. The civil war between Otho and Vitellius gave him the opportunity to profit by his popularity, and he was proclaimed emperor at Alexandria in 69. The army of the east stood by him and, entering Italy, defeated and put to death Vitellius, sacked Cremona, and took Rome after a terrible fight, in which the capitol was burned. Vespasian entered Rome in 70, where he restored the capitol, rebuilt the city, reorganized the army, and by his own example shamed the luxury and extravagance of the period. The Jewish war, under the lead of his son Titus, ended with the capture of Jerusalem, and the temple of Janus was closed, Rome enjoying peace for the nine years of Vespasian's reign. A new forum, the public baths, the temple of peace, and the Colosseum were begun in Rome in the reign of Vespasian. He favored men of letters, Quintilian among others, to whom he gave a pension of $4,000 a year. He died June 24, 79. See *History of the Romans under the Empire*, by Merivale.

Vespucci (*ves-pōō'chē*), **Amerigo,** an Italian navigator, was born at Florence, Italy, March 9, 1451. He began life as a clerk in the commercial house of the Medici, and in their employ was sent to Spain, where, at Seville, he entered the service of a Florentine merchant, who had fitted out the second expedition of Columbus, in 1493. Vespucci finished a contract his master had with the king of Spain to fit out twelve vessels for him. Vespucci, according to his own story, sailed first perhaps as an astronomer, with an expedition from Cadiz, May 10, 1497. After touching at the Canary islands, they reached "a coast which we thought might be that of a continent"—probably, from the description, Campeachy bay—and then sailed as far north as Cape Hatteras, returning to Spain in 1498. In a second voyage, in 1499, he reached the coast of Brazil, sailing north to the mouth of the Amazon and to San Domingo. He then entered the service of Portugal and made another expedition to Brazil, going as far as Georgia, and in 1503 he made his fourth voyage. Vespucci wrote a journal after his fourth voyage, but nothing of it remains except allusions to it. He also wrote several letters to a school-fellow in Florence, of one of which a Latin translation was printed in 1507. His claim that he reached the American continent in 1497, eighteen days before the Cabots, has been disputed, and the general opinion is that he did not make that voyage, but there is no evidence that he had any thought of taking the honor of the discovery of the New World from Columbus. The name America was first applied to the New World by a geographer of Freiburg, named Waldsermüller, who, referring to Vespucci's letter, says, "now a fourth part (of the world) has been found by Amerigo Vespucci, I do not see why we should be prevented from calling it Amerigo or America." Vespucci died at Seville, Feb. 22, 1512. See *Life and Voyages of Americus Vespucius*, by Lester; *Narrative and Critical History of America*, by Winsor.

Vest, George Graham, United States senator from Missouri, was born at Frankfort, Ky., Dec. 6, 1830, and graduated at Centre college, Kentucky, and at the law department of the Transylvania university at Lexington, Ky. In 1853, he removed to Missouri, where he practiced law, and became a member of the state legislature. During the Civil war, his secessionist leanings induced him to become a member of the Confederate congress and later of the Confederate senate. In 1879, he was elected Democrat member for Missouri in the United States senate, where he has been prominent in many important debates. He has since been reelected to the chamber continuously and has served on several committees on finance, on commerce, and on the transportation of meat products.

Ves'ta, in Roman mythology, was the goddess of fire and the domestic hearth. The guardianship of the sacred fire in her temples was given to priestesses, called *Vestal Virgins*, at first four, but afterward six. They were from six to ten years old when chosen, and spent thirty years in the service, the first ten in learning their duties; the second ten in acting as priestesses and guarding the sacred fire which must not be allowed to go out; and the last ten in teaching the new priestesses. If a vestal virgin violated her vow, she was stoned to death or buried alive. They lived in great splendor at the public expense, had the best seats in the theatres, and rode in state, preceded by a lictor. In Greece, the priestesses of Vesta, or Hestia, were widows. On the first day of March, the Latin New Year's Day, the sacred fire of Vesta was renewed. The Vestalia, the chief festival in honor of Vesta, was celebrated June 9, after which the temple was closed for five days for cleansing. In private houses, the feast was kept by eating fish, bread, and herbs before the hearth and the images of the Penates or household gods. The worship of Vesta died out in the 4th century, after the adoption of Christianity by Constantine.

Vesu'vius, Mt., the most celebrated volcano in the world, is on the bay of Naples in Italy. It is about 4,000 feet high, and has two distinct peaks, called Somma and Vesuvius, though it had but one in ancient times. It is about thirty miles around the base of the mountain, and the ascent on the west side is for three miles a gradual slope to the cone, which rises nearly 2,000 feet higher. The top of the cone is cut off, or truncated, and is 2,000 feet across, and the crater is 500 feet deep. About forty kinds of minerals are found around the cone in the ancient lavas. A rope railroad now carries visitors to within a short distance of the mouth of the crater, and an observatory has been built about half way up the volcano, to study the eruptions and watch for indications of an approaching earthquake. The region around Vesuvius has been densely populated for more than twenty centuries, in spite of its numerous eruptions. The great eruption of Aug. 24, 79, which destroyed Herculaneum and Pompeii, is the first one of importance. It was not lava but showers of ashes, condensed into mud by the rain produced by the steam of the volcano, that seems to have overwhelmed the cities below it. In an eruption, in 472, the ashes were carried to Constantinople, and in 1066 the lava flow reached the sea. The next great eruption was in 1631, when 18,000 lives were lost. A stream of lava 1,204 feet wide and 15 feet high destroyed the town of Torre del Greco in 1794. The eruptions increased in frequency in the last century, and the volcano is never entirely quiet. See *Volcanoes*, by Scrope; and *The Geology of Monte Somma and Vesuvius*, by Johnstone-Levis.

Ve'to, a word introduced from the Latin, meaning "I forbid." It is used to indicate the power possessed by the people or their rulers to object to an act of the legislature, and to prevent in some degree its being carried out. The Roman tribunes had the power of stopping the decrees of the senate by using the word "*interdico*" (I interdict); and so it is customary to say that the use of the veto began with them. In Poland, it was settled by law, in 1652, that in the imperial diet any deputy could hinder the passage of a measure by saying "*Nie dozwalam*" (I do not allow). In the national assembly of France, at the revolution, the king had a conditional veto, but Napoleon restored an absolute veto to the ruling power. The sovereign of England has the power to veto a bill of parliament, but the right has not been used since 1707. The veto in the United States is the power of the President to refuse his signature to a bill passed by both houses of congress; but congress can pass a bill over the President's veto by a majority vote of two-thirds in each house. President Jackson's veto of the bill to recharter the bank of the United States is one of the earliest instances of the use of this power by the President of the United States.

Vevay', a town of Switzerland, ten miles southeast of Lausanne, on lake Geneva. Its situation on the lake, with a range of mountains opposite, and the fine scenery near it, make it very attractive to tourists. It is built in a triangle, with a fine market place and two or three churches. Population 32,982.

Vi'a-Ma'la, a gorge in the canton of Grisons, in Switzerland, 1,600 feet deep, through which rushes the Hither Rhine, looking like a thread. It is about two miles long, and the great walls of rocks are so hard that apparently they have not been changed by the effects of the weather since they were thrust apart, and they are so near together in some places that a trunk of a tree or a stone may be wedged in between them. It was once considered inaccessible, and called the Lost Gulf, but a road has been built by blasting from 400 to 600 feet above the river, crossing from side to side by bridges, and protected by overhanging rocks or a wooden roof from falling trees and stones.

Vibur'num, a class of shrubs and small trees belonging to the honeysuckle family. Of the nearly eighty species about a dozen are found in the United States, growing in woods or hedges. The hobble bush, whose straggling branches catch the traveler's foot, is found in the northern states; the sheepberry or sweet viburnum, having clusters of fragrant flowers in May or June, and a blue-black, eatable fruit, and growing sometimes from 20 to 30 feet high; the arrowwood, with sharp teeth on its large-veined leaves; the maple-leaved viburnum, easily mistaken for a small maple tree, and called dockmackie in some parts of the country, are the most common varieties. The lamestinus, a native of southern Europe, with evergreen leaves and white flowers, belongs to the viburnums and is a favorite house plant.

Vichy (*vē'shē*), a town of France on the river Allier, celebrated for its mineral waters. There are twenty-one springs in the city or near it, the water of those outside the town being carried in by aqueducts. All the springs, whether hot or cold, are strongly impregnated with soda. The water is clear, with an alkaline taste. The bath houses can furnish 3,500 baths a day. There is a large trade carried on in the natural waters, and in the manufacture of salts for artificial baths. The visitors often number 15,000 yearly. Population 12,000.

Vicks'burg, a city of Mississippi on the Mississippi river, about half way between Memphis and New Orleans. The city is built on terraces rising up from the river, with streets narrow but well laid out. Situated in the finest cotton region of the country, it has a large trade in cotton, and manufactories of cotton-seed oil and cake, besides rolling mills, foundries, machine shops, breweries, and carriage and harness factories. Vicksburg was fortified and guns were placed to command the river in the Civil war as early as January, 1861. It was unsuccessfully attacked by Farragut, and also by Sherman in 1862, but on July 4, 1863, it surrendered to Grant. Population 14,834.

Vic'tor Emman'uel II., king of Italy, born at Turin, March 14, 1820, was the son of Charles Albert, king of Sardinia. After serving gallantly in the army, he became king of Sardinia by the abdication of his father, on the evening of the battle of Novara, March 23, 1849. From the Austrian conquerors of his country, he succeeded in obtaining the withdrawal of their demand that the Sardinian constitution should be abolished. This liberal constitution, granted by his father, he faithfully maintained, earning by this conduct the title of the "honest king," and winning the confidence of the Italian nation. He chose wise counselors, and with Cavour to guide, made many reforms, took part in the Crimean war, and visited Paris and London. With the help of the French, the battles of Solferino and Magenta were fought against Austria, but the peace of Villafranca between Austria and France left Italy still distant from its hoped-for unity. But Tuscany, Modena, Parma, and the Romagna voted for annexation to Sardinia, and the Prussian alliance in 1866 gave Venice to Italy. The French withdrew from Rome, and on Dec. 31, 1870, Victor Emmanuel entered Rome and became king of a united Italy. He reigned eight years, dying at Rome, Jan. 9, 1878. See *Life*, by Dicey, and by Godkin; *Italy under Victor Emmanuel*, by Arrivabene.

Victo'ria is a British colony in southeastern Australia. The river Murray forms its northern boundary, dividing it from New South Wales, and the ocean its southern. On the west is South Australia. It is 480 miles long and about 250 miles wide, and covers 87,884 square miles. The coast line is about 800 miles long, with Portland bay, Port Phillip bay, and Corner inlet as harbors. A chain of mountains, called the Dividing range, running nearly east and west, divides it unequally. The eastern part of the range, called the Australian Alps, is from 1,000 to 7,000 feet high Mt. Hotham, Mt. Smyth, and Mt. Selwyn, being high peaks. Along these ranges grow the giant trees of Victoria. The western part of the range is called the Grampians, where the principal peak is Mt. William. The western part of Victoria is level, with fine pastures for the merino sheep, whose wool brings the highest price in the markets of Europe. A part of it is covered with timber and reserved as a state forest. Many thousand square miles in the eastern part of the state are still unexplored, and more than ten millions of acres are so covered with forest-clad mountains as to be too wild for settlement. The streams are too small for navigation, except the Murray and the Yarra. The climate is very fine, about half the days of the year being bright, with a bracing, dry, pleasantly warm atmosphere. The temperature is never below the freezing point, except for an hour or two before sunrise, in the coldest month. Snow has fallen only twice at Melbourne, though common on the higher plains and mountains. The disagreeable feature of the climate is the north wind, cold and dry in winter, and hot and dry in summer. The trees of Victoria, among the largest in the world, are mostly the eucalypti or gum trees. The white gum trees are the most beautiful, standing in groves, with their long, branchless trunks, smooth as marble, looking like the pillars of a cathedral. The largest tree of this variety ever measured was 470 feet long and 81 feet around. Eucalyptus oil comes from the blue gum, and the red gum is used for timber, being almost indestructible. Magnificent ferns and fern trees are found in the Victorian forests. The kangaroo, opossum, wallaby, vandicoot, and wombat are among the peculiar animals of Victoria, all belonging to the class of marsupials (which see), and the parrot, cockatoo, and laughing jackass or kingfisher are among the native birds. Snakes are numerous, but not venomous. Wheat, barley, and oats are the principal crops, and almost all fruits except oranges and bananas are grown.

About one-third of Victoria is thought to contain gold, though only 1,300 square miles have been worked; 30,460 miners are employed, and the shafts used in mining are becoming very deep, one descending over 2,400 feet. Over $1,250,000,000 worth of gold has been already extracted. In 1899, the gold yield was 854,500 ounces, valued at over 17 million dollars. Besides gold, there is tin, copper, lead, bismuth, and zinc, while iron and coal occur in small quantities, but are undeveloped. All the important towns have good schools, and there are several colleges at Melbourne, the capital, a city of 491,000 inhabitants. The University of Melbourne has four faculties: art, law, medicine, and engineering. The governor is appointed by the British crown, but the country has its own parliament. In 1900, the colony furnished a military contingent for South Africa, to aid the Imperial Government in its war with the Boers. In 1901, Victoria was federated with the commonwealth of Australia. To mark the occasion, the colony was visited by the duke and duchess of Cornwall and York, as representatives of the British royal family.

The first settlement was made in 1835 at Port Phillip harbor. In 1851, gold was discovered, in 1852 there were 70,000 emigrants, and in ten years the population had increased six times. Population 1,163,400.

Victo'ria, the capital of British Columbia, is in the southeastern part of Vancouver island, on the strait of Juan de Fuca. The entrance to the inlet which forms its harbor is narrow and winding, and only the smaller vessels can enter; so the British naval station is at Esquimalt, three miles distant. The government offices, Cary castle, the governor's house, the free library, theatre, and several churches and schools, are among the best buildings. There is a public park, water works, and factories for making soap, sashes, iron, leather, and beer, and ship and lumber yards. Victoria was a port of the Hudson Bay company until 1858, and became a city in 1862. Population 20,821.

Victo'ria, queen of Great Britain and Ireland, and empress of India, was born at Kensington palace, May 24, 1819. She was the daughter of Edward, duke of Kent, and granddaughter of George III. At the death of her uncle, William IV., she became queen June 21, 1837, when eighteen years old. On Feb. 10, 1840, she married her cousin, Prince Albert of Saxe-Coburg-Gotha. When she came to the throne, she found Lord Melbourne, under whom her education had been conducted, at the head of her government, where he remained until 1841. His successors have

THE LATE QUEEN VICTORIA.

been such men as Robert Peel, Russell, Derby, Palmerston, Disraeli, and Gladstone. Under her wise leaders, the queen of England saw the country carried safely through the revolutionary period of 1848, the fall of the French monarchy, the formation of the kingdom of Italy, and the German empire, and the Civil war of the United States. Some of the important measures of the period are the adoption of the penny postage, abolition of the corn laws, the transfer of the East India company's possession to the crown, the Irish land act, and the admission of Jews to the house of commons. The most disturbing question of the period, which is still unsettled, has been the relation of Ireland to Great Britain. The Crimean war, the war in India at the time of the mutiny, the Abyssinian war, and wars in Egypt and Afghanistan are the principal military events of her reign. In 1861, her husband, known as the Prince Consort, died, and the queen lived in partial retirement until 1876, when she again opened parliament in person. In 1877, she was proclaimed empress of India. The reign of Queen Victoria was one of the longest and most prosperous in English history. She understood the relation between the crown and the people, did not oppose reforms, and left the government largely in the hands of her ministers, which justified her being considered the most constitutional monarch of Britain. The home life of the queen was also an example to her subjects, and earned for the royal family the respect of the civilized world. She had nine children, the oldest daughter being the late Empress Frederick of Prussia, and the oldest son, Albert Edward, now reigning as Edward VII. The Queen's Jubilee was celebrated in 1887, and the Diamond Jubilee in 1897. She died Jan. 22, 1901, after a reign of sixty-three years. See *Life of the Prince Consort*, by Martin; *Leaves from the Journal of Our Life in the Highlands*, by the Queen; *Life*, by Greenwood; *History of Our Own Times*, by McCarthy; and *Journal of Victoria's Reign*, by Greville.

Victo'ria Nyanza (*nī-ăn'zȧ*), one of the great fresh-water lakes of Africa, is crossed by the equator, and is about 3,308 feet above the sea. The word "Nyanza" means a large body of water. The lake was discovered by Speke, the African traveler, in 1858, and he explored the western and northern shores again in 1862. The lake flows into a beautiful river, with cataracts, called Ripon falls, Karuma falls, and Murchison falls, the last, a descent of 120 feet, entering the Albert Nyanza after a journey of 100 miles. This river is now called the White Nile, and Victoria Nyanza is considered to be the source of the Nile.

Vien'na, the capital of the Austrian empire, is on the Danube river. An arm of the river, called the Danube canal, passes through the city, and a little stream, the Wien, flows into it and gives its name to the city. Vienna is in a plain, bordered by hills, belonging to the Styrian Alps. There are two parts — the old town, and the suburbs. The streets of the old town, run to a point in the center, like the spokes of a wheel. Between the old town and the suburbs is an open space, from 600 feet to 1,500 feet wide, turfed, shaded with trees, and laid out in walks, which occupies the place of the old wall and fortifications. The suburbs, thirty-six in number, completely surround the old town and are encircled by a wall twelve feet high, with thirteen gates, called the "lines" of Vienna. Another wide boulevard goes around the city, which is sixteen miles in circumference. The old town is the most fashionable part of the city, and contains the palaces of the emperor and nobility. The people live in flats, none but the richest nobles occupying a whole house. The apartment houses, called Zinspalaste (tenement places), are many of them finely adorned with statues and other ornaments, and are quite a feature of Vienna. Other modern buildings are the museums of art and natural history, the palace of justice, the houses of parliament, the new court theatre, and the new opera house, one of the finest in Europe. The most important of the old buildings is the Cathedral of St. Stephen, one of the finest specimens of Gothic architecture in Europe, with a tower 450 feet high, the catacombs where the emperors are buried, and the tombs of Frederick III. and Prince Eugene of Savoy. The imperial palace dates from the 13th century, though additions have been made to it at various times. It has a library of 400,000 volumes, and fine collections of antiquities and curiosities. The University of Vienna, established in 1365, has nearly 6,000 students. There are also two theological seminaries, a conservatory of music, a military school, an academy of science, and an academy of art. The academy of art, the Belvedere palace, and some of the private galleries of the nobles, have very fine collections of paintings, antiquities, and armor. The Prater is a great park of 2,000 acres on the east of the city, where the great exhibition of 1873 was held. Vienna has a large grain trade, and also exports wine, cattle, and manufactured goods, such as carriages, iron ware, and cotton and silk goods, rivaling Paris in its leather and fancy goods, and being noted all over the world for its meerschaum pipes and bent-wood furniture.

Vienna was probably originally a Celtic settlement. It was taken by the Romans, called Vindobona, and made a military post. In 180, Marcus Aurelius died there. Attila and his Huns occupied it for a time in the 5th century; the crusades made it prosperous by the large trade they brought to it, and in 1276 it became the capital of the Hapsburgs. It was besieged by the Hungarians in 1477, taken by Matthew Corvinus in 1485, defended bravely against the Turks in 1529, and again in 1683. It was the meeting-place of the

congress of Vienna in 1814, where the affairs of Europe were settled after the downfall of Napoleon. Population 1,364,548.

Villafran'ca, a town of Italy, nine miles south of Verona. Its chief industry is the silk trade. It is known as the scene of several battles, including the defeat of Charles Albert, king of Sardinia, by Radetzky, the Austrian general, July 25, 1848, and of the Italians by the Austrians, June 24, 1866. It is also noted as the place where (July 11, 1859) the emperors Napoleon III. and Francis Joseph signed the treaty which gave Lombardy to Victor Emmanuel, called the peace of Villafranca. Population 9,729.

Villars (*vil'arz*), **Claude Louis Hector,** Duke of, a French general, was born at Moulins, France, May 8, 1653. His first service was in Holland and Germany. During the time of peace he was sent as an ambassador to Vienna and Munich. In the war of the Spanish succession he captured Kehl, defended the northeastern frontier of France against Marlborough, and took several towns in Alsace. He was defeated at Ramilies and wounded at Malplaquet. His brilliant campaign in 1712, in which he defeated the Austrians at Denain, compelled Prince Eugene to raise the siege of Landrecies, and took several towns; brought about the peace of Utrecht (1713), and the peace of Rastadt (1714). When more than eighty years old, in 1733, when the war with Austria began, he was given command in Italy, but soon asked for his recall, and died on his way home, at Turin, June 17, 1734. He was made marshal-general of France by Louis XV., a rank before conferred only on Turenne.

Vill'iers. See BUCKINGHAM.

Vincennes (*vĭn-sĕnz'*), **Ind.,** an old settled historic city, the capital of Knox county, on the Wabash river, in southwestern Indiana, 50 miles north of Evansville, and about 105 miles southwest of Indianapolis. It is served by four railroads, and has a number of fine parks and public buildings. From 1800 to 1813 it was the capital of Indiana and was originally a fort, erected in 1702 by the French. Here is the seat of Vincennes university, with 300 students, and of a Roman Catholic academy, and other educational institutions. It has a number of industries, including flour and woolen mills, packing houses, breweries, brick and tile works, and carriage and furniture factories, etc. Population 10,249.

Vin'cent, John Heyl, bishop of the Methodist Episcopal church and chancellor of the Chautauqua system, was born at Tuscaloosa, Ala., Feb. 23, 1832, and educated at Lewisburg and Milton, Pa., and in the Newark (N. J.) Wesleyan institute. After this he removed to Illinois and there held charge at Joliet, Galena, Rockford, Mount Morris, and subsequently at Chicago. Here he founded the *Sunday School Quarterly* and the *Sunday School Teacher*, containing the lessons that have become international. With Hon. Lewis Miller, of Akron, O., he established the Chautauqua assembly in 1874, and four years later founded also the Chautauqua Literary and Scientific circle, of which he has since been chancellor. He has been preacher at Yale, Harvard, Cornell, Wellesley, and other colleges, and is the author of *The Chautauqua Movement*, *The Church at Home*, *Our Own Church*, *Little Footprints in Bible Lands*, *The Modern Sunday School*, *The Church School and Sunday School Institutes*, *Earthly Footsteps of the Man of Galilee*, *To Old Bethlehem*, *Studies in Young Life*, etc.

BISHOP VINCENT.

Vinci, da (*da vĭn'chē*), **Leonardo,** an Italian painter, was born at the Vinci palace, near Florence, Italy, in 1452. He was celebrated as painter, architect, sculptor, musician, scientist, engineer, and mechanic, anticipating many of the great discoveries of astronomy and geology. He founded an academy of art; executed a model for an equestrian statue of Francesco Sforza; traveled through Tuscany as an engineer and architect; and designed the canal of Martesana at Milan. His celebrated picture, *The Last Supper*, was a fresco in a convent at Milan, now in a damaged condition. The best copy, by one of his pupils, is in the Royal academy, London, and the most celebrated engraving of it is by Morghen. His *Adoration of the Kings* was painted at Florence, as were several portraits, now in the Louvre at Paris. He went with Francis I., as court painter, from Milan to France, where he died, near Amboise, France, May 2, 1519. See *Life*, by Clement; *Legends of the Madonna*, by Mrs. Jameson.

LEONARDO DA VINCI.

Vine. See GRAPE.

Vin'egar is a weak form of acetic acid, generally produced by fermentation of the juices of fruit, which have already undergone

alcoholic fermentation, and varying in flavor according to the material from which it is made. In Great Britain, vinegar is usually made from malt, which is fermented in casks, which are three-quarters full, with holes for the entrance of air. They are kept at a certain temperature (about 70°), and the process may take weeks or months. The vinegar is then filtered and cleared. What is known as the German rapid process consists in pouring the malt or fermented wort in a shower on to shavings in a cask, and drawing off the liquid and pouring it in again, repeating the process until the vinegar has the right degree of acidity. Wine vinegar is largely made in France, and other wine-producing countries from the poorer wines, and the lees or settlings of the wine vats. It is white or red, according to the color of the wines used. In the United States, cider vinegar is considered the best, and the process is essentially the same as that used in making malt vinegar, warmth and exposure to the air being the two necessary conditions. Home-made vinegar is often produced by putting what is known as the vinegar plant or "mother" into a weak solution of sugar or molasses. The vinegar plant is found in old vinegar barrels and is a fungus growth similar to the yeast plant. The word vinegar means sour wine. See FERMENTATION.

Vi'olets, a class of well-known plants, found mainly in temperate regions. There are over 200 species, which are sometimes divided into stemless and leafy-stemmed violets. The common violet, found wild in the United States in pastures and woods, has heart-shaped leaves and flowers usually light or dark violet, though there are white and yellow varieties; the round-leaved violet, found in the northern woods with yellow flowers; the sweet white violet, the larkspur violet, arrow-leaved violet, Canada violet, etc., are among the many varieties. The English violet is prized for its fragrance, and is cultivated extensively for winter bouquets. The most showy and popular variety of the violet is the pansy, or tricolor, which has been introduced from Europe. Its irregular-shaped flowers, with their beautiful coloring, in white and shades of purple and yellow, are among our commonest garden flowers. They are said to have been first raised about 1810 by Lady Mary Bennett from a common weed. They are called pansies from the French word "*pensées*" (thoughts), "heartsease," "none-so-pretty," "love-in-idleness," "Johnny-jump-up," and "kiss me at the garden gate."

Vi'olin', a stringed instrument, which is played with a bow. It is a hollow wooden box, made from pine and maple, or sometimes deal and sycamore wood, with a solid handle, and is strung with four strings. The bow is strung with horsehair, and when drawn across the strings sets them in motion. The different notes of the musical scale are produced by stopping the strings with the fingers on a fingerboard on the handle. The quality of a violin depends upon the fineness and thinness of the wood, the curvings and arches, the strings, the varnish, the shape of the sound-holes or openings, etc. The best violins were made at Brescia, Cremona, Mantua, Milan, and Venice, where on the southern slopes of the Alps could be found the fine elastic pine best adapted to the purpose. Salo, Maggini, the Amati family, Joseph Guarnesius, called "Gesu," and Stradivarius are among the most celebrated violin makers of Italy; Norman was the first English maker of violins, and Jacobs and Kloz are well known among German artisans. The greatest of all violin makers is Stradivarius, born in Cremona, in 1644. He learned his trade of the Amati family, but made such improvements that all violins since, whether good or bad, are copies of his work. A fine violin of his manufacture will bring from $1,500 to $3,000. The Cremona varnish, very fine, brilliant, clear, and red of brown in color, but in its most beautiful form resembling amber, was used by these Italian artists, but the secret of its manufacture or the mode of applying it seems lost. The viol was the original of the violin. It was a stringed instrument with from five to fifteen strings, and the fingerboard was divided by frets—strips of metals—as in the guitar. The viola and violoncello are varieties of the violin, called also tenor and bass viols. The violin is also called fiddle, from the Anglo-Saxon "*fythel.*" Violins are now made mostly in France and in Saxony. See STRADIVARI.

Vi'per, the common name for several very poisonous snakes of the Old World. They have a triangular head and a robust body. The European viper, often called the asp, is widely distributed in Europe. It is about two feet long, of yellowish brown color, with black spots. In England, a similar form commonly called the adder, is the only venomous reptile known to inhabit Great Britain. In Africa, the most common variety is the horned viper with a horn-like scale over each eye. It lies partly hidden in the sandy wastes of northern Africa, awaiting its prey. It is possible that this is the asp used by Cleopatra in committing suicide. There are two vipers in India, one about twenty inches long and the other about four feet long.

Vir'chow, Rudolph, a German physician and pathologist, was born in Pomerania, Oct. 13, 1821. He studied medicine at Berlin, and lectured on anatomy in the university there. In 1848, he became a leader of the Liberal party and was elected to the Prussian house of deputies, losing his position in the university because of his liberal ideas. He was appointed professor of anatomy at Würzburg in 1849, and in 1856 was called back to Berlin and

put in charge of a medical institute, and given the chair of pathological anatomy in the university. The Prussian government sent him in 1848 to Silesia, to study the typhoid fever that was prevailing there; and the Bavarian government, in 1852, asked his aid in ascertaining the causes of a famine fever; while the king of Sweden begged him to investigate the leprosy that was extensive in the western part of Norway. He has been a member of the German congress and for a long time was an alderman of Berlin. He has distinguished himself in a number of different fields of learning. He is recognized as the originator of cellular pathology, and, on account of the general bearing of his studies, as one of the founders of modern biology. Since 1856, he has been director of the Pathological institute, Berlin. He has published a large number of scientific papers, a hand-book of *Special Pathology*, one on *Cellular Pathology*, etc. On his seventieth birthday, Oct. 13, 1891, he was given a public reception, attended by thousands of his friends and former pupils.

Vir'eo or **Green'let,** a class of birds somewhat like the shrikes. They are found in America, migrating usually in May from South America to the United States. They are very destructive to insects, but are sweet singers. The color is usually a shade of green, with white markings. They build their nests in trees and bushes, hanging them from twigs and making use of pieces of hornet nests, flax, and paper, which they glue together with the silk from the caterpillar or the saliva of birds. The nests are so strong that other birds and even mice will use them after they are deserted by their owners. The red-eyed vireo, the white-eyed vireo, the solitary vireo, and the "Whip-Tom-Kelly," are varieties found in the United States.

Vir'gil, Publius Virgilius Maro, a Roman poet, was born Oct. 19, 70 B. C., at Andes, near Mantua, Italy. He studied at Cremona, Milan (then Mediolanum), and Naples, his father, a small landed proprietor, evidently appreciating his son's genius and having him carefully educated. He was not a Roman citizen by birth and does not seem to have aspired either to military or to political distinction. When the lands of the country were seized for the benefit of the army, his father lost his small farm, but it was restored by Virgil's influence with Pollio and the young Octavianus (Augustus). He had, however, to escape by swimming across the river from the violence of the soldier who held possession of it. He lived in Rome for a time, where he had for friends Mæcenas, Varius, and Horace, and afterward at Naples and Sicily, and went with Horace on his famous journey to Brundusium. In 19 B. C., he went to Athens, intending to spend three years in Greece and Asia in perfecting his *Æneid*, which was finished, but met Augustus at Athens, and was persuaded by him to return to Italy. He died on the journey, Sept. 21, 19 B. C. at Brundisium.

His tomb at Naples was long held sacred and visited as a temple. His fame rests on three works: the pastoral poems or *Eclogues*, the *Georgics*, and the *Æneid*, though a few other poems are thought to have been written by him. The *Eclogues* were published in Rome in 37 B. C., and are poems treating of matters of current interest, connecting with them the love of home and of nature. The *Georgics* are said to have been written at the suggestion of Mæcenas, and treat of the life and work of an Italian farmer. The cultivation of the fields, the constellations which serve for a calendar, the signs of the weather, the culture of the olive and the vine, the rearing of herds and cattle, and the care of bees, are the subjects of the four books. His great work, the *Æneid*, is in twelve books, and gives the history of the wanderings of Æneas and his final settlement in Latium. He had not finished the poem to his satisfaction, and in his last illness is said to have called for the cases that held the manuscript, intending to have it burnt. He also left directions in his will that none of his unpublished writings should be given to the world, but the commands of Augustus prevented the loss of this great poem. The Romans were very proud of Virgil and his work; his writings were used as text-books, and copied by later poets, while various traditions made him looked upon as almost a magician. Dryden's and William Morris' translations of the *Æneid* are among the best English translations. See *Roman Poets of the Augustan Age*, by Sellar.

Virgin'ia is one of the thirteen original states of the Union. It is a rough triangle in shape, with its broad base resting on North Carolina and Tennessee, running along Kentucky and West Virginia on its western side, and Maryland and the Atlantic ocean on the eastern side. Its longest line from east to west is 476 miles, and from north to south 192 miles; the whole area being 40,125 square miles. It has a hilly region and a region of lowlands, as the southeastern part is a broad, undulating plain, nowhere rising more than 800 feet, while the northwestern part has parallel mountain ranges, reaching in their highest points 5,700 feet, with valleys between. The region next the Atlantic, on the Chesapeake bay, called Tidewater Virginia, is divided into five great peninsulas, with hundreds of smaller ones, giving a coast line of nearly 2,000 miles. This region going inland for 100 miles only rises from 12 to 100 feet above the sea. Midland Virginia and Piedmont are two of the six steps by which Virginia rises gradually from the seashore to the Appalachian mountains, and reaches to the fourth rise, the Blue Ridge country, which is diversified by the two portions of the range, and the fine table-

lands, at heights varying from 916 to 5,700 feet. The valley of Virginia, the next step, 300 miles long, is a part of the great Appalachian valley, stretching from Canada to Alabama, and lies between the Blue Ridge and the Kittatinny or North mountains, and, with its broad valleys, its mountain chains and rivers, forms one of the finest regions in the United States. The Appalachian region has high mountains and deep, trough-like valleys, and forms the grazing and timber region of the state, while beyond lies the Virginia portion of the tableland stretching westward from the Alleghanies, which is the coal region. The highest peak in Virginia is Mt. Balsam (5,700 feet), on the border of North Carolina. The Potomac, Rappahannock, York, and James, with their tributaries, flow into the Atlantic ocean through Chesapeake bay. The Great Kanawha flows into the Ohio river, and other small rivers into the Tennessee river. The climate is as varied as the country, and the productions vary with it from the market gardens, and sweet potato, cotton, and peanut fields of the low coast region; the tobacco, wheat, and corn crops, orchards and vineyards of the middle regions; the pasture lands and big cattle farms of the higher valleys; to the great forests of balsam, pine, and other trees with which more than half the state is still covered. The state is noted for its clear skies, pure air, and freedom from great storms.

The mineral wealth of the state is scarcely developed. Gold, silver, iron, copper, lead, zinc, coal, granite, marble, plumbago, salt, and gypsum are found there. There are some gold mines in the belt which extends from Washington to Halifax Court House, 200 miles long, and from 15 to 25 miles wide, and the manganese mines are the largest in the world. Salt is obtained from artesian wells, which reach down to a solid bed of salt. There are many mineral springs, some of which, notably the White Sulphur, have long been popular as summer resorts. The Natural Bridge of Virginia, with a span of 80 feet, 215 feet high and 100 feet wide, is one of the most remarkable natural arches in the world. The caverns of Luray, Weyer's cave, and Madison cave, the Crabtree falls, descending 2,000 feet, and the Dismal swamp, covering 150,000 acres, are among the peculiar features of the state. The crops of Virginia include the cereals, early fruits, and vegetables for the northern markets, peanuts, one of its chief productions, and tobacco, for which it is famous; sumac leaves and sassafras oil are also special products, and its oyster beds are very productive. The manufactures of the state include machinery, especially that used on rice, sugar, and coffee plantations, locomotives, cigarettes, tobacco, and canned fruits and vegetables.

The school system of Virginia dates from 1870, and costs the state about $2,000,000 annually. In 1898, there were 1,873 schools in the state, the elementary ones having 8,658 teachers and 354,859 pupils, and the high schools having 178 teachers and 3,966 students, besides seven colleges. The College of William and Mary, now used as a state normal school, was for more than a century one of the principal southern colleges and stands next to Harvard in age, being the second college founded in the United States. The University of Virginia, near Charlottesville, owes its existence mainly to Jefferson. The old buildings were designed by him. It has a museum of natural history, a Gothic chapel, an experimental farm, and an observatory with one of the largest telescopes in the world. Washington and Lee university, named first Washington college, in honor of Washington, who endowed it with property given him by the state of Virginia, after being presided over for five years by Robert E. Lee, received its present name from the legislature. Hampden-Sidney college, Emory and Henry college, Randolph-Macon college, Roanoke college, Virginia Military institute, Virginia Agricultural college, with the United States experiment station, St. John's Theological seminary, and the Hampden institute, a training school for negroes and Indians, are among the other educational institutions of the state. There are national cemeteries at Arlington, Ball's Bluff, Culpeper, Fredericksburg, Richmond, etc., a navy yard and naval hospital at Gosport, an artillery school at Fortress Monroe, and a home for disabled volunteers at Hampton.

The whole country from Cape Fear to Halifax was first named Virginia, in honor of Queen Elizabeth (the Virgin queen), after its discovery by Raleigh. The first permanent English settlement in America was made at Jamestown on May 13, 1607. The London company, under whom the colonists had been sent out, held by charter from James I. the land for 400 miles along the coast and 400 miles back into the interior, and all islands within 100 miles of the coast. In 1619, negro slavery was brought into the United States by the sale of twenty slaves brought to Jamestown in a Dutch man-of-war. In 1744, Virginia established a fort at Pittsburgh on the Ohio, which was taken by the French, and the French and Indian war followed, ending in the treaty of 1763, which left the Mississippi river as Virginia's western boundary. In 1784, the state ceded to the United States all the land beyond the Ohio, on condition that slavery should be prohibited in the new states formed out of the territory. in the war of independence and in that of 1812 Virginia was very prominent, giving the head to the Revolutionary army and also the first President to the new republic in the person of Washington, whose home, Mt. Vernon, on the Potomac, has been presented to the nation. In the Civil war, Virginia at first refused to secede, but later joined the southern confederacy, losing thereby the western

part of the state, which refused to join in the act of secession. The state suffered more than any other state in the Union, being the most important battleground of the country, on which were fought some of the most destructive contests of the war, which ended on the soil of Virginia at Appomattox Court House, as had that of the Revolution by the surrender of Cornwallis at Yorktown. The chief cities of Virginia are the capital, Richmond (population 85,050), and Norfolk (population 46,624). Population of the state 1,854,184. See *History of Virginia*, by Magill; *History of Virginia*, by Burke; *Early Settlement of Virginia*, by Neill.

Virgin'ia City, a city in Montana, on the eastern slope of the Rocky mountains, 110 miles south of Helena. It was the capital of the territory for ten years. It was settled in 1863, when gold was found in the Alder gulch, one of the most famous mining regions in the world. This district has since yielded $50,000,000 worth of gold. Population 800.

Virgin'ia City, a city of Nevada, about 180 miles northeast of San Francisco. It is on the steep slope of Mt. Davidson, about 6,300 feet above the sea. It is built over the great Comstock lode, the largest mineral vein in the world (which see). The city was founded in 1859, and grew rapidly with the influx of gold-seekers, until in 1875 it had 15,000 inhabitants. Since then the mines have been less productive and the present population is only 9,000. The Comstock lode was discovered by a Virginian, and this fact has given the name to the city.

Virgin'ia Creep'er, a vine belonging to the grape family. It is found in North America, and known by its glossy five-parted leaves, which become a bright scarlet in the fall, and its dark-blue berries. It grows 50 feet or more, clinging by tendrils to old walls and trunks of trees. It is also called American woodbine and American ivy, and is sometimes mistaken for the poison ivy. It can be distinguished easily by its five-parted leaves from the poison ivy, which has three-parted ones. A Japanese variety of the American creeper has been introduced, with variegated leaves, which is very popular, and hardy as far north as Boston.

Vir'gin Islands, a group of over 30 islands, lying to the east of Porto Rico, in the West Indies, with an area of fifty-eight square miles. About one-fourth of them are inhabited. Sugar, molasses, cotton, salt, turmeric, pimento, and ginger are among the products. Most of the islands belong to Great Britain, and since 1872 are included with the Leeward islands, the president of the British Virgin islands being under the authority of the governor of the Leeward islands. The other islands of the group belong to Denmark, except Crab island, which is owned by Spain. Columbus discovered the islands in 1494. They were secured by Britain by settlement in 1635, shortly after the British occupation of the Bahamas. The chief town is Roadtown, on Tortola island. The other principal islands of the group are Anegada and Virgin Gorda. To Denmark belong Santa Cruz, St. Thomas, and St. John. Population 4,691.

Vir'gin Ma'ry. See MARY.

Viscos'ity of Liquids, a term employed in physics to describe a kind of friction between the particles of a liquid when the various parts of the liquid are moving with different velocities. If a surface of area, A, in the liquid be chosen in a plane parallel to one of the fixed walls of the vessel, then the viscosity of the liquid is expressed as follows: Let V denote the velocity with which the liquid is moving at the surface A; and let D be the distance from the surface A to the fixed parallel wall.

Then if R is the tangential resistance experienced by the plane A,

$$R = \frac{n A V}{D}$$

where n is a constant for any one liquid and is called the *coefficient of viscosity* for that liquid. This coefficient is the measure of the viscosity of any liquid. It is the viscosity of water that causes water waves to "die down" after a storm.

Vish'nu, one of the Hindu gods, belonging to their trinity, which consists of Brahma, the creator; Vishnu, the preserver; and Siva, the destroyer. In the *Rig-veda*, a sacred book of the Hindus, he is considered to represent the sun. In his character as preserver of the world, he has descended several times, to set it right. These appearances are called "avatars," in which the god is supposed to have taken the form of some animal, god, or man. There are usually ten of these avatars mentioned, such as the man, the lion, the fish, the dwarf, the Buddha. One more appearance is looked for, when the "close of the present age shall be nigh." Vishnu is represented with four hands, holding a shell to be blown in battle; a disc, an emblem of power; a mace, a symbol of punishment; and either a lotus flower or a sword. He is sometimes represented floating on a serpent, seated on a throne, or riding on an animal half bird and half man. See *Hindu Pantheon*, by Moor.

Vis'igoths. See GOTHS.

Vision (*vĭzh'un*). See EYE.

Vis'tula, a river of Europe which rises in Austrian Silesia, and crossing Russian Poland and Prussia, flows into the Baltic sea at Dantzic. It is navigable to Cracow, 550 miles, and 100 miles below its source. At Vistula in Silesia, there are falls of 200 feet.

Vladimir (*vlă'dĭ-mĭr*) **the Great,** a Russian emperor, who reigned from 980 to 1015. He added largely to the kingdom by conquest, but is best known for the introduction of Christianity into the empire. He embraced the doctrines of the Greek church, and was baptized at Constantinople in 988, the day after his marriage to the sister of the Turkish czar. He died in 1015.

Vladivostok (*vlă'dē-vŏs-tŏk'*), the chief naval station of Russia in Siberia, is on the gulf of Peter the Great in the sea of Japan. It is situated on the point of a peninsula, called the Golden Horn, on a strait named the Eastern Bosphorus, with one of the finest harbors in the world. The climate is severe, but the gulf is frozen only along the shores, even in December. The navy workshops have been established at Vladivostok, which, with the discovery of gold in the neighborhood, has increased the importance of the place. Some 3,000 or 4,000 Koreans are employed in gathering seaweed, which is sent to the Chinese markets. The city is connected by submarine cable with Nagasaki and Shanghai; and in 1897 that section of the great Siberian railway was completed which brought Vladivostok into communication with the rest of the Russian empire. There is also a series of military posts and telegraph lines. Population 28,896.

Vogt (*fokt*), **Karl,** a German naturalist, was born at Giessen, July 5, 1817. At Neufchatel he studied natural history for five years under Agassiz. He was made professor of natural history at Giessen in 1847, but lost his position and had to leave Germany because of his zeal in the revolutionary movements of 1848. In 1849, he was made professor of geology at Geneva, and held that position to the time of his death, May 6, 1895. He claims to have written the first volume and a part of the second of Agassiz's *Natural History of Fresh-Water Fishes.* He wrote also *Studies in Geology and Petrefactions; Man, His Place in Creation and in the History of the Earth; Essays on the Darwinian Theory;* works on physiology, zoology, anthropology, and geology, and many scientific papers. His work on *Faith and Science,* published in 1855, is best known, and has been severely criticised for its supposed atheistic tendencies.

Voice is the sound produced by the movements or vibrations of the vocal cords in the larynx. The larynx is in the neck, between the trachea or windpipe and the pharynx, that part of the throat directly behind and below the mouth. The vocal cords are two elastic bands fastened across the larynx between which the air from the lungs passes out. The arrangement resembles two strips of india rubber stretched across the mouth of a glass tube, into which air is forced by a bellows, which would cause the edges of the rubber strips to vibrate with sufficient rapidity to produce a sound, the pitch depending upon the number of vibrations in a second. The first thing necessary to produce a sound is the expulsion or driving out of the air through the glottis or opening between the vocal cords, and the second necessary condition is that the cords should be close enough together and tight enough to vibrate rapidly. All the variations between high and low notes are produced by changes in the width of the opening and in the tension or tightness of the cords. If the cords are more than one-tenth of an inch apart there will be no sound. The pitch of the voice, depending upon the number of vibrations in a second, is determined by the length, size, and tension of the cords. The pitch of the male voice is lower than that of the female voice, because the cords are longer. A boy's voice "breaks" and falls about an octave at the period of life when the cords lengthen; and in old age the voice changes, because the muscles which move the cords lose their elasticity. Hoarseness is caused by roughness or swelling of the cords. The ordinary range of the voice is two octaves, while the ear can perceive musical tones for eleven octaves. The quality of the voice depends upon the strength and elasticity of the vocal cords, and also upon the shape of the passages of the ear, throat, and mouth, through which the sound passes, a slight difference in these respects causing the same varieties of tone, etc., in the human voice, as in a musical instrument. Voice differs from speech, which is the production of sounds to express ideas. Animals have voice without speech. In speech the tones produced by the voice are changed by the action of the organs of the throat and mouth, such as the tongue, lips, teeth, palate, etc., into a large number of simple sounds, which, put together, form words. These vocal sounds are divided into vowels and consonants, the different combinations of which produce the hundreds of thousands of words which form the languages. See *Human Physiology,* by Carpenter; *Voice, Song, and Speech,* by Browne and Behnke.

Volca'noes, vents in the earth's crust from which lava is ejected. The lava may flow out quietly, or it may be ejected forcibly. In the latter case, much or all of it may be solid. Small fragments of solid lava are called cinders, but if they are as small as particles of fine sand or dust, they are called ashes. Volcanic ash does not, however, imply combustion. It is nothing more nor less than powdered lava. Besides the lava which issues from volcanoes, either in the liquid or solid form, many gases or vapors escape from the vents. Among the latter, water vapor is most abundant. Steam is, indeed, the principal force in the violent expulsion of materials from volcanoes of the explosive type. Chlorine and sulphur, and various compounds of these

substances, are among the commonest fumes escaping from volcanic vents. Carbonic acid gas is also one of the common gases. Many of the gases are noxious, so that it is sometimes difficult to approach the openings whence volcanic products issue.

The solid material and the liquid lava which escape from volcanoes accumulate about the vents, and build up volcanic cones. In the top of a volcanic cone there is generally a depression, the *crater*, in the bottom of which the vent is situated. When a volcanic cone becomes high, the lava may break through its sides, instead of flowing over the top. Cones built up by lava flows have low slopes, often less than 5°, and rarely so much as 10°; cones built up by cinders often have steeper slopes, but rarely more than 25° or 30°. When a volcano ceases to be active, it is said to be extinct, if the quiescence be permanent. When it becomes extinct, however, it really ceases to be a volcano. When the activity of a volcano is temporarily suspended, the volcano is said to be dormant; but it is often difficult to tell whether a volcano is extinct or only dormant. Vesuvius was thought to be extinct until the time of its destructive eruption in 79 A. D. When this occurred, it was seen that the volcano had been dormant only, instead of dead. A volcanic vent often continues to give off vapors and gases long after the lava ceases to issue. Vapors and gases also escape, and often in quantity, during periods when no lava is ejected.

When volcanoes cease to be active, their craters may be occupied by water, giving rise to crater lakes. Such a lake, Crater lake, exists in Oregon. Volcanic cones retain their perfect form for a short time only. Erosion by rain and melting snow soon modifies them. Volcanic cones in all stages of degradation occur in many mountain regions. Mt. Shasta in California, Mt. Ranier in Washington, and the San Francisco mountain in Arizona, may serve as examples of volcanic mountains in process of degradation. In southern California and northern Arizona, there are volcanic cones so recently formed that they have been modified scarcely at all by erosion. In many of them the craters are still preserved. These fresher cones are largely of cinders.

Volcanoes are often associated with earthquakes, and the violent eruptions of volcanoes are often the direct cause of earthquakes. In many cases, however, it may be true that the two phenomena, the earthquakes and the volcanic eruptions, are to be referred to a common cause, rather than either one to the other. In the explosive eruptions of Vesuvius, the quakings are felt for considerable distances from the crater. In many cases of violent eruption, the old cones are partly or wholly blown away. Even large parts of the islands where they occur may be demolished. Outside the present cone of Vesuvius, there is a remnant of an older cone, partially destroyed in a violent eruption subsequent to its formation. A large part of the island of Krakatoa was blown away in the eruption of the volcano of the same name.

The great destructiveness of volcanic action is more commonly due to the material blown out than to the lava which flows out. The flow of lava is usually slow, and in most cases it flows but a short distance before it congeals. But the solid matter may be widely distributed. It was by ashes ejected from Vesuvius that Pompeii, with its 2,000 people, was buried in 79 A. D. Torrents of rain, due to the condensation of the escaping water vapor, often fall with the ashes, converting them into a sort of hot fluid mud, and this is sometimes most destructive in its flow. In the Krakatoa eruption of 1883, it has been estimated that bits of pumice and dust were sent up into the air 20 miles. Sent up into the upper air by the violent explosion, some of the dust was carried by air currents completely around the earth. Large blocks of lava are sometimes hurled miles from the volcano whence they are ejected.

The number of active volcanoes is estimated to be between 300 and 400. About one-third of the active volcanoes are situated on the continents, the others on islands. Most of the volcanoes on continents are relatively near their borders, though extinct volcanoes occur at great distances from the coasts. Continental volcanoes are, on the whole, more numerous about the borders of the Pacific ocean than about the Atlantic. Many islands are really nothing more than the crests of volcanic cones which have been built up above the surface of the water. There are doubtless very many volcanic cones the tops of which are still below sea level. Of such submarine volcanoes, little is known. The lava which issues from volcanoes comes from the interior of the earth, but from what depths is unknown. Active volcanoes are more numerous in regions where the formations are relatively young than where they are old. They are thought to occur in regions where the crust of the earth is in movement, that is, where it is either sinking or rising, rather than in regions where it is stable.

No existing volcano seems to have been active for a period of time which would be considered long, as geologists reckon time, though many of those now known have been active since the beginning of the historic period. There is, however, reason to believe that all existing volcanoes will, in time, cease to erupt, and new ones will doubtless come into existence. Volcanoes have been more numerous at some stages of the earth's history than at others, but some of the periods of great volcanic activity were early in the earth's history, and some late. On the whole, it cannot be affirmed that volcanic activity has increased or decreased as the history of the earth has advanced.

Vol'ga, a river in Russia, which rises in the western part of the country in the Valdai hills, and by a winding course crosses Russia and flows through many mouths into the Caspian sea. It is the longest river in Europe, being 2,320 miles in length. It is connected by canals with the Baltic and White seas.

Vol'ta, Alessandro, an Italian physicist, the inventor of the Voltaic cell, was born at Como, Feb. 18, 1745, where also he died, on March 5, 1827. From 1779 to 1819 he occupied the chair of physics in the University of Pavia.

His discovery of the "electric pile" (as the form of battery which he devised was then and is still called) begins with the division of all conductors into two classes, *viz.*, conductors of the first class, which become electrified by contact, but in such a way that equilibrium is at once established without any permanent current; and conductors of the second class — what we now call electrolytes. Volta's discovery is that whenever two conductors of the first class are joined in series with a conductor of the second class, an electric current flows through the closed circuit. This phenomenon was first reported by letter to Sir Joseph Banks, then president of the Royal society, on March 20, 1800, and was read before the Royal society on June 26, 1800. The centennial of this important discovery was recently celebrated by an electrical exposition at Como. Volta is also the inventor of the electrophorus and of an absolute electrometer. See ELECTRICITY.

Voltaire (*vol-têr'*), **Francois Marie Arouet,** a famous French writer, was born at Chatenay, France, Nov. 21, 1694. His father's name was Arouet. After studying at Paris, and in his father's law office, he began his career as a literary man. He spent a year in the Bastille imprisoned on suspicion of having written some verses which reflected on the government, and there finished his *Œdipe*. On leaving prison he changed his name to Voltaire, which is probably an anagram on his original name. His tragedy was successfully brought out in 1718, but *Artémire* was hissed off the stage. On a visit to Holland, he met Rousseau, of whom he made an enemy by a sarcastic reply to Rousseau's question: "What is your opinion of my *Ode to Posterity?*" "It is a letter that will never reach its address," was the answer. His visit to England, which was an exile, introduced him to the literary men and the literature of England. Through the favor of Queen Caroline, who headed the list of subscribers, his *Henriade* brought him nearly $40,000, making him independent of the great men in France whose patronage had been so injurious to him. In 1729, he was allowed to return to France, where *Brutus*, *Eriphile*, and his best play, *Zaire*, were produced at intervals. His *English Letters*, reflecting on everything in church or state in France, under the pretense of praising England, brought out in 1733 was condemned and burned, he himself being safely out of the way in Lorraine, where he lived for fifteen years with Madame du Châtelet, writing and studying Newton's *Principia*. His *Mérope* and *Mahomet*, among his best plays, belong to this period, as also his *Age of Louis XIV*.

His life at the Prussian court, as the friend of Frederick the Great, lasted three years, with the jealousies, squabbles, and court quarrels which Voltaire always succeeded in falling into. Being refused permission to return to France, he bought Ferney, an estate four miles from Geneva, which was his home for the last twenty years of his life. Here he was visited by many of the most celebrated men of Europe, carried on an immense correspondence, rescued from want and educated a niece of Corneille, interfered in several cases of oppression and injustice, and adopted a young girl whom he had rescued from a convent. After the death of Louis XV. he was permitted to return to Paris, and on Feb. 10, 1778, he entered the city after twenty-eight years of exile. He was received with enthusiasm, and crowned with laurel at the theatre where his new play *Irene* was produced. He died at Paris soon after, May 30, 1778. His works fill about ninety volumes, including the tragedies *Zaire*, *Merope*, and *Mahomet*, which give him a place with the best French dramatists; historical works, which embrace *Charles XII.*, *Louis XIV.*, and *Peter the Great;* philosophical works, poems, criticisms, and miscellaneous writings. See *Life*, by John Morley.

Voltam'eter. See GALVANOMETER.

Voorhees (*vôr'hēz*), **Daniel W.,** an American politician, was born in Ohio, Sept. 26, 1827. He studied at Asbury university in Indiana, and began his law practice in that state, where he was appointed district attorney. He was a representative from Indiana for four terms of congress, became United States senator in 1877, and was re-elected in 1885 and 1891. He died April 10, 1897.

Vosges (*vôzh*), a range of mountains on the left bank of the Rhine, in northeastern France and western Germany. The tops are rounded and called balloons, and are covered with snow for several months in the year. Mines of iron, lead, salt, and copper abound.

Vul'can (Greek, *Hephæstus*), in Roman mythology the god of fire, was the son of Jupiter and Juno. He was deformed in his feet, from his birth, according to some stories, while others assert that his lameness was due

to his being hurled down to earth by Jupiter for interfering in a family quarrel. He fell on the island of Lemnos, where he built a palace, with a workshop and anvil. He had also a beautiful palace in Olympus, or according to others in the heart of an island, where with the help of the Cyclops, he made the scepter for Jupiter, the armor of Achilles, and the weapons of Hercules. There was a temple to him at Rome, and a raised square outside the city called the Volcanol, where statues of persons struck by lightning were sometimes placed. There were also several festivals in his honor.

Vul'ture, the common name for various carrion-eating birds of the Old World. They are birds from two to four feet long, and the largest of them have an expanse of wing from nine to ten feet. Their head and part of the neck is destitute of feathers. There are six species more or less common about the shores of the Mediterranean. Two of these inhabit Africa and the other four are found in Europe. There, the crested black vulture is the type; it is one of the large vultures reaching a length of nearly four feet. It ranges east through Asia to China, and south into northern Africa. Other common species are the griffon, the nubian, or eared vulture, and the Egyptian vulture. These birds are called the true vultures; they are closely related to the eagles and to buzzards. A number of

EGYPTIAN VULTURE.

American birds, belonging to a different family, are also called vultures. They include the carrion crow, the turkey buzzard (which see), and the California vulture. See CONDOR.

W

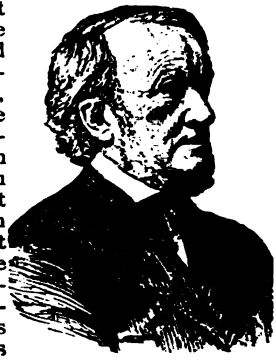
Wabash (*wŏ'bash*), a river of Indiana. It rises in western Ohio, runs through Indiana, forming for 100 miles the boundary line between that state and Illinois, and flows into the Ohio. It is 600 miles long, and is navigable for 300 miles.

Wa'co, a city of Texas, on the Brazos river. It is a prosperous manufacturing city and growing rapidly. There are fifteen public schools, one high school, four colleges, and Baylor university, founded by the Baptists in 1845. Population 20,686.

Wade, Benjamin Franklin, an American statesman, was born at Springfield, Mass., Oct. 27, 1800. He studied law in Ohio, and was three times elected state senator, becoming United States senator in 1851, again in 1857, and also in 1863. He was known as a strong anti-slavery man, being one of six senators who voted to repeal the fugitive slave law. He also opposed all the measures proposed as compromises between the north and the south, and was influential in getting the homestead bill through congress. After the death of President Lincoln, Wade was acting Vice-president of the United States. He died at Jefferson, O., March 2, 1878.

Wads'worth, James, a New York pioneer, was born at Durham, Conn., April 20, 1768. He with his brother in 1790 bought a large tract of land in what is now the town of Geneseo, N.Y., and became one of the great landowners of the state. He was very active in promoting the interests of religion and education in the new state, publishing pamphlets, paying for lectures on education, and giving a premium to any town that started a school library. A library was founded by him at Geneseo, and in all his land sales he insisted that 125 acres should be set apart for a church and 125 acres for a school. He died June 8, 1844.

Wagner (*väg'ner* or *wăg'ner*), **Wilhelm Richard,** a German musical composer, was born at Leipsic, May 22, 1813. He was educated at Dresden and Leipsic, and in 1836 was made conductor of the opera at Magdeburg. *Rienzi* and *The Flying Dutchman* were composed at Paris, where *Rienzi* was unsuccessfully put on the stage, but at Dresden it made him a musical conductor. For his next opera, *Tannhäuser*, he went to the old German songs, but the work was only partially successful when brought out at Dresden. During the revolution of 1849 in Saxony, Wagner was prominent as a leader and had to flee to Zurich, where he lived ten years, until allowed to return. *Lohengrin*, composed before he left Dresden, was produced at Weimar under the direction of Liszt in 1850, and in answer to Liszt's call for a new creation he began his collection of operas based on the *Nibelungenlied*. In order to bring out his "festival stage play," as he called his Nibelungen collection of operas, he built a theatre at Bayreuth, Bavaria. Founded on the old German poem, it was a great success, both in Bavaria and at London, where Wagner was present at its performance in 1877. His last and perhaps greatest work, *Parsifal*, founded on the story of the Holy Grail, was finished at Palermo, in 1882. He died at Venice, Feb. 13, 1883, and was buried at his home at Bayreuth. See HOLY GRAIL, and NIBELUNGENLIED. See also *Life*, by Nohl.



WILHELM RICHARD WAGNER.

Wagram (*vä'gram*), a village in Austria, ten miles from Vienna, important as the site of the great battle between the Austrians and the French in 1809. Napoleon surprised the Austrians under Archduke Charles by crossing the Danube at night, and was at first driven back; but the next day the French, with a loss of 25,000, forced the retreat of the Austrians, who left 25,000 dead on the field. This battle was followed by the peace of Vienna, Oct. 14, 1809.

Wain'wright, Richard, American naval officer, was born at Washington, D. C., Dec. 17, 1849 (the son of Commander R. Wainwright, who died near New Orleans while commanding Farragut's flagship *Hartford*, Oct. 10, 1862). Young Wainwright entered the Naval academy and graduated in 1868, when he was attached for a time to the brig *Jamestown*, on the Pacific station. Later on, he served on the Asiatic station, and after gaining a lieutenancy he did duty on the coast-survey vessel *Arago*. In September, 1894, he reached the rank of lieutenant-commander, and was executive officer on the battleship *Maine*, when she was destroyed in Havana harbor (Feb. 15, 1898). After this, he did good service at the battle of Santiago de Cuba as commander of the gunboat *Gloucester*, when Cervera's squadron was destroyed. He has since been in command of the ships of the United States navy at the Naval academy, Annapolis, Md.

Waite, Morrison Remich, an American statesman, was born at Lyme, Conn., Nov.

29, 1816. He graduated at Yale and began practicing law at Maumee City, O., afterward settling in Toledo. His reputation as a lawyer led to his being sent to Geneva, in 1871–72, as one of the counsel for the United States in the Alabama case. He presided over the constitutional convention of Ohio in 1873, and in 1874 was appointed chief-justice of the United States. He died at Washington, D. C., March 23, 1888.

Wake, from the Anglo-Saxon word meaning to watch, is a religious festival, once universal in England. The early churches were dedicated to a particular saint, and the festival was kept on the birthday of that saint. The day at the time was reckoned from sunset to sunset, so that the first part of the festival was the night watch, hence the name "wake." These festivals degenerated into fairs, because of the peddlers, etc., who were attracted by the crowds, and became scenes of riot. They were forbidden to be held in the country churchyards by Edward I., and Henry VI. abolished all selling at wakes, except of food, while Henry VIII. made the first Sunday in October the day of the feast. The wake is still observed in some country parishes in England. The Irish wake is the custom of watching all night around the dead, which is often accompanied by loud moaning, drinking, and even riot.

Wake-Rob'in, the common name of species of trillium, and also for the plant known as "Jack-in-the-pulpit." There are several varieties of the trillium, which is a species of lily. They grow in damp woods from Canada to Georgia, and are among our best-known wild flowers. There is usually a long stalk with a cluster of three leaves, with a single white or purple flower. The curious Jack-in-the-pulpit, which is called wake-robin in the south, has a large greenish or purplish spathe, or leaf-like envelop, turning over like a hood, which incloses a long finger-shaped stem, called the spadix. The calla lily belongs to the same family.

Waldenses (*wŏl'dĕn-sēz*) or **Vaudois,** a Christian denomination in Italy, founded about 1170 by Peter Waldo, a rich merchant of Lyons, who sold his goods and gave them to the poor, then went forth preaching voluntary poverty. His followers were called the "Poor of Lyons." They did not intend to secede from the church, but thinking it utterly corrupt, they sought to bring it back to its primitive purity. When the archbishop of Lyons commanded them to be silent, they appealed to Pope Alexander III., but he also forbade their meetings. Waldo, however, continued to preach, and with his followers was excommunicated. His doctrines spread in Italy, France, and Bohemia, and especially in the valleys of Piedmont, where the Waldenses were greatly persecuted during the 16th and 17th centuries. In 1680, they suffered at the hands of an Italian and French army, 3,000 being killed, 10,000 imprisoned, and 3,000 of their children being placed in different Catholic towns and villages. They had permission to emigrate the next year, and about 5,000 went from Piedmont to Switzerland, Holland, Brandenburg, Hesse, and Würtemberg. There are now ten congregations in Würtemberg, with over 16,000 members. When all Italy was opened to them, in 1858, they chose Florence as their center, removing there their theological seminary and printing press. They formed an Italian evangelical publication society in 1861, and have been especially active in printing religious books. They accept the Bible as their only rule of faith, but hold their *Confession of Faith*, published in 1655, as the most correct interpretation of it.

Waldersee (*väl'der-zā*), Count **Alfred von,** a German general, recently in command of the allied forces in China during the Boxer rising, was born at Potsdam, April 8, 1832, and entered the German army in 1850. He served with distinction through the war of 1866, and was chief of the general staff in the Franco-German war; he succeeded Von Molke as chief of staff in 1888, and in 1891 became commander of the ninth army corps. In 1895, he was created field-marshal, and in August, 1900, was appointed to the chief command in China of the allied armies engaged in suppressing the Boxer disturbances at Pekin and in the province of Pe-chili. In 1874, he married an American lady, widow of Prince Frederick of Schleswig-Holstein.

Wales, a part of Great Britain, is a peninsula on the western coast of England, lying between the Bristol channel and the Irish sea. It is 136 miles long and about 90 wide, with an area of 7,442 square miles, making it about as large as Massachusetts. It has a broken coast line of 360 miles, and is a mountainous country. The Snowdon mountains in the north, the Plinlimmon, and the Black mountains are the main ranges, with peaks over 3,000 feet high. There are several small streams, and only one lake, Bala. The country abounds in minerals; copper, lead, iron, coal, zinc, and silver are found, and remains of gold mines worked by the Romans. The climate is not severe, though somewhat cold and very damp. Butter, cheese, wool, and grain are among the most important products, and iron and flannel are the principal manufactures. All children between the ages of five and fourteen are required to attend schools provided for them, which are practically free. In 1897, Wales expended $200,310 on its secondary and technical schools. Among the higher institutions are: the University of Wales, consisting of the Aberystwith, Bangor, and Cardiff colleges; University college; St. David's college; St. Beuno's college; and colleges at Bala, Brecon, Llangollen, and Trevesca. The people are

of Celtic origin, and call themselves Cymri, the name Welsh being given them by the English. The English language is spoken in most of the large cities, but Welsh or Cymraeg, as they call it, is the language of the country. It is the best preserved of the Celtic dialects.

Wales was inhabited by three Celtic tribes when the Romans invaded it, but never conquered it. It was in constant warfare with the Saxons and the Danes, paying tribute to Athelstan, king of England, and later to Harold. William the Conqueror subdued it, and the English kings have ever since claimed possession of the country. In 1267, Llewellyn ap Gryffith was acknowledged prince of Wales by Henry III., but refusing to obey the call of Edward I. to parliament, was attacked and defeated. In 1282, he rebelled again, was slain in battle, his brother David, who succeeded him, was executed as a traitor, and Wales was united to England. The title Prince of Wales has been given ever since to the eldest son of the English sovereign. Under Owen Glendower the Welsh made a final effort for freedom, the struggle lasting fifteen years from 1400 till his death in 1415. Population 1,519,035.

Walhalla (*wŏl-hăl'la*) or **Valhalla** (the hall of the slain), in Scandinavian mythology, the hall where were gathered the dead who had fallen in battle. The hall, according to the legend, was in Gladsheim (the house of joy), with a grove of golden-leaved trees around it. It was ornamented with shields and spears, and had 540 doors so wide that 800 people could walk abreast through them. Every morning the inmates marched out at the crowing of the cock, and fought furiously until noon, when all wounds were healed, and they sat down to a banquet with Odin, where they were waited on by the Walkyries, or battle maidens.

Walker (*wâ'ker*), **Amasa,** an American political economist, was born at Woodstock, Conn., May 4, 1799, and died at Brookfield, Mass., Oct. 29, 1875. His early career was spent chiefly in commercial pursuits, but for six years (1842–48) he lectured on political economy at Oberlin college, and subsequently (1859–69) at Amherst. In 1848, he was a member of the Massachusetts assembly, and in the following year member of the state senate. In 1862–63, he sat in congress as member (Republican) for Massachusetts. He was a zealous advocate of temperance, was active in the anti-slavery movement, and was one of the founders of the Free Soil party. He was an authority in finance, and wrote a series of articles on political economy. In 1857, he published a work on the *Nature and Uses of Money*, and in 1866 issued *The Science of Wealth*. His son, Francis Amasa, was professor of political economy and history in the Sheffield Scientific school at Yale (1873–81).

Wal'ker, Francis Amasa, American statistician and political economist, was born at Boston, Mass., July 2, 1840, and died there Jan. 5, 1897. Graduating from Amherst in 1860, he took part in the Civil war and in 1865 rose to the brevet rank of brigadier-general of volunteers. He was wounded at Chancellorsville, and for a time was an inmate of Libby prison. In 1871–72, he was United States Indian commissioner; he was also chief of the bureau of statistics at Washington, and superintendent of the 9th and 10th United States censuses. From 1873 to 1881 he was professor of political economy in the Sheffield Scientific school at Yale, and in 1881 became president of the Massachusetts Institute of Technology at Boston. In 1898, he acted as United States commissioner to the international monetary conference at Paris, and in the same year was elected to the National Academy of Sciences, and made an honorary fellow of the Royal Statistical society of London. His published writings include *The Indian Question; The Wage Question; Money; Money, Trade, and Industry; Land and Its Rent; Political Economy; Bimetalism;* and a *History of the Second Army Corps.*

Wal'ker, Robert James, American statesman and financier, was born at Northumberland, Pa., July 19, 1801, and died at Washington, D. C., Nov. 11, 1869. Graduating at the University of Pennsylvania in 1819, he studied law and practiced first at Pittsburg, Pa., and then at Natchez, Miss. Here he came into notice as an opponent of nullification, and from 1836 to 1845 was United States senator from Mississippi. In 1845, he was secretary of the treasury in Polk's cabinet, and prepared and carried what was then known as the "Walker Tariff." In 1857, he became governor of Kansas, and in the years 1863–64 was financial agent of the United States in Europe. Throughout the Civil war, he remained loyal to the Union and advocated vigorous measures for the suppression of the rebellion. In later years he practiced law at the capital, where he died in his 68th year.

Wallace (*wŏl'ăs*), **Alfred Russel,** a distinguished English traveler and naturalist, was born at Usk, Monmouthshire, Jan. 8, 1823, and received his education at the Grammar school at Hertford. From an early age he manifested a great love of nature, with marked scientific tastes. This bent was greatly developed in a voyage he made, in company with W. H. W. Bates, a naturalist, to South America, an account of which he has given us in his *Travels on the Amazon and the Rio Negro*, with a fund of material on the physical aspects of these great water-systems, enriched by valuable botanical and ornithological collections. Of this voyage we have further results in his *Palm Trees of the Amazon, and Their Uses*, and *Tropical Na-*

ture, dealing with the colors of bird, animal, and insect life, and on the geographical distribution of plants and animals, sexual selection, etc. A prolonged visit to the Malay islands (1854–62) is the source of his work on *The Malay Archipelago*, published in 1869. This and a volume entitled *Contributions to the Theory of Natural Selection* give him place alongside Darwin as an exponent of evolution — his views on natural selection and variation being, like Darwin's, an explanation of the mode of origin of existing species of animals and plants. A little volume (issued in 1889) explains his theories in regard to evolution and Darwin's work: the volume is entitled *Darwinism*. Two other works from his pen also throw valuable light on the evolutionary theory, *viz.*, *Natural Selection* (1870), and *The Geographical Distribution of Animals* (1876). For these labors, Doctor Wallace received the founder's gold medal of the Royal Geographical society, the gold medal of the Linnæan society, and the first Darwin medal of the Royal society. Among his other published works are a volume on *Australasia*, contributed to Stanford's *Compendium of Geography and Travel; The Wonderful Century, Its Successes and Its Failures* (1898); *Island Life* (1880); *Miracles and Modern Spiritualism* (1874); *Bad Times* (1885); and *Land Nationalization* (1882), comprising his views as a social reformer.

Wall'ace, Lewis, an American general and writer, was born at Brookville, Ind., in 1827.

GEN. LEW. WALLACE.

His military service was in the Mexican war and in the Civil war, where he commanded a division at the capture of Fort Donelson, and guarded Cincinnati when besieged by Gen. Kirby Smith. In July, 1864, though defeated by General Early, who was marching on Washington, his attack detained the Confederate forces until Grant had re-enforced the capital. He was governor of Utah from 1878 to 1881, and minister to Turkey from 1881 to 1885. His writings include *The Fair God*, a story of the conquest of Mexico; *Life of Benjamin Harrison*, *The Boyhood of Christ*, *The Prince of India*, and one of the most popular books of the kind, *Ben Hur, a Tale of the Christ*.

Wall'ace, Sir **William,** the most popular national hero of Scotland, was born about 1270. While studying at Dundee, so tradition relates, he killed a young Englishman in revenge for an insult, and was outlawed. He gathered around him a band of desperate men, whom he led in attacks on the English. His followers and his successes increased until the English king recognized it as an insurrection, and sent an army against the insurgents, when most of the nobles deserted Wallace. He fled to the north, soon collected another army, and drove the English from Scotland, and was chosen guardian of Scotland in 1297. The English renewed the contest, and the Scottish nobles again deserting, Wallace was defeated at the battle of Falkirk, 1298, and a price put upon his head. He was captured and executed as a traitor, Aug. 22, 1305, though he denied the accusation of treachery, saying he could not be a traitor to the king of England as he had never been his subject. See *Early Days of Wallace*, by Bute; *Life*, by Carrick; and *Tales of a Grandfather*, by Sir Walter Scott.

Wallachia (*wo-lā'kī-ā*). See RUMANIA.

Walla Walla (*wŏl-a-wŏl'a*), (meaning "many waters"), **Wash.,** a city on the Walla Walla river, capital of the county of the same name, in southeastern Washington, 245 miles east of Portland, 75 miles southwest of Lewiston, Idaho, and 125 miles south of Spokane. It is the seat of a United States military post, and of the state penitentiary. Here, also, is located Whitman (Congregational) college, and a number of important educational institutions. It is a considerable trade center, especially for the region about (an agricultural, fruit-growing, and stock-raising one), including northern Idaho and northeastern Oregon. It is situated on the Union Pacific railroad. The city has ample water-power and has a number of manufactories, including flour-mills, foundries, and machine shops; lumber, sash, door, and blind factories; iron and wire-fence works, etc. Population, which has more than doubled in the past decade, 10,049.

Wallenstein (*wŏl'en-stīn*), **Albrecht Eusebius von,** was born in Bohemia, Sept. 24, 1583. After the death of his parents, who were Protestants, he was sent by an uncle to the Jesuit college at Olmütz, where he joined the Catholic church. His studies at Altdorf, Bologna, and Padua resulted principally in a faith in astrology and trust in the stars. He served in the Hungarian army, and on the side of the emperor in the troubles in Bohemia, securing in the confusion the large estates belonging to his mother's family, and confiscated lands, which he formed into a state called Friedland, and in 1623, was given the rank of prince. In 1626, Wallenstein raised an army of 30,000 men for the Emperor Ferdinand, and joined with Tilly, the great German general, against Christian IV., who was obliged to accept terms of peace in 1629, though Wallenstein had failed in his plan of reaching the sea, and destroying the naval power of Scandinavia and of England. He

secured for himself the duchy of Mecklenburg. His success, ambition, and arrogance made the princes of the kingdom combine against him, and to prevent civil war the emperor, in September, 1630, removed him from the head of the army; but with the advances of Gustavus Adolphus, he was recalled, and in 1632 with an army of 40,000 men, he drove the Saxons from Bohemia and attacked the Swedish army at Nuremberg and Lützen, where, though Wallenstein's forces were defeated, Gustavus Adolphus was killed. Wallenstein failed to follow up the advantage this gave the Austrians, as he was secretly negotiating with Saxony, Sweden, and France, with the condition that he should be given Bohemia. He had blind confidence in his army, and in his destiny, as foretold to him by his astrologers, and did not realize his danger, though knowing that the emperor knew of his plans, until an order was issued at Prague, charging him with treason, and naming his successor. He fled with 1,000 followers to Eger, where he was assassinated, Feb. 25, 1634. Though the deed was not ordered by the emperor, the murderers were rewarded. See *Wallenstein's Death*, by Coleridge; *Life*, by Mitchell; *The Thirty Years' War*, by Schliler; *The House of Austria*, by Coxe.

Walloons (*wo-lönz'*), the name of the people living in southeastern Belgium, who differ from the rest of the Belgians by language and by their darker color. They are descendants of the Belgæ, a tribe of Gauls, who held their ground among the Ardennes mountains when the rest of Gaul was overrun by German conquerors. Their language is a French dialect, with a large proportion of Gallic words. The name "Walloon," that is, Welsh or "foreign," was given them by their Flemish neighbors. They are steadily increasing in numbers, and are likely soon to overbalance the Flemish population of Belgium, as they already take the lead in everything, except music and painting. They number about two and one-half millions.

Wal'nut, species of *Juglans*, and native of the temperate regions of the northern hemisphere. They are fine forest trees, and also yield most valuable timber. The nuts of various species are well known. The "English walnut" is *J. regia*, and is the common walnut of commerce. The common "black walnut" of the eastern United States is *J. nigra*, well known for its fine dark timber, as well as for its characteristic nuts. The "butternut" or "white walnut" of the same region is *J. cinerea*.

Wal'pole, Horace, earl of Orford, an English author, was born at London in 1717. He studied at Eton and Cambridge, traveled in Italy, and took his seat in parliament in 1741, but was never active in public life. His home at Twickenham, near London, called "Strawberry Hill," adorned with vast collections of pictures, books, manuscripts, armor, etc., was one of the sights of the time, and admittance was granted by ticket to parties of four from May to October. His writings include *Castle of Otranto*, *Memoirs of the Last Ten Years of the Reign of George II.*, *Memoirs of the Reign of George III.*, *Catalogue of Royal and Noble Authors*, *Historic Doubts on the Life and Reign of King Richard III.*, *Anecdotes of Painting in England*, and *Catalogue of Royal and Noble Authors of England*. But his fame rests upon his *Letters*, which are the product of years of acquaintance with public men and events, and entitle him to the rank of one of the best letter writers in English literature. He died March 2, 1797. See *Letters*, edited by Cunningham; *George Selwyn and His Contemporaries*, by Jesse; and essay on *Letters of Horace Walpole*, by Macaulay.

Wal'pole, Sir **Robert,** earl of Orford, an English statesman, was born at Houghton, in Norfolk, England, Aug. 26, 1676. He studied at Eton and Cambridge. Entering parliament in 1701, he became secretary of war in 1707, and treasurer of the navy in 1709. He defended the Whig party with both voice and pen, and his political enemies brought against him a charge of corruption, for which he was expelled from the house of commons and imprisoned in the Tower. With the accession of George I. he became in succession privy councilor, chancellor of the exchequer, and first lord of the treasury. Jealousy among the Whigs and the opposition of the German favorites of the king compelled Walpole's resignation in 1717, but in 1721 he was again called to power, and remained prime minister of England until 1742. His policy was to maintain peace abroad and quiet at home, and during his administration the country was very prosperous. The difficulties between King George II. and the Prince of Wales led to his resignation, when he was made earl of Orford. Charges of bribery were brought against him, but failed to be supported, though he doubtless did not scruple to gain his ends by this means. He died in 1745. See *Memoir of the Life and Administration of Sir Robert Walpole*, by Coxe.

Walpur'gis Night is in Germany the night in which the witches and wizards hold their yearly gathering, the largest being the one held on the Brocken in the Harz mountains. It was originally a vigil kept the night before May 1, in honor of St. Walpurgis, a sister of some early English missionaries to Germany, who established convents in that country, but it was changed with the belief in witchcraft to its present signification.

Walrus (*wŏl'rŭs*), a marine carnivorous mammal, closely related to seals and sea lions. It is known by its enormous down-turned tusks, or canine teeth, projecting from the upper jaw. They sometimes reach a length

of sixteen inches beyond the sockets. Walruses have a thick clumsy body, deepest at the shoulders, and their feet, which are adapted

WALRUS.

for swimming, are also furrowed so as to hold on to smooth surfaces. They reach a length of twelve feet or more and a weight of 2,200 pounds. There are two living species, one found in the Atlantic and one in the Pacific. The Atlantic form is still found on the coast of Labrador and Hudson bay, but formerly extended further south. The Pacific form is more northern, being rarely found on the mainland. They feed largely on clams and other mollusks, which they dig from the sea bottom with their tusks. They visit islands and ice floes, and congregate in considerable numbers during the breeding period. They are hunted for their hides and oil.

Walsall (*wôl'sôl*), a town in Staffordshire, England, eight miles northwest of Birmingham. Its churches and most of its public buildings are all modern. Harper's almshouses founded by James I., memorial cottages for twelve poor couples or widows, and cottage hospital are among its charities. It has a public library, town hall, guildhall, theatre, and schools, including a grammar school founded in 1554. Its situation in a region of extensive coal mines and limestone quarries, with iron, stone, and brick clay near, makes it a manufacturing town, with iron and brass foundries. Locks, keys, bolts, pulleys, and all kinds of ironware used in making carriages or harness are special manufactures. Walsall was fortified by Ethelfleda, daughter of Alfred the Great, held by William the Conqueror as a royal house, belonged to Richard Neville Warwick (the king-maker), and was given by Henry VIII. to the duke of Northumberland. Population 74,789.

Walsingham (*wol'sing-am*), Sir **Francis**, an English statesman, was born at Chiselhurst, Kent, in 1536. He studied at Cambridge. He was distinguished among Queen Elizabeth's ministers for his acuteness and knowledge of public affairs. He was sent on an embassy to France in 1570, to the Netherlands in 1578, to France again in 1581, and to Scotland in 1583. He was secretary of state to Elizabeth, and managed foreign affairs by a system of spies, having had, it is said, nearly sixty, "agents" in his service. In this way he got possession of the correspondence of Mary, Queen of Scots, which was used to prove her guilty of conspiring against the life of Queen Elizabeth, and he was one of the commissioners at her trial. He died April 6, 1590.

Waltham (*wôl'tham*), a city of Massachusetts, on the Charles river, ten miles northwest of Boston, is a suburb of that city. It has a Swedenborgian theological seminary, a free public library, and numerous schools and churches. It is known all over the world for its machine-made watches, of which about 1,400 a day are turned out. There are also cotton cloth, hosiery, machinery, paper, boots, and shoes produced, and there are bleaching and dye works. It was settled in 1630. Population 23,481.

Walther von der Vogelweide (*vâl'ter fon der fō'gel-vī'de*), (Walter of the Bird-Meadow), a German minstrel or minnesinger, was born in Tyrol, between 1165 and 1170. He was attached to the court of Duke Frederick of Austria, at Vienna, for many years, and at his death went from court to court after the fashion of the minnesingers. His early poems were love songs, but the crusades and civil troubles of Germany furnished the subjects of his later verses. He stands in the front rank of the lyrical poets of his country. He died in 1228 at Würzburg, where Frederick II. had given him a valuable estate. A monument was erected there to his memory in 1843, and a statue of him at Innsbruck in 1877. See MINNESINGERS, and LITERATURE, GERMAN.

Walton (*wôl'ton*), **Izaak**, a famous English author, and the "Father of Angling," was born at Stafford, England, Aug. 9, 1593, and died at Winchester, England, Dec. 15, 1683. He was engaged in trade in London, as a linen-draper, between the years 1624 and 1644, and made a competence, upon which he retired and devoted himself to literary pursuits, and to angling, of which he became a renowned exponent. Besides his quaint and fascinating treatise on the rod — *The Complete Angler, or the Contemplative Man's Recreation* (1653), he wrote a series of sketches of English divines, embraced in what is known, in their collective character, as *Walton's Lives*. These sketches dealt with Dr. John Donne, Richard Hooker (the judicious Mr. Hooker), the poet and divine George Herbert, Bishop Robert Sanderson, and Sir Henry Wotten, the English diplomatist and author. *Walton's Lives* have deservedly found a place in the best literature and are sure of a long immortality. Considering the stormy era in which he lived, that of the great English rebellion (1642-80), waged by the Parliamentary army against Charles I., and on to the Restoration, it is curious to note the serenity of mind and life of Master Izaak Walton.

Wal'worth, Reuben Hyde, an American lawyer, was born at Bozrah, Conn., Oct. 26, 1789. He settled at Plattsburg, N. Y., where he began his law practice, moving afterward to Saratoga. He was a member of congress, circuit judge, and chancellor of the state for twenty years. He was considered an authority on all matters connected with courts of equity, and was one of the greatest lawyers of America. He died at Saratoga, N. Y., Nov. 21, 1867.

Wampum (*wŏm'pum*), the name of Indian money, consisting of strings of shells and shell beads, which were worn as ornaments. They were used mostly by the Algonquins, and were made on Long Island and around New York. The white wampum, called "wampumpeag," was made from the conch shell, and the black or purple wampum, or "suckanhock," from the hard-shell clam. The black was worth twice as much as the white. The beads were made by breaking the shells, rubbing the pieces smooth on a stone, and drilling holes in them so they could be strung. The French, Dutch, and New England settlers made use of them, from four to six beads being worth a penny. A string was called a fathom, and was worth from five to ten shillings. A string of wampum was given with every article of a treaty, and a belt of wampum to bind the whole transaction. The belts were embroidered with colored beads, which formed a record of the event.

Wan'amaker, John, an American merchant, ex-postmaster-general of the United States (1889–93), and man of affairs, was born at Philadelphia, Pa., July 11, 1838, and was educated in the public schools of that city. In 1861, after removing for a time to Indiana, he set up in business for himself in his native city; and in 1876, after turning his establishment into a colossal department store, with a separate house in New York city, he became the head of the firm — one of the largest concerns in the United States. In the conduct of these establishments, he introduced the profit-sharing system among his employees, to their great pecuniary advantage; while his philanthropies manifested themselves in other directions, especially in the founding of Bethany Presbyterian church and its organizations at Philadelphia, and presiding over the Young Men's Christian association in that city. He also showed his great organizing and executive ability in the office of postmaster-general of the United States, to which he was appointed in 1898 by President Benjamin Harrison. During the Civil war, he was one of the founders of the "Christian Commission." In politics, he is an independent Republican, and an opponent of the "machine."

Wan'dering Jew, the name given to the hero of a popular legend. In one story he belonged to the tribe of Naphtali and went with the three wise men from the east to Bethlehem, and his stories of the adoration of the infant were the cause of Herod's slaying the children of that region. As a carpenter, he was making the cross for Christ, when He passed on His way to Calvary, and refused Him rest. Christ bade him wander through the earth, without rest, till His second coming, which he has done ever since, seeking death in vain — so runs the legend. In another form of the story, he was a shoemaker at his bench, whereon he refused the Saviour permission to rest. The legend appeared first in the chronicle of Matthew of Paris, and many poems and novels have been based on it, notably *The Wandering Jew*, by Eugene Sue. It has also been the subject of illustrations, among the finest being those by Gustave Doré.

Warb'ler, the name for any one of a family of small abundant birds. There are two distinct families, the Old World and the New World warblers. The latter are the ones especially referred to here. There are about 100 species, all American. Many of them are less than five inches long, and nearly all are less than six and one-half inches. They show great variation in colors and are difficult to identify. About thirty-five species regularly visit the northeastern states, but very few are familiar to the casual observer for the reason that they perch mostly in the tree tops, and must be especially looked for. They are all insect-eating and migratory, May and September being the months in which they are most abundant in the eastern United States, some arriving and others passing on their way north or south. The yellow warbler is a summer resident and is abundant in lawns, parks, and orchards, but the others mostly inhabit woods. The redstart is also very abundant. It is a pert little bird, with red and black colors and a white belly. The black and white warbler nests in the eastern states. It runs over the bark of trees like a nuthatch. The black-throated, green warbler nests in pine woods from southern New England northward. Besides the tree-inhabiting warblers are a number which live in undergrowth and on the ground. Among these are the oven bird and Maryland yellow throat. The former makes an oven-shaped nest of grass on the ground. It is one of the larger warblers, being about 6.15 inches long. The yellow-breasted chat is the largest of warblers, reaching a length of 7.45 inches. It is one of the few birds which sing regularly at night. The Old World warblers are not represented in America. The tailor bird (which see), is an example.

Ward, Ar'temas, an American general, was born at Shrewsbury, Mass., Nov. 27, 1727. He was a graduate of Harvard college. He served in the French and Indian war and was sent as delegate to the provincial congress in 1774. He was commander of the Massachusetts troops at the beginning of the Revolutionary war and was head of the army

until the appointment of Washington, when he was made second in command. He was placed first on the list of major-generals by congress. He was sixteen years in the Massachusetts legislature and a member of congress for four years. He died at Shrewsbury, Mass., Oct. 28, 1800.

"Ward, Ar'temus" (Charles Farrar Browne), the "nom de plume" or pen name of an American humorist, was born at Waterford, Me., April 26, 1834. He began life as a printer, then acted as a reporter for a weekly paper in Cincinnati. His first letter signed with the famous name "Artemus Ward" pretended to be from a traveling showman and was published in a Cincinnati paper. He edited a humorous paper, *Vanity Fair*, in New York, gave humorous lectures, and brought out *Artemus Ward: His Book*. He published three other volumes of the same nature, which were all successful in their line. His last years were spent in England, where he was a contributor to *Punch*. He died at Southampton, England, March 6, 1867.

Ward, John Quincy Adams, an American sculptor, was born at Urbana, O., June 29, 1830. His first work was done in Washington, and consisted largely of busts of noted men, as Alexander Stephens, Hamlin, etc. Since 1861, his home has been in New York. His *Indian Hunter*, *A Private of the Seventh Regiment*, and *Shakespeare* are in Central park, New York; his colossal statue of Washington is on the steps of the subtreasury building in Wall street, New York, and a statue of Henry Ward Beecher in Brooklyn, and that of William E. Dodge on Broadway, New York. The *Good Samaritan*, *The Freedman*, statues of *Commodore Perry*, *Washington*, and *General Thomas*, are others of his well-known works.

Ward, Mary Augusta Arnold (Mrs. Humphry Ward), English novelist, who has achieved a world-wide fame, was born in 1851 at Hobart, Tasmania, where her father, Thomas Arnold, M. A., son of Dr. Thomas Arnold, of Rugby, and brother of Matthew Arnold, held an educational appointment. "Like George Eliot, Mrs. Humphry Ward's contact with literature and life has been broad and fruitful." Her ability and scholarship were shown early in her literary career by her contributions to *Macmillan's Magazine*, by her articles in Sir Wm. Smith's *Dictionary of Christian Biography*, and by her translation of Amiel's *Journal Intime*. Her first venture in fiction was a tale of an actress's life—*Miss Bretherton* (1884). Four years later, appeared *Robert Elsmere*, a remarkable though rather skeptical production, dealing with the struggle of an aspiring soul toward a newer theistic faith and creed. In 1892, came from her gifted pen *The History of David Grieve*, and two years subsequently appeared *Marcella*, the latter a noble study of woman nature. Her other writings embrace *Sir George Tressady*, a sort of art sequel to *Marcella;* and *Helbeck of Bannisdale*, two works of remarkable power and compelling interest. Mrs. Ward is intimately associated with the social and educational work of University hall, an institution in London, now merged in the "Passmore Edwards' settlement."

MRS. HUMPHRY WARD.

Waring (*wā'ring*), **George Edwin,** American sanitary engineer, was born at Poundridge, N. Y., July 4, 1833, and died in New York city, Oct. 30, 1898. He was educated at Poughkeepsie, studied agriculture, and lectured on it in Maine and Vermont. From 1857 to 1861 he was drainage engineer of Central park, New York; and on the outbreak of the Civil war he became major of the Garibaldi guard, after which he raised and became major of the Fremont hussars, and subsequently colonel of the 4th Missouri cavalry. In 1880, he became special agent of the United States 10th census and later member of the national board of health. His knowledge of drainage problems made him very useful to the authorities of New York city and led to his being consulted by those of other towns and cities. After the yellow fever epidemic of 1878 in Memphis, he devised the sewage system of that city, and from 1895 to 1898 he was commissioner of street cleaning in New York, doing wonders as administrative head of the department. In October, 1898, he was appointed head of a commission to improve the sanitary condition of Havana and other Cuban towns, and to select the sites of camps for the American troops. His published works embrace *Draining for Profit and Draining for Health*, *How to Drain a House*, *Sewerage and Land Drainage*, and *Sanitary Drainage of Houses and Farms*.

Warm'ing and Ventila'tion are so connected as to be best treated in one article. In one sense they are opposed to each other, as the necessity of ventilation or pure air requires frequent changes of the air, which thus carries off the heated air of a room, and requires more heat to replace it. The human body must be kept at a temperature of 98° for healthy living, which is secured partly by food, which supplies heat, and by clothing to retain the heat, but largely by artificial heat in houses. Pure air to breathe is also a necessity. The air we breathe contains oxygen and a small part of carbonic acid, which in large quantities is a poison. In breathing,

the oxygen is taken from the air and carbonic acid is added to it, so that without a fresh supply the air of a room becomes in a short time so full of carbonic acid as to be poisonous. In warming and lighting a room, the same process goes on—the oxygen is taken from the air and carbonic acid gas is given out. A person uses up the oxygen in four cubic feet of air every hour, and makes impure with carbonic acid one cubic foot of air every minute. A large oil lamp will make impure 70 cubic feet of air an hour; a pound of coal in burning will use up 120 cubic feet of air, and a cubic foot of gas will rob ten feet of air of oxygen. Besides heating the fresh air let into a room for ventilation, the warming apparatus has to overcome the loss of heat through glass windows, walls, floors, and ceilings.

The methods of warming and ventilating a room are numerous. The open fire, stoves, and furnaces, supplying hot air, hot water, or steam, are all in use and all have their advocates. The open fire gives the best ventilation, but is wasteful of coal and unequal in its heat. The close stove is economical of fuel and heats a room quickly, but burns the air, making it too dry for health. The use of furnaces is becoming quite general, especially for large buildings, as they heat every part of the house, and at much less expense than would be necessary to heat the same space with stoves or grates. They burn the air, however, rendering it too dry, and need careful management. In order to prevent the escape of heat double walls, double windows, well-fitting doors, etc., are used, but the more successful these contrivances are, the less fresh air enters and the more need of artificial ventilation. If houses were perfectly built the inmates would suffocate. Two things are necessary in ventilation, to remove foul air and bring in pure air. As hot air rises, an open chimney in which the air is heated and drawn up, the cold air from the cracks and crevices taking its place, is always a ventilator, and in ordinary rooms, as houses are usually built, a sufficient one. Other methods in use are ventilating shafts, with openings at top or bottom or both, for the removal of the impure air and the introduction of fresh air; the heating of currents of fresh air introduced into stoves or furnaces and then distributed; and in large buildings pumping engines to force fresh air through pipes into all the rooms. The whole subject of warming and ventilation, however, is still a problem to builders.

War'ner, Susan, an American author, was born at New York city in 1819. Her stories for girls have been very popular, especially the *Wide, Wide World*, which has had the largest circulation of any American novel, except *Uncle Tom's Cabin*. Other writings are *Queechy*, *The Hills of the Shatemuc*, *The Old Helmet*, *Ellen Montgomery's Book Shelf*, etc. She is best known by her pen name, "Elizabeth Wetherell"; she died at Highland Falls, N. Y., March 17, 1885.

War'ner, Charles Dudley, an American writer, was born at Plainfield, Mass., Sept. 12, 1829. He was a graduate of Hamilton college, practiced surveying in Missouri, studied law in the University of Pennsylvania, and practiced in Chicago until 1860. He was editor of the *Press* and *Courant* at Hartford, Conn., and of a department in *Harper's Magazine*. Among his writings are *My Winter on the Nile*, *A Roundabout Journey*, *Mummies and Moslems*, *Their Pilgrimage*, *My Summer in a Garden*, *Baddeck and that Sort of Thing*, and *Backlog Studies*. He died Oct. 19, 1900.

CHARLES DUDLEY WARNER.

War'ren, Joseph, an American patriot, was born at Roxbury, Mass., June 11, 1741. He graduated at Harvard college, and began the practice of medicine at Boston. He twice delivered an address on anniversaries of the Boston massacre. In 1774, he was president of the Massachusetts congress, and was made by it a major-general. At the battle of Bunker Hill he appeared unattended, and declining to take the command which was offered him, fought as a volunteer. As he was leaving the field, being one of the last to retire, his name was called by a British officer, who commanding his men to stop firing, urged Warren to surrender. But as he turned his head at the sound of a voice, he was instantly killed by a ball striking him in the forehead, June 17, 1775. His statue at Bunker Hill was unveiled June 17, 1857. See *Life*, by Frothingham, and by Everett, in Spark's "American Biography."

War'ren, Samuel, an English novelist, was born in Wales in 1807, and died at London, July 29, 1877. He was a lawyer and edited an edition of Blackstone's *Commentaries;* but is best known by his novels, which appeared in *Blackwood's Magazine*, entitled *Ten Thousand a Year*, and *Passages from the Diary of a Late Physician.*

War'saw, the former capital of Poland, and the third city of the Russian empire, is on the Vistula river, about 395 miles east of Berlin. It stands partly on a plain and partly on rising ground, and is connected with one of its beautiful suburbs by two fine bridges. There are about 160 palaces in Warsaw, and 180 churches, among them the Cathedral of

St. John, which dates from 1250; several theatres, one of them in a garden laid out in the old bed of the Vistula; fine squares, and public gardens, with monuments to Sobieski, Copernicus, etc. The university, founded in 1816, and closed by the Russians in 1832, was opened again in 1864. It has a library of 350,000 volumes, a fine observatory, and 1,114 students. The leading industries of the place are plated silverware, musical instruments, carpets, boots and shoes, carriages, woolen cloth, and beer. Warsaw is first mentioned in history in 1224. It belonged to the dukes of Mazovia until 1526, when the land of the Mazurs was annexed to Poland. It was fought over continually by the Swedes, Russians, Brandenburgers, and Austrians. In 1795, it was given to Prussia; in 1806, Napoleon's troops occupied it; in 1809, the Austrians, and the Russians finally obtained possession in 1813. Two unsuccessful rebellions against Russia occurred, one in 1834, and the last in 1863. The Russian government, determined to crush out utterly the spirit of independence, took severe measures, executing or banishing to Siberia the nobles and clergy, and confiscating their property, carrying off in large bodies the tradesmen, closing the university, schools, monasteries, and convents, and placing Russian officials in all places of power. The use of the Russian language was commanded, and even the name Poland was cut out of all legal documents. Population 638,209.

Wart'burg, an old German castle, near Eisenach, in Saxe-Weimar. The Wartburg war is the name given to a contest of the principal Minnesingers of Germany, which was held at the castle about 1206. The castle is also the scene of the legend of St. Elizabeth of Hungary, who was the wife of one of the landgraves of Thuringia, to whom it belongs. It is best known, however, as the place where Luther was hid after the Diet of Worms, and where he translated the Bible into German. In 1817, the German students celebrated here the three hundredth anniversary of the Reformation. The castle was built in 1070.

War'wick, Richard Neville, Earl of, called the king-maker, was born about 1420. He was a son of the earl of Salisbury, but through his wife obtained the estates and title of earl of Warwick. In the Wars of the Roses, he sided with the duke of York, and won for him the battle of St. Albans, receiving in recompense the governorship of Calais, and command of the English fleet for five years. At the battle of Towton, near York, the followers of Lancaster were gaining ground, when Warwick, riding up to Edward, duke of York, and getting down from his horse, which he shot in the head as a signal for an attack without retreat, said, "Sire, let him flee who will, but by this cross, I will stand by him who will stand by me." The York party won, and Edward was crowned king in London, June 22, 1461. Edward's marriage with Elizabeth Woodville, and that of his brother Clarence to Warwick's daughter, made a breach between the two, which ended in the battle of Edgecote, where Edward was made a prisoner. After a partial reconciliation and another insurrection, Warwick openly deserted to the Lancaster party under Queen Margaret, his son-in-law Clarence being promised the succession to the throne. Edward IV. fled to Holland, and the imprisoned monarch Henry VI. was restored, but only for a few months. Edward returned, with an army of 2,000 Englishmen; Clarence deserted Warwick and came to his aid; Henry was again sent to the Tower; and at the battle of Barnet, Warwick's forces were defeated and Warwick was slain, April 14, 1471. He lived royally, owning 100 manors, the city of Worcester, and the islands of Guernsey, Jersey, Alderney, and Sark. At his house in London six oxen were usually eaten at a breakfast, and he daily fed 30,000 guests. He is called "the Last of the Barons." See *Baronage of England*, by Dugdale; *History of England*, by Lingard.

Wash'burne, Elihu Benjamin, an American statesman, was born at Livermore, Me., in 1816. He studied law and began his practice at Galena, Ill., in 1840. He was in congress from 1852 to 1869, and was called the "Father of the House" for his long service. He was minister to France during the Franco-Prussian war, and at the request of Germany very skillfully protected Germans who were residing in France at the time. He wrote *Recollections of a Minister to France*. He belonged to a family of statesmen, two of his brothers being in congress with him, and the governors of Wisconsin and Maine, and another brother was United States minister at Paraguay. Elihu Washburne died at Chicago, where he spent the last years of his life, Oct. 22, 1887.

Wash'ington, a city in Pennsylvania, thirty miles southwest of Pittsburg. It has several factories, including iron foundries, woolen and carriage factories, and is the seat of Washington and Jefferson college. The college was formed in 1865, by the union of Washington college, which as an academy dated back to 1787, and Jefferson college, which grew out of the Canonsburg academy, opened in 1791. Population 7,063.

Wash'ington, the capital of the United States, is situated in the District of Columbia on the Potomac river, thirty-nine miles southwest of Baltimore. The city was laid out under the direction of Washington, on a plain forty feet above the river, with wide streets and twenty-one broad avenues, named after the states. Three streets, known as North, South, and East Capitol streets, radiate from the Capitol, and with a line of public parks divide the city into four quarters.

The avenues run diagonally, and where they cross circles are formed, with triangles at their intersection with the streets, and besides these ornamental spaces there are a number of squares with trees, shrubbery, fountains, and statues. Pennsylvania avenue is the main street of the city, and Massachusetts avenue the finest.

The chief public building is the Capitol, of which the corner stone was laid by Washington in 1793, and the structure finished in 1827. An extension of two wings was finished in 1867. The building covers about 3¼ acres, and is 751 feet long and 348 feet broad. The dome, 287½ feet high, is crowned by a bronze statue of Liberty. The rotunda under the dome, senate chamber, hall for the house of representatives, and one for the supreme court, are some of the interior rooms. The White House, the residence of the President of the United States, is a mile and a half from the capitol. It was first used by President Adams in 1800. The other public buildings are the treasury, state, war,

THE CAPITOL, WASHINGTON.

navy, interior, and post office departments, pension building, Smithsonian institute, observatory, arsenal, and the new congressional library building, in modified Italian renaissance style, which has a capacity for 4,500,000 volumes, and is one of the finest of all the capital buildings. The National Deaf-Mute college, the only one in the world, Howard university, Columbian university, and the Catholic university, are among the educational institutions. The government hospital for the insane, naval hospital, soldiers' home, and Columbian institution for the deaf and dumb, are a part of its charities. The Corcoran art gallery contains one of the finest collections in America. The Washington monument, 555 feet above the foundations, the highest in the world; the Lafayette monument, naval monument, Abraham Lincoln with the proclamation of emancipation, a statue of Jackson, made from the cannon captured at New Orleans, and one of Scott, from cannon taken in the Mexican war; of Washington, Garfield, Greene, Marshall, Dupont, Farragut, Franklin, and Luther, are some of the best known of the monuments of the city. The site of Washington was selected by General Washington in 1791, and congress met there for the first time Nov. 17, 1800. In 1814, it was occupied by the British and the public buildings burned. Though several times threatened during the Civil war, it was never attacked. Since 1871, the city has been improved at great expense, making it now one of the most beautiful cities in the world. Population 278,718. See DISTRICT OF COLUMBIA.

Wash'ington, the most northwestern state of the Union, stretches from Idaho to the Pacific ocean, and from British Columbia to Oregon. It is 350 miles wide and 250 miles long, with an area of 66,880 square miles. The eastern and the western parts of the state are quite different, the western part being mountainous, with its coast deeply indented, while the eastern division is more level, with good grazing land. The Cascade mountains cross the state from north to south, and the Coast range follows the Pacific coast. Mt. Tacoma, one of the highest peaks in America, Mt. St. Helen's, and Mt. Baker, both volcanoes, are the highest mountains. Puget sound on the western coast of the state, one of the most beautiful sheets of salt water in the world, is an arm of the sea joining the gulf of Georgia and strait of Juan de Fuca, stretching about 100 miles into the heart of the country, with bays, coves, inlets, and channels, forming a collection of magnificent harbors. The Columbia river, flowing across the state, part of the way through cañons 2,000 feet deep, forms in its lower course part of the boundary between Washington and Oregon. Clarke's Fork and Spokane, Yakima, and Snake rivers are the most important branches of the Columbia. There are mountainous islands used as fruit farms and sheep pastures, scores of beautiful lakes, and many mineral springs. The climate is mild in winter and cool in summer, the Chinook wind from the Pacific ocean moderating the cold winds from the north. Grass is green the whole year, and flowers often blossom in mid-winter. Western Washington is densely wooded, and its streams and lakes abound in fish, and whales and seals are found on the coasts. The principal crops are wheat, barley, oats, hops, and fruits. Gold, silver, iron, and coal are the minerals of the country, which have only begun to be developed. The most important industries of the country are the lumber trade and the fisheries, especially of salmon and oysters.

In 1898, the state expended $1,815,662 for school purposes. There were about 1,900 school buildings, the elementary departments having 3,211 teachers and 94,928 pupils, and the high schools having a force of 110 teachers and an attendance of 2,988 students. There are eight universities and colleges, among them the state university, with a

grant from congress of two townships of land, opened in 1862 at Seattle, with five departments, the Agricultural college and School of Science being located at Pullman; Whitman college, at Walla Walla, dating from 1866; and Puget Sound university, at Tacoma. The coast of Washington was first explored by Americans in 1789, when some Boston merchants sent out the *Columbia* and the *Lady Washington*, to trade with the Indians for furs. The party ascended the river, which they named after their ship, *Columbia*. Great Britain obtained from Spain, who claimed the coasts, a treaty allowing the English to trade there, and in 1791 Vancouver took possession of a large part of the country in the name of England, and in 1805 Lewis and Clarke descended the Columbia river and spent the winter on the coast. In 1846, England yielded her claims to the region to the United States. The first settlement was made at Turnwater in 1845. The territory was organized in 1853 and became a state in 1889. Capital, Olympia. Population 518,103.

Wash'ington and Lee Univer'sity, located at Lexington, Va., was chartered in 1782 as Liberty Hall academy. The first important gift of property to the school was made by George Washington in 1796. In recognition of this benefaction the name of the school was changed to Washington academy, which later became Washington college. At the close of the Civil war, Gen. Robert E. Lee was elected president of the college, and was installed Oct. 2, 1865. This position he held until his death, Oct. 12, 1870. In 1871, the general assembly of Virginia changed the name of the institution to Washington and Lee university. It now has a faculty of 22, with 222 students in attendance.

Wash'ington, Booker T., principal of the Tuskegee Normal and Industrial institute, Tuskegee, Ala., was born in Franklin county, Va., about the year 1859. Born a slave, he has become prominent as a speaker and writer on racial and on educational topics. Early in life he worked in salt mines in Malden, W. Va., but managed to make his way to the Hampton institute, Virginia, where he received an education. In 1881, he was called to the Tuskegee institute, founded by him in the interests of the colored race, which he seeks to elevate by means not only of religious instruction, but by an academic training, coupled with courses in manual and industrial work of a useful and practical character. Over 1,000 students annually attend the institute and find their way afterward into industrial occupations. The institution is non-denominational and one for both sexes, the founder's idea being to enable his colored brethren to meet present-day conditions, social and industrial, in the south, and to do that by suitable education and moral training in the students he turns out from his seminary.

Wash'ington, George, the first President of the United States, was born in Westmoreland county, Va., Feb. 22, 1732. At the age of sixteen he was made surveyor of the large Fairfax property in Virginia, through his brother Lawrence, who had married into the Fairfax family. In this work he camped out in the forests for months and was in constant danger from Indians. When the French and Indian war broke out, he was sent by Governor Dinwiddie, of Virginia, to warn off the French, and his vigorous defense of Fort Necessity gained him when only twenty-three the post of commander-in-chief of all the Virginia forces. He served in Braddock's campaign, and at Fort Duquesne, though he had two horses shot under him and four bullets through his coat, he was one of the few officers not wounded, and the Indians believed him to lead a charmed life. With the close of the war, he married Mrs. Martha Custis, a wealthy widow, and settled down at Mount Vernon, which had been left him by his brother, Lawrence. Here he lived for twenty years the life of a southern planter, cultivating his estate and owning a large number of slaves, who were emancipated at the death of his wife by his will. He was several times a member of the Virginia legislature, where Patrick Henry called him, "for solid information and sound judgment, the greatest man in the assembly"; and in 1774 was sent to the continental congress. After the battles of Lexington and Concord, congress, on motion of John Adams, unanimously selected George Washington as commander-in-chief of the army. Refusing any salary, he accepted the position, asking every gentleman in the room to remember his declaration that he did not consider himself equal to the command; a humility that went with him in all the high places to which he was called. He hastened to the camp at Cambridge, Mass., where he assumed the command, July 2, 1775. His courage, prudence, firmness, and perseverance through defeats, jealousies, disaffection, and lack of men and supplies, never failed, and brought the war to a successful issue in 1783. His influence secured the quiet disbanding of the discontented army, and he himself retired to his home on the Potomac. When the convention met in Philadelphia, in 1788, to frame the constitution, he was its presiding officer, and approved the constitution, and when the time came under its provisions to elect the first President, there was only one choice in the country and Washington was made first President of the United States by the unanimous vote of the electors in 1788, was unani-

GEO. WASHINGTON.

mously re-elected in 1792, and declined an election in 1796. His prudence and firmness and good judgment were as much needed in the forming days of the young republic as they had been in its struggles for liberty, and gradually with the help of his wisely selected cabinet the many difficult problems of the new government were settled. He made his farewell address Sept. 17, 1796, and retired to Mount Vernon. Within a short time, however, difficulties with France threatening war, Washington was again called to the command of the armies of the United States. In the midst of these military preparations, he died, after a short illness, Dec. 14, 1799. In the resolutions adopted in congress at his death, moved by John Marshall, occurs the well-known expression, "First in war, first in peace, and first in the hearts of his countrymen." He was six feet two inches in height. with a large frame, brown hair, and blue eyes, and was very dignified and self-controlled, He had no children, but adopted two grandchildren of his wife. See *Life*, by Irving; *Critical History of the United States*, by Winsor, etc.

Wasp (*wŏsp*), any one of a considerable group of insects, forming, with bees and ants, the highest order of insects (Hymenoptera). These well-known insects show some variation in form, sometimes the thorax and abdomen are connected by a slender thread; in other forms these parts of the body merge into one another. The social wasps, like the hornet, or yellow jacket, are the best known. They build nests of paper attached to bushes, trees, roofs, and eaves of buildings. The paper is manufactured from wood fiber obtained from posts and unpainted boards. This is chewed in the jaws and united into sheets, often of considerable extent. The nests are often top-shaped or balloon-shaped, with layers of cells inside resembling honeycomb, all inclosed in a spherical paper envelop with a hole at the bottom for entrance and exit. These nests in tropical countries are sometimes six feet long. Other species of social wasps make nests in the ground, forming a more fragile sort of paper from decayed wood. The colonies include three forms, males, females, and workers. The males and workers die on the arrival of cold weather, but the females live over the winter in sheltered places, and start a new colony in the spring. The workers only have stings. The solitary wasps form another division of these insects which include miners, mud-daubers, and carpenters. The mason wasps, or mud-daubers, are the most familiar, as their mud nests are commonly seen on beams and walls. The carpenters cut tubular nests in wood and divide them by mud partitions. The miners dig tunnels in the earth. Wasps are endowed with a considerable degree of intelligence. See Lubbock's *Ants, Bees, and Wasps* (1881).

Watch. See CLOCK.

Wa'ter is a clear, transparent liquid, formed of oxygen and hydrogen. It is almost colorless, though in large masses it looks blue. It freezes at 32° and boils at 212° and passes off in steam. Water dissolves almost everything it comes in contact with, so that strictly pure water is never found. Rain water is the purest form, but even that has absorbed air and ammonia. Water is found very widely distributed in nature in the form of ice and snow, in watery vapor in the air, in lakes, rivers, and seas, in the soil and rocks, and in the sap and juices of plants and in the blood and flesh of animals. It covers three-fourths of the surface of the earth, and forms a large part of the bodies of animals. The ocean is Nature's great reservoir (or cistern), and from it all other water may be said to be taken. A constant stream of vapor passes into the atmosphere, and is condensed in colder regions, returning to the earth in the form of rain, dew, frost, and snow, which fertilize the earth, and are collected into pools, springs, lakes, and rivers, and finally find their way back to the ocean. These waters all take up various substances, as is seen by the color of different rivers, which varies as the soil through which they pass. The water of the ocean is salt, but the saline (salty) matter does not form a vapor, and so is left behind when the watery vapor rises from its surface. Besides its use in watering the earth, feeding animal and vegetable life, water has been the great agent in forming the surface of the earth. A river carries with it a large amount of earthy matter, of which it has robbed the hills in which it springs, and deposits it in the valleys through which it flows; the great bars and deltas at the mouths of rivers being examples of the amount of land sometimes formed by the sediment in a river. This double process of breaking down and dissolving the rocks, and depositing and building up the land is constantly going on, and has been going on for ages. Geology gives the results of this constant action of water in past ages, as seen in the strata or layers of rocks, which form the earth. In the form of ice or glaciers it has also had a large part to play in forming the continents. Some of the many purposes it serves are its use in supplying a motive power to machinery, either mechanically, as in waterfalls, or by its expansion into steam, its use in cleansing and cooking or domestic purposes, its use in the laboratory as a solvent or dissolver of most substances, its universal use by men, animals, and plants, for drinking purposes. See ICE, GLACIERS, WATER WORKS, WATERFALL, OCEAN, SEA, etc.

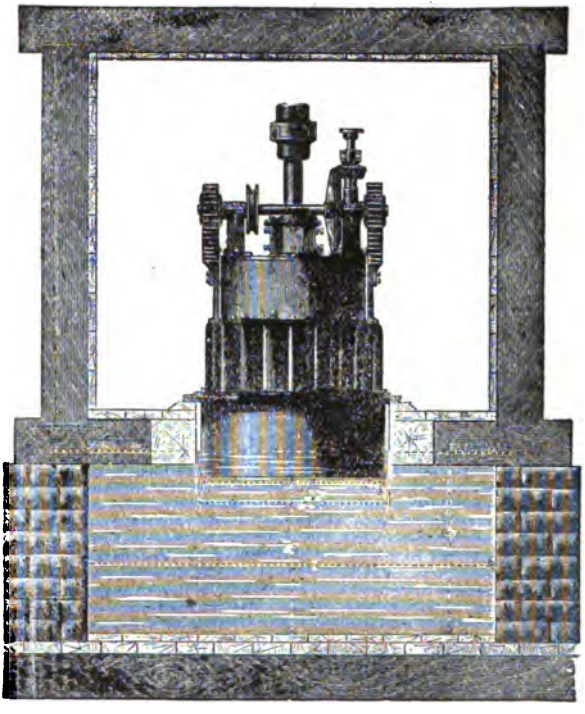
Wa'ter, Ascent of (in plants). Water to supply the evaporation (see TRANSPIRATION) from the larger land plants enters by the roots, especially the root-hairs, and passes thence into the woody strands which lie in the

center of the root. These connect with similar strands in the stem, which run out into the leaves and branch profusely, following the so-called veins and constituting the veinlets. The water travels chiefly in the interior of the minute elongated tubes (ducts or vessels) which make up the greater part of these strands (see VASCULAR BUNDLES). These ducts are not continuous tubes, however, so that the water has to traverse the partition walls which occur here and there (abundantly in pines and their kin). The water is not forced up from below by the roots, except in low plants and at some seasons (see ROOT PRESSURE); it certainly does not rise by capillarity. No satisfactory understanding of the forces concerned has yet been reached, though the problem has been attacked by many investigators.

Wa'ter Bug, the name for a number of water insects inhabiting the streams and ponds of the United States. They belong to the order of true bugs, that is, they have the mouth parts in the form of a sharp stylet or beak for sucking. The water boatman is one form, swimming on its back. The water stick is a long, slim water bug. The water scorpion, also sometimes called the electric light bug, is the most formidable of them all. It is about two inches long, with sharp, pointed forelegs with which it catches small fishes and frogs and sucks their blood. It flies from pond to pond at night, and is attracted by strong lights. See ELECTRIC LIGHT BUG.

Wa'ter Lily, a general name applied to all members of the family *Nymphæaceæ*. They are aquatic herbs, native to all temperate and tropical regions. The stems are submerged, and the broad leaf-blades ("lily-pads"), on long petioles, float on the surface of the water. The true water lilies are a species of Nymphæa or Castalia, the flowers being showy and of various colors. In the common species the petals are numerous and beautifully white and fragrant. The yellow pond-lily or spatter-dock is a species of Nuphar.

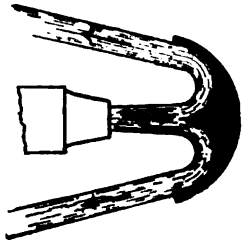
Wa'ter Wheel, a wheel arranged so as to transform water-power into rotary mechanical power. The work done is due to the force of gravity on the water and the possible work is equal to the fall multiplied by the weight of the water. To get the maximum work it is necessary that the water shall enter without shock and leave the wheel without further fall and velocity, conditions which can, of course, only be approximated. But water wheels give efficiencies which rival that of other prime motors. Efficiencies of over 90 per cent. have been reached, while efficiencies 75 to 85 per cent. are commonly attained in the best wheels. Water wheels have been used from a very remote period in human history. Up to about 1825, practically all wheels used were of three types, overshot, undershot, and breast wheels. These were wheels revolving on horizontal axes. They had buckets or paddles on the circumference. As the name implies, the water fell from above into the buckets of the overshot wheel, while in the case of the breast wheel the height of the water was about that of the axis of the wheel, and in the undershot wheel, the water flowed below and moved the wheel by impact against the blades. The overshot and breast wheels commonly reached efficiencies of from 75 to 80 per cent., while the efficiency of the undershot wheel was much less. The above wheels are seldom used now, except in small powers and in old mills. The two kinds of wheels used to-day are turbine wheels and impact wheels of the Pelton type. The turbine wheel was introduced into France by Fourneyron about 1827, and from there soon afterward into England and the United States



TURBINE WHEEL.

by Fairbain and by Boyden. The peculiarity of the turbine is that the water flows between curved channels, so that it impinges on the vanes or buckets of the turbine tangentially, and thus by a reaction force rotates the

turbine. The vanes of a turbine are commonly warped surfaces, shaped for local conditions and according to the special ideas and experience of the designer. The older turbines revolved about a vertical axis, but many modern turbines have horizontal axes. There are three methods by which the water has been led into the wheel, from the center outward, from the rim inward, and from above downward through the wheel. Turbines are smaller and have a higher rotation speed than older kinds of wheels. They run with greater regularity and their efficiency is equal to, if not greater, than most of the older wheels. An efficiency of from 85 to 90 per cent. is common. The most powerful turbines ever built are those for the Niagara Falls Electric plant. There are ten of these, each with a capacity of 5,000 H. P. The water has a mean head of 136 feet and is led through a steel penstock 7½ feet in diameter. The wheels are 63 inches in diameter and make 250 revolutions per minute. The shafts of the turbines carry directly the revolving parts of the generators for this great plant. Since about 1880 a special form of water wheel, called the impact wheel, has been developed and introduced in California. The Pelton water wheel is the best known of the impact wheels. It is used where the head is very great. A jet of water is led against the steel buckets on the edge of the wheel and these are shaped so as to throw the water off to the side. Pelton wheels are used in practically all the long distance electrical transmission lines in California where the head is high. In the Fresno plant the water head is 1,400 feet, and the Pelton wheels have an output of 1,000 H. P. The use of water-power in the world has been increased by the development of long-distance power transmission by electricity. It is estimated that 5,000,000 H. P. in water-power can be made available in the United States by electric transmission, and a recent writer in the *Engineering Magazine* places the water-power of Italy that can be made available by electric transmission as over 1,000,000 H. P. The use of water wheels is thus likely to increase. A. P. CARMAN.



NOZZLE AND BUCKET OF PELTON WATER WHEEL.

Wa'ter Works, a system of pipes and conduits connected with reservoirs or pumping stations for the supply of water to communities. The ordinary supply of water to communities where the population is scattered is from shallow wells, but in crowded cities such wells become very dangerous on account of the contamination of the water by impurities from the soil. The water supply of large cities is often a very difficult problem, and large reservoirs and long conduits often have to be built to get an ample supply of pure water. The common sources of supply are streams, lakes, springs, and wells. If the water is derived from streams or lakes, the great difficulty is to get a drainage area which has not been rendered impure by the refuse of the surrounding population. The water of New York city is derived from the water shed of the Croton river and is led into reservoirs in New York city through an aqueduct 29.6 miles long. This aqueduct has an average diameter of over 13 feet. (See *Century Magazine* for December, 1889). Chicago and Cleveland pump their water from the neighboring lakes, a tunnel of several miles being bored out under the lakes in each case so as to secure water free from shore refuse. Where the water for public supply is taken from wells, the wells are always sunk or driven several hundred feet into the lower strata, where the supply is both more constant and also freed from surface impurities. Two systems of distribution are in use, the reservoir and the pumping system. In the reservoir system, the water is collected by natural flow or by pumping into reservoirs and then distributed by gravity to the houses. In the direct pumping system the water is pumped into the mains by pumps which are kept working day and night. The latter system is cheaper to install, but more expensive to operate. Where there is no natural elevation for a reservoir, it is common to erect a large steel stand pipe, which will have sufficient capacity to furnish part of a day's supply. The daily consumption of water in American cities is about 100 gallons per person. This is from two to three times the amount used in European cities. To check the waste of water, it is common now to supply water by meter, so that each user pays according to the amount consumed by himself.

Wa'terbury, a city in Connecticut, thirty-three miles southwest of Hartford. It is on the Naugatuck river and surrounded by hills. It has a fine public park, a free library, and other public buildings. It is known as the center of the brass manufacturing business of the United States, which began in 1802 with the making of gilt buttons. Electric wire, student lamps, hinges, match safes, clocks, watches, pins, hooks and eyes, and percussion caps are made by the million. Waterbury was settled in 1667. Population 45,859.

Wa'terfall or **Cat'aract,** a break in the slope of the bed of a river so abrupt that the water falls from the higher to the lower level. They usually occur in mountainous regions, where the streams flow from the mountain sides into valleys. The channel of the river must be rocky to form a fall, as the quantity of water would otherwise soon wear out a side channel. Some of the finest waterfalls are the Orco falls, at Monte Rosa, 2,400 feet; Staubbach falls in Switzerland, 1,000 feet;

Zambesi falls in Africa, 360 feet; Niagara falls, 163 feet; and among the most wonderful in the world for their great width and the enormous volume of water which pours over them, are the falls of the Yosemite, in California, 2,526 feet, the highest in the world.

Wa'terloo, a village in Belgium, nine and a half miles southeast of Brussels, which owes its fame to the great battle fought in its neighborhood between Napoleon and Wellington, June 18, 1815. The French army numbered about 72,000 men, and Wellington's army numbered about 67,000, made up of British, German, and Dutch troops. Napoleon supposed he had only Wellington's army to fight, as the Prussians had retreated before Ney on the 16th. But their retreat was toward Waterloo, and their arrival on the battlefield on the afternoon of the 18th turned the battle against the French, who, finding themselves hemmed in between the British and Prussians, fled in disorder. The roads southward were crowded with fugitives fleeing from the pursuing cavalry. One regiment of the guard which had covered Napoleon's retreat was surrounded and ordered to surrender, but their general, making the well-known answer, "The guard dies; it does not surrender," charged upon the enemy, and perished almost to a man. The combined losses of this battle were about 50,000 men. Victor Hugo says the defeat of Napoleon was brought about by a rain the night before, which delayed the attack in the morning, thus giving the Prussian troops time to reach Waterloo; while others ascribe it to Grouchy's failure to obey orders. For a description of the battle, see *Les Miserables*, by Victor Hugo.

Wa'terloo, Ia., the capital of Black-Hawk county, on both banks of the Cedar river, which furnishes water-power for its industries, northeastern Iowa, 94 miles west of Dubuque, and 105 miles northeast of Des Moines. It is on the Burlington, Cedar Rapids, and Northern, the Illinois Central, and the Chicago and Great-Western railroads. It is the center of a productive agricultural country and the shipping point for large supplies of grain and produce. Besides the repair shops of the Illinois Central railroad, the city's industries include flour mills, foundries, carriage and machine shops, sash, door, and blind factories, agricultural implement works, etc. Population 12,580.

Wa'termel'on, the fruit of *Citrullus vulgaris*, a species of the gourd family, and native to Asia and Africa. Over sixty varieties have been produced and catalogued.

Wa'tertown, a city of New York, is on the Black river, ten miles from Lake Ontario. The river crosses the city and falls 112 feet in about two miles, thus giving fine water-power for the manufactures of the place. Flouring mills, paper mills, foundries, breweries, sewing machine works, and factories of paper flour sacks, boots and shoes, cigars, carriages, and sashes are the most important of its manufactures. It also has a large trade with the fine agricultural region in which it is situated. The city annually expends $87,687 on its public schools, which have a force of 114 teachers and an enrollment of 4,300 pupils. It was settled in 1800, and became a city in 1869. Population 21,696.

Wa'tertown, a city of Wisconsin, is on the Rock river, thirty-five miles northeast of Madison. It has a large trade and a number of manufactories, such as flouring mills, threshing machine works, brick factory, etc. It is the seat of the Northwestern university, a Lutheran institution founded in 1864, and of the Catholic University of the Sacred Heart, chartered in 1872. Population 8,437.

Wa'terville, a town of Maine, on the right bank of the Kennebec river, eighteen miles northeast of Augusta. The Ticonic Falls give it a fine water-power, around which are clustered the factories of shovel handles, boot shanks, sash and doors, shirts, furniture, etc. It is the seat of Colby university, a Baptist institution, which was first called Waterville college, becoming Colby university in 1867. It has several fine buildings and a library of 25,000 volumes. Population 9,477.

Watervliet (*wȧ'ter-vlēt*), **N. Y.** (formerly West Troy village, incorporated as a city since 1890), in Albany county, on the Hudson river, opposite Troy and a few miles north of Albany. Here, on a reservation, is Watervliet arsenal, with its ordnance-constructing plant, powder and ammunition magazines, etc., owned and operated by the national government. The Erie canal passes through the reservation, and the arsenal controls considerable wharfage on the Hudson. The town grows apace, and in civic institutions, as well as in residences, begins to assume the status of a city. Population 14,321.

Wat'son, John Crittenden, American naval officer (rear-admiral in command of the Asiatic station, with pennant on United States battleship *Oregon*), was born at Frankfort, Ky., Aug. 24, 1842, entered the United States Naval academy in 1856, and graduated in 1860. From 1862 to 1864, he acted as aide to Admiral Farragut on the *Hartford*, and took part in forcing the Mississippi river and capturing New Orleans; he was wounded at the battle of Mobile bay. From 1865 to 1867, he served on the *Colorado* in the European squadron, and was promoted to commander in 1874, to captain in 1887, and to commodore in 1897. In the war with Spain, he commanded the blockading squadron on the north Cuban coast on the *Newark*. In June, 1898, he was given command of a squadron designed to operate against the coasts of Spain, but the collapse of the war

rendered the project unnecessary. In June, 1898, he was appointed commander-in-chief of the eastern squadron.

Wat son, Rev. **John** (nom de plume "Ian Maclaren"), one of the most popular of the Scotch school of story writers, and a prominent figure in English religious life, was born of Scottish parents at Manningtree, Essex, Nov. 3, 1850, and educated at Edinburgh university, and at Tübingen. Ordained a minister of the Free church of Scotland, he had his first important charge at Free St. Matthew's, Glasgow, and afterward was transferred to the Sefton Park Presbyterian church, Liverpool. Till 1893, Dr. Watson was known as an able and popular preacher; but in that year he acquired greater distinction and a wider fame by a series of Scottish prose idylls, written for the *British Weekly*, and afterward published under the title of *Beside the Bonnie Brier Bush*. This work won deserved praise for the fidelity with which he has portrayed humble and reverent Scottish life and scenes. The volume was followed by *The Days of Auld Lang Syne*, *Kate Carnegie*, *A Doctor of the Old School*, and by *Rabbi Saunderson*, and *Afterwards, and Other Stories*. His religious writings embrace *The Upper Room*, *The Mind of the Master*, *The Cure of Souls*, *The Potter's Wheel*, and *Companions of the Sorrowful Way*. In 1896, and again in 1899, he visited the United States on lecturing tours, and delivered the Lyman Beecher lectures, at Yale university, on practical theology.

IAN MACLAREN.

Watt, James, a Scottish inventor, was born at Greenock, Scotland, Jan 19, 1736. He began as a maker of mathematical instruments, and eked out his living by mending fiddles. In 1767, he got employment as a civil engineer, making surveys for canals and for the improvement of harbors. He also invented a micrometer, an instrument for measuring distances. The work for which he is famous, however, is the improvement of the steam engine. Before his day, the steam engine was a slow-working, wasteful, cumbersome steam pump. His first patent made it quick and efficient, but still only a steam pump. His later inventions adapted it to driving machinery of all kinds and made it virtually the steam engine of to-day, except for a few late improvements. The business of making steam engines which he and his partner had built up, he passed on to his son James, spending the rest of his life at his home near Birmingham, where he still amused himself with inventions, his last work being a machine for copying sculpture. He presented copies of busts made by it to his friends "as the work of a young artist just entering his eighty-third year." He died Aug. 19, 1819. See *Lives of Boulton and Watt*, by Smiles.

JAMES WATT.

Wat'terson, Henry, American journalist and Democratic politician, was born at Washington, D. C., Feb. 16, 1840, and was educated by private tutors. Early in his career he took to journalism and edited at Nashville, Tenn., the *Republican Banner*. During the Civil war, he served on the staff of the Confederate army and was chief of scouts under Gen. Joe Johnston. He subsequently settled at Louisville, Ky., where he founded and has since edited the *Courier-Journal*, which he has made one of the foremost Democrat newspapers. During the years 1875–77 he was member of congress, and though repeatedly urged he has uniformly declined office, but has contented himself with presiding over conventions and supporting his Democratic friends and allies in their political contests. At Chicago, in 1893, he delivered the dedicatory oration at the opening of the World's Columbian exposition. In 1896, he declined the offer of a nomination for President on the National (gold) Democratic ticket. He has published a *History of the Spanish-American War*, and edited *Oddities of Southern Life and Character*.

HENRY WATTERSON.

Watts, George Frederick, R. A., a noted English artist, sculptor, portrait painter, and delineator of historical subjects, was born at London in 1817. He first exhibited at the Royal academy in 1837, his early pictures winning attention by their colossal size, as well as by their artistic excellence and beauty of coloring. His chief exhibits have been *Caractacus*, *Alfred the Great*, *St. George and the Dragon*, *Cymbeline*, *Fata Morgana*, *Life's Allusions*, *Endymion*, *Love and Death*, *The Good Samaritan*, *Hope*, *Sir Galahad*, *Orpheus and Eurydice*, together with portraits of *Tennyson*, *Browning*, *Gladstone*, *Lord Lytton*, *Matthew Arnold*, *Holman Hunt*, *Swinburne*, *Dean Stanley*, and *John Stuart Mill*.

Watts, Isaac, an English hymn writer, was born at Southampton, England, July 17, 1674. He is said to have written hymns for his mother when seven or eight years old. He became a clergyman, and was pastor of the Independent Congregation of Mark Lane, London, for a number of years, having an assistant and preaching only occasionally, as his health was permanently injured by overstudy when a young man. In 1712, a visit to Sir Thomas Abney, of Abney Park, a London alderman, led to his making his home with this friend for the remainder of his life. He wrote a number of theological works, a treatise on *Logic*, and a volume on *The Improvement of the Mind*, which has been much used as a textbook. His reputation, however, is due to his hymns, of which he published three volumes, *Hymns and Spiritual Songs*, *Psalms of David Imitated in the Language of the New Testament*, and *Divine Songs in Easy Language for the Use of Children*. A large number of his hymns and psalms are still retained in church collections, many of them our best-known hymns, such as *Before Jehovah's Awful Throne; O! God, Our Help in Ages Past; Joy to the World, the Lord has Come*, and *Come Holy Spirit, Heavenly Dove*. His beautiful "cradle hymn," *Hush, My Dear, Lie Still and Slumber*, is perhaps the best known of his children's songs. He died Nov. 25, 1748. See *Lives of the Poets*, by Johnson.

Wat Ty'ler, the leader of a rebellion in England, in the reign of Richard II. A poll tax was levied on every one over fifteen years of age, which was very odious to the people. When Walter "the Tiler" killed a taxgatherer who had insulted his daughter, the people were ready to rally around him. The insurgents numbered 100,000 by the time they had reached London, where they took possession of the Tower and put to death the archbishop of Canterbury and others. The first demands of the rebels were granted, but Tyler grew insolent and was killed by the mayor of London (June 15, 1381). Richard II., in his sixteenth year, took command of the rebels, and succeeded in leading them back to their homes, but when they were once scattered the promises made to them were not kept, and many of them were severely punished.

Wauke'gan, a city of Illinois, on Lake Michigan, thirty-five miles northwest of Chicago. It is built on a bluff on the lake shore. On account of its mineral springs and pleasant situation, it is quite a popular summer resort. There are several important industries, among them a sugar refinery, wire mills, brass works, scale works, a table factory, and manufactures of brick and tile. At North Chicago, a village a few miles south on an electric railway, are large zinc works. Population 9,426.

Waukesha (*wau'ke-shaw*), a town of Wisconsin, twenty miles west of Milwaukee, is one of the most popular summer resorts in the country. There are ten mineral springs, the Bethesda being the largest and the first discovered, in 1868. The water is shipped to all parts of the world, the works covering twenty acres. There is a very large hotel, and fine bathing houses, with beautiful parks and drives. Population, 7,419.

Wau'saw, Wis., a city on the Wisconsin river, the capital of Marathon county, central Wisconsin. It is on the Chicago, Milwaukee, and St. Paul, and on the Chicago and Northwestern railroads, and is 180 miles northwest of Milwaukee. It lies in a heavily timbered pine belt, and its industries, consequently, are chiefly mills for dressing lumber and the manufacture of furniture, sashes, doors, blinds, together with planing-mills. It has also machine shops, foundries, and cigar factories, besides mining and granite-quarrying. Population 12,354.

Wave Mo'tion, a state of disturbance being propagated from one part of a medium to another. A body is said to be *disturbed* when it is thrown out of equilibrium. Thus a stone dropped into quiet water produces a disturbance which at a later instant may reach a point several yards away. And since a body is in equilibrium only when its potential energy is a minimum, a disturbance implies the addition of energy to the system. Indeed, wave motion might be defined as one of the two principal methods for distributing energy, the other being *currents*.

In any consideration of wave motion, it is quite important to distinguish carefully between the motion of the wave and the motion of the particles of the medium through which the wave is traveling. Waves are roughly divided into two classes, according to the motion of the particles. If these motions occur in the same direction in which the wave is traveling, the wave is said to be a *longitudinal* one; but if the particles are displaced in a plane which is perpendicular to the direction of propagation, the wave is said to be *transversal*. If the period of vibration of one of the disturbed particles of the medium is T, and the length of the wave be λ, then the speed of the wave V is given by the following equation:—

$$V = \frac{\lambda}{T}$$

This is a perfectly general expression, true for all kinds of waves whatsoever.

Following is an outline of some of the more important types of waves met with in nature:—

Water Waves.— These are the ordinary waves encountered at sea and at the seashore. They are really due to gravitation, which tends to pull down the crest and elevate the trough of a disturbance as if the surface of the water were elastic. They are more properly called *Surface waves*,

The motion of the small particles which make up the water must be carefully distinguished from the motion of the waves. The motion of the particles in surface waves is in a circle, which gives to the outline of the wave a form very approximately that of a trochoid. The speed with which water waves travel depends very greatly upon the depth of the water.

If the depth of the water is greater than half a wave-length the speed of a wave is $\sqrt{\frac{g\lambda}{2\pi}}$ where g is the acceleration of gravity and λ is the length of the wave. The longer the wave, therefore, the faster it travels. But in case of shallow water, the speed of the wave is $\sqrt{gh}$, where g, as before, is the acceleration of gravity, and h is the depth of the water. The speed of waves in shallow water is, therefore, independent of wave length.

Ripples.— In the case of water waves which are very short — say less than about 4 millimeters — the surface tension (See SURFACE TENSION) of the water is the principal factor in determining the speed of the waves which is $\frac{2\pi T}{\lambda \rho}$, where T is the value of the surface-tension, λ the wave length, and ρ the density.

The slowest of all waves are those which are about 16 millimeters long. Waves shorter than this are called "ripples." It is important to note that the speed of ripples, unlike that of waves, varies *inversely* as the wave-length.

Waves in Stretched Strings.—These waves are seen when a stretched clothes-line is struck with a walking stick. They occur also in all stringed musical instruments, and often in long belts in power-houses. The speed of the wave here depends upon two factors only, *viz.*, the tension or the force with which the string is stretched, say F, and the mass per unit length of the string say, μ.

Then

$$Speed = \sqrt{\frac{F}{\mu}}$$

Sound Waves.—These travel in gases, liquids, and solids. The character of these waves is described in the article ACOUSTICS, in this work. There also will be found the evidence for thinking that sound is a wave motion.

The speed of sound-waves in air was first computed by Newton and Laplace, and found to be as follows:

$$Speed = \sqrt{\frac{\gamma p}{\rho}}$$

where p denotes the pressure of the air, ρ its density, and γ a constant, *viz.*, the ratio between the specific beats of air at constant pressure and at constant volume.

In the case of a sound-wave traveling in water we have,

$$Speed = \sqrt{\frac{Bulk\ Modulus}{Density}}$$

But in case sound travels through a solid rod, as for instance a fence made of gas pipe, we have,

$$Speed = \sqrt{\frac{Young's\ Modulus}{Density}}$$

Light Waves. The evidence that light consists of a wave motion is presented in the article LIGHT in this work. Concerning the nature of light waves, very little is known; but it used to be thought that they were elastic disturbances in a solid ether, in which case the speed of light waves would have been given by the following equation: —

$$Speed = \sqrt{\frac{Rigidity\ of\ Ether}{Density\ of\ Ether}}$$

It is now generally believed that light consists in electrical disturbances of the ether, in which case the speed of light waves would be determined as follows: —

$$Speed = \sqrt{1/\mu\kappa}$$

where μ is the magnetic permeability of the medium and κ the specific inductive capacity of the medium.

Besides these, there are many other kinds of waves, such as the tides, barometric waves, temperature waves, solitary waves, etc., the discussion of which is beyond our limits of space. For these, as well as the composition of waves, stationary waves, etc., the larger treatises must be consulted. One of the best of these is Lamb's *Hydrodynamics* (Cambridge, 1895). HENRY CREW.

Wax is a solid, fatty substance of animal and vegetable origin. It is harder than fat, and does not melt so easily. It will not dissolve in water, and burns with a bright flame. Bees' wax, Chinese insect wax, and spermaceti are animal waxes, while Japanese wax, palm wax, and myrtleberry wax are vegetable waxes. Bees' wax is secreted by the bees, and forms the cells in which they store honey. It is prepared by draining out the honey, and melting the comb in boiling water, and collecting the wax from the top of the water as it cools. It is, in its natural state, a light yellow color, and is made into white wax by bleaching. It is produced in large quantities, and used mainly for the manufacture of candles. Chinese wax is supposed to be the product of an insect. It is found as a thin white coating on the branches of certain trees, and is removed with boiling water. It is white, like spermaceti, and is used for candles. Japanese wax is got from the fruit of a tree by boiling it and collecting the wax; palm wax is scraped from the branches of two kinds of South American palms; and carnauba wax is found on the leaves of the carnauba palm, and is obtained by drying the leaves and shaking off the wax like dust. Myrtleberry wax or candleberry

wax is made from the berries of the wax-myrtle or bayberry, and as it burns about as well as bees' wax and costs only a quarter as much, it is largely used. Mineral wax is a substance found in small quantities oozing from rocks in coal regions. Paraffin, produced from shale and petroleum, is also much used as a wax for candles, etc. See SPERMACETI, BEES, PARAFFIN, etc.

Wax'wing, the name for birds having the wings, at times, ornamented with small spots that look like red sealing-wax. There are two species in North America, the cedar bird and the Bohemian waxwing. The former nests from Virginia to Labrador, and is found in winter from Massachusetts south to Costa Rica. It is about 7.2 inches long, with a plumage grayish brown above and yellowish below. There is a black stripe running across its face, and the head is crested. The secondaries of the wings are sometimes provided with red wax-like tips. These birds live in flocks and fly in close rank. Their food varies with the season, but consists largely of cedar berries, soft fruits, and insects. The Bohemian waxwing is a more northern bird, but is found south in winter. It is slightly longer than the cedar bird, and has a distinct purple cinnamon color on the head. Similar birds are found in Europe.

Way'land, Francis, an American clergyman, was born at New York, March 11, 1796. He graduated at Union college, and studied both medicine and theology, becoming pastor of a Baptist church in Boston. In 1826, he was made president of Brown university, Providence, R. I. He was one of the first teachers to make the study of Greek and Latin a matter of choice in a college course. He is well known as a writer, his works on moral science and intellectual philosophy having been quite generally used as textbooks. He died at Providence, R. I., Sept. 30, 1865.

Wayne (*wān*), **An'thony,** American general, was born at Waynesborough, Pa., Jan. 1, 1745. He became a surveyor and was elected by Benjamin Franklin to form a settlement in Nova Scotia. When the Revolutionary war began, he raised a regiment of volunteers, and served first in Canada, at the battle of Three Rivers, and in command of Fort Ticonderoga. While with Washington in New Jersey, he commanded the rear guard at Brandywine, led the attack at Germantown, captured supplies for the army at Valley Forge, and surprised the garrison at Stony Point, on the Hudson, one of the most brilliant operations of the war, for which he received a gold medal and the thanks of congress. In Virginia, he saved Lafayette's forces, and assisted in the capture of Cornwallis. He was made major-general, and commander-in-chief in the war against the Indians in 1792, and was made the commissioner to treat with the Indians and to take possession of the British forts in the northwest. He gained the title of "Mad Anthony" by his dash and bravery. He died on his western expedition at Presque Isle (now Erie), Pa., Dec. 15, 1796. See *Life and Services*, by Moore; also Spark's *American Biography*.

Weasel (*wē'z'l*), the name of a number of small carnivorous mammals related to the sable, mink, and skunk. They have a remarkably slender, round body with a long neck, which gives the animal the appearance of having the fore legs set back too far. The legs are very short. The common weasel, found both in the Old and the New Worlds, reaches a length of eight or ten inches; it is light reddish brown and whitish below, and in northern districts becomes whitish in winter. It feeds on mice, moles, and rats, following them into their holes, and even rabbits fall a prey to it. It rarely visits hen-yards. It ranges in America east of the Rocky mountains, and south to the border of the southern states. The stoat, or ermine, likewise inhabits Europe, Asia, and America, ranging, east of the Rocky mountains, from the extreme northern limit of terrestrial animals to the southern states. It is eight to eleven inches long. In summer, its color is mahogany brown, with a black tip to the tail. In winter, it changes, in northern regions, to a pure white except the tip of the tail which remains black. Other examples are the brindled weasel of the western coast, found from California to Ecuador, and the long-tailed weasel of the northwest.

Wea'ver Bird, the common name for a number of sparrow-like birds that show especial skill in weaving their nests. This is so thoroughly fixed a characteristic, that they

YELLOW-CROWNED WEAVER AND NEST.

keep up their weaving habits in captivity when material can be obtained, even weaving fibers about their cages. There are about 250 spe-

cies of this bird, belonging mainly to Africa. Those outside Africa inhabit the oriental region and Australia. There are none in New Zealand or in America. They are small birds, usually of plain colors, but the males become brightly colored during the breeding season. Some of them construct hanging nests, shaped like a pouch, and suspended from high, slender branches. They are closely woven and elongated into a tube opening from below. The social weavers of South Africa are the most noteworthy. A number of birds unite in building an umbrella-shaped structure of coarse grass to form a protection for their nests. The individual nests are placed below this roof and open downward. The roof not only sheds the rain, but enemies like snakes and other animals will slip from it in attempting to get to the nests. As many as 800 or 1,000 nests have been found under a single canopy. Year after year the nests are added to, and sometimes break the branches by which they are supported.

Weav'ing, the art of making cloth by interlacing threads of any substance, such as cotton or wool. The machine employed is a loom, which has improved from the simple hand looms of the Egyptians and other ancient nations, to the complicated machines used at the present time in weaving silk, cotton, carpets, and other woolen goods. The introduction of the power loom instead of the hand loom dates back two centuries, the first successful one being the invention of Cartwright, in 1784, of which the Jacquard loom is the most important improvement. The process of weaving is seen best in the common mode of darning, where a set of lengthwise threads are first fastened firmly and then crossed by other threads, which are woven in and out by taking up one thread and leaving one. In weaving, the threads are fastened in the loom, as many as are necessary for the width of the goods. This is called the warp. The cross thread is wound on spools, or bobbins, in a shuttle and forms the weft, or woof. By a movement of the loom, the alternate threads are raised and the shuttle passes between the two sets of threads. In hand looms, the shuttle is thrown by hand, but moved by machinery in the power loom. The raised threads are then lowered and the lower threads raised, and the shuttle returned to the side whence it came, crossing in this way the threads alternately. The thread in the shuttle is thus carried back and forth, forming the well-known "selvedge" to woven goods. When every other thread is taken up, it is called plain weaving; but there are many varieties introduced, such as taking up one thread and leaving two or three, etc. The quality of the threads also varies, making wool goods with cotton or silk warp, velvet with silk or linen warp, etc. The colors and figures are sometimes stamped on plain goods, when the "wrong side" will present a plain surface; in other goods they are made in the weaving by the use of colored threads. See *Theory and Practice of the Art of Weaving*, by Watson.

Webb, Alexander Stewart, American general, and since 1869 president of the College of the City of New York, was born at New York, Feb. 15, 1835, and graduated in 1855 at West Point, when he entered the United States army, artillery branch. In the Civil war, he served in the army of the Potomac, was chief of staff of the fifth corps in the Maryland and Rappahannock campaigns, was wounded at Gettysburg, where he commanded a brigade, commanded a division in the Rapidan campaign, and led a brigade at the battles of the Wilderness and Spottsylvania (was severely wounded at the latter), and was chief of staff to General Meade till the close of the war. He subsequently held several important army posts until he retired from the army in 1870, acting also as a professor at West Point, until appointed president of the College of the City of New York. He is the author of a work on McClellan's campaign of 1862, entitled *The Peninsula*.

Weber (*vā'ber*), **Karl Maria von,** a German composer, was born in Holstein, Dec. 18, 1786. He early showed the musical genius which he inherited from his father. By the time he was fourteen, he had already composed two operas, the second one, *The Forest Maiden*, being put on the stage. He held several positions, such as conductor of the opera at Breslau, musical instructor in the family of Duke Louis at Stuttgart, director of the opera at Prague and at Dresden, and musical director to the king of Saxony. His work includes operas, symphonies, and overtures for the piano, clarionet, oboe, bassoon, and violoncello, and a large number of songs, among them a series of national songs from Körner's *Lyre and Sword*, which roused the patriotic sentiment during the war of liberation. His best opera, *Der Freichutz* (The Archer), was produced in 1822 at Berlin, and created a great sensation throughout Europe, so that Charles Kemble asked him for an opera for the English stage. *Oberon* was written in answer to this request, and brought out under his own direction at London in 1826, where he was greeted with enthusiastic applause. He died while on this visit to England, June 5, 1826. See *Life*, by his son, translated by Simson.

We'ber, Wilhelm Eduard, who has been called the "Nestor of German physicists," was born at Wittenberg on the 24th of October, 1804. At the suggestion of Gauss he was appointed professor of physics at the University of Göttingen; but in 1837 he was compelled to resign on account of antagonism to the state authorities. Living for the next six years as a private citizen, he was in 1843

appointed to the chair of physics in the University of Leipsic; but was recalled to his old place in Göttingen in 1849. The volume on *The Theory of Waves* (Wellenlehre), which he published with his brother, E. H. Weber, in 1825, is the first scholarly experimental treatment of water waves in existence. But perhaps Weber's chief service to science was the introduction of the absolute system of units into physical measurement — a work which he performed conjointly with Gauss. The invention of the earth-inductor and the electro dynamometer are also due to Weber. As early as 1833, Gauss and Weber had connected the observatory and physical laboratory at Göttingen by means of a telegraph line. Weber died at Göttingen, June, 23, 1891.

Web'ster, Daniel, American statesman and orator, was born at Salisbury (now Franklin), N. H., Jan. 18, 1782. His family came from Scotland, and settled in New Hampshire in 1636. His father, Ebenezer Webster, rose to the rank of captain in the French and Indian war. Living on the frontier, Daniel was forced to depend for his early teaching on his mother and on the scanty schooling to be had in winter; and for much of this he was indebted to the fact that he was physically the weakest of the family. It is a little odd, however, that he failed utterly in that in which his reputation afterwards became so great. As he said: "There was one thing I could not do: I could not speak before the school." When he was fifteen years old, a family council decided to send him to college, a step making necessary hard economy and an extra struggle at home. After a poor preparation he entered Dartmouth college, paying part of his expenses by teaching in winter, and

DANIEL WEBSTER.

graduated in 1801. He then taught in a Maine academy for a year, getting a salary of $350, the greater part of which he saved to help a younger brother through college, earning money to pay his board by copying deeds during the winter evenings. After studying law and being admitted to the bar at Boston in 1805, he began to practice in the town of Boscawen near his early home. But his father died within a year, and he opened an office in Portsmouth, the largest city of the state. Here he took a leading place at the bar, having but one rival. In May, 1813, he entered congress, and was placed at once on the committee of foreign affairs. As a Federalist he held that attacks on Canada should stop, and the war be confined to the ocean. His first speech showed that he was no longer the raw New Hampshire boy of a dozen years before, and that a new power had arisen in oratory. But at this time the influence of a Federalist in congress could not be great, and Webster, removing to Boston in 1816, gave up political life for some years.

At the Massachusetts bar, Webster soon gained a place as prominent as he had held in New Hampshire, and within three years his reputation as a lawyer became national. His national standing was gained in the "Dartmouth college case." In 1816, the New Hampshire legislature undertook to change the college charter given it by the English king in 1769. A suit brought by the old trustees was appealed to the supreme court in 1818, before which Webster claimed that the legislature's action was against the provision of the constitution, which forbids a state to alter contracts. The decision of the supreme court, which upheld Webster's view, is one of the most important in its history. From this time Webster was recognized as the leading lawyer of the country, and his services were in constant demand. The most celebrated of his criminal cases was the trial of Knapp for murder, in which is the passage on conscience that has been declaimed by countless schoolboys.

Webster's reputation as an orator began with his speech at Plymouth in 1820, on the 200th anniversary of the landing of the Pilgrims. Others of these great addresses were the speech at the laying of the corner stone of the Bunker Hill monument in 1825, fifty years after the battle; and that in 1826 on the deaths of Jefferson and John Adams, on the same day, the fiftieth anniversary of the Declaration of Independence. On every great public occasion, after this, if Webster could be had, he was the chosen speaker.

In 1823, Webster again entered congress, where his first speech on the Greek revolution made him the first of congressional speakers. Four years later, Massachusetts sent him to the senate, where he remained until his death, except while serving as cabinet minister. In January, 1830, came the crowning event of his political life. A debate on public lands, known as "Foot's resolution," had wandered off into all possible fields. In the course of it, Hayne, of South Carolina, attacked New England. Webster answered

him; but it was in answer to Hayne's second speech that he made the famous "second speech on Foot's resolution," in which occurs the oft-quoted defense of Massachusetts, and which goes on to trample on the South Carolina doctrine of nullification (see CALHOUN). It was on this speech that the orator's fame was built. Southern men had taken the lead so long that it was a new feeling in the north and west to see a southern leader overmatched by their champion, and "Black Dan Webster," a popular name, due to his dark complexion, beetling brows, and heavy cast of features, was for twenty years the representative of northern feeling as to the nature of the Union. When the Whig party came into power in 1841, Webster was appointed secretary of state, and though on General Harrison's death the other cabinet minsters resigned, he remained under Tyler. This course lost him strength with the Whigs, but he felt that he was needed to settle many important questions, such as the searching of American vessels by the British on the coast of Africa, and the Maine boundary. These matters Webster settled by the Ashburton treaty with England in 1842. He was back in the senate in 1845, and on March 7, 1850, delivered his speech on the compromise between the north and the south, which had now drifted widely apart. Webster's keynote in the speech, as it had been all along, was for the Union first and foremost, detesting all whom he held to be its enemies, whether abolitionists or nullifiers. This speech destroyed his last hopes of reaching the presidency. He died Oct. 24, 1852, while secretary of state under Fillmore.

Web'ster, Noah, an American scholar, was born at Hartford, Conn., Oct. 16, 1758. He studied at Yale college and served in the militia under his father in the Revolutionary war. While a teacher at Goshen, N. Y., he published *Grammatical Institutes of the English Language*. He published books and lectured on political subjects, taught an academy at Philadelphia, practiced law at Hartford, edited a magazine and a newspaper, and wrote pamphlets on epidemic diseases, banking, and international law. In 1807, he published a grammar and began his *American Dictionary of the English Language;* but decided to fit himself more perfectly for the work, and spent ten years in the study of the origin of the English language and its connection with other languages. Seven years were then spent on the dictionary, including a visit to Europe to consult books and scholars, both at Paris and at Cambridge. The dictionary was published in 1828, in two volumes in the United States, followed soon by an edition of 3,000 in England. It has long been the standard dictionary of the English language, and has passed through many editions and revisions. More than 300,000 copies have been sold yearly and the income from the book is still about $25,000 a year. As celebrated as the dictionary is *Webster's Spelling Book*, which was used for many years in every school in the land, and of which more than 70,000,000 copies have been sold. Webster published also a *History of the United States*. He was one of the founders of Amherst college and a member of the Massachusetts legislature while residing in Amherst, and of the Connecticut legislature when living at New Haven. He died May 28, 1843. See *Life*, by Scudder.

Wedg'wood, Josi'ah, an English potter, was born at Burslem in Staffordshire, England, in 1730. He learned his trade from his father, but was not satisfied with merely carrying it on in the old methods, but made effort toward improvement. He succeeded in producing a cream-colored porcelain which was known as queen's ware. He extended his improvements also to the form and decoration of his pottery, copying from ancient models and employing the sculptor Flaxman to design for him. He thus raised the rude manufacture of pottery in England to a high position as an art. He built large factories near Burslem for the manufacture of the Wedgwood ware, invented by him in 1775, calling the village Etruria. His liberality and public spirit equaled his wealth, and he was known also as a writer on philosophical subjects. He died Jan. 3, 1795. See *Life*, by Meteyard.

Weed, Thurlow, an American journalist, was born at Cairo, N. Y., Nov. 15, 1797. At ten, he was a cabin boy on a sloop on the Hudson river, and at twelve an apprentice in a printing office at Catskill, N. Y. He served as a volunteer in the War of 1812. He established the *Agriculturalist* in western New York, editing several other journals until he was selected as the editor of the *Albany Journal*, the organ of the Whig party. Here he became an acknowledged leader of the Whig and Republican party, and had great influence in securing the nominations of William H. Harrison, Taylor, and Scott. In 1865, he moved to New York city and became editor of the *New York Times*, and afterward of the *Commercial Advertiser*. He died at New York, Nov. 22, 1882.

Wee'vil, a common name for a number of beetles with long snouts, abundant in the United States. Some of the most destructive insects belong to this family of beetles. The plum weevil, for example, often destroys a large part of that fruit. The female bores a hole in the fruit with her snout, and lays an egg in the cavity; the egg is then pushed to the bottom with the snout. The larva hatches and feeds upon the fruit, which spoils and drops off the tree. The same insect infests cherries, but the wormy cherries hold to the tree. It is also destructive to apricots and peaches. Fortunately, this species is not found on the Pacific coast. The acorn weevil

and the nut weevil are destructive to acorns, hickory nuts, and chestnuts, the snout being in all cases used to make a hole for the eggs. Apple and strawberry weevils attack those fruits, and the latter are especially destructive when they get into a strawberry patch.

Weim'ar (*vī'mär*), a town in Germany, capital of Saxe-Weimar, is sixty miles southwest of Leipsic. It is on the Ilm river, in a pleasant valley, and though a court residence, has little trade and no manufactures. It is celebrated as the home of Goethe, Schiller, Herder, and Wieland. The ducal palace has rooms decorated with frescoes illustrating the works of these authors, the public library contains busts of them, and there is a double statue of Goethe and Schiller, one of Herder, and one of Wieland, and the tomb of Herder is in the town church. There is a gymnasium, a free school of design, a public library, a theatre, once famous under Goethe's and Schiller's management, and a fine musem. Population 27,000.

Weir (*wēr*), **Robert Walter,** an American painter, was born at New Rochelle, N. Y., June 18, 1803. After studying in Italy several years he was made professor of drawing at West Point, N. Y., where he remained for forty-two years. His best-known works are *The Landing of Henry Hudson, Columbus before the Council of Salamanca, Indian Captives,* in the Boston Athenæum; *Embarkation of the Pilgrims,* in the rotunda at Washington; and *Christ in the Garden.* Some of his works in private collections at New York are very fine, as a *View of Hudson from West Point; Rebecca,* from *Ivanhoe;* and *A Pier at Venice.* He died at New York, May 1, 1889.

Weismann (*vīs'man*), **August,** a distinguished German zoologist, was born at Frankfort-on-the-Main, Jan. 17, 1834, and studied medicine at Göttingen, Paris, and Vienna. He early showed a decided fondness for natural science, being specially interested in biology. In 1873, he was appointed professor at Freiburg, and has since devoted himself enthusiastically to research. His writings embrace *Studies in the Theory of Descent, Germ Plasm, Essays on Heredity,* and other works bearing on Evolution.

Wel'land, a Canadian river which flows east sixty miles and empties into the Niagara. It was used as a part of the Welland canal, built to connect Lake Erie and Lake Ontario, and to enable vessels to pass around Niagara Falls.

Welles, (*welz*) **Gideon,** American statesman was born at Glastonbury, Conn., in 1802. He was for many years editor and part proprietor of the *Hartford Times.* While a member of the Connecticut legislature, he secured the abolishment of imprisonment for debt. He held a position in the navy department under President Polk, and was made secretary of the navy under President Lincoln, holding the position for eight years. He found the navy at the beginning of the Civil war without a single warship, yet succeeded in maintaining a blockade for over 2,000 miles of coast, and formed a fleet of ironclads and transports on the Mississippi river. He died at Hartford, Conn., Feb. 11, 1878.

Wellesley (*wĕlz'lĭ*), a town in Massachusettes, fifteen miles west of Boston, where is situated Wellesley college, one of the largest colleges for women in the country, opened in 1875. It is intended to give to women as high an education as the best colleges in the land, and requires the same entrance examination, with the exception of Greek. There are seven courses to select from. There is a large building, with grounds covering 300 acres, a library, a reading room, gymnasium, etc. Population 5,072.

Welles'ley, Richard Colley, Marquis of, a British statesman, brother of the duke of Wellington, was born at Dublin, June 20, 1760. He studied at Eton and Oxford, took his seat in the Irish house of peers, and was one of the original Knights of St. Patrick when the order was formed in 1783. In 1784, he obtained a seat in the British house of commons, and in 1797 entered the house of lords as Baron Wellesley. He was sent to India in 1798 as governor-general, where he found the British possessions threatened by the French in alliance with Tippo Sahib, a powerful native prince. He secured the French officers who were over the native troops, sent them out of the country, and defeated Tippo Sahib, who was slain in battle. He effected a treaty with Persia, and carried on successfully the Mahratta war, which ended by making England the great power in India, adding forty million people and $50,000,000 of revenue to her kingdom. He built the palace of Calcutta, founded the College of Fort William, and introduced financial reforms that doubled the revenues of the East India company. The great expense of his administration and charges of cruelty to native princes were the complaints made against him, and articles of impeachment were presented but rejected by the house of commons. He was ambassador to Spain, secretary of state, lord lieutenant of Ireland, and lord chamberlain. He had an annuity of $25,000 from the East India company, and a gift of $100,000 toward the close of his life. He died at London, Sept. 26, 1842.

Wel'lington, Arthur Wellesley, Duke of, one of England's greatest generals, was born at Dungan castle, Ireland, May 1, 1769. He studied in a military college in France. His first actual service was in command of a regiment in the Netherlands in 1794. While his brother was governor of India, he won his first fame in the Mahratta war with the bril-

liant victory of Assaye, gained with 4,500 men against 40,000 Mahratta troops. After serving in Hanover and Denmark, and commanding an expedition sent to Portugal, he was put in command of the peninsular army in Portugal and Spain, which was opposed to the veteran forces of Soult and Victor. He won, July 27 and 28, 1809, the battle of Talavera, for which he was created a peer and given a pension of $10,000. He carried the war into Spain, which was held by the French, gained the battles of Badajos and Salamanca, and was made general in chief of the Spanish armies, as he had already been of the Portuguese forces. His pension was doubled, and $500,000 given him to purchase lands. He followed the retreating army into France, took Pamplona, and defeated Soult under the walls of Toulouse. He received for the twelfth time the thanks of parliament, and a gift of $2,000,000. When Napoleon escaped from Elba, Wellington was put in command of the British forces; while the Prussian army was led by Blücher and June 18, 1815, came the great battle of Waterloo, which finally crushed the power of Napoleon. The allied armies marched upon Paris, and Louis XVIII. entered the city the day after the English army. Wellington took command of the army of occupation, living in Paris for three years, where two attempts were made upon his life. He was created field-marshal of the armies of Russia, Prussia, and Austria, and prince of Waterloo by the king of the Netherlands, while parliament added $1,000,000 to its former gift. He represented Great Britain at the congress of Verona, was sent on an embassy to Russia, and became commander-in-chief of the British army. His political career, during which he filled the first positions in the country, lost him much of his great popularity, as he took a firm stand against reform, his opposition to the reform bill being followed by an attack of a London mob on his house, and hooting and pelting in the streets. His share in the repeal of the corn laws restored the "Iron Duke," as the people loved to call him, to popularity. He died at Walmer Castle, Kent, Sept. 14, 1852. See *Lives* by Browne, Gleig, Maxwell, and Yonge, and *Dispatches and Memoranda*.

Wells, David Ames, an American economist of note, free trader, and lecturer, and writer on economics and political science, was born at Springfield, Mass., June 17, 1828, and died at Norwich, Conn., Nov. 5, 1898. After graduating at Williams college, and at the Lawrence Scientific school, Harvard, he was for a time associate editor of the *Springfield Republican*, and took a hearty interest in the publication for a series of years of *The Annual of Scientific Discovery*. In 1866, he was appointed United States commissioner of revenue; in 1877 was chairman of a commission to report upon the laws relating to taxation in the state of New York; and generally took a prominent part in discussions of the time on financial and economic subjects. He was an industrious and prolific writer. Among his published works are text-books on *Familiar Science*, the *Science of Common Things*, *Elements of Natural Philosophy*, and *First Principles of Geology*, and in economics *Production and Distribution of Wealth*, *Practical Economics*, *The Relation of the Tariff to Wages*, *Recent Economic Changes*, and *The Principles of Taxation*. He also published *Robinson Crusoe's Money*, and a work entitled *Our Merchant Marine*.

We'ner, Lake. See SWEDEN.

Weser (*vā'zer*), one of the chief rivers of Germany, flows through Prussia and empties into the North sea. It is 260 miles long, but of little use for navigation.

Wes'leyan Univer'sity, at Middletown, Conn., was founded in 1831, and is the oldest of the colleges established under the auspices of the Methodist Episcopal church. It has 35 instructors, and an attendance of 350 students.

Wes'ley, Charles, was born at Epworth, in Lincolnshire, England, Dec. 18, 1708. The name is thought to be the same as Wellesley, and Garrett Wellesley offered to make Charles Wesley his heir if he would settle in Ireland, but the offer was declined, and the estate went to another branch of the family, from which came Arthur Wellesley, duke of Wellington. Charles Wesley, after studying at Oxford, went to Georgia with his brother John. On his return to England, he took an active part in the work of forming the Methodist church. He is especially known as a hymn-writer, some of the most beautiful hymns in church collections being his work. *Jesus, Thy Robe of Righteousness*, and *Blow Ye the Trumpet, Blow*, are among the best known of his large contributions to the music of the church, which numbered 4,100 published hymns and 2,000 in manuscript. He died at London, March 29, 1788. See *Life*, by Jackson.

Wes'ley, John, the founder of Methodism, was born at Epworth, in Lincolnshire, England, June 17, 1703. He was made a fellow in Lincoln college, Oxford, where, with his brother Charles and a few others, he began a systematic course of religious exercises that gave them the name of Methodists. In 1735, he went to Georgia as preacher to the colonists and missionary to the Indians, and became impressed with the views of the Moravians who were his fellow-passengers at sea. His strict discipline was distasteful to the colonists, and after two years he returned to England. Here he studied the Moravian doctrines, and ascribed his conversion to a Moravian meeting at London. He began his preaching at London, and soon joined Whitefield in open air services, sometimes deliver-

ing 800 sermons a year. The meetings were attended by thousands, especially in the mining and manufacturing districts. Persecution and opposition resulted in Wesley's forming "bands" for prayer, and a church society, and finally in his ordaining preachers to be sent to America, Scotland, etc., thus separating entirely from the Church of England. He traveled nearly 270,000 miles, usually on horseback, and preached over 40,000 sermons. He wrote a large number of volumes on religious subjects, and published with his brother Charles a collection of hymns. He died at London, March 2, 1791. See *Lives*, by Southey, Watson, Moore, etc., and *History of the Religious Movement of the 18th Century*, by Stevens.

West Bay City. See BAY CITY.

West, Benjamin, an American painter, was born at Springfield, Pa., Oct. 10, 1738. His first portrait was a picture of his baby sister, smiling in her sleep, made when he was seven years old. His colors were made from berries, and his brush was of hairs stolen from the cat's tail. His first work was done at Philadelphia and New York, but in 1760 he went to Italy for further art study, and after three years of training settled in London. Here he became famous at once, and was appointed historical painter by George III. He was one of the four artists who formed the Royal academy, and was chosen to succeed Sir Joshua Reynolds as its president. His paintings were mostly on historical and religious subjects, on a large scale, in imitation of the old masters. The *Death of Wolfe*, the *Battle of La Hogue*, and *Christ Healing the Sick* are among his best paintings, of which he left nearly 400. He died in 1820, and was buried in St. Paul's, London. See *Lives of Eminent Painters*, by Cunningham; *Century of Painters of the English School*, by Redgrave.

West'cott, Brooke Foss, an English prelate, writer, and biblical scholar, was born near Birmingham in 1825, and educated at Trinity college, Cambridge. He was successively a Master at Harrow, canon of Peterborough, regius professor of divinity at Cambridge, canon of Westminster, and in 1890 was appointed bishop of Durham. His writings are numerous, embracing a *History of the Canon of the New Testament*, *Introduction to the Study of the Gospels*, *History of the English Bible*, *The Gospel of the Resurrection*, *The Gospel of Life*, *Social Aspects of Christianity*, *The Historic Faith*, *The Revelation of the Risen Lord*, and *Characteristics of the Gospel Miracles*.

West'ern Austral'ia forms about a third of Australia, and is 1,400 miles long and 850 broad, covering 975,920 square miles, with a coast line of 3,500 miles. The Murray, Blackstone, Swan, and Murchison, 400 miles long, the Fitzroy and the Ord, are some of the principal rivers. The country is mostly level, covered with forests, with a dry, sandy region in the interior and a few shallow salt lakes. The Darling, Victoria, and Herschel are the principal mountain ranges—not over 3,000 feet high. The eucalyptus, mahogany, red gum, York gum, jarrah, baobab, sandalwood, grass tree, paper-bark tree, and mangrove are some of the peculiar trees; while the kangaroo, wombat, wallaby, and "dingo" or wild dog, are found among the animals. The raising of sheep, goats, and cattle is the most important industry; the fisheries, including turtle, rock cod, snapper, etc., provide material for the canneries; and the pearl fisheries are increasing in value; salt, raisins, castor oil, honey, and wax, manna, gums, and wine are other products. Gold is found in Kimberley; magnetic iron ore at Mt. Magnet; lead and copper in the Victoria region, besides silver and plumbago. In 1899, the government expended $310,140 on its schools. There were 205 public schools, with 16,033 pupils in attendance, and 83 private schools with 5,812 pupils. There were at that time 1,850 miles of railway, and 8,749 miles of telegraph. Western Australia is a British colony, first settled by a convict colony at Port Jackson, but it made little growth until convict labor was introduced. From 1850 to 1868, 10,000 convicts were brought into the country. The capital is Perth (population 34,610). Population 178,196.

West Ho'boken, N. J., a flourishing town in Hudson county, N. J., on the Hudson river, adjacent to New York city. It is largely engaged in the manufacture of silk goods. It has a number of schools, churches, and civic buildings, a convent of the Sisters of St. Dominic, a Roman Catholic school, and a monastery of the Passionist Fathers. The population has more than doubled in the past decade, its inhabitants now numbering 23,094.

West In'dies, an archipelago of about 1,000 islands lying between North and South America. The island of San Salvador was the first land seen by Columbus, and he gave the name of West Indies to the region, thinking he had found a new route to India. The islands separate the Atlantic ocean from the gulf of Mexico, and are in four groups: the Bahamas, the Greater Antilles, including Cuba, Jamaica, etc., the Lesser Antilles, and the islands off the coast of Venezuela. The Bahamas are low coral islands, while the Antilles are mountainous and volcanic, having peaks from 6,000 to 8,000 feet high. The summers are very hot, and hurricanes are numerous and severe. Insects, snakes, lizards, scorpions, etc., abound, and the birds are especially beautiful. The forests produce mahogany, satinwood, crabwood, rosewood, and other valuable lumber. Ginger, pepper, pimento, aloes, sassafras, cochineal, and indigo are other products. The chief trade is in sugar

and tobacco. The mineral wealth is not great, though gold, silver, iron, copper, tin, lead, salt, and other minerals are found and worked to some degree.

The Spaniards began their dominion over the islands by enslaving the native tribes they found there, who at times revolted against their masters, but with no effect, and were almost exterminated. As a result of the Spanish-American war, in 1898, Porto Rico was ceded to the United States, and Cuba was freed from Spanish sovereignty. Guadaloupe, St. Bartholomew, Martinique, etc., belong to France; the Bahamas, Jamaica, Leeward and Windward islands, and Trinidad to England; some of the smaller islands to the Dutch, and some to the Danes; while Haiti is independent. Population (total estimated of the whole of the West Indies) 5,678,128.

West'minster Abbey is in the city of Westminster, which is now a part of London. On an island formed by a branch of the Thames, Sebert, king of the East Saxons, built a church in the 7th century, which was replaced, it is thought, by an abbey called Westminster, to distinguish it from St. Paul's or Eastminster. The first stone building on the site was built by Edward the Confessor, of which the Pyx house is a remnant. The present abbey was mostly built by Henry III., beginning in 1220 with a chapel. The west front with its great window was the work of Richard III., and Henry VII., who also built the chapel called by his name. Two towers were added by Sir Christopher Wren. The building is a cross, 511 feet long. It was used as the burying-place of the English kings, and is crowded with monuments. The shrine of Edward the Confessor was built by Henry III.; the tombs of Edward I., Henry III., Henry V., Edward III., and of most of the sovereigns from Henry VII. to George III. are within the walls. There are besides the two coronation chairs, one inclosing the stone brought by Edward I. from Scone, on which the Scottish kings were crowned. The most interesting part of the abbey is the "Poets' Corner" on the east aisle of the south transept, where are memorials of the great British poets, among them Chaucer, Dryden, Milton, Gray, Shakespeare, Addison, Thomson, Tennyson, and of the American poet Longfellow. The monuments of Pitt, Fox, Chatham, Canning, and Wilberforce, and of the great inventors Talford, Watt, and Stephenson, are in other parts of the building. See *Memorials of Westminster*, by Walcott.

Westpha'lia, a province in western Prussia, bordering on Holland. It is 110 miles long and 124 wide, including 7,803 square miles. The Lippe, Ruhr, Ems, and Weser are the principal rivers, the Weser crossing the Weser hills by a pass, called the Westphalian gate. The Lippe divides the country into two parts, the northern portion flat like Holland, and the southern portion with hills and valleys. The farming is carried on by small farmers with old methods, the most important crops being hemp and flax. Cattle, goats, and hogs are raised, the latter yielding the well-known Westphalian hams. Its mineral resources give it its great prosperity. There are large coal fields in the north, and it produces more iron ore than any province of Prussia, except Silesia. It is also rich in copper, zinc, sulphur, and salt. The leading manufactures are linen weaving and iron working. Westphalia was the name of the western part of the duchy of Saxony, and was divided when Henry the Lion's Saxon domains were distributed by the Emperor Maximilian, the archbishops of Cologne receiving a part, with the title of dukes of Westphalia. Napoleon formed the kingdom of Westphalia for his brother Jerome, which was abolished after the battle of Leipsic. The congress of Vienna (1815) finally gave Westphalia to Prussia. The peace of Westphalia at Osnabrück and Münster, in 1648, ended the Thirty Years' war. Population 3,188,072.

West Point, the seat of the United States Military academy, is a village on the Hudson river, fifty-two miles north of New York. It is a promontory, about 180 feet above the river, commanding the fine scenery of the Highlands, and surrounded by hills reaching from 500 to 1,500 feet in height. The military school was founded in 1802, and provides free education for 300 cadets, who are bound to serve in the army for eight years. Each congressional district can send one cadet and ten are appointed by the President. The course of training lasts four years, and the graduates have the rank of second lieutenant in the regular army. The buildings include several batteries, besides the library, stone barracks, and buildings for instruction, and contain many war relics and portraits of military heroes. West Point was guarded during the Revolutionary war by two forts and a chain across the river, which were taken by the British in 1777, but abandoned by them after Burgoyne's surrender. The point was afterward strengthened by forts and other works, which the commander, Benedict Arnold, was bargaining to betray to the British, when the arrest of Major André defeated the plot.

West Virgin'ia, one of the central states of the Union, lies mostly between Virginia and the Ohio river, with the narrow strip, called the "Panhandle," running for sixty miles between Ohio and Pennsylvania. It covers 24,645 square miles, nearly all of it being mountainous or hilly, which has given it the name of the Switzerland of America. The Alleghany mountains are on the eastern border, and in the western part of the state are Laurel hill, Greenbrier, Gauley, and Rich mountains, a continuation of the Cumberland range. The Potomac forms 100 miles of the northern boundary of the state and the Ohio 300 miles of the western border, with the

Monongahela, Great and Little Kanawhas, and the Big Sandy flowing into it. The Kanawha is 450 miles long and is navigable for 100 miles. Nearly all the lower hill country can be cultivated, and in the mountainous regions are broad, fertile valleys. A large part of the state is still covered with magnificent forests of pine, chestnut, ash, maple, etc., in places so dense that a stranger needs a guide. The coal fields cover 16,000 square miles, or a larger extent of country than Great Britain, and give the state the fourth place in the coal states of the country, while it is second in producing coke. Petroleum, natural gas, iron ore, salt, bromine, sandstone, marble, alum, and copper are other minerals found very abundantly in the state. The mineral springs, such as Greenbrier White Sulphur Springs, used by the Shawnee Indians and early white settlers, the Berkeley Springs, Red Sulphur Springs, Old Sweet, and Capon Springs, are all famous summer resorts, as are Deer Park, Oakland, and other places in the mountain region.

Corn is the largest crop, followed by wheat, oats, and tobacco. Ginseng is a peculiar product, a root dug out of the mountain, and exported mainly to China. The raising of horses, sheep, and cattle is a large industry; the great lumber business, with tanneries and wood-pulp mills in connection with it, and coal-mining are other industries. The manufactures are those of leather, iron, steel, glass, and pottery, with a peculiar variety of cigars, called "stogies," from the Conestoga wagons which traveled west from Pennsylvania in early days.

In 1894, there were 5,302 school buildings in the state. The elementary schools in 1898 had 6,734 teachers and 234,410 pupils; the high schools had 94 teachers and 1,778 pupils; there were several normal schools, and twenty-nine colleges and academies, among them, Bethany college near Wheeling, whose first president was Alexander Campbell, organizer of the Disciples of Christ, and the State university near Morgantown, which has an agricultural experiment station, and a law school connected with it.

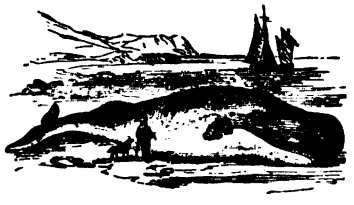
The first permanent settlers in West Virginia came from Pittsburg, and one of the first landowners was George Washington, who held 32,000 acres in the Ohio and Kanawha valleys. When the state of Virginia seceded, the western part, separated from the eastern part by the Alleghany mountains and closely connected with Ohio, refused to join in the movement, held conventions at Clarksburg and Wheeling, and formed the state of West Virginia, which was admitted into the Union in 1863. The battles of Philippi, Beverly, Rich mountain, Cheat mountain, and Carnifex Ferry, and John Brown's raid at Harper's Ferry were the chief actions on the soil of West Virginia connected with the Civil war. The chief town of the state is Wheeling (population 38,878). Population 958,800.

West Virgin'ia Univer'sity, located at Morgantown, was founded in 1867, as West Virginia Agricultural college. In 1868, by act of legislature, the name was changed to West Virginia university. The organization now includes colleges of art and sciences, engineering, and mechanic arts, agriculture, school of music, and commercial and preparatory schools. The faculty numbers 64, with an enrollment of 885 students.

Wet'terhorn, a lofty mountain in Switzerland, about ten miles from the lake of Brienz. It rises almost perpendicularly in one great wall of limestone, 12,200 or 14,105 feet, according to different measurements.

Wey'man, Stanley John, English novelist, was born at Ludlow, Shropshire, Aug. 7, 1855, and educated at Shrewsbury school and Christ church, Oxford. Studying law he was called to the bar, and practiced on circuit from 1881 to 1889, when his first work, *The House of the Wolf*—a romance of French history—appeared. After this, his health necessitated his traveling abroad and he abandoned law altogether. His later novels include *The New Rector*, *The Story of Francis Cludde*, and *A Gentleman of France*. The success of the latter, which was published in 1893, and at once translated into many European languages, was immediate, and has proved one of the most successful of recent historical romances. His later stories are *Under the Red Robe*, *My Lady Rotha*, *The Red Cockade*, *The Man in Black*, *The Castle Inn*, and *Shrewsbury*, and the *Memoirs of a Minister of France*. He is a vivid and picturesque writer, and has been most successful in his treatment of themes drawn chiefly from the era of mediæval France.

Whale, a marine mammal of fish-like form belonging to the order Cetacea. The dolphins are included with the whales. Few people realize what the term a marine mammal means as applied to whales, the fish-like form suggests an affinity with fishes, but they are warm-blooded animals, breathing by lungs, and suckling their young with milk—in short, ranking above reptiles and birds, in the class mammalia. There are two divisions, those



SPERM WHALE.

with teeth, as the dolphin and sperm whale, and those without teeth in the adult, but with whalebone plates inside the mouth. The latter group, often called the true whales, have teeth in embryonic stages, and the fact that

teeth arise and disappear before birth, is taken to mean that the whalebone whales are descended from ancestors which had teeth, and that the embryonic teeth are a matter of inheritance, but in the changed habits of the animal are not required. The whales have nostrils located on the top of the head, and in coming to the surface they spout or blow. They do not, however, as is generally supposed, throw out a jet of water. The column of spray is due to the condensing of their warm breath which is laden with watery vapor. The head, which in some species may make one-third the length of the entire animal, merges into the body without a perceptible neck. The fore limbs are modified into paddles, but, internally, they show bones corresponding to those in the arm of man, and not to those in the fins of fishes. The hind limbs are absent, but there is a distinct trace of the hip bones. The tail is expanded horizontally and not vertically as in the fishes. Most warm-blooded animals are kept warm by a hairy covering, the whales, however, are almost destitute of hair, but the body is surrounded by a very thick layer of fat or blubber under the skin to keep up the temperature. The whales wander over a wide part of the ocean, being found in tropical, temperate, and frigid seas. Their food is varied, that of the sperm whales being partly made of large cuttlefish. The ambergris of commerce is derived from an internal secretion coming from these whales, and containing the hard beaks of cuttlefish. The large whalebone whales feed on small crustacea, squids, fish, and the like. They swim with their mouths open, and when a number of these small creatures are collected within the mouth, it is closed and the water is strained through the plates of whalebones, while the animals are retained.•

The rorquals, from 65 to 75 feet long, are among the most abundant whales. The finback whale, about sixty feet long, is found along the coast of the eastern United States and is sometimes seen in Massachusetts bay. Another common whale of our eastern, Atlantic coast is the black whale or right whale, about forty feet long. It is occasionally found as far south as South Carolina. In the Arctic region is found the great bowhead, the most valuable of whales to the whale hunters, but not the largest one. It reaches a length of 50 to 60 feet, but an adult will yield from 200 to 300 barrels of oil and two tons of whalebone. The largest whale is the sulphur bottom of the Pacific, which reaches 100 feet in length, and is the largest of living animals and, probably, of all animals that have ever lived. The razorback of the north Atlantic grows to be seventy feet in length. The sperm whale, or cachalot, is a toothed whale, which attains a length of eighty feet. It inhabits the open sea, especially in southern latitudes. It yields the fine sperm oil and spermaceti. The chase of these monsters of the ocean has greatly declined, largely on account of their growing scarcity and the abundance of other oils. Formerly, New Bedford and San Francisco were the principal whaling ports of the United States.

What to Read. Boys and girls who pass their school days without having formed a taste for good books, either drop the reading of books altogether when they leave school or fall into the habit of reading trash. On the other hand, the youth who through wise supervision and guidance has been led to read along right lines and to appreciate good literature, has secured a possession, the value of which, both as a means of advancement and a source of highest enjoyment, is beyond price. Many regard the benefits to be derived from the companionship of books as open only to those who have the advantages of what is termed a liberal education. No greater mistake can be made. Says Dean Farrar: "Any one who simply knows how to read has in his hands a key which will admit him into the richest treasuries of human thought. He may so use the simple knowledge of his own language as to raise himself to an intellectual level with those who have enjoyed the amplest opportunities. The youth who has learnt to read with thoughtfulness and intelligence, who loves reading, and who knows what to read and how to read, has within his reach the best gifts that life can offer. He need never be dull, he need never be ignorant, he need never be unprogressive."

In view of considerations such as these, no problem is more worthy the thoughtful attention of parents than that which is presented in the wise direction of the reading of their children. The abundance of material which is available affords ample room for individual taste and judgment in the choice of books. In respect to mature readers, it is often claimed that no definite advice should be attempted in this direction, on the ground that restraint and guidance will interfere with the individual taste or natural bent of the mind, or that the reading of books which are not congenial to the reader is a waste of time. As to children, however, the need of guidance is evident. Here something may be learned from the methods which are pursued in respect to school studies. In the earlier years, studies are arranged without reference to the personal aptitudes or tastes of pupils. Certain branches are considered fundamental, and these they are required to pursue. It is well understood that their preferences cannot be followed. With maturing years, and with mental growth which results from the accomplishment of the tasks assigned them, comes the development of judgment and taste which can be made the basis of intelligent choice. Accordingly, in higher schools, while guidance is still deemed essential, and the curriculum is for the most part defined, yet the presence of a matured and developed taste in the student is recognized in the introduction of

optional courses, and finally, when the course has been finished, the hand and the mind of the instructor is withdrawn, and the taste and judgment of the individual become supreme in the choice of all future study and work in life. So in respect to reading, there should be at first close direction, and later such guidance and suggestion as may give room for the development of individual taste and preference.

A starting point is afforded in the love of the "story," which is universal among children. Fresh wholesome narrative comes earliest. The fairy and folk stories which have delighted many generations of children, here properly have place and serve a valuable purpose. No child should miss the delights of the inimitable *Wonder Stories* of Hans Christian Andersen, Kingsley's *Water Babies*, *Alice's Adventures in Wonderland*, Scudder's *Fables and Folk Stories*, and others of this class. These may be followed by the myths and legends of primitive ages, as found in Hawthorne's *Wonder Book*, and *Tanglewood Tales*, Kingsley's *Heroes*, and Cox's *Tales of Greece*.

There are many charming and instructive books relating to animal and bird life to which children should be introduced during the early years of their school life. A list of such books will be found under *Nature Study*, in the article PEDAGOGICS in this work. Books of voyages and travel early excite the interest of bright boys and girls and justly have an important place in the reading of the young; for while they hold the attention, they at the same time have a distinct educational value. They widen the horizon of the youth, and fill his mind with a rich store of facts. Here, however, there is need of caution. Of real travel, exploration, and discovery, there is little danger that too much will be read; but in the use of fictitious travel and adventure there is need of moderation and close scrutiny. A flood of stories of this class appear every year, which are untruthful, exaggerated in style, and unhealthy in sentiment. On the other hand, there is an abundant supply of books which are admirable in matter and style. A few of these, such as *Robinson Crusoe*, Dana's *Two Years before the Mast*, Bayard Taylor's *Boys of Other Countries*, the *Bodley Books*, Knox's *Boy Traveler Series*, may well be placed in the library of every youth. There is, however, danger in over indulgence in even the best books of this class. A fondness for fiction must ever be held in check, if a taste for reading of a more solid and enduring kind is to be developed. The explorations of Livingstone, Stanley, Baker, Du Chaillu, and others, and the history of American pioneers, afford not less interesting and far more profitable reading than even the best of fiction in the same line. Quite early the important fields of history and biography may be entered. Books like Guerber's *The Story of the Thirteen Colonies*, Johonnot's *Stories of Our Country*, Towle's *Biographies*, *Pizarro*, *Magellan*, etc., may be read with interest and profit by pupils in the fifth and sixth school grades. As supplementary to language work in school, children should be made familiar with some of the best literature in prose and poetry, choice being made of such selections as are marked by purity and simplicity of style.

The following brief list, in which are named books which are adapted to pupils in each of the grammar school grades, can readily be enlarged from the abundant material which is available. Many of these are issued in inexpensive form in the *Riverside Literature Series*.

FIRST GRADE.— *The Hiawatha Primer; Verse and Prose for Beginners; Æsop's Fables*, Vols. I. and II., Pratt.

SECOND GRADE.— *Fables and Folk Stories*, Scudder; *Hans Andersen's Stories; German Household Tales; Fifty Famous Stories Retold*, Baldwin; *Bird World*, Stickney-Hoffman.

THIRD GRADE.— *Stories of Colonial Children*, Pratt; *Wonder Book*, Hawthorne; *Legends of Norseland*, Pratt; *The Nine Worlds*, Litchfield; *Old Stories of the East*, Baldwin; *Old Greek Stories*, Baldwin.

FOURTH GRADE.— *Tanglewood Tales*, Hawthorne; *Stories from Old Germany*, Pratt; *Hiawatha*, Longfellow; *King of the Golden River*, Ruskin; *Old Greek Folk Stories*, Peabody.

FIFTH GRADE.— *Child Life in Poetry*, Whittier; *Children's Hour and Other Poems*, Longfellow; *Gulliver's Voyage to Lilliput*, Swift.

SIXTH GRADE.— *Courtship of Miles Standish*, Longfellow; *The Story of the Shad*, Church; *A Christmas Carol*, Dickens; *Enoch Arden*, Tennyson; *Birds and Bees*, Burroughs.

SEVENTH GRADE.— *Rip Van Winkle and Other Essays*, Irving; *The Story of the Æneid*, Church; *Snowbound and Other Poems*, Whittier; *Grandmother's Story of Bunker Hill and Other Poems*, Holmes; *Sharp Eyes and Other Papers*, Burroughs.

EIGHTH GRADE.— *Evangeline*, Longfellow; *My Hunt after the Captain and Other Papers*, Holmes; *The Vision of Sir Launfal*, Lowell; *Tales of the White Hills*, Hawthorne; *Thanatopsis and Other Poems*, Bryant; *Merchant of Venice*, Shakespeare; *Gettysburg Speech and Other Papers*, Lincoln; *Lays of Ancient Rome*, Macaulay; *Lady of the Lake*, Scott.

SUPPLEMENTARY MATERIAL IN GEOGRAPHY. — *Stories of Starland*, Proctor; *Our Own Country*, Smith; *North America*, Carpenter; *Story of Our Continent*, Shaler; *Hawaii and Its People*, Twomby; *Our American Neighbors*, Coe; *The South American Republics*, Warwick and Smith; *Boy Traveler Series*, Knox; *By Land and Sea*, Companion Series; *Persons and Places in Europe*, Benedict; *Modern Europe*, Coe; *Asia*, Carpenter; *Life*

in Asia, Badlam; *Australia and the Islands of the Sea*, Kellogg; *Australasia*, Pratt.

SUPPLEMENTARY MATERIAL IN HISTORY.—*American History Stories*, Pratt; *Beginners' American History*, Montgomery; *Primary History*, MacMaster; *Short Stories from English History*, Blaisdell; *Story of Our Country*, Burton; *Four Great Americans*, Baldwin; *Four American Patriots*, Burton; *Four American Naval Heroes*, Beebe; *Stories of American Life and Adventure*, Eggleston; *Colonial Massachusetts*, Dawes; *Pioneers of the Mississippi Valley*, McMurry; *Heroes of the Middle West*, Catherwood; *Story of the Thirteen Colonies*, Guerber; *Story of the Great Republic*, Guerber; *American Indian*, Starr; *George Washington*, Scudder; *War of Independence*, Fiske; *The Story of the Chosen People*, Guerber; *The Story of the Greeks*, Guerber; *The Story of the Romans*, Guerber.

High school students have reached a point when they should begin to consider for themselves what books they shall read, and to form some plan and purpose in their choice of books. Where needs and tastes are so variable, it is not practicable to map out courses of reading which shall be adapted to all readers. Some maxims, however, may well be considered:—

1. Let your reading have definite direction; do not be an aimless reader.

2. Do not read exclusively along one line; see that the best books in each of the departments of literature have due attention.

3. If you adopt a definite course of reading, let it be a brief one. Do not invite failure by undertaking more than you can accomplish.

4. Having formed your plan, go forward with it steadily to the end; let nothing divert you. "Putting the word *done* opposite a purpose is a wonderful incentive to a larger achievement in the next attempt."

5. Beware of the enticements of fiction. Let at least one-third of the books that you read be of the more solid kind — history, biography, essays, etc.

6. Read the old books — those that have stood the test of time and have taken rank as belonging to the world's best literature.

7. Read carefully, thoughtfully, and read over again some of the best books, especially those that have most interested you. Thus your own critical judgment will be developed and you will be fitted for progress in the art of reading. See the articles on LITERATURE, in this Cyclopædia.

Whate'ly, Richard, a British theologian, was born at London, Feb. 1, 1787. He studied at Oxford with honor, and remained there as tutor and afterward as Bampton lecturer. After having charge of a parish for two years, he returned to Oxford as principal of St. Alban's hall, and later was made professor of political economy. His appointment soon after as archbishop of Dublin, "a call to the helm of a crazy ship in a storm" as he called it, gave him work of a different kind, but he endowed the chair of political economy in Trinity college. During the Irish famine, he was unwearied in his efforts to help his people, and his charities were always on a large scale. His treatises on *Logic*, *Rhetoric*, and *Christian Evidences* his best-known works, were used for generations as text-books. His *Historic Doubts Relative to Napoleon* is also famous. He died Oct. 8, 1863. See *Life and Correspondence*, by his daughter.

Wheat, a species of Triticum (*T. sativum*), a genus of the grass family. It is not known in the wild state, but its original home is believed to have been in western Asia. It has been under cultivation throughout the entire time covered by human records. "Spelt" is a kind of wheat cultivated in some parts of Europe, in which the chaff adheres firmly to the grain, as in barley. In the wheat of ordinary cultivation, however, the chaff is easily removed by threshing. The numerous varieties are variously known as "spring" and "winter wheat," "bearded" and "beardless wheat," etc. Spring wheat is sown in early spring; while winter wheat is sown in the autumn. Wheat is one of the most valuable of cereals, and is the source of all the common white flour of the United States. In 1899, the wheat crop of the world amounted to 2,725,407,000 bushels, the United States leading all other nations with its production of 547,304,000 bushels. In the same year, the five states showing the largest yield were Minnesota, 68,223,581 bushels; North Dakota, 51,758,630 bushels; Ohio, 39,998,006 bushels; South Dakota, 37,728,339 bushels; and Kansas, 36,468,044 bushels.

Wheat'stone, Sir Charles, an English inventor and scholar, was born at Gloucester, England, in February, 1802. He began making musical instruments, and made many experiments in sound, inventing an instrument that was played by a piano in another room, and so seemed to play itself. His first paper was on *New Experiments in Sound*. He extended his studies to light and electricity, invented a number of instruments, and took out, with Cooke, a patent for an electric telegraph in 1837. He invented the stereoscope, the cryptograph, and a telegraph barometer and thermometer, by which an observer at the foot of a mountain could read the instruments at the top. Scarcely a year passed without a paper from him on some difficult scientific subject, or an invention. He was made professor in King's college, London, a fellow of the Royal society, a member of all the leading foreign scientific associations, and, after the completion of his automatic telegraph, was knighted. He died at Paris, while perfecting an instrument for submarine cables, Oct. 19, 1875.

Wheat'stone's Bridge, a piece of electrical apparatus devised by Sir Charles Wheatstone for measuring the electrical resistance of a conductor. It consists of a network of six wires arranged as shown in the accompanying diagram. Four resistances R, R_1, R_2, and X are joined in series so as to form a closed circuit. In this circuit there will always be four junctions, namely, A, D, B, and F. The next step in manufacturing a Wheatstone's bridge is to join a battery across two diagonally opposite junctions, say A and B, as

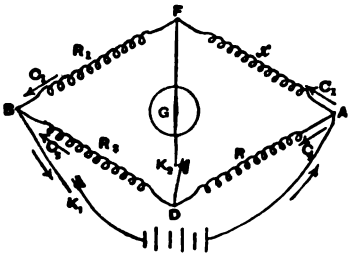


DIAGRAM OF WHEATSTONE'S BRIDGE.

shown is diagram. The current entering at A divides into two parts, one flowing along the branches X and R_1, the other flowing along the branches R and R_2.

Next join the remaining two junctions, F and D, by a circuit containing a galvanometer. In general, the potential at F and the potential at D will be different; but by diminishing the resistance in R and increasing the resistance in R_2, or vice versa, we can easily make the potentials at F and at D the same. When this adjustment is reached, there will be no current flowing through the galvanometer G even though the key K_2 be closed. Let us now call the fall in potential between A and F (and hence also between A and D) E_1; and the fall in potential between F and B we shall denote by E_2. Then, by Ohm's law, we may write

$$\frac{E_1}{X} = \frac{E_2}{R_1} \text{ and } \frac{E_1}{R} = \frac{E_2}{R_2}$$

Dividing one of these equations by the other we have

$$X = \left(\frac{R_1}{R_2}\right) R$$

Accordingly, if we know the value of one resistance R and the ratio of the other two, R_1 and R_2, we can obtain at once the value of the unknown resistance X. And this is the purpose of the Wheatstone bridge. See any good text-book of physics for a discussion of this subject.

Wheel, a piece of wood or metal, usually round and either solid or open, fastened to a center piece, around which it turns. The center piece is called an axle when the wheel turns on it, and an arbor or shaft when the wheel turns with it. Wheels are used to produce motion, and are of different kinds, as wagon wheels, water wheels, car wheels, steamboat wheels, fly wheels, balance wheels, crown wheels, spur wheels, band or belt wheels, ratchet wheels, cog wheels, and pinions, the kinds used in machinery. Carriage and wagon wheels are made of wood with a band of iron; car wheels and machinery wheels of iron, though sometimes of wood or brass; and clock and watch wheels of brass also. Carriage and wagon wheels are made with a central hub of wood, which turns on an axle, from which spokes radiate to the wooden rim of the wheel. An iron tire or hoop, heated hot, so that it expands, is fastened on the rim, and as it cools it tightens, connecting the parts very firmly. Car wheels are made either of iron or steel, or iron and steel, or of iron, steel, and wood combined, and are usually solid, with the edge or rim fitted to the rail. Water wheels are used for turning machinery by water. The overshot wheel has boxes or buckets on the rim. The buckets on one side fill with water and their weight makes the wheel turn, the buckets emptying themselves as they reach the bottom. The undershot wheel has flat boards called floats instead of buckets, and is used where there is plenty of water. The turbine wheel is one that works flat instead of up and down. In machinery, the sets of wheels are joined by bands or belts, or work by cogs or teeth. See WATCH, CLOCK, STEAMBOAT, etc.

Wheel'er, Joseph, American soldier, a distinguished cavalry general of the Confederate army and in command of the cavalry division of the United States army of Santiago in the war with Spain, was born at Augusta, Ga., Sept. 10, 1836, and graduated at West Point in 1859. In April, 1861, he entered the Confederate army and by the close of that year he rose to the rank of brigadier, and later to that of major-general and lieutenant-general. He was present at the battle of Shiloh, served under Bragg in the west, distinguished himself at Chickamauga, and opposed Sherman in his march through Georgia and South Carolina, and during the war was thrice wounded and had sixteen horses shot under him. In 1869, he settled at Wheeler, Ala., where he became a planter and lawyer, and in 1880 was returned to congress as a Democrat from Alabama, and served continuously until May, 1898, when he became major-general of volunteers, and was assigned to the command of the cavalry division in the army of Santiago. He was present at the battles of Las Guasimas and San Juan Hill, and was the senior member of

GENERAL WHEELER.

the commission to arrange for the surrender of Santiago de Cuba. During 1899, General Wheeler was on service in the Philippines, and in August, 1900, he retired from the United States army, having reached the age limit of sixty-four.

Wheel'er, William Almon, nineteenth Vice-president of the United States, was born at Malone, N. Y., in 1819. He began his political career as a state senator in 1858. In 1860, he was in congress, and again from 1866–77. The "compromise" which allayed the disturbed condition of politics in Louisiana in 1874 was largely his work, and he was also foremost in returning his back pay to the national treasury when the act increasing the salary of congressmen was passed. He was elected to the vice-presidency in 1876, when Hayes was President. He died June 4, 1887.

Wheel'ing, a city of West Virginia, in the narrow strip known as the Panhandle, on the Ohio river. Part of the city is built on an island in the river, connected with the mainland by a suspension bridge. It has the capitol building, used for government purposes while it was the capital of West Virginia, post office, customhouse, public library, opera house, and other fine buildings. It is chiefly known as a manufacturing city, the coal in the region furnishing an abundance of cheap fuel as well as natural gas, which is used in many factories. There are blast-furnaces, iron foundries and forges, and manufactories of mowing and reaping machines, steam engines, wagons, and carriages, nails, leather, and paper, besides extensive glass factories, potteries, and cigar factories. It was the capital of West Virginia until 1870, and again in 1875. Population 38,878.

Whelk, the name for marine Gasteropod mollusks belonging especially to the family Buccinidæ. The common whelk of the northern Atlantic is eaten in England. These animals look somewhat like very large snails. The shell is pointed, but has only a few whorls. The animal has a broad body, with tentacles projecting from the head. It can be entirely retracted within its shell. It burrows in the sand, and feeds on clams and other bivalve mollusks. Some whelks are used for bait.

Whig Party, The. (1) In British history, one of the two political parties in the state, of an advanced and reforming character, now known as Liberals; the term had its origin in the middle of the 17th century, and was applied to the Scotch Presbyterians (Covenanters, as opposed to the Cavaliers), who had rebelled against the crown; and thus the appellation was at first regarded as a contemptuous epithet, hurled at them by the Tory party—the organization opposed to them in the state, and that favored monarchy and conservative rule. The Whigs may be said to be the successors of the Cromwellian Roundheads, whose liberal principles led them to favor and defend the Revolution of 1688, insist upon parliamentary control of the government, and desire the Hanoverian rather than the Stuart rule. The influence of the party became powerful in the state from the era of George I. and was represented by the great Whig families of the time—Burke and Fox being its chief leaders. After the era of the Reform bill (1832), a piece of legislation brought about by the Whigs, the latter term began to be replaced by that of the progressive and reforming Liberals. Prof. Goldwin Smith thus defines the two party names (*United Kingdom*, Vol. II., p. 46.) "The Tory was the friend of government by prerogative and of church privilege; the Whig was the friend of constitutional liberty and toleration; in effect, the Tory was a supporter of monarchical, the Whig of parliamentary, supremacy. . . . In later times, the Tory party became that of political and ecclesiastical reaction, the Whig party that of general progress."

(2) In American history, the Whigs of the days of the American colonies were those who favored the Revolution, as opposed to the Tories, who advocated adherence to the mother country. The term more specifically dates, however, from about the year 1830, and refers to the political party in this country under the leadership of Henry Clay, known as National Republicans (or Whigs), as opposed to the Jackson, and later to the Democratic, Republicans. The Whigs favored a protective tariff, a national bank, with a system of internal improvements. It was they who, in 1840, elected W. H. Harrison to the presidency, and sought in 1844 to elect Clay to the office; but the latter was defeated by Polk. With the election of Zachary Taylor, the Whig party fell into a state of disintegration, many of the northern Whigs becoming "Free Soilers," and most southern Whigs becoming Democrats. The Whigs had a long line of representative leaders in the north; but the term fell into disuse, or, more correctly, gave place to that of Republicans—the last action of what remained of the Whig party being the nomination by the "Constitutional Union" party, in 1860, of Bell and Everett, at Baltimore, for the presidency and vice-presidency.

Whip'ple, Abraham, an American naval officer, was born at Providence, R. I., Sept. 16, 1733. He commanded a privateer in the French and Indian war, and in one cruise took twenty-three French prizes, and during the Revolutionary war his ship *Providence* took more vessels than any other in the service. After his ship was finally taken by the British, he sailed for France with dispatches in a new ship and encountered the British merchant fleet of 150 vessels on its way to Jamaica. Hiding his guns and running up the British flag, he joined the fleet,

and at night captured a vessel, putting on a crew from his own ship, and sent it to America. This he did until he had taken ten ships. He was taken prisoner near Charleston in 1780. His ship was the first American vessel to enter the Thames with the United States flag, in 1784. He moved west with the Ohio company, dying at Marietta, O., May 29, 1819.

Whip-poor-will, a bird widely known on account of its oft-repeated cry of *whip-poor-will*. It is not often seen, although it is abundant in damp woods of the eastern United States. It usually rests on the ground during the day and is active at twilight and early nightfall, sending forth its cry, and also coursing low over the grass in search of insects. It is about ten inches long and of plain colors, being grayish, much variegated with black and buff. Its bill is very broad, its mouth large and provided with a tuft of long bristles. It builds no nest, but deposits its eggs on leaves or a slight depression in the ground. To the same family belong the chuck-will's-widow and the night-hawk.

Whirl'pool is a current in a river, which moves in a circle, owing to opposite tides or winds. The two celebrated sea-whirlpools are Charybdis, near Sicily, and the Maelstrom, in the North sea, which are not usually dangerous to ships, but when the current and the wind are strongly opposed to each other, large ships are driven against the rocks. Whirlpools were dreaded by sailors and many legends arose about them. They were thought to be openings into great caverns, within whose depths lived mermaids and sea monsters, and the Norwegian fishermen still believe that if they can throw a heavy object into the whirlpool it will close up without injuring their ship.

Whirl'wind, a small vortex motion of the earth's atmosphere, generally produced by the meeting of two contrary winds.

Prof. R. W. Wood has shown a very neat method of producing artificial whirlwinds. He heats a large iron plate—say four feet square—by placing a number of Bunsen burners underneath. While the plate is hot a little sal ammoniac is scattered over it. The fumes thus produced render visible the vortices which are formed by the two currents of air coming over opposite edges of the hot plate. See STORM, and CYCLONE.

Whis'key, a spirit or liquor distilled usually from grain of some kind, originating probably among the Celtic inhabitants of Ireland and Scotland, as the name is from the Celtic, meaning "water of life." It was first known as "*aqua vitæ*" (water of life) and used only as a medicine, and was first used as a drink in Scotland in the 17th century. The tax on whiskey was imposed partly for revenue, but largely to reduce its use, but resulted in evasions of the tax by illegal manufacture and smuggling. Whiskey was first made from malted barley by distillation (which see), but can be made from any grain, or even from potato starch or grape sugar. In the United States, it is made largely from corn and rye. A great deal of whiskey is made into alcohol, gin, and French brandy. Whiskey is nearly colorless when made, but grows red from the wood of the barrels in which it is kept, which are usually charred to help to darken it. It is improved by age. Nearly 39,000,000 gallons a year are made in Great Britain, of which over 26,000,000 are used there. In the United States, the tax on whiskey is one of the greatest sources of revenue to the government, and about 80,000,000 gallons a year are manufactured.

Whistler (*hwis'ler*), **James Abbott McNeill,** a brilliant Anglo-American painter, etcher, and author, was born at Lowell, Mass., in 1834, and educated at West Point at the United States Military academy. He studied art at Paris and settled at London, England, where he became president of the British Society of Artists, and held exhibitions of his pictures in the British metropolis. There is a strain of the erratic in his mental composition, which has more than once brought him into antagonism with art critics—notably with Ruskin; but he has genius and gifts of a high order in the impressionist school and has attained eminence as an etcher and colorist. Some of his more important paintings include what he terms *Nocturne in Blue and Gold*, arrangements in black, gray, and green; his *Portrait of My Mother* is excellent, as are *The White Girl*, and *The Last of Old Westminster*. He has also done good work in the painting of the portraits of some celebrities, and is, moreover, the author of that amusing human document, *The Gentle Art of Making Enemies*. His other published works include *Ten O'clock*, *Four Masters of Etching*, and *The Baronet and the Butterfly*.

JAMES ABBOTT M'NEILL WHISTLER.

Whit'by, a seaport in Yorkshire, England, on the North sea, at the mouth of the Esk river. The old town has narrow, steep, irregular streets, while the new part has all the features of the fashionable watering-place. The old abbey is in ruins, but Whitby hall has been restored. The parish church stands on a cliff 350 feet high, with a flight of nearly 200 steps. The piers run out about 1,000 feet in the ocean. The chief exports are jet ornaments and iron, the jet being obtained from a kind of petrified wood peculiar to the re-

gion. The herring fishery is increasing, but the shipping trade, which was large when the vessels for Captain Cook's voyages were built here, has declined, and the town is gradually becoming merely a watering-place. Population 15,274.

Whitby (Whitetown) was originally the seat of a monastery, built by Oswy, king of Northumbria, in 658. The convent connected with it was in charge of the abbess Hilda and became famous. Destroyed by the Danes in 867, it was restored in 1074.

White, Andrew Dickson, American educator and diplomat, was born at Homer, N. Y. Nov. 7, 1832, and after graduating at Yale traveled and studied in France, and became an attaché to the United States legation at St. Petersburg. In 1857, he was appointed professor of history and English literature at the University of Michigan, and ten years later became president of Cornell university, a post which he held until 1885, contributing from his own means to it $100,000, part of which was applied to the equipment of the library of the school of history and political science at Cornell. In 1871, he was appointed one of the United States commissioners to Santo Domingo; in 1878, was commissioner to the Paris exposition from the state of New York; and from 1879 to 1881 was United States minister to Russia (serving also in that post during the years 1892–94). In 1897, he was named by President McKinley ambassador of the United States to Berlin, a post he continues still to hold. Dr. White is a regent of the Smithsonian institution at Washington and has been president of the American Historical society and of the American Social Science association. He is the author of *Lectures on Mediæval and Modern History*, *The New Germany*, *The Warfare of Science*, *History of the Warfare of Science with Theology*, *European Schools of History*, and *Studies in General History*.

ANDREW DICKSON WHITE.

White, Edward Douglass, associate-justice United States supreme court, was born in the parish of Lafourche, La., Nov. 3, 1845, and was educated at the Jesuit college of New Orleans and at Georgetown (D. C.) college. He served in the Confederate army during the Civil war, was admitted to the Louisiana bar, and in 1874 was a state senator. From 1878 to 1891, he sat as associate-justice of the supreme court of Louisiana, and from 1891 to 1894 was a member of the United States Senate. In February, 1894, he was appointed associate-justice of the United States supreme court. In politics, he is a Democrat.

White, Henry Kirke, an English poet, was born March 21, 1785, at Nottingham, England. His mother's ambition led to his being educated as a lawyer, instead of following his father's business. His first poems, published in the *Monthly Mirror*, attracted the attention of the owner of the paper, who advised their publication in book form. The volume was cruelly treated by the critics, but brought him the friendship of Southey, and a scholarship at Cambridge. He is best known by his hymn *The Star of Bethlehem*. He died while at college, Oct. 16, 1806, when only twenty-one years old. His poems were published by Southey, with a memoir, which attracted public attention and sympathy.

White, Richard Grant, an American author, was born at New York city in 1822. Though a student of medicine and of law, he adopted a literary career, being for fourteen years on the *Courier and Enquirer* of New York, part of the time as editor. The result of his studies and writings on music and art was a volume on *Christian Art*, published in 1853. Other works are *National Hymns*, published during the war, *Poetry of the Civil War*, *Words and Their Uses*, and *Every-Day English*. Among his best-known articles to the magazines, to which he contributed for thirty years, were those on the plays of Shakespeare. He died at New York, April 8, 1885.

White Ant. See ANT.

White'bait, a name given in London to the translucent young of the herring and other similar fishes. They are salt-water fishes, but come up the Thames with the tide. Whitebait dinners are stylish and famous. The name is also given to small colorless fishes living at considerable depths off the coast of China and Japan, but approaching the shores to spawn in their season. They are considered a delicacy by English people living in China.

White'fish, a common name for a number of fishes of pale or white color belonging to the salmon family. They are inhabitants mostly of the lakes in the northern hemisphere. The name applies especially to the common whitefish of the great lakes. This is the largest of the group, reaching a length of about 30 inches. It varies in appearance with age and condition. It ranges from the region of the great lakes north to the Arctic circle. It feeds on small crustacea, insects, and minute organisms in the water. It is one of the finest food fishes of America. The whiting is a slimmer and smaller variety of whitefish. The smallest and handsomest of the American whitefishes is the lake herring, or cisco, a slender fish from ten to fifteen

inches long. In Europe, the name whitefish is given to any fish with silvery scales and without spots.

White House, the residence of the President of the United States, at Washington. It is a mile and a half from the capitol, on Pennsylvania avenue. The corner stone was laid in 1792, and President John Adams was

WHITE HOUSE, OR EXECUTIVE MANSION.

the first to occupy it in 1800. In 1814, it was burned by the British, and rebuilt and occupied again in 1818. The grounds cover about 75 acres, 20 acres being inclosed as private grounds. It is built of freestone, painted white, 170 feet long by 86 feet deep, with a circular porch in the rear, and a colonnade in front. The architect was an Irishman, and the house is modeled after the duke of Leinster's palace at Dublin.

White Lady, a being who, according to German legend, appears in snow-white garments with a bunch of keys at her girdle, and sometimes watches over sleeping children. Bertha of Rosenberg, in Bohemia, is one of the most famous of these appearances, and Sir Walter Scott's *White Lady of Avenel* is also celebrated. See *Curious Myths of the Middle Ages*, by S. Baring-Gould.

White Lead is one of the compounds of lead, called by chemists basic carbonate of lead, and is used extensively in the manufacture of paint. The Dutch process of manufacture is the oldest. Thin sheets of lead are rolled up and put into earthen vessels, which have some weak vinegar at the bottom. These vessels are surrounded with spent tan bark or some other material which ferments readily, and thus produces heat and gives off carbon dioxide. The pots are thus left for about six weeks, when the lead is found either thickly coated or entirely changed into the white basic carbonate of lead. This process is thought to give the best material for fine work, and is used in some of the American white lead factories, but the patent process manufactures it more cheaply. There are thirty-six white lead factories in the United States, the largest being at Brooklyn, and the product is 70,000 tons a year. The lead used is brought from the Rocky mountain region.

White Mountains, a chain of mountains in New England, commencing with Mt. Katahdin on the Aroostook river, Maine, and crossing New Hampshire. It has twenty high peaks in New Hampshire, the highest, Mt. Washington, 6,288 feet. Mount Pleasant, Franklin, Monroe, Jefferson, Adams, Madison, and Lafayette are other summits. Mt. Washington is the highest point in New England and is a favorite summer resort, with a hotel on its summit. The first mountain railroad in the world was built up this peak in 1868. The White Mountain Notch, the Franconia Notch, and others are natural openings through which the rivers and railroads pass. At Franconia Notch is the famous stone profile, forty feet high, called the "Old Man of the Mountains," and Profile lake, known as the "Old Man's Washbowl."

White Plains, a town of New York, twenty-five miles northeast of New York city. During the war, in October, 1776, it was held by Washington, while General Howe tried to get around the American army on Manhattan island. There were several skirmishes, but Washington held the high ground above White Plains until November 5, when Howe moved to Dobbs Ferry and Washington began sending his troops into New Jersey. White Plains is in Westchester county, N. Y., and has a population to-day of 7,869.

White River, a river of the United States, which rises in the Ozark mountains, flowing through Missouri and Arkansas into the Mississippi, which it enters near the mouth of the Arkansas river. It is 800 miles long, and is navigable for 350 miles.

White Sea, a great bay of the Arctic ocean on the northern coast of Russia. It pierces the land for 350 miles, beginning with a width of 100 miles and narrowing to thirty-five miles. It then sweeps south for 200 miles, and widening forms the gulfs of Kandalak, Onega, and Archangel. Its coast line is about 1,000 miles long, and it covers about 47,000 square miles. Ice forms after August thirty miles out and does not melt till July.

Whitefield (*hwit'fēld*), **George,** an English preacher and reformer, was born at Gloucester, England, Dec. 16, 1714. While at Pembroke college, Oxford, he became associated with Wesley and his band of followers, who were already known as Methodists, and even among them was remarkable for his zeal, as shown in his labors in the jails. He preached his first sermon at Gloucester cathedral, where the earnestness and eloquence of his oratory produced a great impression. Five persons are said to have gone crazy with excitement, but when complaint was made to the bishop he said he hoped "the madness

would last till next Sunday." The same excitement attended his preaching in London, where the streets were filled in the early morning with persons carrying lanterns on their way to hear him preach, hours before the time of service. The clergy of the English church were offended at Whitefield's open air preaching, which he soon used almost entirely, owing to their unwillingness to open their churches to him. He and Wesley separated on doctrinal points, and Whitefield's supporters, led by Lady Huntingdon, built him a large shed called the Tabernacle, where immense crowds gathered. He paid seven visits to America, some of them lasting two or three years, where he preached to as large crowds as in England and Scotland, 20,000 persons hearing him at one time on Boston Common. His health failing, he put himself on what he called "short allowance," one sermon a day and three on Sunday. He died on his last visit to America, at Newburyport, Mass., Sept. 30, 1770. See WESLEY. See *Life*, by Tyerman; *Life and Times*, by Philip, and Lecky's *History of England*, Vol. II.

Whit'man, Walt, was born at West Hills, Long Island, N. Y., in 1819. As a young man he was a school teacher, printer, editor, and builder. His early verses attracted little or no attention, but his *Leaves of Grass*, published in 1855, at once made him one of the widest read of American poets. In the pieces which made up this book, an irregular rhythm took the place of rhyme and measure. In this he but followed Matthew Arnold's *Strayed Reveller*, the old Anglo-Saxon poem *Beowulf*, etc. Whitman is variously called by his admirers, "the poet of democracy" and the "good gray poet." Says Professor Beers: "He liked the people — multitudes of people; the swarm of life beheld from a Broadway omnibus or a Brooklyn ferryboat. The rowdy and the negro truck-driver were closer to his sympathy than the gentleman and the scholar." Whitman himself said, "I sound my barbaric yawp over the roofs of the world." During the Civil war he gave himself up to the care of the wounded soldiers in the Washington hospitals, and about this experience he wrote his *Dresser*. In his *Drum Taps*, a volume of poems on the Civil war, is one of his finest pieces, *My Captain*, written after the assassination of Abraham Lincoln. In 1888, appeared his last volume, *November Boughs*. Whitman made his home in the latter part of his life at Camden, N. J., where he died March 26, 1892. See *Poets of America*, by E. C. Stedman.

WALT WHITMAN.

Whit'ney, Eli, an American inventor, was born at Westborough, Mass., Dec. 8, 1765. He worked his way through Yale college, where he graduated in 1792, and then taught school and studied law. The great want of the south was a machine to separate the cotton from the seed, a very slow and expensive process by hand. At the desire of his neighbors, Whitney in 1793 invented his famous cotton or saw gin, which was the foundation of the wealth of the Gulf states. He worked under great disadvantages, as he had to make his own tools and even the wire for the hopper. For a description of the cotton gin, see COTTON. Like many other valuable inventions, this one was stolen by some one who broke into his workshop before he had time to get a patent. Though South Carolina voted him $50,000, this sum was spent in useless lawsuits. Whitney, however, made a fortune in the manufacture of fire arms at Whitneyville, Conn. He died at New Haven, Conn., Jan. 8, 1825.

ELI WHITNEY.

Whit'ney, William Collins, was born at Conway, Mass., July 15, 1841. He studied at Williston academy, at Easthampton, Mass., and graduated at Yale college in 1863. He next studied law, began to practice in New York in 1865, and soon had a large business. His father, Gen. James S. Whitney, was a prominent Democrat, and Whitney became also interested in politics in New York city. In 1885 he became secretary of the navy in President Cleveland's cabinet. During his term of office new vessels were added to the navy, and Mr. Whitney is regarded as having been an especially able secretary. He is now living in New York city.

Whit'ney, William Dwight, American philologist, and brother of J. D. Whitney, the distinguished geologist, was born at Northampton, Mass., Feb. 9, 1827, and died at New Haven, Conn., June 7, 1894. In 1845, he graduated from Williams college, and was for several years employed in a bank at Northampton, meanwhile studying Sanskrit and other languages there, at New Haven, and later at Berlin. In 1853 he was appointed professor of Sanskrit at Yale, and in 1870 had added to his chair that of comparative philology in the same institution. Professor Whitney gained a European as well as national fame as a linguist and expositor of the science of language. His published works

include, besides a *German Grammar and Reader*, and a *Grammar of Sanskrit*, a work on the *Life and Growth of Languages*. He was also editor-in-chief of the *Century Dictionary of the English Language*, completed in 1891. He was president of the American Oriental society, and first president of the American Philological association.

Whit'tier, John Greenleaf, the Quaker poet, was born at a farmhouse near Haverhill, Mass., Dec. 17, 1807. Here and at the neighboring town of Amesbury most of his life was spent. He was a farmer's boy, and all the schooling he received was at the district school, with two years at the Haverhill academy. A copy of Burns awoke a desire to write, and he began to send verses to Garrison's *Free Press* and the local newspaper. For a short time he was editor of the *Manufacturer* at Boston, and for a year and a half edited George D. Prentice's paper, the *New England Weekly Review*, at Hartford. At Hartford, he published, in 1831, his first volume of verses—*Legends of New England*. Whittier was back in Haverhill, engaged in farming, when the antislavery movement

JOHN GREENLEAF WHITTIER.

began, into which he threw himself with the greatest enthusiasm. In 1833, he published a prose tract against slavery; he helped to found the American Antislavery society at Philadelphia, and became the poet of the movement, writing for it his *Voices of Freedom* in 1849 and his *Ichabod*. In 1838–39, he edited the *Pennsylvania Freeman* at Philadelphia, where his office was sacked and burned by a mob. *Laus Deo* was his last poem of freedom, written on hearing the bells ring for the passage of the constitutional amendment abolishing slavery. His chief works are *Maud Muller*, *Home Ballads and Poems*, *Miriam*, *National Lyrics*, *Poems of Nature*, *Among the Hills*, *In War Time*, and *Ballads of New England*. Among Whittier's larger poems are *Snow-Bound*, *The Bridal of Pennacook*, and *The Tent on the Beach*. He died Sept. 7, 1892. See *Poets of America*, by E. C. Stedman, and *American Literature*, by Henry A. Beers.

Whit'tington, Sir **Richard,** was born at Pauntley, Gloucestershire, England, about 1350. According to the well-known story, his father died when Richard was ten years old, and he tramped to London, where he became a merchant's apprentice. At one time he started to run away from his master, but while seated at the foot of Highgate hill seemed to hear in a chime of bells—

"Turn again, Whittington,
Thrice lord mayor of London town."

He did so; married his master's daughter, and became wealthy, his first stroke of business having been to send a cat to an eastern market; was lord mayor of London in 1397, and made loans to Henry IV. and Henry V. Whittington died in 1423.

Wichita (*wich'i-tâ*), the third city of Kansas, on the Arkansas river, in the midst of a very fertile region. It has 60 miles of street-car lines; factories and packing houses employing 1,500 workmen, and six railroads. There are good public schools, a high school, a medical college, Lewis academy, Fairmount college, and Wichita university. Its growth has been very fast. In 1870, not an inhabitant was on the site of Wichita; in 1880, the population was 4,911; in 1900, 25,625.

Wieland (*vē'lant*), **Christopher Martin,** a German poet and novelist, was born at Oberholzheim, Swabia, Germany, Sept. 5, 1733. He was carefully taught by his father, a clergyman. In 1750, he went to the University of Tübingen, where he devoted himself a little to law and very much to literature, and wrote his poem on the *Nature of Things*. After some years spent in Switzerland, where he supported himself by tutoring, and wrote a number of poems and plays, he settled in 1760 at Biberach as director of the chancery. From 1769 to 1772 he was professor of philosophy at Erfurt, after which he made his home at Weimar. Here he tutored, and also edited a monthly magazine, writing for it an immense number of poems and articles. His *Oberon* is held to be the best of his works. Wieland's romances were highly popular, and have not yet been surpassed in Germany. To him also belongs the merit of having first suggested to his countrymen that it might be worth while to study their own literature, as well as that of France, England, and Italy. He died at Weimar, Jan. 20, 1813.

Wiesbaden (*vēs-bä'den*), a fashionable watering-place of Prussia, stands on the slopes of Mount Taunus, five miles north of Mainz, and three miles from the Rhine. Its prosperity is entirely owing to its hot springs, and it is filled with hotels, lodging houses, villas, bath houses, and promenades for the

benefit of its 60,000 yearly visitors. The main buildings are the palace, the Cursaal, the five-towered Protestant church, the Roman Catholic church, the museum with a picture gallery and a library of 70,000 volumes, and the synagogue built in Moorish style. The chief spring is the Kochbrunnen, the waters of which are drank, besides which there are twenty-eight other springs used for bathing. These springs were known to the Romans, who fortified the place. Population 74,133.

Wigan (*wig'an*), a city of Lancashire, England, on the Douglas river, eighteen miles northwest of Manchester, and the same distance northeast of Liverpool. It is joined by rail and canal with these cities and with London. The main buildings are All-Saints' church, the royal Albert Edward infirmary and dispensary, the arcade, public library, and public baths. A park covering 27 acres was opened in 1878. The growth of the city is largely owing to its coal mines, which give employment to a large part of the people, and furnish cheap fuel for its cotton and iron mills. Wigan was a Roman station and later a Danish town. Three battles were fought there during the civil war, in the era of Charles I. and the Commonwealth. Population 59,000.

Wight, Isle of, a small island in the English channel, off the coast of Hampshire, separated from the mainland by a narrow strait, the Solent, and Spithead. It is 23 miles long and 13 miles broad, and covers about 145 square miles. High chalk downs cross the center of the island from east to west. Along the south coast is the Undercliff, a district noted for its wild scenery and mild climate, where a large hospital has been built. The isle has long been a favorite place for tourists, and there are fashionable watering places at Cowes, Ryde, etc. Farming, sheep raising, shipbuilding, and cement making are carried on. Vespasian conquered the Celts of the Isle of Wight in 43. From the time of Henry VII. it was ruled by a royal captain or governor. Charles I. was imprisoned in Carisbrooke castle, a fine old ruin, the inner walls of which were built in the 11th century. Near Brading are the remains of a Roman villa. Population 85,718.

Wilberforce, William, an English philanthropist, was born at Hull, England, Aug. 24, 1759. He attended Cambridge university and in 1780 was elected to the house of commons, where he became a friend of Pitt. In 1787, he first began to stir up opinion against the slave trade, in which he was seconded by his friends Pitt and Thomas Clarkson. Clarkson carried on the work in the country, while Wilberforce endeavored to gain over the the house of commons. By 1789, he succeeded in getting the subject before the house, but the friends of the planters were too strong, and the matter was postponed. In 1791, he brought it to a vote, but the motion for abolition was lost. He never ceased his efforts, but it was not till 1807, a year after Pitt's death, that the first great step toward doing away with slavery was taken, and it was not till a month after his own death that the emancipation bill, which owed so much to his efforts, was passed. Wilberforce also had a leading part in religious measures in parliament and religious work out of it. He died July 29, 1833, and was buried in Westminster Abbey, where a monument has been set up to his memory. See *Life*, by his sons.

Wilhelmina (*wil-hĕl-mē'na*), **Helena Pauline Maria,** queen of the Netherlands, was born at The Hague, Holland, Aug. 31, 1880, and is the only child of the late King William III. and of his second wife Princess Emma, daughter of Prince George Victor of Waldeck. She succeeded to the throne of the Netherlands on the death of her father, Nov. 23, 1890, though she only came of legal age eight years later (1898) when she was inaugurated as queen. On Feb. 7, 1901, she married Prince Henry, youngest son of the late grand-duke of Mecklenburg-Schwerin. Queen Wilhelmina is the fourth in the list of sovereigns of the Netherlands of the house of Orange since the reconstruction of the kingdom by the congress of Vienna (1814–15). Her Majesty is known to possess simple tastes, is an accomplished linguist, and an experienced horsewoman.

Wilkes, Charles, an American naval officer, was born at New York in 1801. At fifteen he entered the navy. In 1826, he was made lieutenant, and four years later was attached to the depot of charts and instruments at Washington. Here he made the first astronomical observations in America. In 1838, he was given command of a squadron of six ships, with which he surveyed the Samoan islands, discovered other Pacific islands and the Antarctic continent, and explored the Fiji islands. On coming back to Washington he published his *Narrative of the United States Exploring Expedition*, and was made a commander. In 1861, as captain of the United States steamer *San Jacinto*, he seized the Confederate commissioners to England — Mason and Slidell — on board the British steamer *Trent*, and carried them to Boston. This was the *Trent Affair* between the United States and England, and resulted in the commissioners being set free. In 1862, Captain Wilkes was made commodore. He died at Washington, D. C., Feb. 8, 1877.

Wilkesbarre, a city of Pennsylvania, on the north branch of the Susquehanna river, in the Wyoming valley, ninety-eight miles northwest of Philadelphia. The city is built partly on the bottom lands and partly on the surrounding hills. It is entered by four railroads. Wilkesbarre is in the midst of a great coal mining district, and is a center for mining supplies, and for coal shipment, besides having important manufactures of locomo-

tives, leather goods, lace, cutlery, wire rope, and steel, as well as foundries, breweries, and silk mills. Wilkesbarre was settled in 1770, but eight years afterward the whole region was laid waste by the Wyoming massacre (which see), the town being sacked and burnt. The same year a fort was built and the town rebuilt. Its growth is mainly since 1855. Population 51,721.

Wil'kie, Sir **David,** a Scottish painter, was born at Cults, Fifeshire, Scotland, Nov. 18, 1785. His father, who was a clergyman, placed him in 1799 in the Edinburgh academy, where he gained a prize for his *Callisto in the Bath of Diana.* He settled at London in 1805. In 1836, he was knighted. In 1840, he painted the portrait of the sultan, and made a trip to Palestine; and as he was returning to England, he died at sea, June 1, 1841. Among his best pictures are *Blindman's Buff, Guess My Name,* and *Reading the Will.* See his *Life,* by Allan Cunningham.

Wil'kins, Mary Eleanor, American authoress, was born at Randolph, Mass., in 1862, and has written largely on New England life. Her chief works, besides poems, short stories, etc., contributed to magazines, embrace: *Pembroke; Jane Field; A Humble Romance; A New England Nun; A Pot of Honey; Jerome, a Poor Young Man; Giles Corey, Yeoman; The Adventures of Ann;* and *Young Lucretia, and other Stories.*

Wil'kinsburg, Pa., a borough of Allegheny county, seven miles east of Pittsburg, and closely identified with the latter's business and civic interests. Its industries are chiefly those appertaining to coal mining. It has nearly trebled its population in the past decade, its present inhabitants numbering 11,886.

Willamette (*wil-ăm'met*) **River,** the main branch of the Columbia, west of the Cascade mountains, is formed near Eugene City by the junction of three streams which rise in the Cascade range. It flows north 155 miles, and falls into the Columbia 110 miles from its mouth. It is navigable for 126 miles above Portland for steamboats. Locks have been built around the falls at Oregon city at a cost of $450,000. The chief city on its banks is Portland, and the Willamette valley is the most thickly settled of any part of Oregon.

Wil'lard, Frances Elizabeth, noted for her temperance work, was born near Rochester, N. Y., in 1839. After attending the Milwaukee and Northwestern seminaries, she became a teacher and a writer for several magazines and papers. After two years spent in European travel, she was appointed in 1871 president of the woman's college of Evanston, Ill. She was very active in religious and temperance work, helping Mr. Moody in his meetings, and being made the first secretary of the Woman's Christian Temperance union, of which she was president from 1879 until her death, at New York, Feb. 18, 1898.

FRANCES E. WILLARD.

Will'iam I., the Conqueror, the son of Robert, duke of Normandy, was born in 1027 or 1028, and became duke in 1035. His guardians had to fight to make good his claim to the dukedom, and more than once his life was in danger. On visiting England, where Edward the Confessor then reigned, William found Norman influence strong at Edward's court, and felt sure that the crown would pass to him, but the Witenagemote chose Harold as king, ignoring William's claims. The Conqueror at once invaded England, and won the battle of Hastings and the throne, Oct. 14, 1066. He at first ruled the conquered Saxons mildly, but an uprising in 1070 was savagely put down, and the hatred between Saxon and Norman thereby aroused forced him to rule harshly. The Saxons were deprived of office, and ground down by taxes, while fortresses garrisoned by Normans were built throughout the country. In 1072, Scotland was invaded and King Malcolm Canmore forced to acknowledge William's authority. A civil war with his son Robert was ended through the intercession of Queen Matilda. Most of the latter part of William's life was spent in Normandy, the government of England being intrusted to his half-brother, Bishop Odo. William was rather fat, and a sarcastic remark made about this by Philip I. of France caused William to raise an army and invade France. He captured and set fire to Mantes, but while watching the blaze he was thrown from his horse, and died Sept. 9, 1087. Not only was William a successful soldier, but he knew how to rule, and England had never before been so well governed. See Freeman's *History of the Norman Conquest.*

Will'iam II., king of England, surnamed Rufus, the second son of William the Conqueror, was born in Normandy in 1056. The celebrated Archbishop Lanfranc was his teacher, and he was his father's favorite son. He had no sooner been crowned, Sept. 26, 1087, than his elder brother Robert, who had inherited Normandy, tried to stir up an insurrection in England. In return, William invaded Normandy in 1091. When a peace had been patched up between them, they joined arms against their third brother Henry, and drove him from Cotentin, a district covering

a third of Normandy, which he had bought from Robert. These scenes of strife were carried on throughout William's reign. He invaded Scotland, waged a second war against Robert and was engaged in putting down disturbances in Wales and the north of England. Robert, on leaving for the crusades, sold Normandy to his brother for $50,000. William Rufus' last campaign was in defense of a part of his newly acquired possession, the district of Maine, which was claimed by a chieftain named Helias de la Flèche. He was shot accidentally by an arrow as supposed to have come from the bow of Sir Walter Tyrrel while hunting in the New Forest, Aug. 2, 1100. See Freeman's *Reign of William Rufus.*

Will'iam III., king of England, the son of William II. of Orange, and Mary, eldest daughter of Charles I. of England, was born in 1650. Cromwell had the young prince shut out from the stadtholdership of the united provinces, but on the murder of De-Witt, William, then twenty-two years old, was chosen stadtholder. He found the republic in the midst of a hopeless struggle with Louis XIV., but by his ability as a general and by his skill as a diplomat, at the end of seven years he won an honorable peace by the treaty of Nimeguen in 1678. This achievement made him famous throughout Europe. By an alliance, formed at Augsburg in 1686, William became the head of a league of German princes, including Spain and Sweden, against Louis XIV. William had married Mary, the eldest daughter of James II., and to escape that monarch's tyranny the English now looked to the stadtholder as their only hope. He had but to land, Nov. 5, 1688, to bring the whole country to his support, and William and Mary were crowned joint sovereigns. Ireland, however, did not submit until after a two years' contest, and throughout William's reign, plots were hatched against his life by the followers of the Stuarts. The league, now strengthened by the addition of England, carried on vigorously its war with France, but the English people were never heartily in favor of it, and William was forced by home pressure and defeats in the field to make the peace of Ryswick in 1697. His reign in England was one of great progress in real liberty for the English people, and William is acknowledged to have been one of the ablest of English kings. He died March 8, 1702. See Macaulay's *History of England.*

Will'iam IV., king of England, the third son of George III., was born at Windsor, Aug. 21, 1765. When fourteen years old he was sent to sea as a midshipman under Admiral Digby. Next year he sailed under Admiral Rodney, and took part in the action off Cape St. Vincent. During the rest of the war the prince saw plenty of service. In 1789, he was made duke of Clarence. He joined his brothers, the prince of Wales and duke of York, in their opposition to the king, and took his seat in the house of lords. In 1827, on the death of the duke of York, William became heir to the throne, and was crowned king June 28, 1830. The great event of his reign was the passage of the reform bill, June 4, 1832. He died June 20, 1837.

Will'iam I., king of Prussia, and German emperor, was the second son of Frederick William III. of Prussia. He was born at Berlin, March 22, 1797. Though a delicate child, he became one of the most vigorous men in Germany. Made a captain in 1813, he accompanied his father in the campaign of 1814, and the next year was given the iron cross for his bravery at Bar-sur-Aube. When twenty-one he was made major-general, and mastered the military system of his own and other European countries. On the accession of his brother Frederick William IV. in 1840, he became heir to the throne, and was made prince of Prussia. At the outbreak of the revolutionary movement, in 1848, William saw that some of the demands for a freer government must be granted, but urged that order should first be restored. At this time he was the best hated man in Germany. In 1849, he skillfully crushed the rebellion in the grand-duchy of Baden, at which time an attempt was made upon his life.

On Jan. 2, 1861, he became king of Prussia as William I. The successful wars against Denmark and Austria changed the feelings of his subjects toward him, and on his return to Berlin he was received with unbounded enthusiasm, being looked upon from this time as the father of his people. On the outbreak of the war with France, in 1870, all Germans rallied round the king of Prussia, and when he quitted Berlin to join his army, he knew he had the support of a united nation. He personally commanded at the battles of Gravelotte and Sedan, and during the siege of Paris was proclaimed German emperor, Jan. 18, 1871. He left the destinies of Germany almost entirely in the hands of Bismarck, the chancellor of the empire. William I. died at Berlin, March 9, 1888.

Will'iam II., emperor of Germany and king of Prussia, is the eldest son of Emperor Frederick III. of Germany. He was born Jan. 27, 1859. After being tutored at home, he entered the Cassel gymnasium, where he was graduated in 1877. He then took a course under the professors of the Potsdam Military academy, and was made a colonel of hussars. On the death of Frederick, William II. became emperor June 15, 1888. He at once went back to the policy of William I. and Prince Bismarck, much to the disappointment of the great body of the nation, who had looked forward to enjoying the more liberal government which it was felt Emperor Frederick would have given Germany had he lived. The chief events of William's reign have been the forced retirement from office of the chancellor, Prince Bismarck, the

most powerful of his subjects, owing to their disagreements as to measures to be adopted toward the socialists, who are fast becoming one of the most powerful of the political parties of Germany; the widening of Germany's colonial empire; the interest taken by the empire in the punitive expedition to China (General von Waldersee in command) after the attack on the Legations at Pekin; and the struggle in the reichstag over the increase of the army, deemed necessary by the emperor in view of the state of Europe.

EMPEROR WILLIAM II.

Will'iam, prince of Orange, called "William the Silent," founder of the independence of the Netherlands, was born at Dillenburg, Nassau, April 16, 1533. He inherited Nassau from his father, and Orange from a cousin. As a boy he was a page at the court of Charles V., who gave him the command of a body of troops and employed him in diplomacy. When Philip II. left for Spain he appointed William one of the state council to help Margaret of Parma to rule the Netherlands as regent. He opposed the persecution of the Protestants, and refused to permit it in the provinces of which he was stadtholder. When the duke of Alva marched to Brussels and put to death Egmont and Horn, William, who had fled to Germany, had his property seized and his son sent to Spain as a hostage. After raising an army he marched against Alva, but was forced to retire to French Flanders, and with his brothers Louis and Henry joined the Huguenots under Coligny. In 1569, he sent out privateers, known as the "beggers of the sea," which captured Briel in 1572. This exploit was followed by the rebellions of Flushing, Haarlem, Dort, Leyden, and other cities, which acknowledged William of Orange as their prince. William and his brother captured several other towns, but the massacre of St. Bartholomew destroyed his hopes of French aid, and he was forced to disband his army. The Spaniards retook city after city, sacked Haarlem after a seven months' siege, and defeated and slew his brothers Louis and Henry. But William, by cutting the dikes and flooding the country, allowed Admiral Brissot to bring his fleet to the relief of Leyden, which had long been beseiged. In 1576, the five provinces which had all along held to Spain joined the states-general at Ghent, and formed a league under William. But two years later, the new Spanish governor, Don John of Austria, won a victory near Gembloux. His successor, Alexander Farnese, also gained the Walloon provinces. However, William formed in 1579 a league between Holland, Zealand, Utrecht, Friesland, Gelderland, Gronigen, and Overyssel which was the foundation of the Dutch republic. Two years later, the United Provinces declared themselves independent, July 26, 1581. William twice refused to become the ruler of the new country, and was assassinated at Delft, July 10, 1584. See Motley's *The Rise of the Dutch Republic.*

Will'iams, John, a noted English missionary, was born at Tottenham, near London, June 29, 1796. He was trained as an ironmonger, but in 1816 went as a missionary to the South Sea islands. After learning the native language by a short stay at Eimeo, in the Society islands, he made his headquarters at Raiatea. His success as a missionary here and elsewhere was remarkable. The people rapidly became Christians, and adopted many civilized habits. Williams traveled unceasingly among the various island groups planting stations and settling native missionaries, whom he himself had trained. From the Society islands he visited the Hervey group, where he discovered the island of Raratonga. Most of the people of the group were converted in a remarkably short time, and Williams' influence over them was very great. At their request he drew up a code of laws for their government. At Raratonga, he built himself a ship with the help of the natives, and with this he made voyages to Samoa and other islands. In 1834, Williams came back to England, and had printed his translation of the New Testament into Raratongan. Four years afterward, he went back to the Pacific, and while visiting Erromango, one of the New Hebrides, was murdered by the natives Nov. 20, 1839. See *Memoir of John Williams*, by Rev. Ebenezer Prout.

Will'iams, Roger, born about 1600, was one of the founders of Rhode Island. In early life he left his home, either in Wales or in Cornwall, and went to London. Here his skill as a reporter gained him the patronage of Sir Edward Coke, who sent him to the famous Charterhouse school, and then to one of the universities. He next studied law, but, changing his mind, became a clergyman. On account of his Puritan beliefs he left England and reached Massachusetts bay in 1631. He preached for some years at Plymouth and at Salem. Chiefly on account of his strongly expressed opinion that the government should have no control of religious matters, he was exiled from Massachusetts colony. In January, 1636, he left with a few followers for Narragansett bay. At first the band settled on the site of Seekonk, Mass. But in June

Williams and five others embarked in a canoe for Rhode Island and founded a settlement, to which Williams, in remembrance "of God's providence to him in his distress," gave the name of Providence. He went to England in 1643 and the next year obtained a charter for the colony, of which he was made deputy president in 1649. In 1651, he made a second voyage to England in behalf of the settlers and spent there three years, during which he enjoyed the friendship of Milton, Cromwell, and other leading Puritans. From 1654 to 1658, Williams was governor of the colony, and died (in 1683) in his eighty-fourth year.

Will'iams, Samuel Wells, the historian of China, was born at Utica, N. Y., September 22, 1812. After studying at Rensselaer institute, at Troy, he went to Canton in 1833 as a printer in the employ of the American Board of Foreign Missions. In 1853, he acted as interpreter to Commodore Perry's expedition, which opened Japan to the world. As secretary of legation at Pekin, he was of great help in making the treaty of 1856 between China and the United States. In 1876, he became lecturer on Chinese at Yale college. He published several valuable Chinese dictionaries and text-books, but is best known by *The Middle Kingdom*, which is held to be an authority on Chinese history, life, and manners, both in America and in Europe. Professor Williams died at New Haven, Conn., Feb. 17, 1884. See his *Life*, by his son, F. W. Williams.

Will'iamsburg, formerly the capital of Virginia, is about fifty miles southeast of Richmond and as far from the entrance to Chesapeake bay. It is built on high ground on the tongue of land between the James and York rivers. Here is the eastern insane asylum of the state, opened in 1773, the oldest institution of the kind in America. The Episcopal church was built in 1678. The town, which was named after William III., was ordered built by the Virginian general assembly in 1699, and in 1700 the seat of government was moved here from Jamestown. The capital was changed to Richmond in 1780. Williamsburg is noted as the seat of the College of William and Mary, the oldest in the country, except Harvard. Its charter was obtained from England in 1693, and the reigning English sovereigns after whom it was named gave it money, lands, a tobacco duty, and the office of surveyor-general of the colony. This office it held until 1819, and among the state surveyors it appointed were Washington and Jefferson. At the outbreak of the Revolutionary war it was the richest college in America. Most or all of the buildings were burnt four times, in 1705, 1781, 1859, and 1862. French and American troops held the buildings in 1781, during the siege of Yorktown; and during the Civil war they were used as barracks, hospitals, or headquarters most of the time. Among the chancellors were George Washington and John Tyler. The college was reopened after the war, in 1869. Population of Williamsburg 2,044.

Will'iamsport, a city of Pennsylvania on the west branch of the Susquehanna, seventy miles northwest of Harrisburg. The post-office is a fine building, and there are many beautiful private grounds. Williamsport is the center of Pennsylvania's lumber trade, and the west branch is filled in spring with pine and hemlock logs. There are also a number of manufactures. The city was settled in 1797. Population 28,757.

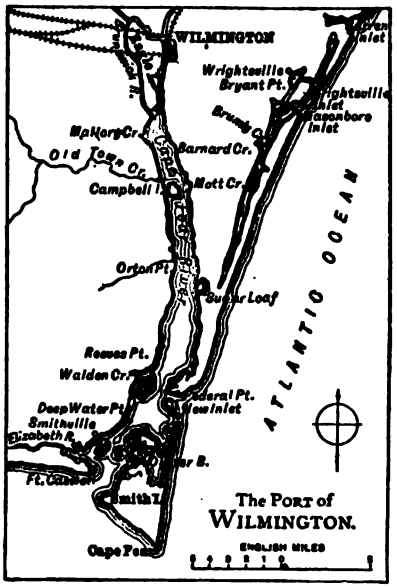
Will'iamstown, a town of Massachusetts, twenty-five miles east of Troy, N. Y. It nestles among the famous Berkshire hills, and is the seat of Williams college. The college was founded as a free school by the bequest of Col. Ephraim Williams, a Massachusetts soldier in the French and Indian war, who was shot in a skirmish near the head of Lake George, in 1755. At this spot the college alumni set up a monument to his memory in 1854. The first building was finished in 1790 and the school opened the next year. Two years later the school became a college. There are now 30 professors and about 600 students. Williams college is noted in many ways, but chiefly for its famous president, Mark Hopkins, and for the fact that American missions to the heathen started here in a students' prayer meeting. Population of Williamstown 5,013.

Will'is, Nathaniel Parker, was born at Portland, Me., Jan. 20, 1806. He graduated at Yale college in 1827, and the same year published *Poetical Sketches*. He wrote for the magazines, and in 1829 started the *American Monthly Magazine*. After its death, in 1831, he traveled in Europe, recording his saunterings in *Pencilings by the Way*, which with its lifelike and rapid sketches of Old World scenes at once gained him a wide popularity. These pencilings were contributed to the New York *Evening Mirror*, for which Poe also wrote. In 1839, appeared the most charming of his books, *Letters from Under a Bridge*. Others of the best of his writings are tales and sketches, such as *F. Smith, The Ghost Ball at Congress Hall*, and his simpler poems, like *Unseen Spirits*, *Spring*, etc. Willis died Jan. 20, 1867. See *Life*, by Henry A. Beers.

Will'ow, a class of trees of the same family as the poplar. Willows vary in size from those of the Alps, which are an inch or two high, to trees of from 50 to 80 feet. They are found in most countries, with the exception of Australia, and they grow rapidly. They have many and large roots, which grow a long distance through moist soil, and bind it with a network of fibers, thus preventing the banks of streams from being worn away. The bark is tough and bitter; it is used in making fish nets, ropes, etc.; for tan-bark, and sometimes

in Norway and Sweden for mixing with oatmeal. The wood is used in houses, vessels, farm tools, casks, etc.; as fuel and for charcoal. The twigs and young shoots are used in making baskets and light furniture. There are some sixty North American willows, ten of which are not found elsewhere. The most important of all kinds is the white willow, common throughout Asia, Europe, and America. It sometimes reaches the height of 80 feet. It is very useful on the prairies, as it is a fast grower, and also protects other trees from the wind. Other kinds are the golden, blue, brittle, varnished, and green willows. The weeping willow, a native of Asia and North Africa, has been introduced into America. It is a large tree, and one of the first to leaf out in the spring.

Wil'mington, the largest city and chief port of North Carolina, is on the Cape Fear river, twenty miles from the sea, and 110 miles southeast of Raleigh. It is a railroad center, and its wharves are kept busy with a



large coast and foreign trade. Steamers run to Baltimore, Philadelphia, and New York. The chief exports are lumber, turpentine, rosin, tar, pitch, shingles, and cotton. Wilmington was first called Newton, and was founded in 1733. During the Civil war, it was a noted port for blockade runners, until the capture of Fort Fisher at the mouth of the Cape Fear inlet by General Terry in January, 1865. In February of the same year, General Schofield forced the Confederates to abandon Wilmington. Population 20,976.

Wil'mington, the largest city of Delaware, is on the Delaware river, twenty-eight miles southwest of Philadelphia. The city stands on hilly ground between Brandywine and Christiana creeks, and slopes toward the Delaware, which is not yet reached by the built-up part of the city. At this point, sixty-five miles from the ocean, the Delaware is three miles wide, with thirty feet of water at mid-tide in its shallowest parts. There are electric lights and electric street cars. A fine park has been laid out along the Brandywine. The city annually expends the sum of $258,005 on its public schools, which have a force of 253 teachers, and an attendance of 11,005 pupils. The high school has a handsome building and furnishes manual training. The Old Swedes church, founded in 1698, received funds from William Penn, a bible from Queen Anne, and a communion service from the miners of Sweden. Among the larger manufactures are railroad passenger cars, for which it is the second city in America, powder, flour, morocco, carriages, and iron shipbuilding. Wilmington was founded in 1732, on the site of the first Swedish settlement in 1638. Population 76,508.

Wil'son, Alexander, an American naturalist, was born at Paisley, Scotland, July 6, 1766. He was a weaver and peddler, and at twenty-four published a volume of poetry. In 1794, he reached New Castle, Del., with but a few borrowed shillings in his pocket. While peddling through New Jersey he began to study the habits of birds, and after teaching some years, he determined to form a collection of American birds. His first trip was made in 1804 through the unbroken wilderness of western New York to Niagara Falls. He gave an account of this journey in his poem *The Foresters*. His position of assistant editor of *Rees' Cyclopædia* gave him more means and time for his undertaking, and when the first volume came out, in 1808, he spent some months in tramping, "looking for birds and subscribers." He sailed down the Ohio to Louisville, and rode on horseback from Nashville to New Orleans. He made another tour of the eastern states in 1812. He had, however, overworked himself in preparing his book, and lived only to finish seven volumes. Two more were edited by George Ord, who had accompanied him on some of his journeys, and the work was carried on further by Charles Lucien Bonaparte. Wilson was the first to make a careful study of American birds, and his great work on *American Ornithology* is a scientific classic. The author died at Philadelphia, Aug. 23, 1813. See *Difficulties Overcome*, by C. Lucy Brightwell.

Wil'son, Sir **Daniel,** a Scoto-Canadian educator, and archæologist, and from 1881 to 1892 president of Toronto university, was born at Edinburgh in 1816. In 1853, he was appointed professor of history and English literature in University college, Toronto, succeeded to the presidency in 1881. His writings embrace *Prehistoric Man; Prehistoric Annals of Scotland; Memorials of Edin-*

burgh; Caliban, the Missing Link; and a study of *Chatterton*. He was knighted in 1888, and died at Toronto, Aug. 7, 1892.

Wil'son, Henry, eighteenth Vice-president of the United States, was born at Farmington, N. H., Feb. 16, 1812. His proper name was Jeremiah J. Colbaith, which at twenty-one he had changed for some unknown reason to that of Henry Wilson. His father was a day laborer, and poor. When ten years old he went to work as a farm hand. The boy was greedy for reading, and before the end of his apprenticeship had read more than a thousand volumes. He then walked to Natick, Mass., and learned the trade of shoemaker, by which he paid his way through Concord academy. After setting up as a shoe manufacturer he became a noted public speaker in support of Harrison in the campaign of 1840. For the next ten years he was regularly elected to the state legislature. In 1848, he left the Whig party and became a Free Soiler. In 1853, he was defeated for governor on the Free Soil ticket, but two years later was made Sumner's colleague in the United States senate. Wilson had helped to form the anti-slavery society; throughout his political life he had earnestly upheld that cause, and he became one of the founders of the Republican party. In 1872, he was chosen Vice-president on the ticket with Grant, but died during his term of office, Nov. 22, 1875. He left three important historical works, *Anti-Slavery Measures in Congress, Reconstruction Measures in Congress,* and *The Rise and Fall of the Slave Power in America*. See *Life*, by Nason.

Wil'son, James Harrison, American soldier (major-general United States volunteers) was born near Shawneetown, Ill., Sept. 2, 1837, and was educated at McKendree college there and at West Point, where he graduated in 1860, and was assigned to the corps of topographical engineers, serving in the department of Oregon. He was distinguished as an officer of engineers in the Civil war, notably in the Richmond raid and in the operations near Petersburg; he commanded in 1864 the 3d division of Sherman's cavalry and the cavalry corps in the military division of the Mississippi; participated in the capture of Fort Pulaski, took part in the campaigns of Antietam, Vicksburg, Chattanooga, and the Wilderness; commanded in the assault and capture of Selma and Montgomery, Ala., Columbus and Macon, Ga., and finally in the capture of Jeff Davis. After the war, he was engaged in railroad and engineering operations; and in the war with Spain he commanded the 1st division of the 1st army corps in the campaign in Porto Rico. He is the author of *China: Travels and Investigations in the Middle Kingdom;* of a *Life of Andrew J. Alexander;* and in conjunction with the late Chas. A. Dana, of a *Life of General Grant.*

Wil'son, John, famous as the "Christopher North" of *Blackwood's Magazine*, was born May 18, 1785, at Paisley, Scotland, where his father was a rich manufacturer. After being privately tutored, he spent four years at Glasgow university, and then four more at Oxford, where he led in both scholarship and athletics. On leaving Oxford he settled in the beautiful lake country of Cumberland, where he soon became a close friend of Wordsworth, Southey, Coleridge, and De Quincey, and amused himself by measuring his strength against that of the far-famed Cumberland wrestlers, the very sturdiest of whom said that he was "a vera bad un to lick." After writing his first two poems, *Isle of Palms* and *The City of the Plague*, most of his fortune was lost through the rascality of a relative, and Wilson went to Edinburgh and became a lawyer. In 1817, *Blackwood's Magazine* was founded, for which, during its earlier years, Wilson and his friend Lockhart were the writers who gave it its success. In 1820, Wilson was made professor of moral philosophy in Edinburgh university. Here he had almost unexampled power of rousing the enthusiasm of his students. He, however, cared little for dignity, and on more than one occasion the professor of moral philosophy took off his coat in the public market place to punish some ruffian. The amount of his writings in *Blackwood's* was enormous; from this mass he selected and published in 1842 *The Recreations of Christopher North*. The power of his genius is best seen perhaps in the series of table talk, called *Noctes Ambrosianæ*. As a writer and a man the Scotch idolized him almost as much as they did Burns and Scott. He died at Edinburgh, April 3, 1854. See the *Memoir*, by his daughter, Mrs. Gordon.

Wil'son, William Lyne, LL.D., American statesman, and late president of Washington and Lee university, was born in Jefferson county, Va., May 3, 1843, and died at Lexington, Va., Oct. 17, 1900. After an education at the Columbian (D. C.) college and at the University of Virginia, he served for a time in the Confederate army, subsequently becoming a professor of Latin in Columbian college, and president of West Virginia university. He also studied and practiced law, and from 1883 to 1895 was a member of congress, regent of Smithsonian institution, and president of the National Democratic Convention of 1892. Between the years 1895 and 1897, he was postmaster-general of the United States, and in the latter year he accepted the presidency of Washington and Lee university. While in congress, he drafted the bill for the revision and reduction of tariff duties, known as the "Wilson Tariff Bill."

Wil'son, Woodrow, American historian and professor of jurisprudence and politics at Princeton university, was born at Staunton, Va., Dec. 28, 1856, and graduated at

Princeton. He subsequently studied and practiced law, and was for a time professor of history and political economy at Bryn Mawr college, but since 1890 has taught at Princeton. His writings embrace a life of *George Washington; Congressional Government, a Study in American Politics; The State, Elements of Historical and Practical Politics; Division and Reunion*, etc.

Win'chell, Alexander, a distinguished American geologist and author, was born in Dutchess county, N. Y., Dec. 31, 1824, and died at Ann Arbor, Mich., Feb. 19, 1891. In 1847, he graduated from Wesleyan university, Middletown, Conn., taught natural science subsequently in several schools, and was for a time president of the Masonic Female university, Selma, Ala. In 1854, he became professor of physics and civil engineering in the University of Michigan, and in the following year was transferred to the chair of geology, zoology, and botany there, which post he held until 1873. Between the years 1873 and 1878, he held the same position at the University of Kentucky, and a lectureship in geology at Vanderbilt university. In 1897, he was recalled to the University of Michigan as professor of geology and paleontology, which he retained for the remainder of his life. His published writings embrace *Sketches of Creation, The Doctrine of Evolution, The Geology of the Stars, Reconciliation of Science and Religion, Pre-Adamites, Sparks from a Geologist's Hammer, World-Life: a Comparative Geology, Geological Excursions*, and *Geological Studies*.

Wind'mill, a wheel driven by the wind for power purposes. Windmills have been used since the 12th century in Europe. The European mill, sometimes called the Dutch mill from its extensive use in Holland, for pumping purposes, consists usually of four inclined radial arms, revolving on an axis nearly horizontal. These arms are covered with canvas, and the diameter of the wheel is generally very large. One is mentioned with a diameter of 150 feet, but a common diameter is about a third of this. These wheels are largely used for pumping water and for grinding grain. They have various schemes for setting them to face the wind, a common method in Germany being to rotate the whole tower on wheels. The windmill has been developed in the United States along different lines, and the American windmills are so superior to the older forms that they now practically control the market. The American windmill consists of a wheel with a great number of narrow radial inclined arms of wood or metal, the axis of the wheel being horizontal, and the direction of the wheel being regulated by an arm carrying a vane. These wheels vary in diameter from ten to thirty feet; the largest sizes in ordinary winds develop as high as 4 H.P. The ordinary pumping wheel develops less than ¼ H.P. The number of hours that they run depends on local conditions. Wolff, who has written the best book on windmills, estimates an average of eight running hours per day for most parts of the United States. The number of windmills in use is very great, and the manufacture of them is a very large industry. One firm in the United States is said to make nearly 20,000 windmills annually. For small powers where constant and continuous service is not vital, as in pumping water, grinding feed, etc., windmills are, according to Wolff, the cheapest power available.

Win'dom, William, an American politician and financier, was born in Ohio in 1827. After being admitted to the bar he went to Minnesota and entered politics as a congressman in 1858. He was regularly re-elected for ten years, and was in his second term as United States senator when, in 1881, he was appointed secretary of the treasury in President Garfield's cabinet. On Garfield's death in that year, he resigned and was at once sent back to the senate, having in the short time that he held his secretaryship gained the reputation of being a worthy successor of Hamilton, Gallatin, and Sherman. In 1889, he was again made secretary of the treasury in President Harrison's cabinet, but died before serving out his term, at New York, Jan. 29, 1891.

Win'dow, an opening in the wall of a building to admit light and ventilation. Windows were practically unknown among the Greeks and Romans; at least, the few windows used were mere holes in the side of the building. Even among the Anglo-Saxons a window carried with it no association of glass as it does to us, for the early windows in England were merely covered with stretched hide or filled with lattice work. The Anglo-Saxon word for window is *eagdura*, that is an "eye door"; and our word for window is a compound of *wind* and *eye*. Even as late as the discovery of America, 1492, windows were enormously expensive. See Trail's *Social England*, Vol. II., p. 572. It is only since the days of cheap glass that the luxury of windows, as we now understand them, has been enjoyed by every one.

Winds are currents in the earth's atmosphere, produced by disturbances which result from differences of temperature in different parts of the country. Thus the air in contact with heated ground becomes itself heated and rises to the upper regions, thus diminishing the barometric pressure in that locality. Accordingly, the air flows in from neighboring regions where the barometric pressure has not been diminished, and this current is what is known as a wind. Winds have received various names, according to their velocities and their characteristics. Thus a barely perceptible wind moves from one to two feet per second; a moderate breeze, from 10 to 20 feet per second; a fresh breeze from 20 to 30 feet per

second; a strong breeze, from 30 to 55 feet per second; a storm, from 55 to 90 feet per second; a hurricane, from 90 to 120 feet per second.

Regular winds are those which blow always in the same general direction. Such are the trade winds.

Periodical winds are those which recur at regular intervals. Among these may be mentioned the land and sea breezes of the seashore; the *sirocco* of Algiers, a wind which blows off the desert of Sahara, etc. Most of our winds are *variable*. See CYCLONE, and STORM.

Wind'sor Castle, the chief home of the English sovereigns, is at Windsor, a town on the Thames river, twenty-one miles from London. As early as the time of the Heptarchy, there was a stronghold there. Henry III. built a round tower on the site, but it was wholly rebuilt by Edward III. in 1344, as a meeting-place for his newly established order of the Knights of the Garter. He chose this spot because of the popular story that King Arthur used to sit here surrounded by his Knights of the Round Table. Henry III. built many of the present walls and towers, and two chapels, one of which Henry VIII. gave to Cardinal Wolsey, who had a costly tomb erected there, and the chapel was for a long time after known as "Wolsey's tomb-house." It is now called the Albert memorial chapel. The magnificent chapel of St. George ranks next to Westminster abbey as a royal burying-place. Among the many treasures kept in the royal library is a fine collection of drawings by the chief Italian painters, and a series of eighty-seven portraits by Holbein, of Henry VIII.'s court. The royal forest of Windsor is one of the finest in England.

Wine, the fermented juice of grapes. For wine making, grapes are usually picked dead ripe, and sometimes are even allowed to wither, while some wines are made from raisins, and champagne and other kinds from grapes not quite ripe. In making the best wines, great care is taken with the grapes, the unripe or faulty berries being picked off the bunches by hand and only the best bunches used. The grapes are put into the winepress, a large tub, and the juice pressed out by treading with the naked feet, or mechanical presses are used for this purpose. The juice runs through holes in the bottom of the press into a vat where it is left to ferment, this process lasting from a few hours to several days. This fermentation or "working" changes the sugar of the juice or "must" into alcohol and throws off carbonic acid gas. When the must has stopped frothing and becomes clear and cool, it is drawn off from the vat, or "racked" and put into casks, where a second fermentation takes place. In sweet wines or liquors, all the sugar is not changed into alcohol; when all or most of the sugar is so changed, the wine is called dry wine. When wines are bottled before fermentation is finished they contain carbonic acid gas, which causes them to foam when uncorked. This gives the sparkle to champagne and other wines. The color of wine comes from the skins, white grapes yielding an amber-hued wine, and dark grapes the rich color of clarets and port. Logwood, burnt sugar, etc., are also used to color wine. In the middle ages, most of the wine drunk in Europe came from the Greek islands which grew the famous malmsey. Later, the Rhine wines of Germany and the Burgundy wines of France became noted, and then began the vine culture and wine trade which has spread all over those countries. Their chief wines now are Bordeaux or claret, champagne, Burgundy, Hockheim, and Moselle. The finest of the Hungarian wines is Tokay. Spain furnishes the sherry wines and Portugal, port. One of the best of the many Italian wines is the Lachrymæ Christi. Madeira has long been famous for its fine white wine. The California wines are the best in the United States, and amount to over a third of the yearly output of the country, about 30,000,000 gallons.

Winkelried (*vink'el-rēt*), **Arnold von,** a hero of Switzerland, the story of whose exploit is, after that of William Tell, the most popular in the early history of the Swiss confederation. We are told how, at a critical moment in the great battle of Sempach, when the Swiss had failed to break the serried ranks of the Austrian knights, a man of Unterwalden, Arnold von Winkelried, came to the rescue. Intrusting his wife and children to the care of his comrades, he rushed toward the Austrians, gathered as many of their spears as he could together against his breast, and fell pierced through and through; but into the gap thus made rushed the Swiss mountaineers and routed the Austrians. By the battle of Sempach (July 9, 1386), Switzerland gained its freedom.

Winneba'go, Lake, the largest lake in Wisconsin, is 28 miles long from north to south, about 10 miles wide, and covers about 212 square miles. It is navigable, as is also Fox river, which carries its waters to Green Bay and Lake Michigan. For fifteen miles along the eastern shore is a rock wall, in some places reaching hundreds of feet below the surface. Fond du Lac and Oshkosh border it.

Winneba'goes, a tribe of Indians belonging to the Dakota family, whose name means "men from the salt water." The French traders found them a large tribe in the Green Bay region of Wisconsin, and ruling over the neighboring Algonquin tribes. But in the beginning of the 17th century, several banded tribes cooped them up in one town, where 500 warriors died of want and sickness. The Illinois next attacked them, and at the end of the war the Winnebagoes were only a small tribe. They fought with the French against

the English, and with the British against the Americans. They were conquered by Gen. Anthony Wayne, and were among the tribes banded together by Tecumseh. They ceded their land in parcels, beginning in 1829. By 1846, they had all been removed from Wisconsin, except a few who had taken allotments of land. After being sent to several reservations in Iowa, Minnesota, and Dakota, they were moved to Winnebago, Nebraska, and given in charge of the Quakers, who, as well as the Catholics and Presbyterians, established missions among them. They number now about 2,000.

Win'nipeg, the capital of Manitoba, stands at the junction of the Red and Assiniboine rivers, 764 feet above the sea, and 400 miles northwest of St. Paul. A number of fur traders' forts stood on its site. It was laid out as a town in 1870, when Rupert's Land became a part of Canada, and the province of Manitoba was formed. The city is built on both sides of the Assiniboine, but only on the west side of the Red river, the suburb of St. Boniface being on the east side. The city is well built, and has water, gas, electric light, and seven railroads; it is the center of the Canadian Northwest. There are here Manitoba university, Manitoba college, Manitoba Medical college, St. Boniface college, and St. John's college. The city hall, parliament buildings, and courthouse are handsome buildings. Population 42,336.

Win'nipeg, Lake, a large lake in Manitoba, Saskatchewan, and Keewatin, about 260 miles long, from 6 to 60 miles wide; and covering about 8,500 square miles. It stands 628 feet above the sea. It drains about 400,000 square miles. It receives the waters of Lakes Manitoba and Winnipegosis, of the Lake of the Woods, of the Red, Berens, and Saskatchewan rivers, and discharges its own waters through the Nelson river into Hudson bay. In winter, the ice is sometimes five feet thick, and in the upper part does not disappear till June.

Winnipego'sis, Lake, meaning "Little Winnipeg," a lake of Manitoba and Saskatchewan. It is about 125 miles long; its greatest width is 25 miles, and it covers about 2,000 square miles. It is 60 feet higher than Lake Winnipeg and 20 feet higher than Lake Manitoba, into which it discharges its waters by means of Water Hen river. The waters of Dauphin lake, and Swan and Red Deer rivers, fall into Lake Winnipegosis.

Winnipiseogee (*win'e-pe-sä'ke*), **Lake,** a lake of New Hampshire, 25 miles long and about 10 miles wide. There are a number of bays and many islands. The Winnipiseogee, or Winnepesaukee, river carries its waters to the Merrimac. Its waters are very clear and deep, and well stocked with fish.

Wino'na, the fourth city of Minnesota, on the Mississippi, ninety-six miles southeast of St. Paul. It is built on rich lowlands under the Mississippi bluffs. One of its finest buildings is the State Normal school. Winona is a large wheat and lumber mart, besides which it has manufactures of carriages, farm tools, sashes and doors, flour, etc. The city was settled in 1851. Population 19,714.

Wins'low, Edward, governor of Plymouth colony, was born at Droitwich, Worcestershire, England, Oct. 19, 1595. He came to New England in the *Mayflower* and offered himself to the Indian chief Massasoit as a hostage for the fair dealing of the colonists. In this way, and by curing the chief when he was sick, he gained his friendship. After two voyages to England on behalf of the colony, he was made governor in 1633, in 1636, and in 1644. On his third visit to England, in 1635, he was imprisoned for seventeen weeks by Archbishop Laud for teaching in the church, as he was not a clergyman. Winslow's portrait in the gallery of the Pilgrim society at Plymouth is said to be the only authentic likeness of any of the *Mayflower* pilgrims. His marriage with Mrs. Susanna White was the first marriage in Plymouth colony. In 1655, Cromwell sent Winslow on a mission to the West Indies, but he died on the voyage, May 8, 1655. See Justin Winsor's *Narrative and Critical History of the United States.*

Win'slow, John Ancrum, American admiral, who in 1864, when in command of the *Kearsarge*, defeated and sunk the Confederate privateer *Alabama* off Cherbourg harbor, was born at Wilmington, N. C., Nov. 19, 1811, and died at Boston, Mass., Sept. 29, 1873. Entering the United States navy in 1827, he served in the Mexican war and for gallantry was given command of the *Morris*, and subsequently promoted to the rank of commander. After his encounter with Captain Semmes and the sinking of the *Alabama* (June 14, 1864), he was promoted to commodore, and in 1866–67 commanded the Gulf squadron. In 1870, he received a rear-admiralship, and was given command of the Pacific squadron (1870–72), dying in the following year, aged sixty-two.

Win'sor, Justin, American historian and librarian, was born at Boston, Mass., Jan. 2, 1831, and died at Cambridge, Mass., Oct. 22, 1897. After studying at Harvard and at Heidelberg, he became superintendent of the Boston library and held this post from 1868 to 1877, passing in the latter year to the librarianship of Harvard. From 1876 to 1886, he was president of the American Librarian association, and was also president of the American Historical association, and secretary of the Massachusetts Historical society. He was a large contributor to the periodical press and an extensive and instructive author. His chief publications embrace *The Readers' Handbook of the American Revolution, Bibliography of Original Quartos and*

Folios of Shakespeare, Christopher Columbus, Cartier to Frontenac, a *Narrative and Critical History of America*, and was editor of the *Memorial History of Boston*.

JUSTIN WINSOR.

Wins'ton, N. C., a city and manufacturing center, the capital of Forsyth county, adjoining the city of Salem, in the northwestern portion of North Carolina. It is on the Southern and on the Norfolk and Western railroads, twenty-seven miles west of Greensboro, and 120 miles northwest of Raleigh. It has a number of tobacco factories and warehouses, besides iron works, cotton and woolen mills, carriage and wagon factories, and shuttle and bobbin works. Population 10,008.

Win'throp, John, governor of Massachusetts colony, was born at Groton, Suffolk, England, Jan. 12, 1587. He became a lawyer, and because of his good and religious character he was chosen governor by the Massachusetts Bay company in 1629. The next year he came over, bringing with him 900 emigrants. He was generally re-elected every year throughout his life, except from 1634 to 1636, when he was deputy under Sir Harry Vane. His influence was very great in the colony, and through it on the life, thought, and later politics and institutions of New England. Governor Winthrop's *Journal* is one of the most important sources of early American history. His son John was governor of Connecticut. Governor Winthrop died at Boston, March 26, 1649.

Win'throp, Theodore, an American author, was born at New Haven, Conn., Sept. 22, 1828. He was graduated at Yale college in 1848. He then entered business in New York, spent two years at Panama and opened a law office at St. Louis. On the outbreak of the Civil war he enlisted, and was one of the earliest martyrs of the struggle, being shot while leading a charge at Big Bethel, June 10, 1861. He was hardly known as a writer till the appearance in the *Atlantic Monthly* of his life-like sketches of *Washington as a Camp*, describing the march of his regiment, the famous New York Seventh, and its first quarters in the capitol at Washington. Soon after his death his novels were published from manuscript, and his magazine stories reprinted. *Cecil Dreeme*, *John Brent*, and his other novels have a breezy, outdoor air about them that is delightful, while the short story, *Love and Skates*, is an English classic.

Wirt, William, was born at Bladensburg, Md., Nov. 8, 1772. He began to practice law in 1792 at Culpepper Court House, Va., but within a few years moved to Charlottesville and thence to Richmond. In 1803, appeared his *Letters of a British Spy*. He took part in the prosecution of Aaron Burr, and was attorney-general of the United States from 1817 to 1829. In 1832, he ran for the presidency on the ticket of the anti-Masonic party. Wirt is now best remembered as the author of the famous *Life of Patrick Henry*. He died at Washington, D. C., Feb. 18, 1834. See *Life*, by J. P. Kennedy.

Wiscon'sin covers 54,450 square miles; its greatest length from north to south is 300 miles; its breadth 250 miles. No peaks are over 1,800 feet high. The state is merely a swell of land between the basins of Lakes Michigan and Superior and the Mississippi. The highest part of this swell is within thirty miles of Lake Superior. In the south central part of the state is the diagonal valley occupied by Green bay, and the Fox and Wisconsin rivers. The ice of the glacial period invaded in force the eastern and northern part of the state, while an area of 10,000 square miles in the southwestern part was left untouched. About 2,000 lakes and many waterfalls dot the northern and eastern part, all within the portion covered by the glacial ice. The greater part of the state was once covered by forests, though there were occasional prairies in the south and west. Oaks, poplars, and hickories are the chief trees, while maple, elm, and ash forests are found along the eastern border. In the north, a once unbroken forest of pine and hard wood covered the state. This is the great lumber region of Wisconsin. Almost half the state is now covered with woods, and Wisconsin produces more lumber than any other state, except Michigan and Pennsylvania.

The leading crops in order are oats, corn, wheat, potatoes, barley, hay, and tobacco. Large water-power for mills is found chiefly on the Fox, Wisconsin, and Chippewa rivers. The leading products are lumber, flour, wooden articles, iron products, beer, and articles made of leather. The largest iron mines are found in the Menominee region and along the Montreal river. Lead and zinc are found in the southwest. Building stone is plentiful; the best is the red-brown sandstone of Bayfield county and the granite of Marquette county. Whitefish and lake trout are caught in large quantities in Lakes Superior and Michigan, while pickerel, bass, pike, sturgeon, and brook trout are plentiful in the 3,000 square miles of inland clear-water lakes. There are 6,566 miles of railroad. The Fox and Wisconsin rivers are joined by a canal at Portage, and the Sturgeon Bay canal joins Green bay and Lake Michigan.

The state legislature, made up of the senate and assembly, meets every two years. The

public school fund at interest is $3,000,000, besides valuable lands. The elementary schools have 11,818 teachers and 418,366 pupils; the high schools have a force of 647 teachers and an attendance of 17,548 pupils; and there are 10 colleges and universities with 233 professors and instructors and 3,361 students. The chief colleges are the University of Wisconsin at Madison, Beloit, Ripon, Milton, and Racine colleges, and Lawrence university. The State university and Beloit college, especially, stand high throughout the country.

In Wisconsin are many of the animal mounds of the "Mound Builders," and the finest collection of old copper tools and weapons has been made in this state. Wisconsin was the meeting ground of the great Algonquin and Dakota families of Indian tribes. As its waters connected the Great Lakes and the Mississippi, it was the keystone of the French possessions in Canada and Louisiana. The fur trade first drew French explorers to Wisconsin. Going up the Ottawa they would cross to Lake Huron, whence they easily passed through the straits of Mackinaw to Green bay; thence up the Fox to the Portage between it and the Wisconsin, and on to the Mississippi. The first known white man to enter Wisconsin was Jean Nicollet, who went up the Fox in 1634. In 1665, Father Claude Allouez founded a Jesuit mission at La Pointe, followed four years later by the mission of St. Francis Xavier on the shores of Green bay. By the ordinance of 1787, Wisconsin was made part of the Northwest Territory. In 1825, a war with the Sacs and Foxes and Winnebagoes won from them the lead mining region. Black Hawk's war took place in 1832. Wisconsin territory was formed in 1836, and it became a state in 1848. Wisconsin furnished to the Union army during the Civil war over 91,000 men, the famous Iron Brigade being chiefly from that state. Population, in 1900, 2,069,042.

Wiscon'sin River, a branch of the Mississippi, rises in lake Vieux desert on the northeastern border of Wisconsin, and flows south 600 miles falls into the Mississippi four miles below Prairie du Chien. It is navigable for steamboats for 200 miles to Portage, where it is joined by canal to the Fox, thus making a waterway across the state from Lake Michigan to the Mississippi, by way of Green bay, the Fox, and the Wisconsin.

Wiscon'sin, Univer'sity of, located at Madison, is a part of the free school system of the state and is coeducational. It was established by the constitution when the state was organized in 1848. In 1866, the university was reorganized and united with the college of agriculture, endowed with the proceeds of the agricultural college grant given by the United States in 1862. It is supported by income from three sources, a state tax, federal grants, and private gifts. The buildings of the university are thirteen in number, and the grounds comprise 300 acres, extending for more than a mile along the shore of Lake Mendota. The departments of instruction embrace a department of graduate study, college of letters and science, school of economics, political science, and history, school of education, college of mechanics and engineering, college of agriculture, college of law, school of pharmacy, and school of music. The faculty numbers 151, and the number of students in attendance, exclusive of the summer school, is 2,200.

Wise, Henry Alexander, an American statesman, was born at Drummondtown, Va., Dec. 3, 1806. He graduated at Washington college, Pennsylvania, and studied law. He became prominent in politics, advocating the nomination of Jackson at Baltimore, and favoring the doctrine of state rights. He was sent to congress in 1833, where he went over to the Whig party, in opposition to Jackson's course. Under Tyler, whose nomination Wise had secured, he had a strong influence, and was made minister to Brazil, and in 1854 governor of Virginia. In December, 1859, he signed the death warrant of John Brown. Though making an effort for peace as a member of the Virginia convention, he went with his state into secession, and became a brigadier-general in the Confederate army. He served in the Kanawha valley, and at Roanoke island, where his forces were captured and his son was killed. He wrote *Seven Decades of the Union.* He died at Richmond, Va., Sept. 12, 1876.

Wise'man, Nicholas, cardinal and Catholic archbishop of Westminster, was born at Seville, Spain, of Irish parents, Aug. 2, 1802. He studied in Ireland and at Rome, where his brilliant course secured him in 1823 the appointment of vice-rector of the English college, which in 1828 was changed to rector. In England, he was first known by a series of lectures on the doctrines of the Catholic church, which was followed by the founding with Mr. O'Connell of the *Dublin Review.* His appointment as archbishop of Westminster and cardinal produced great excitement, as it was looked upon as an effort of the Catholic church to recover possession of England, where there had been no Catholic bishops since the reign of Elizabeth. Wiseman's addresses and publications did much to allay the excitement, and his ability and moderation, as well as his literary position, won him the admiration of all. He wrote on literature and art besides his religious works. *Influence of Words on Thought and Civilization, Lectures on Religion and Science, Points of Contact between Science and Art,* and *The Real Presence,* were books that obtained a large circulation. He died at London, Feb. 15, 1865.

Wista'ria, a class of climbing plants named after Professor Wistar, of Philadelphia. The leaf is formed of from nine to fifteen oval leaflets, and the flowers, usually lilac in color, grow in thick, long clusters, and resemble the flowers of the locust tree, or sweet peas or other plants of the "leguminosæ" or bean family, to which it belongs. The seeds or beans are found in long pods. It grows rapidly, often 20 feet in a season. The Chinese wistaria, introduced from Japan, blooms earlier, with a looser cluster of flowers, of a paler lilac or white. There are several other varieties, including a double-flowered one.

Witch and Witch'craft. The names "witch" and "wizard" are given to persons supposed to possess unusual powers, popularly thought to have been acquired by a compact with Satan. The belief is an old one, as the Witch of Endor appeared to Samuel in the early days of the Jewish nation, and Paul had several contests with sorcerers. Sorcerers, sooth-sayers, diviners, and magicians were often popularly classed together and with witches; but the magicians claimed to be a distinct class, using their knowledge of the secrets of nature for the benefit of mankind, while the witches and sorcerers delighted in doing harm. The belief in evil spirits has been common in every nation and country, and the legends of a people are full of the deeds of supernatural beings. In popular belief, a witch was usually an old woman, who rode on a broomstick through the air by night to attend the witches' gathering, and who delighted in acts of spite and meanness. Their victims, on whom they had cast the evil eye, pined away mysteriously, or were troubled by strange noises and curious losses, etc. The witches' mark was a spot of some kind made on the body by the devil as a sign of his bargain, and was indelible, and was sought for by the class of inquisitors known as the witch-finders. Shakespeare's *Macbeth* and other plays, Burns' *Tam O'Shanter*, and the *Walpurgis Night* in Goethe's *Faust*, give an idea of these popular beliefs.

The belief in witchcraft as the work of evil spirits led to the bloody and cruel prosecution and punishment of witches which lasted in Europe for four centuries, and in which it is estimated 9,000,000 persons were put to death. The bull of Pope Innocent VIII. in 1484 began the work of destruction, in which by torture confession was extorted, and the testimony of enemies and children accepted. In one year in the district of Como, 1,000 persons suffered as witches and 500 in three months in Geneva, while 4,000 persons perished in Scotland, and during the session of the long parliament alone 3,000 persons were condemned in England. The delusion was almost universal, such a judge as Sir Matthew Hale giving sentence against a suspected person, and a physician as eminent as Sir Thomas Browne declaring his belief in witchcraft, inspite of having written a volume on *Popular Fallacies*. The last execution in England was in 1716, and the laws against witchcraft were repealed in 1735. The last execution on the continent took place in Posen as late as 1793. The notorious persecution of supposed witches in Salem, Mass., was a result of the general belief so common at the time. Cotton Mather published, in 1685, an account of cases of witchcraft and made experiments on suspected persons, by which he learned that the devils understood Latin, Greek, and Hebrew well, but the Indian dialects only imperfectly. He wrote *Wonders of the Invisible World* to convince doubters, and his book received the recommendation of the governor of the state and the president of Harvard college. Nineteen persons were hanged between June and September of 1692. See *Salem Witchcraft*, by Upham.

Witch-ha'zel, the name of a small tree or shrub belonging to a family of which there are several species, among them the liquid-amber, a forest tree. The witch-hazel grows in damp woods about ten feet high, has leaves much like the hazel, with clusters of three or four bright yellow flowers which appear in the fall. The fruit is a pointed two-celled pod, which does not ripen until the next summer. The wood is white, the bark and leaves contain tannin, and an extract of the bark and leaves is used as an external application in medicine. The name comes from the popular belief that a branch of the tree carried in the hand will turn toward the ground to indicate a hidden supply of water.

Wittenberg (*wit'ten-bĕrg*), a town of Prussian Saxony, is on the Elbe river, fifty-five miles southwest of Berlin. It is famous as the home of Luther and Melanchthon, whose tombs are in the church on the doors of which Luther nailed his famous "theses." The church was restored, and in 1858 new bronze doors with the theses in Latin were erected. In another church are two pictures, one of Luther preaching, and the other of Melanchthon administering the communion. The houses of Melanchthon and Luther are still shown, Luther's containing his chair and table and two portraits of himself, and in the market place is a bronze statue of him. The university where Luther was professor, and where, according to Shakespeare, Hamlet studied, has been removed to Halle. Wittenberg has manufactures of woolen and linen goods, hosiery, leather, brandy, and beer. Until 1422, it was the residence of the dukes and electors of Saxony. In 1547, it was taken by Charles V., and in 1760 by the Austrians, when nearly one-third of it was destroyed. Napoleon captured it in 1806 and fortified it in 1813, the Prussians finally capturing it in 1814. Population 22,000.

Wo'burn, Mass., a city and manufacturing center in Middlesex county, eastern Massachusetts, on the Boston and Maine railroad, ten miles northwest of Boston. The chief industry of the place is the tanning and dressing of leather, the manufacture of boots and shoes; there are also some glue factories and chemical works. The town has a number of good schools, churches, and a well-equipped public library. Population 14,254.

Wolcott (*wōl'kŏt*), **Roger,** a governor of Connecticut, was born at Windsor, Conn., Jan. 4, 1679. He was in service in the attack on Canada in 1711, and at the siege of Louisburg in 1745. He was governor of Connecticut from 1751 to 1755, and had already been a member of the assembly, and of the council, a judge, and the deputy governor. He published a volume of poems, and a historical work in which is a description of the Pequot war. He died May 17, 1767.

Wolf, a carnivorous mammal belonging to the dog family. The domesticated dogs are very likely descended from wolves. The latter animals have a wide geographical range, being found over nearly the whole of Europe, Asia, and North America. There are none in South America or Africa, the jackal and foxes apparently taking their place in those countries. Wherever found near inhabited regions, they prey upon sheep, which they run down in open chase. Assembled in packs, they also attack herds of cattle, and when bisons were abundant on the western plains, they would overcome those large animals. Several centuries ago wolves were abundant in the British islands, but they were hunted by the ancient Britons, and at different times a reward was offered for their heads and skins. As a result they were exterminated. They became very scarce in the 16th century, and by the middle of the 18th century were exterminated in Europe, Scotland, and Ireland. In America, the common wolf and its varieties extend from Greenland to Mexico. They are about sixty-five inches long, with a tail of fifteen inches. They vary in color, but are chiefly gray, becoming whitish in the north and dark in the south. In Florida, there are black wolves and in Texas red ones. The coyote is a smaller wolf peculiar to the United States. It is common on the western plains, burrowing in the ground. It reaches a length of about fifty-five inches, and is yellowish gray clouded with black. See JACKAL, DOG.

COMMON WOLF.

Wolfe, Charles, a British poet, was born at Dublin, Dec. 14, 1791. He graduated at Trinity college, Dublin, and was a curate in Tyrone county. He is famous for his ode on the burial of Sir John Moore, beginning "Not a drum was heard, not a funeral note," which is known to every schoolboy. He died at Cork, Feb. 21, 1823.

Wolfe, James, an English general, was born at Westerham, in Kent, England, Jan. 2, 1727. When only thirteen years old, he was prevented by sickness from going with his father, a British officer, on the expedition to Carthagena. In his first service in Flanders, he took part in the famous battle of Dettingen, and in Scotland was at the battles of Falkirk and Culloden. His conduct while in charge of a regiment in Scotland, and in the expedition against Rochefort in 1757, won him the rank of colonel, and gave him the command of a brigade in the expedition against Cape Breton. His skill and bravery at the attack on Louisburg won him the title of "Hero of Louisburg." In the effort to drive the French out of Canada, Pitt gave the charge of the invading army to Wolfe, who had been made major-general. The story of his attack on Quebec, how he scaled the cliffs with his army by night, and died in the moment of victory, while his brave antagonist Montcalm, dying too, said: "It is a great consolation to have been vanquished by so brave an enemy," is well known. He died Sept. 13, 1759, when only thirty-three years old. See *Life*, by Wright; *Montcalm and Wolfe*, by Parkman.

Wolseley (*wōlz'lĭ*), Viscount **Garnet Joseph,** G. C. M. G., P. C., etc., field-marshal, and lately commander-in-chief of the British army, was born near Dublin, June 4, 1833, and was educated under tutors. He entered the English army in 1852 and served successively in the Burmese war and in the Crimean war, and was severely wounded at the siege of Sebastopol. He subsequently served in India and China, and in 1867 in Canada, where he acted as deputy-quartermaster general and commanded the expedition to the Red river. In 1873, he commanded the troops on the Gold coast during the Ashanti war, and entering Kumasi received the submission of the king. For this campaign he received the thanks of the British parliament and a gratuity of £25,000 "for courage, energy, and perseverance." He also received the freedom of the city of London and a sword valued at 100 guineas. In 1875, he was governor of Natal; in 1880, quartermaster-general of the forces; and from 1882 to 1885 was adjutant-general. In 1882, he

LORD WOLSELEY.

was in command of the expeditionary force in Egypt, and of the Gordon Relief expedition. Subsequently he was commander of the forces in Ireland, was raised to the rank of general (1882) and field-marshal (1894), and from 1885 to 1900, was commander-in-chief of the army, being relieved at the latter date by Lord Roberts. He is the author of a *Life of Marlborough*, of the *Decline and Fall of Napoleon*, and of *The Soldier's Pocket-Book for Field Service*.

Wolsey (*wŏl-zĭ*), **Thomas,** an English cardinal, was born at Ipswich, in Suffolk, England, in 1471. He secured by some means an education at Oxford, and became rector at Lymington. Through the influence of a friend he was made chaplain to Henry VII., with whom he became a favorite, and was appointed dean of Lincoln. When Henry VIII. became king, Wolsey governed the kingdom. Honors were showered upon him. In the church he was made bishop of Lincoln, archbishop of York, and cardinal. In 1515, he was prime minister and lord high chancellor. He was successful in command of the royal army at Tournay, and effected a treaty in 1514 with Louis XII. of France, which left England the first power in Europe. His income was enormous, and large sums were used in founding a college at Ipswich and Christ Church college at Oxford. Wolsey's efforts to obtain the pope's permission for Henry's divorce of Queen Catherine were unsuccessful and lost him the royal favor, which alone had stood between him and those whom his splendid living and overbearing conduct had made his enemies. Anne Boleyn, whose marriage to the king he had opposed, with her uncle Norfolk now plotted his ruin. He was driven from court to his diocese in York, where he won the hearts of the people by his gracious manner. The king, too, showed signs of relenting, and his enemies alarmed, had him arrested for high treason, but he died at Leicester abbey on his way to London, Nov. 29, 1530. See Shakespeare's play, *Henry VIII.*; *History of England*, by Froude.

Wol'verine, a carnivorous animal of the northern forests of Europe, Asia, and America. There is only a single species. The American form reaches a length of about 30 inches, and is covered with shaggy hair of a blackish color, with pale bands along the sides of the body, and one on the forehead. The body and limbs are stout and the animal resembles a small bear. It climbs trees, and, during the breeding season, forms burrows for the mother animals. It feeds on squirrels, hares, foxes, grouse, reindeer, and other animals. It is noted for its cunning and often steals bait from traps. Michigan is called the wolverine state, from the occurrence of the wolverine in its forests.

Wolverhampton (*wŏl-ver-hamp'tun*), a market town of Staffordshire, England, is thirteen miles northwest of Birmingham, on a height which commands a fine view toward Wales. The old church was founded in 996 and the free grammar school in 1515. There is a corn exchange, market hall, agricultural hall, public baths, a free library, a cattle market covering five acres, and a large park. It is famous for the manufacture of hardware, especially iron implements, tools, locks, hinges, nails, and kitchen furniture. It has also smelting furnaces, iron and brass foundries, chemical works, dye works, rope walks, varnish works, and breweries. The town was named Wulfrunahamton in honor of Wulfruna, sister of Ethelred II., who founded the church and college in 996. Population 89,662.

Wo'man's Chris'tian Tem'perance Un'ion. See TOTAL ABSTINENCE.

Wom'bat, a marsupial, or pouched animal of Australia. The body of the common wombat is a little more than two feet long, covered with dark brown hair, and the animal has somewhat the appearance of a small bear. The tail is rudimentary and the legs are short and stout. The toes end in sharp, curved claws which are of service to the animal in burrowing. These animals are active at night, they feed largely on roots. They are easily caught alive, but in captivity show no affection for their keepers, caring only for the food given them. Their flesh is said to resemble pork in flavor and is often eaten in Australia.

Wood Carv'ing, one of the oldest branches of art, was much practiced among the Egyptians, Greeks, and Romans. A life-size statue of a man carved out of a solid block of sycamore, dating probably from 4000 B. C., now in the Boulak museum, is a fine specimen of Egyptian wood carving. Egyptian carvings have been preserved in the tombs, but the Greek and Roman carvings have nearly all perished and are known to us only by the descriptions of early writers. It was much used in the decoration of churches in the middle ages, and reached its height in the 15th century, when every church had its carved oak screen and stalls. The roof of Westminster hall, made in the early part of the 15th century, is one of the finest examples of the open timber roof in use, which admitted of very fine decoration. Skill in wood carving still lingers in Nuremberg and Switzerland. The Moslem wood carvers of Persia, Syria, and Spain produced beautiful work, as seen in the mosques and private houses of Damascus, Cairo, and other oriental cities. The wood carving of China and Japan is the finest in the world.

Wood Engrav'ing is a process of copying pictures from blocks of wood, and differs from plate or steel engraving in having the picture raised on the surface of the wood, instead of being sunk, as it is in the metal. The picture is printed from the prepared

block, just as the letters are from type, the block being made the height of the type. The wood must be hard and fine grained, boxwood being the best. The block of wood is covered with a white coating, on which the artist draws the picture with a lead pencil, pen, or brush. The engraver then cuts away all of the wood around the drawn lines, leaving them raised or in relief. For large pictures several blocks are fastened together for the drawing, and then given to different engravers, so that a large picture can be produced very quickly.

Wood engraving is the earliest and simplest form of engraving. The Chinese claim to have printed from wooden blocks 1,000 years before Christ, and it is probable that the art was brought from China to Europe. A wood cut of St. Christopher, dated 1423, is one of the oldest specimens of engraving. It was used largely in Europe in the 15th century for two very opposite purposes, the engraving of playing cards and the illustration of books of devotion. A book of forty leaves, with a picture and a text of Scripture on each page, is one of the earliest illustrated books known, dating back to the early part of the 15th century. Durer made great advances in the art in the beginning of the 16th century, and Bewick, who published in 1790 his *British Quadrupeds*, and in 1804 *British Birds*, illustrated by himself, showed the possibilities of the art and made it what it is to-day — one of the most important of the arts. Its use has become general in books, magazines, and newspapers.

Wood, Leon'ard, major-general United States volunteers, and military governor of Cuba, was born at Winchester, N. H., Oct. 9, 1860, and graduated in medicine at the Harvard Medical school (1884). In 1886, he was appointed first lieutenant and assistant surgeon United States army, and reached the rank of captain and surgeon in 1891. In 1886, he served in Arizona and New Mexico in General Miles' campaign against the Apaches under Geronimo and Natchez, and received a medal of honor for this duty. In May, 1898, on the outbreak of the Spanish-American war, he recruited the 1st regiment of United States volunteer cavalry ("Rough Riders"), and took part in the fight at Las Guasimas and in the battle at San Juan, near Santiago de Cuba, and was given the rank of brigadier-general for gallant service in Cuba. In July, 1898, he succeeded General Brooke as governor-general of Cuba, where he has greatly aided in the orderly government and in the improved sanitary condition of the island.

Woodbine, a common name for the Virginia creeper or American ivy, *Ampelopsis quinquefolia*. The name was originally applied in Europe to a species of honeysuckle (*Lonicera*).

Wood'chuck, or Ground Hog, a burrowing rodent of eastern North America belonging to the family of ground squirrels. It is a true marmot. It is about eighteen inches long and grizzly gray in color, varying to chestnut and blackish. It is destructive to crops and a pest to the farmer. Ground hog day is Feb. 2; according to an old tradition the animal then awakes from its winter sleep and comes from its burrow. If the sun is shining, it returns for another six weeks, but if it cannot see its shadow, it knows that there will be an early spring. See MARMOT.

Wood'cock, a famous game bird belonging to the snipe family, and found in northern parts of both the Old and New Worlds. The American woodcock is about eleven inches long, variegated in black, brown, gray, and rusty colors. The bill is very long and flexible at the end. It is thrust into the soft ground, in search of earthworms, and the

WOODCOCK.

presence of woodcocks can often be detected by a cluster of these holes. The European bird is larger. It is a winter resident in England, breeding in summer in north Scotland.

Wood'pecker, the name for any member of the family *Picidæ*. This includes birds with stout bills with which they peck wood to obtain insects. Their long tongue is barbed at the end and capable of being greatly protruded. It is in every way adapted for piercing and securing insect larvæ. These birds are of great service to the farmer. There are about 350 species found in all parts of the world, except the Australian region and Madagascar. Nearly one-half of the entire number occur in the New World, and about twenty-five species are found in North America. Their colors are generally bright and the males usually have some red on the head. Among the species of the United States the flicker, or golden-winged woodpecker, is one of the best known. It feeds mainly on ants and therefore is frequently seen on the ground. The other woodpeckers are almost always seen on trees. The red-headed woodpecker is abundant in the United States east of the

Rocky mountains. The downy and hairy woodpeckers are smaller birds, both being common. The ivory-billed woodpecker, with a length of twenty-one inches, is the most magnificent of North American woodpeckers. It is black, with white on the shoulders and wings, and, in the males, a scarlet crest. This bird is found in the south and formerly ranged as far north as southern Illinois. See Eckstrom's *The Woodpeckers* (1901).

Wood's Holl, a town in Falmouth township, Barnstable county, Mass., on Cape Cod, noteworthy as being a center for zoological research. Here is located the Marine Biological laboratory (C. O. Whitman, director), which is the most important seaside laboratory in America. The laboratories of the United States Fish commission are also located here.

Wool, one of the most important of all animal substances, ranks next to cotton in its use in the manufacture of clothing. It is a sort of hair, growing on sheep, and goats. The fiber of the wool differs from a hair in being crinkly or wavy, and having very minute scales, both of which properties fit it for its uses. The wavy twist keeps it from unwinding when made into yarn, and the scales make the threads catch each other, a process known as felting. Wool varies in quality with different species of sheep, and also with the food and shelter and climate. The Saxon wool has the most of the felting property, and the wool of the Angora goat, called mohair, is the whitest, while that of the Cashmere goat is very soft and rich though short. The merino sheep furnishes one of the best varieties of wool, a single fleece usually weighing about four or five pounds. In the manufacture of woolen goods, the wool is sorted into different grades, washed, scoured, and dried. It is then dyed, if to be dyed in the wool, and carded or made into threads, ready for weaving. After weaving, the cloth is scoured to remove the oil and dust, dyed, if dyed in the piece, and dried on stretchers. It is then fulled, a process that shrinks the cloth and makes it more compact. Teasling, a process to raise the threads, and shearing, which cuts them the right length to form the nap, follow, shearing being often repeated several times. The boiling of the cloth, which prevents spotting and gives a luster, brushing, pressing, and folding, finish the work. Broadcloths, cassimeres, and beavers are strictly woolen goods, while merinoes, bombazines, delaines, etc., are worsted goods, from the town of Worsted, England, in which the processes of manufacture are somewhat different, the wool being combed, which prevents its felting as closely, and also differently spun. The introduction of machinery and steam-power has revolutionized the manufacture of woolen goods. A woman could card one pound of wool a day by hand, and spin two skeins of yarn a day, and weave two or three yards of cloth a day. Now, by the use of machinery, one worker can card 150 pounds of wool, spin 500 pounds, and weave from 35 to 50 yards of cloth in a day. The amount of wool produced in the world is estimated at about 2,000,000,000 pounds a year, over one-half of which comes from Australia, South America, and South Africa. Great Britain has been the largest producer of woolen goods, but the manufacture is growing rapidly in the United States both in extent and in the quality of the goods.

Woolsey (*wŏl'zĭ*), **Theodore Dwight,** an American scholar, was born at New York city, Oct. 31, 1801. He studied at Yale, at Princeton, and for three years in Germany. He became professor of Greek at Yale college in 1830, and from 1846 to 1871 was the president of that institution. He was considered an authority on questions of international law, on which he published a volume. He also edited in Greek a number of Greek plays, and wrote several religious works. The American company of revisers of the New Testament selected him as their president. He died at New Haven, Conn., July 1, 1889.

T. D. WOOLSEY.

Woolwich (*wŏl'ĭch*), a town in Kent, England, on the Thames river, about nine miles east of London. It is known as the seat of the principal arsenal of Great Britain, and has the government factories for producing war material of all sorts, except gunpowder. The dockyards have existed since 1515, and some of the largest ships of the English navy have been built here. The royal artillery barracks and the Royal Military academy are also situated at Woolwich. Population 44,848.

Woonsock'et, a city in Rhode Island, on the Blackstone river, sixteen miles northwest of Providence. Woonsocket hill, 580 feet high, the highest point in Rhode Island, is near the town. It has good schools and a free library, but is principally a manufacturing town, especially of woolen and cotton goods. Washing machines, rubber goods, and musical instruments are also made. Population 28,204.

Woos'ter, a city in Ohio, eighty miles northeast of Columbus. It is a well-built town, standing on high ground, in a rich farming region. It has factories of agricultural implements, strawboard, whips, organs, and furniture. Wooster university, founded in 1866, has three departments, including the

medical school situated at Cleveland, with 29 instructors and about 575 students. Population 6,063.

Woos'ter, David, an American general, was born at Stratford, Conn., March 2, 1710. He was in the naval service, in command of a vessel to protect the coast in the war between England and Spain, and had command of a war vessel on the expedition to Louisburg. He was in active service during the French and Indian war, and in the Revolutionary war had command in Canada, after the death of Montgomery. When the British invaded Connecticut, in 1777, Wooster attacked them at Danbury and was mortally wounded April 27, and died May 2, 1777. A monument to him was built by the state.

Worcester (*wŏs'ter*), a city of England, is on the Severn river, about twenty-six miles from Birmingham. It is an old town, the old smelting works in the neighborhood being thought to date back to the time of the Romans. The cathedral, one of the noted ones of England, dates from 1084. It was much injured in the Civil war, but has been lately restored at great cost. Of the industries, the most important is glove-making and the manufacture of porcelain, the Royal Worcester ware being celebrated for its fine designs and beautiful execution. Other manufactures are those of leather, horse-hair weaving, vinegar, wine, and engines. Population 45,908.

Worces'ter, a city of Massachusetts, forty miles southwest of Boston. It ranks next to Boston in population and is a beautiful city, with wide, shaded streets; public parks, and fine buildings. The city annually expends the sum of $557,449 on its public schools, which have a force of 539 teachers and an enrollment of 18,831 pupils. Among the higher educational institutions are Clark university, founded in 1888, for strictly graduate work, Worcester academy, the Free Institute of Industrial Science, the College of the Holy Cross, and Polytechnic institute. The public library; the American Antiquarian society, with a fine library; the state insane asylum, one of the finest buildings in the country; and the soldiers' monument by Rogers, are other noticeable features. The city is extensively engaged in manufactures, such as boots and shoes, machinery and machinists' tools, stoneware, jewelry, carpets, machine needles, awls, wirework, cotton thread, blankets, felt, water meters, horse collars, and nails. Worcester was settled in 1713. Population 118,421.

Worces'ter, Dean Conant, assistant professor of zoology in the University of Michigan, and member of the Philippines Commission of 1899, by appointment of the late President McKinley, was born at Thetford, Vt., Oct. 1, 1866, and graduated from the University of Michigan. In 1887, and again in 1890, he was a member of the Steere and of the Menage scientific expeditions to the Philippines, in both of which he studied the fauna and other interesting scientific features of the islands, as well as the existing conditions of the people. In 1900, he was appointed a member of the United States Philippines Commission, and has written a work on the country, entitled *The Philippines and Their People*. In 1893, he was named instructor, and in 1895 assistant professor of zoology and curator of the zoological museum at the University of Michigan.

Worces'ter, Joseph Emerson, an American lexicographer, was born at Bedford, N. H., Aug. 24, 1784, and died at Cambridge, Mass., Oct. 27, 1865. In 1811, he graduated at Yale, and in his early career wrote several geographical and historical text-books, together with one or two popular dictionaries. His chief work in lexicography, however, was the quarto *Dictionary of the English Language*, which appeared first in 1860, and which met with much success.

Words'worth, William, an English poet, was born in Cumberland, England, April 7, 1770. He studied at Cambridge, and traveled in France, where he sympathized strongly with the revolution, but fortunately was compelled by poverty to return home before his friends, the Girondists, were sent to the guillotine. His first publications, in 1793, were two poems, *An Evening Walk*, and *Descriptive Sketches*, which made little impression upon the public, but won the recognition of Coleridge and the friendship of Calvert, who left him at his death $4,500, that he might carry out his desire to devote himself to poetry. He settled with his lifelong companion, his sister Dorothy, at Alfoxden in Somersetshire, to be near Coleridge. *Lyrical Ballads* was the joint production of the two poets, but brought Wordsworth no nearer to public recognition. Sure of himself, he continued his work, publishing several volumes, which were the laughingstock of the critics; the works of Southey and Coleridge, forming with Wordsworth the "Lake School," as it was called, coming in for their share of ridicule. Wordsworth's home was now at Rydal Mount, in the lake district of England. A claim of the family against Lord Lonsdale was paid, and a county office with a small salary was secured for the poet, so that he was able to marry and give himself wholly to his literary work. Gradually a select circle of admirers, Leigh Hunt, De Quincey, Wilson, and others, made the poet appreciated, and when his *Excursion* appeared, in 1814, his genius was acknowledged. From that time it grew until he ranked as the first poet of his day. He received a pension of $1,500 in 1842, and in 1843 became poet laureate. His *Excursion* and *The White Doe of Rylstone* are the only long poems. His shorter pieces, such as *Intimations of Immortality, The*

Skylark, and *The Daisy*, with his sonnets, are the most popular. Some of his early poems, *The Idiot Boy* and *Alice Fell*, etc., still provoke a smile and justify in some degree the ridicule of the critics. Wordsworth died April 23, 1850. See *Memoirs*, by Wordsworth; *Studies in Wordsworth*, by Hudson.

World's Fairs. See EXPOSITIONS.

Worms, a town in Hesse-Darmstadt, on the Rhine. It is one of the oldest cities in Germany and is the scene of the *Nibelungenlied*. Held by the Romans, destroyed by Attila, rebuilt by Clovis, the residence often of Charlemagne and his successors, it was made a free imperial city by the emperor, Henry V. Many German diets (national assemblies) were held here, the most famous being the one when Luther defended his work as a reformer before Charles V. During the middle ages it was a large city with extensive trade, but was almost destroyed by the French in 1689. Among its ancient buildings still standing is the cathedral founded in the 8th century. Tobacco, leather, and wine are the principal manufactures. Population 26,000.

Worms. See VERMES.

Wren, the name for several sprightly little birds always in motion. About a half-dozen species are found in the eastern United States. The house wren nests about yards in any suitable hole or cavity and shows a liking for a bird box, if it can find one unoccupied. It is a pert, bobbing bird about five inches long, of a brown color above, marked with black and gray, and grayish and rusty below. The winter wren is smaller, being only four inches long, but of similar appearance to the house wren. In summer it nests north of New England, but is a common winter resident in the eastern states. It is a fine singer. The long-billed marsh wren is abundant in reedy swamps, making a big globular nest with a little hole on one side, all suspended from rushes. The Carolina wren is a remarkable singer. It is a larger bird, reaching a length of six inches, its color is reddish brown above and pale buff below. It ranges through the southern states north to Pennsylvania. The European bird is a small lively bird, nesting in gardens and hedges, and is a great favorite.

Wren, Sir **Chris'topher,** an English architect, was born in Wiltshire, England, Oct. 20, 1631. He studied at Oxford, where he invented some mathematical instruments. He also, while residing at Oxford as a fellow, became a member of a society for studying and experimenting in natural philosophy, and Evelyn in his *Diary* speaks of Wren at this time as "that miracle of a youth." He made improvements on the newly invented barometer, and a globe of the moon, which he finished by order of the king at the request of his scientific friends, who also asked the king to command Wren to continue "drawing the shapes of little animals as they appear in the microscope." He was professor of anatomy at Oxford and at London, and with others formed the Royal society. He had already made plans for the restoration of St. Paul's cathedral in London, when it was destroyed by the fire of 1666, but in 1675 the new building was begun under his direction, and in 1710 the last stone was laid by his son. Other buildings planned by Wren are the royal exchange, temple bar, customhouse, and fifty churches in London; the Gateway tower, Christ church, Oxford; Pembroke college, Cambridge; the Royal observatory at Greenwich; Buckingham house; and the towers of the west front of Westminster Abbey. He died Feb. 25, 1723, and was buried at St. Paul's. His tomb has the inscription, "*Si monumentum requiris, circumspice* (If you seek a monument, look around). Steele has introduced him in the *Tatler*, in the character of Nestor.

Wright, Carroll Davidson, American statistician and United States commissioner of labor, was born at Dunbarton, N. H., July 25, 1840, and had an academic education. In the Civil war, he enlisted in the United States army, and rose to be colonel of the 14th New Hampshire volunteers. In 1872, he became a member of the Massachusetts senate and chief of the Massachusetts Bureau of the Statistics of Labor. Since 1885 he has been United States commissioner of labor, and took part in the labors of the 11th United States census, and since 1895 has been lecturer on social economics in the Catholic university of Massachusetts. He has written largely on Statistics and on Labor, among his published works being *The Factory System of the United States*, *The Relation of Political Economy to the Labor Question*, *Convict Labor*, *Strikes and Lockouts*, *Working Women in Large Cities*, *Railroad Labor*, *Industrial Evolution of the United States*, *Outline of Practical Sociology*, *Marriage and Divorce*, and *Annual Reports* (1873–88) *of the Massachusetts Bureau of Statistics.*

Writ'ing, the expression of thoughts by characters so as to make them known to others, is found in many forms. The hieroglyphic or picture writing, in which the idea is expressed by a picture, which afterward became a sign, was common in Egypt, Assyria, and Mexico. The invention of the alphabet, which is the basis of the modern art of writing, is ascribed to the Phœnicians, who are thought to have taken some of the signs used in the hieroglyphic writing of Egypt and made of them the characters which represent the sounds of the voice as we now find them in alphabets. The Latin letters were introduced into England by the Romans, and what is called the Roman-Saxon writing prevailed until the

Saxon became general in the time of Alfred. The Norman writing came in with William the Conqueror, and the Gothic, Old English, and English court hand followed. The direction of the writing varies in different nations; the Mexican picture writing begins at the bottom, the Chinese and Japanese write in columns, beginning at the top and going from right to left, and Hebrew is written from right to left. The materials used were various, including papyrus, parchment, and paper, and the instruments have also varied from the stylus and quill to the modern pen. See CUNEIFORM.

Wur'temberg, a kingdom of the German empire, is in the southern part of Germany, separated from Switzerland by Lake Constance. Its greatest length is 139 miles and its width 105 miles, with an area of 7,528 square miles. The Black Forest is on the western border; the Swabian Alps cross the country for eighty miles, dividing it into the valley of the Danube and the valley of the Neckar, which are the principal rivers. The climate is mild in the Neckar valley, but cold in the mountains. It is an agricultural country, with extensive orchards, gardens, and vineyards, and the grains, hay, and fruits are the main products. There is but little coal, but extensive peat beds, fire clay, iron, salt, gypsum, and tourmaline are found. There are manufactures of linen, woolen, cotton, and silk goods. Beer breweries and brandy distilleries are numerous, and 215,500,000 bottles of beer have been used in a year in the country, or 125 bottles for each person. The government is a hereditary monarchy. In the German empire, Würtemberg has four votes in the federal council and seventeen representatives in the diet, or congress, of the empire. Education is compulsory, and there must be at least one school in every commune. Recent official reports show that there is no person in the kingdom over ten years old who cannot read and write. There are 2,334 elementary schools, with 4,855 teachers and 294,521 pupils, and there are 17,969 students in the higher schools; while the educational system is completed by the University of Tübingen, founded in 1477. The Suevi held the country when the Romans found it, followed by the Alemanni and the Franks. Ulric I., count of Würtemberg, added to the territory from 1246–65. In 1495, the counts became dukes. The country suffered in the Thirty Years' war and was invaded by a French army which took Montbéliard. Würtemberg was made a kingdom at the peace of Presburg, 1805, the first king, Frederick, being succeeded by his son William I., who reigned fifty years, giving his people a liberal constitution in 1819, and many other reforms. Würtemberg joined the German empire in 1871. The capital is Stuttgart (population 176,318). Population 2,165,765.

Wurzburg (*vurts'burg*), a city of Bavaria, is in a beautiful valley on the river Maine. Among the noticeable buildings are the episcopal palace, one of the most magnificent royal houses in the world, the large Julius hospital, the cathedral, rebuilt in the 11th century, and the beautiful Marien Kappelle, with fourteen statues of the 15th century. The university, founded in 1582, has medical and law schools, and musical departments, the medical school being connected with the hospital and having a high reputation. There are also gymnasium, agricultural, and trade schools, and a Catholic seminary. The manufactures are woolen goods, mirrors, leather, tobacco, and wines. Population 68,747.

Wy'andots, a tribe of American Indians of the Iroquois family, found originally around Lake Huron. They were called Tobacco Indians by the French, because of the large quantity of tobacco raised by them. They were nearly exterminated by the Iroquois, the survivors finally settling in Michigan, mainly around Detroit, where they furnished the English with 400 warriors in the War of 1812. They settled later on the Sandusky river in Ohio, but sold their lands to the United States and moved to Kansas.

Wy'andotte Cave, a curious cave found in Indiana, four miles from Leavenworth. It is 22 miles long, and the two largest rooms are 245 feet high. In Mammoth hall is a mountain, 175 feet high, with three statues, one called Lot's Wife. The dome is 70 feet from the top of the mountain. The White Cloud Room, Beauty's Bower, and the Pillared Palace are other points of interest, all beautifully decorated with crystals, thought by many to exceed in beauty those of Mammoth cave.

Wy'att, Richard John, an English sculptor, was born at London, May 3, 1795. He studied at London and Paris, and at Rome in the studio of Canova. His favorite subjects were classical. *Penelope, Ino and Bacchus,* and *Eucharis and Cupid* are some of his best-known works, whose delicacy and finish placed him in the front rank of English sculptors, and gained him the highest medal for sculpture at the great exhibition in 1851, though he had died at Rome, where he resided, May 29, 1850.

Wy'att, Sir **Thomas,** an English poet, was born in Kent, England, in 1503. He studied at Cambridge, held a court position under Henry VIII. and at Anne Boleyn's wedding. He was English ambassador at the court of Charles V., and on his return lived at Allington in retirement. His poems were published with those of Surrey in 1557. He shares with Surrey the honor of introducing the sonnet into England, and his love poems are among the sweetest of the time. He died Oct. 11, 1542.

Wycliffe (*wik'lif*), **John,** an English reformer, was born near Richmond, in Yorkshire, England, about 1324. He studied at

Oxford, was master of Baliol hall, since Baliol college, and finally rector of Lutterworth, in Leicestershire. His first opposition to the Romish church was shown in contending for the king against the papal claim to certain tribute money. In 1374, on a visit to Bruges, where he was sent to confer with the papal legate, he seems to have been confirmed by what he saw in his opposition to the pope. His opinions soon brought him into trouble, as he was summoned in 1378 before a religious body, but a London mob burst into the chapel and stopped the proceedings. The pope issued "bulls" (papal decrees) against him, and he was again summoned to Lambeth, but escaped with an injunction to be careful what he preached. He began translating the Bible, sending copies of parts of it from village to village. He had a large following, the Lollards, as his disciples were called, being found in all ranks of the people. He was again summoned before the church tribunal, his works condemned to be burned, and he himself banished from Oxford to his parish at Lutterworth. He died Dec. 31, 1384. His bones were taken up by order of Clement VIII. in 1428, and burned, and the ashes scattered into the Swift, a branch of the Avon. Besides his Bible, which was the first English version, he wrote a large number of tracts, over 200 being burned in Bohemia. See *Life*, by Vaughn.

Wyoming (*wi-o'ming*), one of the western states of the Union, lies between Montana and Colorado. It is 350 miles long and 275 miles broad, covering 97,575 square miles, and as large as New England with Indiana. The Rocky mountains cross the state from southeast to northwest, the snowy peaks rising above the evergreen forests, with rocky cañons for the rivers, and broad, bare plains. Fremont's peak, 13,570 feet high, and Laramie peak, about 11,000 feet high, are among the highest summits. The Laramie mountains, Wind River mountains, Big Horn mountains, Black hills, Rattlesnake hills, and Medicine Bow mountains, are some of the different ranges. The average elevation of Wyoming is about 6,000 feet, and 3,300 square miles are more than 10,000 feet above the sea. The Laramie plains, covering 2,000,000 acres, are 7,000 feet above the sea. The Yellowstone, Madison, and Gallatin rivers flow into the Missouri, and the Snake river to the Pacific. The forests cover about 10,000,000 acres, furnishing yellow and white pine, white spruce, and red cedar. Only one-sixth of the state can be cultivated, and irrigation has had to be introduced, about 5,000 miles of canals having been built at a cost of $10,000,000. The mineral resources of the state are largely undeveloped. Gold and silver have been discovered in almost every county, and the coal region covers 30,000 square miles, some of it producing a very fine coking coal. Iron mountain is a mass of red ore, seven miles long; and on the Laramie plains are several soda lakes, with deposits from 10 to 40 feet thick, and salt springs, soda springs, and sulphur springs. The climate is cool in summer, and cold and dry in winter. Grazing and mining are the leading industries. The Yellowstone National park, covering 3,575 square miles, occupies nearly all of the northeastern part of the state, and has more remarkable natural curiosities than any other equal area in the world. (See YELLOWSTONE PARK.) The elementary schools have 523 teachers and 12,773 pupils; the high schools have 13 teachers and 269 pupils; while higher education is afforded by the University of Wyoming, founded in 1887, with a large land grant from the general government, a force of 14 teachers, and an attendance of 59 students. Cheyenne is the capital. The territory of Wyoming was formed from Idaho, Dakota, and Utah in 1868. Fort Laramie, built in 1834, was bought by the United States in 1849. Fort Bridger, built by a famous trapper, James Bridger, became Mormon property in 1853. The overland route to California passed through Wyoming, and the first emigrant trains crossed it in 1834. The first settlers were Mormons, in the Green river valley, in 1853. The Indians contested the settling of the state in continual warfare, until General Crook reduced them to submission in 1876–77. The Sioux have been removed to Dakota, the Utes to Colorado, the Crows to Montana, and the Shoshones and Arapahoes to a reservation on Wind river in the state. Wyoming was admitted to the Union in 1890, and was the first state to give the ballot to women. Population 92,531.

Wyo'ming Valley is a beautiful valley on the Susquehanna river, in Pennsylvania, inclosed by mountains. During the Revolutionary war, a company of 400 British troops, with 700 Indian allies, entered the valley, where was a town of 2,000 inhabitants. Many of the defenders of the place were absent in the Continental army, and only 300 men could be gathered to meet the attack. After a desperate struggle, July 3, 1778, they were driven back to the fort, which surrendered on July 5, when the Indians massacred indiscriminately all who could not escape by flight. Campbell has preserved the story in his poem *Gertrude of Wyoming*. It is now thought that the Mohawk chief, Brant, according to Campbell one of the chief actors, was not present at the attack. In 1843, a monument was erected on the battlefield. See *Wyoming*, by Peck.

X

Xanthippe (*zan-tip'pe*), the wife of Socrates, has the reputation of being an arch termagant, doubtless with some reason. Still it should be remembered that her naturally infirm temper must have been severely tried by the small concern manifested by Socrates in relation to his domestic affairs. Socrates had completely mastered his naturally strong appetites and passions and had acquired a temper of perfect serenity. It is but natural then that historians, on ever so small a basis of fact, should delight to match such a philosopher with a woman of such a temper as Xanthippe is said to have possessed. On the other hand, if we can trust Plato, she seems to have really loved her husband, and at his death he tenderly committed her to the care of his friends. Many stories are told of her to illustrate her peculiar infirmity, but it is impossible to tell how much credit should be given to them. The era of Socrates was 470–399 B. C.

Xavier (*zav'i-er*), **Saint Francis,** "the apostle of the Indies," one of the first members of the Society of Jesus, was born at Navarre, Spain, April 7, 1506. He was educated at Paris, graduating in 1530. Soon afterward he joined the society formed by Ignatius Loyola, and on Aug. 15, 1534, took vows with five others, devoting themselves to missionary work in Palestine. Being prevented from carrying out this plan by war, they formed the order of Jesuits, and when Loyola was requested to send missionaries to the Portuguese settlements in the Indies, Xavier was selected, and with one associate set out from Lisbon in 1541. He went first to Goa, to the island of Ceylon, then to Malacca, and across to Japan. He intended next to go to China, but died when only in sight of that empire, Dec. 5, 1552. He was buried at Goa. It is said that during his ten years' apostleship, he planted the faith in 52 different kingdoms, preached the gospel through 9,000 miles of territory, and baptized more than 1,000,000 persons. He was canonized by Pope Gregory XV. in 1622.

Xenia (*zē'ni-a*), county seat of Greene county, O., is a flourishing city, midway between Cincinnati and Columbus, on the Pittsburg, Cincinnati, Chicago, and St. Louis railway. Besides its various manufactories and other enterprises it is the seat of the Theological seminary of the United Presbyterian church and the Ohio Soldiers' and Sailors' Orphans' home. Wilberforce university, an institution for the education of colored youth of both sexes, is located three miles from the city. Population 8,545.

Xe'non. See ARGON.

Xenophon (*zĕn'o-fon*), a Grecian general, historian, and philosopher, was born at Athens 430 B.C. At an early age he became a pupil of Socrates, and is said to have been saved from death by that philosopher at the battle of Delium. At the age of forty he joined the expedition of the younger Cyrus against Artaxerxes Mnemon, king of Persia, and after the battle of Cunaxa and the treacherous murder of the Greek generals, played an important part in the Retreat of the Ten Thousand. Soon after his return to Greece he settled in a small town in Elis, where he lived for over twenty years, occupying himself in agriculture and literary pursuits. He is supposed to have died at Corinth, 355 B. C. Xenophon's principal works are the *Anabasis*, which is a history of the expedition of Cyrus and the Retreat of the Ten Thousand; the *Cyropedia*, or education of Cyrus, and the *Memorabilia*, a series of dialogues intended to refute the charges on which Socrates was condemned to death.

Xerophytes (*zē'ro-fits*), plants adapted to dry soil and air. The drought conditions may be occasional, periodic, or permanent, and plants have various ways of meeting them. The plan is to avoid as much exposure as possible and to store what water can be obtained. Prominent among drought adaptations are underground habits ("geophilous plants"), rolling or folding of leaves, profile position of leaves ("compass plants"), motile leaves which can shift their position ("sensitive plants"), small leaves, etc. Probably the most conspicuous feature of plants in permanently dry regions is the organization of reservoirs which retain water and dole it out, according to the need. Such plants, therefore, are usually fleshy or succulent. The xerophytic societies are numerous, and among them may be mentioned "rock societies," composed of plants living upon exposed rocks, walls, etc.; "sand societies," including beaches, dunes, and sandy fields; "shrubby heaths," in which species of the heath family abound; "plains," the great dry areas in the interior of continents; "cactus deserts" of the southwestern states and Mexico; and "tropical deserts," where the drought conditions are extreme and the vegetation scanty.

Xerxes (*zerk'sēs*) **I.**, king of Persia, was the eldest son of Darius by his second wife Atossa, and was appointed successor by his father in preference to Artabozanes, his eldest son by his first wife. Darius died 485 B. C. in the midst of his preparations for a third expedition against Greece; and as soon as Xerxes had subdued the rebellious Egyptians, he gave his whole attention to the completion of his father's plans for the subjugation of the

Grecian states. A bridge of boats a mile in length was built across the Hellespont; and a canal was cut through Mt. Athos, near which the fleet of Mardonius had been wrecked in 492 B. C. In the spring of the year 480 B. C., the vast army, said to number 2,000,000, began to march toward the Hellespont; according to Herodotus it took this force seven days and nights to march across the bridge. Grote, who discredits the immense numbers given by Herodotus, nevertheless says: "We may well believe that the numbers of Xerxes were greater than were ever assembled in ancient times, or perhaps at any known epoch of history." This immense force moved on without resistance till it was brought to a stand by Leonidas at Thermopylæ; and although the Greeks were all defeated and slain, it was not without severe fighting and heavy loss on the part of the Persians. When Xerxes arrived at Athens, three months after crossing the Hellespont, he found the city deserted. Meantime, the two fleets had taken their positions in the narrow strait between Salamis and the Attic coast, where the great naval battle of Salamis took place, in which the Persians were signally defeated, Xerxes himself fleeing in haste to the Hellespont. The bridge of boats having been destroyed in a storm, he crossed over in a vessel, leaving Mardonius with 300,000 men to carry on operations in Greece. The next year that general was defeated by the Greeks in the famous battle of Platæa; and in 478 B. C. the Persians lost their last possession in Europe by the capture of Sestos in the Hellespont. Little more is known of the history of Xerxes, except that he was murdered by Artabanus, who aspired to the throne, and was succeeded by his son Artaxerxes 465 B. C.

Ximenes (*zĭ-mē'nēs*), **Francisco, De Cisneros,** by which latter name he is commonly called in Spain, a well-known statesman, archbishop, and cardinal, was born at Torrelaguna, in Castile, in the year 1436. His great reputation for piety and learning led Queen Isabella to choose him in 1492 for her confessor, and three years after to appoint him archbishop of Toledo—a dignity which he refused to accept until he had received an express command from the pope. In the year 1507, he was still further promoted to the dignity of cardinal. During the lifetime of Isabella he was the guiding spirit in Spanish affairs; and on her death, in 1504, he held the balance between the parties of Ferdinand and Philip of Burgundy, husband of Joanna, heiress of the crown. When Ferdinand died, in 1516, he named Ximenes regent of Spain until the arrival of his grandson Charles; and although the grandees formed a powerful combination against him, he was able to subdue them by his prompt and efficient measures and compelled them to submit to his authority. He died at Roa, on the Douro, Nov. 8, 1517.

Ximenes de Quesada (*zĭ-mē'nēz da ka-sä'dä*), **Gonzalo,** a Spanish explorer, was born in Granada, in 1498, and came to America in 1535, when, under the orders of the governor Santa Marta, he took command of an expedition against the Chibcha Indians in New Granada. After enduring great privations and overcoming all obstacles in his way, he conquered the cities of Tuna and Iraca, where he secured a vast quantity of treasure, which he divided among his soldiers. In the year 1538, Ximenes founded the city of Bogota, and soon after sailed for Europe with Frederman from Venezuela and Benalcazar from Quito, in order to refer all matters in dispute between them to the king. Ximenes was at first fined and suspended from his offices by the king, but was afterward sent to New Granada with the title of marshal, and in 1561 was appointed governor-in-chief of New Granada, which position he continued to hold until his death, which took place at Mariqueta, Feb. 16, 1597.

X-Ray. See ROENTGEN RAYS.

Xylem (*zī'lĕm*), (in plants), that portion of a vascular bundle which contains the tracheary tissue and commonly called the wood. The xylem is chiefly concerned in the "ascent of sap," and in trees forms all of the trunk except the bark. See VASCULAR BUNDLE.

Y

Yacht (*yŏt*), a small vessel constructed so as to secure elegance and speed, and exclusively employed for racing and pleasure sailing. The first authentic record of a sailing club is in 1720, when the Cork Harbor Water club, now known as the Royal Cork Yacht club, was established in Ireland, but the boats were small. From this time to the end of the 18th century yachting developed very slowly, so that it may be said that yacht racing as a pastime scarcely had a beginning at the opening of the 19th century. During that century, however, the progress was such that there are numerous yacht clubs both in Europe and the United States, and improvements almost without number have been devised for increasing the speed and efficiency of vessels constructed for yachting purposes. As to the number of yachts now afloat, cruisers as well as racers, the British yacht fleet, which in 1850 consisted of 500 sailing vessels and three steamers, now numbers over 3,000 yachts. Next to Great Britain, the United States possesses the largest number afloat, amounting to about 1,200, and if to the foregoing are added the yachts of other countries, a grand total of 5,000 or 6,000 is reached. While the construction of sailing vessels has wonderfully progressed since 1850, the building of steam yachts has gone on still more rapidly. The building of yachts has changed greatly from the simple, unpretending brig, with small tonnage, clumsy build, and baggy sails of the early yachts of the Royal Cork club, to the immense flat sails, larger size, long, narrow shape of the yacht of the present time. The effect of these changes was a great increase of speed. Racing yachts are schooners, cutters, or yawls. The schooners are nearly always fore-and-aft rigged, *i. e.*, not carrying square topsail yards on the foremast. The cutter differs from the American sloop in carrying a sail, termed the foresail, on a stay from the masthead to the stem, the jib and flying jib being set on a long running bowsprit. The cutter, in fact, substitutes two head sails for one used in the sloop. The yawl differs from the cutter in carrying a slightly reduced mast and boom, the latter leaving room for a small aftermast, stepped close astern, whereon is set a lugsail sheeted home to the end of a running boom. In racing, the competitors use a large racing sail, called a spanker, set on a long beam projecting from the foot of the mast at right angles to the vessel. The sail, which is flat and triangular, extends from the topmast head to the deck, on the opposite side to that occupied by the main boom, though occasionally shifted to the bowsprit end. In 1851, the schooner *America* crossed the Atlantic and won the queen's cup from the *Aurora*. In the half century following, England has made eleven vain efforts to win back the cup, the most exciting and hardest fought race being the contest between the English *Genesta* and the American *Puritan*, in 1885. Great interest was roused by the last race between the Irish challenger *Shamrock II.* and the American defender *Columbia*, winner in 1901 of the cup which America has now won and held in twelve successive races.

Yak, an ox-like animal found in Tibet and central Asia. It is related to both the bison and the true oxen. In a wild state it is found on the high plateaus of Tibet, between the Altai and Himalaya mountains. It can at once be distinguished by the long hair, which hangs from each side like a curtain, and in some cases touching the ground. The hair is longer in the domesticated forms than in the wild ones. The tail is also very hairy, and the white tips are cut off by the Chinese, who dye them red and use them as tassels. There is a hump over the fore legs, and this is exaggerated by the hairy mane. The yak has been domesticated for centuries in Tibet, and is extensively used as a beast of burden. It feeds on grass, and one peculiarity of its feeding is that it refuses to eat corn. These animals are about the height of a small ox. The cows yield milk, and the skins of both cows and bulls are used for clothing.

Yakutsk (*yä-kötsk'*), the chief town of the government of that name in eastern Siberia. It is situated on the left bank of the Lena river, 5,000 miles from St. Petersburg. The whole industry of the town consists of candle works; but it is nevertheless the principal market of eastern Siberia for traffic with the native tribes of Jakuts and Buriats. Population 5,800.

Yale, Eli'hu, after whom Yale college (now Yale university) was named, was born at New Haven, Conn., April 5, 1648. At the age of ten years his parents returned to England, and he never returned to America. In the year 1678, he went to the East Indies, where he remained several years and accumulated a large fortune. On his return to England he became governor of the East India company and a fellow of the Royal society. His gifts to the new institution in books and money amounted to about $4,000, in consequence of which it was named Yale college. He died at London, July 8, 1721.

Yale University, located at New Haven, Conn., is one of the oldest and most famous of educational institutions in the United States. It was founded in 1701 as the Collegiate School of Connecticut, and was located at Saybrook until 1716, when it was removed to New Haven. In 1718, the name of the school was changed to Yale college, in recognition of

large gifts from Elihu Yale of London. This name was changed by statute to Yale university in 1887. Besides the academical department, still designated as Yale college, it has Sheffield scientific school, a graduate school, divinity school, medical school, law school, school of art, and school of music. In all its departments it is thoroughly equipped and amply endowed. Its libraries contain more than 300,000 volumes. The faculty numbers 275, with an attendance of 2,542 students in 1901.

Yam, the tuberous root of a species of *Dioscorea*, a genus of climbing vines chiefly displayed in the tropics, where they are extensively cultivated for food. The name has been also wrongly applied to certain forms of the sweet potato.

Yan'cey, William Lowndes, a highly distinguished southern orator, was born at Ogeechee Shoals, Ga., Aug. 10, 1815. After receiving a collegiate education he was admitted to the bar in Abbeville, S. C., but in 1836 moved to Alabama, where he successively edited the Cahawba *Democrat* and the Wetumka *Argus*. He was a member of congress in 1844–47, and in all the events leading to the secession of the southern states was one of the most prominent and perhaps the most eloquent leader of the pro-slavery party — the extent of his influence in "firing the southern heart" and inducing the effort to secede being hard to overestimate. When the war broke out, he was sent to Europe as the agent of the Confederate government, but failed to secure its recognition by any of the European powers. On his return home, he became a member of the Confederate congress, and died near Montgomery, Ala., July 28, 1863.

Yang-tse-Kiang (*yăng'tse-kĭ-ăng'*), the principal river of Asia, the "girdle of China," connecting all the central provinces of that empire situated between Tibet and Koko-Nor on the west and the Pacific ocean on the east. Its entire length through all its numerous windings under various names cannot be less than 3,000 miles. To name the cities on the banks and tributaries of this rival of the Mississippi would be to enumerate a large portion of the cities of the empire. It is navigable by the largest vessels to 900 miles from its mouth and by smaller ones for a much greater distance.

Yan'kee, the popular name for a New Englander in America, and in Europe often applied indiscriminately to the entire population of the United States, was, in its origin, a corruption of the word *English* as pronounced by the Indians — *Yenghies*, *Yanghies*, *Yankees*. It seems to have been first applied by the British soldiers to the New Englanders as a term of reproach during the Revolutionary war. During the Civil war, it was applied by the southern people to all the inhabitants of the northern states.

Yan'kee Doo'dle. This popular air was originally *Nankee Doodle*, and is as old as the time of Cromwell. It was known in New England before the Revolution, and is said to have been played by the English troops in derisive allusion to the then popular name of the New Englanders; and afterward the New Englanders adopted the air.

Yank'ton, a city of South Dakota, stands on the north bank of the Missouri river, about 1,000 miles above its junction with the Mississippi. Three lines of railway pass through the city, which is also connected by steamer with various points on the river. Population 4,125.

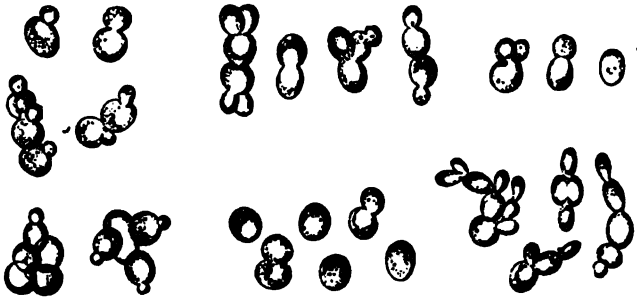
Yard, The Impe'rial, is the British standard of length, being the distance between two parallel lines on gold studs (or plugs) driven into a bar of bronze, deposited at the Standard's Office in London and used at a temperature of 62° F.

Yates, Edmund Hodgson, English novelist and dramatic critic, was born at London in the year 1831, and after serving for a number of years in one of the departments of the London post office, retired in 1872. He successively edited *Our Miscellany*, *Temple Bar*, and the *World* newspaper, besides writing several novels and dramas. He died at London, May 20, 1894.

Yates, Richard, was born at Warsaw, Ky., Jan. 18, 1818, and after being graduated at Illinois college, studied law and was admitted to the bar. He served a number of terms in the Illinois legislature, and during the Civil war was governor of that state, in which position he won a very enviable reputation for zeal and patriotism as well as for the vigor and efficiency he manifested in organizing and equipping the troops of his state. So great was his popularity with the people of Illinois, among whom he was familiarly known as "Dick" Yates, that as soon as his term as governor expired, he was chosen to a seat in the United States senate, which he filled till March 4, 1871. He died at St. Louis, Nov. 27, 1873.

Ya'zoo, a river of Mississippi formed by the union of the Tallahatchie and the Yallobusha, runs southwestward in a very serpentine course in a deep, narrow, sluggish channel — its length being about 300 miles — and empties into the Mississippi, ten or twelve miles above Vicksburg. In the winter of 1863–64, General William T. Sherman sailed up the Yazoo with a considerable military force, for the purpose of capturing the fortified position of "Haines' Bluff" from the Confederates, preparatory to an attack on Vicksburg, but the expedition was unsuccessful.

Yeast, the common name of species of *Saccharomyces*, a genus of low plants (fungi) probably belonging to the Ascomycetes (which see). The yeast plant is a single very simple cell, which produces new cells by a peculiar budding process. Usually the cells thus produced cling together in short chains. The most generally known of the twenty-five described species is *S. cerevisiæ*, the yeast used by brewers and bakers. The use of yeast is due to its great activity in the process of fermentation. When placed in sugar-containing solutions and exposed to a proper temperature, the cells multiply with great rapidity, and in their living cause the sugary solution to "sour." In this "souring" process the gas — carbon dioxide — is given off, and if it is held by some tenacious substance, as dough, it will puff it up, that is, make it "light." The process of adding yeast to dough is simply sowing yeast plants that they may grow.



YEAST, SHOWING THE REPRODUCTION BY BUDDING.

Yed'do. See TOKIO.

Yel'low Bird, the name in general use for two different birds of the United States. One of them is the goldfinch, which is one of our most attractive birds. It is about five inches long, and in the summer has a yellow body, with black on the crown, and black and white on the wings and tail. It is also a winter resident, but the winter dress is different, being grayish brown, with a yellowish crown and soiled white below, and a yellowish throat. The name is also given to the yellow warbler, which is also locally called the "wild canary." See GOLDFINCH, and WARBLER.

Yel'low Sea, an important inlet of the Pacific ocean, washes the northeast coast of China, and is bounded on the west by the Chinese provinces of Shangtung and Keang-su, and on the east by the peninsula of the Korea and Japan. It is more than 600 miles in length, and about 400 in average breadth. Its waters are shallow and are gradually becoming more so, owing to the deposits of earth borne down into it by the Hoang-ho and the Yang-tse-Kiang rivers.

Yel'low Springs, a village of Greene county, O., seventy-five miles from Cincinnati, on the Springfield branch of the Panhandle railroad. It is situated in the midst of a fine agricultural region and is chiefly noted as being the seat of Antioch college, a Unitarian institution, of which the distinguished Horace Mann was the first president. Population 1,377.

Yel'lowstone, a river of the United States, rises in a beautiful lake of the same name high up in the Rocky mountains, and, receiving numerous branches from the south, flows northeasterly through the territory of Montana and empties into the Missouri river, in the state of North Dakota, in 48° north latitude and 104° west longitude. It is 800 yards wide at its mouth, is 1,000 miles long, and is navigable for 700 or 800 miles. The Grand Cañon of the Yellowstone is 3,000 feet deep, and to one looking up from the bottom stars are visible in broad daylight. The grandeur of the cañon is at once heightened and diversified by the upper and lower falls, the latter being one unbroken symmetrical expanse, 350 feet in height. The beautiful lake from which the river issues is about 300 square miles in area, and is situated between 7,000 and 8,000 feet above the level of the sea.

Yel'lowstone National Park, a tract of country sixty-two miles in length and fifty-one miles in breadth, situated mainly in the northwestern part of the state of Wyoming, which has been withdrawn from settlement by action of the United States government and set apart as a public park. The area of the national reservation is 3,412 square miles, exclusive of the area on the south and east of the park proper, set aside by congress as a forest reserve. Yellowstone park was created by an act approved in March, 1872, and is under the supervision of the secretary of the interior. Leases were in 1889 granted by the national government to the Yellowstone Park association, to erect at certain suitable points hotel accommodation for visitors to the park, and to maintain a naphtha launch on Yellowstone lake, conformable to certain restrictions. Government has also provided that care shall be taken of the remnant of our North American fauna and of the ruminants of the western plains and mountains, together with such fish as may live in the waterways of the park outside of the geyser region. The park abounds in scenery of unparalleled grandeur. It is a region of hot springs and geysers, mountains and cañons, lakes and waterfalls. Its surface is mainly an undulating plateau, with a mean elevation of 8,000 feet above the level of the sea, upon the surface of which flow the minor streams, while the larger ones have cut cañons for

themselves, several of them of great depth. The eastern portion, however, is occupied by a mountain chain, known as the Absaroka range, peaks of which rise to heights exceeding 11,000 feet. These mountains, which separate the waters of the Yellowstone from those of the Big Horn, are unsurpassed by any in the United States for grandeur and sublimity of scenery. Another group of mountains, in the shape of a horseshoe, known as the Washburne mountains, occurs in the middle of the park, the highest peak of which has an elevation of 10,000 feet. The Red mountains are in the southern part, their culminating peak, Mt. Sheridan, being likewise about 10,000 feet in height.

The park has an abundant rainfall and its streams are numerous and bold. Within its area are the sources of the Yellowstone and the Madison, which go to make up the Missouri, and of the Snake, one of the forks of the Colorado. It also contains many beautiful lakes and ponds. A convenient way of reaching the park from the east is by the Burlington route from Chicago, via St. Paul (Minn.), and Bismarck (N. Dak.), to Livingston (Mont.), thence southwest to Cinnabar, and from there by stage through the park. From St. Louis, Kansas City, and from Burlington (Ia.), the Burlington route, via Omaha, is also available, the entrance being also by way of Livingston (Mont.) and Cinnabar, on the northwestern boundary of Wyoming. From Cinnabar a daily stage sets out for the Mammoth Hot springs, by way of Gardiner, a distance of six miles, where good accommodation for sight-seers is to be had, as well as at convenient points in the five days' staging throughout the park, under a franchise from the United States government. From Mammoth Hot springs the stage route embraces the Norris geyser basin, the Lower geyser, the Upper geyser, and the Lake geyser, at the west arm of Yellowstone lake (over which a steamboat now plies), thence on the return route by way of the Grand Cañon and the Falls of the Yellowstone. The roads throughout are good, being maintained by the government.

Yenisei (*yĕn'e-sā'ē*), one of the largest rivers of Siberia, formed by the junction of the Onlon-Keme and the Bey-Keme, which rise in the mountains on the southern border of the country. It flows northward through the center of Siberia into the Arctic ocean, forming at its mouth a long estuary. In the earlier part of its course it is interrupted by falls and rapids, but afterward flows through a great plain or steppe, receiving many tributaries, its total length being over 3,000 miles.

Yes'so, the most northerly of the four principal islands which compose the empire of Japan. This island is mountainous with volcanoes; it is rich in fine timber and valuable minerals, especially coal, and the rivers and coasts abound in fish. Area of Yesso, or Yezo, 36,299 square miles. Population 460,155.

Yew, the common name of species of *Taxus*, a genus of Conifers, distributed throughout north temperate regions. The most noticeable peculiarity of the genus is the development of a fleshy (usually scarlet) cup ("aril") about the naked seed, making the fruit look like an open berry. The common yew of Europe (*T. baccata*) is very often cultivated, especially in cemeteries. The American *T. Canadensis* is a more or less prostrate form, which is especially abundant northward.

Yokohama (*yō-kō-hä'mä*), a town of Japan on the island of Niphon. In 1854, it was only a small fishing village, but after it supplanted Kanagawa as the treaty port of Yeddo in 1859, it rapidly increased. Since the recent changes in the policy of the Japanese government, great improvements have been made; and broad and cleanly streets have taken the place of the former narrow and dirty thoroughfares. Population 193,762.

Yonge, Charlotte Mary, English novelist, was born in Hampshire, England, in the year 1832. The novel by which she is best known, although she has published several others, is *The Heir of Redclyffe*. She is said to have devoted large sums accumulated from the sale of her writings to the aid of religious missions in New Zealand.

Yon'kers, a city of Westchester county, N. Y., on the Hudson river, immediately north of New York city. It was incorporated as a village in the year 1855; and in 1872 the town was divided, the northern portion becoming the city of Yonkers and the southern portion becoming a part of the city of New York. The city annually expends the sum of $190,202 on its public schools, which have a force of 160 teachers and an attendance of 7,036 pupils. Population 47,931.

York, a city of Pennsylvania, on Codorus creek, 100 miles west of Philadelphia, and 60 miles from Baltimore. The Northern Central railroad passes through the city, and it is also the western terminus of the Peachbottom railroad. Among its manufactories are car shops, a shoe factory, the Codorus paper mills, etc. In addition to public schools, it contains an academy for boys and a coeducational institute. The Continental congress sat here during the British occupancy of Philadelphia in the Revolutionary war. Population 33,708.

York, a city of England, situated at the junction of the Ouse and Foss rivers, nearly equidistant from London and Edinburgh. York is the most ancient of British cities. Before the Roman invasion it was one of the chief towns of the Brigantes, the most numerous and powerful of the British tribes; and during the Roman dominion it was a city of the first importance. Here Hadrian lived and Severus died. Here, too, died Constantine

Chlorus, and, as many suppose, here Constantine the Great was born. When the Roman emperors visited Britain, York was their chosen residence, as it was the residence of the imperial legates when the emperors were absent. The first English parliament was held at York in 1160 by Henry II., and in the immediate neighborhood of the city, Fairfax conquered Prince Rupert on Marston Moor during the civil war. The city and castle, already besieged, surrendered to the parliamentary forces a few weeks after. The educational institutions of York are both numerous and useful. Notable among them are St. Peter's school, founded in 1557; Archbishop Holgate's free school, dating from Henry VIII.; the Blue Coat school for boys and the Gray Coat school for girls, and the Yorkshire school for the blind, conducted in a palace originally built for the lord president of the council of the north. Population 76,004.

York, H. R. H., **George,** Duke of, second son of King Edward VII. of England, and heir-apparent to the British throne, was born at Marlborough house, London, on June 3, 1865. With his elder brother, the late duke of Clarence, he entered the navy as a cadet in June, 1877, and spent a number of years in the service, his latest command being on H. M. S. *Crescent*. His royal highness has been in most parts of the world and done duty in various stations of the British fleet. In 1892, he became heir to the throne and in 1901 was created Prince of Wales. In 1893, he married Princess Victoria Mary, of Teck. By her, he has four children, the eldest, Prince Edward, was born in 1894. In 1901, accompanied by the duchess of York, the duke of York paid a state visit to Australia, New Zealand, and Canada; the visit to Australia being designed to commemorate the opening of the first parliament of the new Australian Federation or Commonwealth.

DUKE OF CORNWALL AND YORK.

York, a river of Virginia formed by the Pamunkey and Mattapony, flowing southeast to the Chesapeake bay, nearly opposite Cape Charles. It is forty miles long and from one to three miles wide.

York, House of, was founded by Richard, duke of York, who claimed the throne of England in opposition to Henry VI., but never succeeded to it himself. After seeking for many years to correct the weaknesses of Henry's government, Richard first took up arms against the ill advisers who were his personal enemies, and at length claimed the crown in parliament as his right. A compromise was proposed that Henry should retain his crown during his life, and the duke and his heirs should succeed after Henry's death. This was accepted by both Henry and Richard, but the act passed to that effect was repudiated by Queen Margaret and her followers, and the duke was slain at the battle of Wakefield soon after. In little more than two months, however, Richard's son was proclaimed king in London as Edward IV. and the bloody victory of Towton soon after drove his enemies into exile, and prepared the way for his coronation. Edward reigned from 1461 to 1483, when his eldest son, Edward V., after a nominal reign of two months and a half, was put aside and murdered by his uncle, Richard III. Richard then became king; but in a little more than two years was defeated and slain at Bosworth (Aug. 22, 1485) by Henry Tudor, earl of Richmond, who was crowned as Henry VII. and whose marriage with the daughter of Edward IV. (1486) united the houses of York and Lancaster.

York'town, a city of Virginia, on the York river, ten miles from its mouth and about sixty miles from Richmond. Yorktown is noted for the surrender of Lord Cornwallis and his army to Washington, in the year 1781, which was the virtual close of the Revolutionary war, and for the unsuccessful siege of the place made by General McClellan in the spring of the year 1862.

Yosemite (*yō-sem'i-te*), a valley in Mariposa county, Cal., on the western side of the Sierra Nevada, about 150 miles from San Francisco, unequaled for the grandeur and magnificence of its scenery. It is seven or eight miles long and about a mile wide, and is about a mile below the level of the surrounding region. Of its various waterfalls the Bridal Veil is particularly noted for its beauty, and also for its height, which is nearly 1,000 feet. This valley, which was first entered by white men in 1855, is now attracting visitors every year from all parts of the world. Perhaps nowhere else on the face of the earth is there such a remarkable combination of beauty and sublimity.

Youmans (*yō'mans*), **Edward L.,** a distinguished American scientist, was born at Coeymans, N. Y., June 3, 1821, and although suffering for some years from almost total blindness, he pursued his studies in physics and chemistry with marked zeal and proficiency, his sister conducting experiments for him. Among the works for which he is distinguished are *Class Book of Chemistry*, *Correlation and Conservation of Forces*, *Alcohol and the Constitution of Man*, *Handbook of Household Science*, *The Culture Demanded by Modern Life*, etc. In 1872, he established *The Popular Science Monthly*, a magazine which has attained a very wide circulation in

both America and Europe. He died at New York, Jan. 18, 1887.

Young, Brigham, the noted head of the Mormon church, was born at Whittingham, Vt., June 1, 1801. In 1832, having become a convert to Mormonism, he was made an elder of the church, and began to preach at the Mormon settlement at Kirkland, O. Three years later, he was sent as a missionary to the New England states, where he succeeded in making quite a number of converts. After the death of Joseph Smith, at Nauvoo, Ill., in 1844, Young was chosen president in his place. In 1848, he led his followers to Utah and founded Salt Lake City, where for several years he reigned supreme and bade defiance to the United States government in its efforts to abolish polygamy. He died Aug. 29, 1877, leaving a fortune of $2,000,000 to be divided among seventeen wives and fifty-six children.

Young, Charles Augustus, a distinguished American astronomer, was born at Hanover, N. H., Dec. 15, 1834. He was educated at Dartmouth college, where he graduated in 1853. After teaching classics for three years at Phillips Andover academy, he went to the Western Reserve college in Ohio, where he taught astronomy, natural philosophy, and mathematics. For three months during the Civil war he served in the 85th Ohio volunteers. At the close of the war, he was appointed to the chair of physics and astronomy at Dartmouth, a position which his father had held some years earlier. During the following twelve years, Professor Young made a brilliant series of discoveries in solar physics, among which may be mentioned the "reversing layer" of the solar atmosphere, observed at the Spanish eclipse of 1870, the rotation period of the sun measured on Döppler's principle, the bright line spectrum of the chromosphere (1872), the motion and forms of solar prominences. In 1877, he was called to the chair of astronomy at Princeton university, which (1901) he still fills. He is now the highest living authority on the Sun. It is needless to say that he has received many honors, such as election to the National Academy of Sciences, degrees, and honorary memberships. His published works include *The Sun* (in the "International Scientific" series), *A General Astronomy*, *Lessons in Astronomy*, etc.

Young, Edward, English poet, was born in the year 1681, at Upham, in Hampshire, where his father was then the rector. He was educated at Winchester school and afterward at Oxford. He published several poems and tragedies, but the work by which alone he is remembered is *Night Thoughts*, which has passed through a great many editions, and is more or less familiar to the general reader in both England and America. A number of his sententious lines have passed into common use and become in a manner proverbial. He died April 12, 1765.

Young Men's Chris'tian Asso'ciation. This is an organization having a branch in most of the leading cities (and in some smaller towns) in the United States, Great Britain, and other countries, whose special object is to promote the welfare of young men. The condition of active membership in this organization is membership in some evangelical church; but young men not members of churches are admitted as associate members, and are entitled to all the privileges of the association, except a voice in the election of its officers. In addition to various religious services, the association generally provides a library and reading-room (open to the public), a gymnasium, bathroom, lectures, special instruction, proper amusements, etc.; and its power for good has been demonstrated so clearly as to command universal recognition. The first association organized in the United States was at Boston in the winter of 1851–52, but on account of the Civil war the growth of the institution hardly began until the year 1866. In 1901, there were 609 associations in cities and towns, 577 in universities and colleges, 161 among railroad men, 321 with the army and navy, 86 among the negroes, and 43 among the Indians, making a total of 1,797 associations, with 316,710 members. In 400 associations, special work was carried on for boys. They owned 1,027 buildings valued at $30,500,000, with 412 libraries, containing 415,385 volumes; and there were 1,609 secretaries at the heads of the various branches.

Young, Thomas, an eminent man of science, was born at Milverton, England, in 1773; and died at London in 1829. He was born of a well-to-do Quaker family, inherited ample money, and was widely educated, not only by university, study, but also by travel, leisure, and good society. He was a student successively at London, Edinburgh, Göttingen, and Cambridge.

Having completed his medical studies at Cambridge in 1800, he at once settled in London as a practicing physician. But in the year following he was appointed to the professorship of natural philosophy in the Royal institution. It was during his two years' occupancy of this chair that he published his most important memoir, namely, the one in which he shows that two rays of light may be added together to produce darkness—the phenomenon of *interference*. It was during this period also that he wrote his *Lectures on Natural Philosophy*, a work which exerted a powerful and healthful influence on physical science during a full half-century. His contributions cover a very wide field, including such subjects as physiology, music, hydrodynamics, paleography, theory of structures, tables of mortality, etc. His theory of color-vision, as modified by Helmholtz, is, perhaps, to-day as widely accepted as any of the various views which have been expressed upon this subject.

Dr. Peacock has published an interesting *Life of Young* (London: 1855), and has edited his *Miscellaneous Works* (London: 1855). But all of Young's more important contributions are reprinted in his *Lectures on Natural Philosophy*, 2 vols. (London: 1807).

Young's Mod'ulus. See ELASTICITY.

Young Women's Christian Association is an organization which seeks to help young women by providing for their physical, social, mental, and spiritual wants. The means used are Bible training classes, evangelical meetings, personal religious work, libraries and reading rooms, classes in various studies, and musical and literary entertainments, socials and receptions in home-like rooms, helpful companionships and holiday excursions, and there is a special department for young women of colleges. In 1891, there were 1,000 associations in Great Britain; 50 on the continent of Europe; 20 in India; 25 in Australia; 225 in America; other places, including China and Japan, 175; total in the world, 1,500. In 1901, there were in America 74 city and 409 student associations, with a membership of 49,175. The international association was formed in 1886. The work is controlled by an international committee of forty-six members. Twenty-one states had organized state associations in 1901. The state associations hold conventions yearly, and the international convention meets every two years. The *Evangel* is a monthly organ of the associations, published at Chicago.

Young'stown, a city in northeastern Ohio, on the Mahoning river, about sixty miles from Cleveland and the same distance from Pittsburg. Being situated in the midst of a coal and iron region it has become a very important manufacturing center, having several rolling mills, blast furnaces, etc. Population 44,885.

Ypsilanti (*ĭp'sĭ-lăn'tĭ*), a city of Michigan on the Michigan Central railroad, thirty miles west of Detroit. Considerable manufacturing is carried on, and it is a prominent educational center, being the seat of the Michigan State Normal school, one of the leading educational institutions of the country. Population 7,378.

Yucatan (*yō'kä-tan'*), a peninsula of Mexico, bounded on the west and north by the gulf of Mexico, on the east by the Caribbean sea, and on the south by Guatemala, and comprising the states of Yucatan and Campeche. The east coast is indented with numerous bays, some forming excellent harbors. The face of the country is low and level, except in the east, where there is a chain of hills extending from northeast to southwest. The only important river is the Usumasinta. The soil in some portions is very fertile, yielding abundant crops of maize, rice, tobacco, sugar cane, and other agricultural products. According to a law that is now enforced, education is free and compulsory. The primary schools, though mainly supported by the states and cities, receive government grants, and there are secondary schools, seminaries, and colleges for higher education. The area of the peninsula is 53,290 square miles. Population 384,352.

Yucca (*yŭk'ka*) **Moth,** a small moth which gathers pollen and fertilizes the yucca plant. A very remarkable relation has been shown to exist between this moth and the plant. The yuccas are lily-like plants, of which the Spanish bayonet is an example. The stamens are so placed that the pollen cannot get into the tube of the stigma without artificial aid. The plant is sterile without the moth, and the larvæ of the latter feeds on the seeds, so that in fertilizing the plant, the mother moth is providing for her offspring. The female moth (*Pronuba yuccasella*) is about one-half inch long, of a silvery white color. She begins her operations after dark, and in setting about to provide for the future generation, she first collects a pellet of pollen with her jaws and fore legs. She then begins to deposit eggs in the walls of the unripe fruit-pod, using her lance-like ovipositor to penetrate the outer covering. She then goes to the tube of the stigma, which leads into the fruit-pod and thrusts pollen down it, using her tongue to push the pollen toward the undeveloped seeds. The larvæ are hatched and feed upon the developing seeds, but as all of them are not consumed, the double purpose has been effected of fertilizing the plant and providing food for her young. See *The Yucca Moth and Yucca Pollination, Missouri Botanical Garden Report for 1892.*

Yukon (*yō'kon*), a river rising in the British possessions (in the Dominion of Canada) and flowing through Alaska into the Pacific ocean at Norton sound, its total length being about 2,000 miles.

Yu'ma, the southwestern county of Arizona territory, lying directly north of Mexico. It is intersected by the Gila river and is separated from California by the Colorado. The valleys, when irrigated, are fertile, but the rest is desert. Yuma, the county seat, with 1,402 inhabitants, stands on the east bank of the Colorado river.

Yu'mas, a tribe of American Indians, very small in number, occupying the territory on both sides of the Colorado, near its junction with the Gila.

Z

Zacatecas (*zăk-a-tā'kas*), capital of the Mexican state of that name, is situated in a deep valley or ravine, somewhat over 300 miles from the City of Mexico. It is built over a vein of silver which has been deeply explored. The streets are somewhat narrow and crooked but it has a fine appearance from a distance, owing to the size and massiveness of its churches, and the elegance of many of its residences. Population 39,912.

Zambesi (*zăm-bā'zē*) **River and Region,** the extensive region in southeast Africa known to mediæval geographers under the general name of the empire of Monomotapa, is shown on old maps as drained by a river, called Zambese or Zambere, which is plainly the modern Zambesi. Although the lower region of the Zambesi, for a distance of at least 300 miles from its mouth, has been nominally in possession of the Portuguese since the beginning of the 16th century, yet it is only within the last half of the 19th century, through the reports of Dr. Livingstone and other explorers, that we have any definite knowledge of this vast region, the total length of which cannot be less than 1,200 miles. The river bears the name of Zambesi from its mouth to its junction with the Chobe; thence to its junction with the Leeba, coming form Lake Dilolo, it is called the Leeambye. Part of the upper basin of the Zambesi was explored by Major Serpa Pinto in 1878–79. In the region where the Leeba joins the Leeambye, the main stream is 200 or 300 yards wide, and quite deep. From the confluence to Victoria falls there are many long tracts that could easily be plied by large steamers. Lake Dilolo, from which the Leeba flows, seems to have an outlet both to the north and the south, the northern outlet probably running into one of the tributaries of the Congo. Large areas in this region are liable to be flooded and to stand under water for considerable periods at a time. The Victoria falls are estimated to be about 2,500 feet above the sea level, while Lake Shirwa, a smaller lake southeast of Nyassa, is 2,000 feet. The natives inhabiting the coast region drained by the Zambesi are of the pure negro type, while the Makololo, who were found in the central and upper country, belong to the Betjuana family. According to Major Pinto, this tribe has now ceased to have a separate existence. On the Upper Zambesi, Pinto discovered a tribe of Ethiopian origin, of a yellowish white color. The Zulu tribe, who inhabit the high region dividing the Limpopo from the Zambesi basin, have overrun and conquered nearly all the tribes south of them. The possession is governed by the Mozambique and Nyasi companies, and the Zambezia company carries on industrial, commercial, agricultural, and mining operations, while the Mozambique Sugar company has plantations on the Lower Zambesi. The military force of the colony is 4,888 men, three-fourths of whom are natives.

Zanes'ville, a city of Ohio, on both sides of the Muskingum, at the mouth of the Licking, fifty-five miles east of Columbus, is situated in a beautiful and fertile valley, and is crowded with manufactures and other business enterprises. Having fine railroad and river facilities, it is a prosperous and busy city. It has rolling mills, blast furnaces, brass and iron foundries, glass and soap factories, flour, woolen, and paper mills, railroad and other machine shops, and tile works for roofing and flooring. In addition to fine public schools, it is the seat of the Putnam Female seminary, and a Catholic institution. Zanesville was settled in 1799, and was the state capital from 1810 to 1812. Population 23,538.

Zanzibar (*zăn'zĭ-bär*) or **Zanguebar,** a sultanate under British control, comprising all that part of the east coast of Africa between Magdashova, situated in 2° north latitude, and Cape Delgado in 10° 42′ south latitude, the extent of the coast being about 1,000 miles. Parallel to the coast are numerous islands, the most important of which are Zanzibar, Pemba, and Monfia. The territories toward the interior have no defined limit, being occupied by heathen tribes, over whom the sultan has hardly even a nominal authority beyond the seaboard. The island of Zanzibar, about 50 miles in length and from 15 to 30 miles in breadth, is the most important of the sultan's dominions. It contains an area of 640 square miles, and the soil in most parts is exceedingly fertile. The principal products are cocoanuts, cloves, rice, sugar cane, fruits, etc. The population of the island is estimated at 150,000, and that of Pemba at 50,000, among them many foreigners, for the most part engaged in trade. The town of Zanzibar has about 30,000 inhabitants. The soil along the coast is fertile in rice, millet, peas, beans, melons, pumpkins, sugar cane, cocoanuts, bananas, etc., and the forests supply many valuable species of timber. Cattle, sheep, and fowls are plentiful, and wild animals also abound. The heat on the coast is excessive, and the climate is unfavorable to Europeans and Americans.

Ze'bra, a striped animal of Africa related to the wild ass. The true, or mountain zebra, inhabits mountainous regions in Cape Colony. Owing to the persecution of hunters, it is now scarce and fast becoming exterminated. It is about four feet high at the shoulders. Its general color is white, with black stripes on the body, the limbs, and the tail. Those on

the limbs extend to the hoofs and those on the tail to the tuft of hair. Burchell's zebra is a larger and more robust animal, with a longer mane and a fuller tail. Its general ground color is pale yellowish brown. The stripes

ZEBRA.

are dark brown or black, but do not extend so far on the limbs and on the tail as they do in the mountain zebra. The zebra has never been successfully domesticated. The flesh is eaten by the natives, their hide is used for the leather. The quagga is not a true zebra. See QUAGGA.

Ze'bu, the name sometimes used for a humped ox of India (*Bos Indicus*). This name, however, is not used in India, it is an invention of foreign people. The zebu is closely related to the domesticated ox. It is no longer found in the wild state. The animal possesses a well-marked hump of fat on the shoulders, which is considered a delicacy for the table. They have long ears pointing downward and very short blunt horns. The cows are milked. These animals are used in plowing, for drawing carriages, riding, etc. Similar animals are found in China and east Africa. The sacred bulls of the Hindus belong to this species.

Zechari'ah, one of the ancient Hebrew prophets, was born in Babylonia during the captivity, and accompanied the exiles on the return to Jerusalem under Zerubbabel and Joshua. Very little is known of his history, but there is enough to show that he was a man of great influence, and combined in himself the offices of priest and prophet. The prophecies of Zechariah may be divided into three parts. The first eight chapters consist mainly of a series of visions relating to the building of the temple and the glory that shall follow to Jerusalem; the second portion, chapters ix–xi, threatens Damascus and Phœnicia with ruin, predicts that Judah will be greater than Javan (Greece), and that both Egypt and Assyria will be humbled; while the remaining portion sets forth that dark times are before Judah, which shall be as an ordeal for the nation, after which a millennium of holiness will be ushered in. "In that day there shall be upon the bells of the horses, *Holiness unto the Lord;* and the pots in the Lord's house shall be like the bowls before the altar. Yea every pot in Jerusalem and in Judah shall be holiness unto the Lord of hosts."

Zee'man Effect, a phenomenon discovered by Zeeman of Holland in 1897. This important relation between light and magnetism is as follows: Zeeman found that if a flame colored with ordinary table salt — the so-called sodium flame — is placed between the poles of a strong electro-magnet and examined with a powerful spectroscope, the appearance of the sodium lines is very much changed. Later investigations show that spectral lines are tripled when the source of light is in a magnetic field, and that the components of the triplet are polarized. For details, see article by Michelson, in *Astrophysical Journal*, Vol. VII, pp. 131–8 (1898).

Zeis'berger, David, a Moravian missionary, born in Moravia, April 11, 1721, who, after emigrating to America and living in Georgia a number of years, became one of the founders of the Moravian colony at Bethlehem, Pa., in the year 1740. Soon after this he became a missionary to the Indians, laboring among them very zealously at various places in the state. In 1772, he explored the Tuscarawas valley in Ohio, and laid out a town, about ten miles from the present town of Canal Dover in that state, being joined soon after by a number of Moravian Indians from Pennsylvania. In 1781, this settlement was broken up, and Zeisberger and his Indians were compelled to move to Sandusky, but in 1798, when congress granted to the Moravian Indians the tract on which they had formerly lived on the Tuscarawas, a portion of them returned and formed a new settlement, which they named Goshen, where Zeisberger died Nov. 17, 1808.

Zend-Aves'ta. See LITERATURE, PERSIAN.

Zen'ith. See NADIR.

Ze'no, founder of the Stoic philosophy, was born at Citium, in Cyprus, the date of his birth and death being both uncertain. He flourished in the early part of the 3d century B. C., and was a contemporary of Epicurus. At the age of thirty he was shipwrecked, and having lost his property adopted the doctrines of the Cynics, in which contempt for riches is conspicuously taught. Having made himself master of the various schools, he proceeded to open a school of his own, wherein he might bring forth the results of his inquiries and develop his own peculiar system. He selected for his purpose the "Painted Porch"; and there until his death continued to teach those doctrines which, in spite of many objectionable features, inculcate the manly

energy and simplicity, the patience and fortitude, and that reverence for moral worth which made disciples of so many noble Roman characters. The Athenians honored Zeno's memory with a golden crown and a public burial, and his countrymen erected a monumental pillar in his honor. Scarcely any portion of his numerous writings have been preserved. He is supposed to have died about 264 B. C.

Zeno'bia, queen of Palymra, in the year 267 A. D., succeeded her husband Odenathus, who had been acknowledged by Gallienus in the sovereignty of the Roman Empire; but when Aurelian became emperor he marched against her with a large army, and after defeating her in several battles besieged her in Palmyra. She attempted to escape by flight, but was captured and brought to Rome to adorn the triumph of her conqueror. After this she was presented by Aurelian with large possessions near Tivoli, where the remainder of her life was passed. She was a woman of great courage, high spirit, and remarkable beauty, and, with purity of morals in private life, she combined prudence, justice, and liberality in her administration of public affairs.

Zeus (*zūs*) was the greatest of the Grecian deities. According to the most generally received mythology, he was the son of Cronos and Rhea, and the brother of Poseidon and Hera, the latter of whom was also his wife. He expelled his father and the older dynasties of the Titans, assumed the sovereignty of the world, and successfully resisted the attacks of the giants and the conspiracies of the gods. After the dethronement of the Titans, Zeus was allotted the empire of heaven and air, Hades of the infernal regions, and Poseidon of the sea, while the earth was left under the power of the three. Crete, Dodona, and Arcadia were the places where the worship of Zeus was most cultivated; and in process of time all the local gods worshiped under the name of Zeus were merged in one Hellenic divinity, who was afterward identified with the Jupiter of the Romans and the Ammon of Libya. Zeus was the father of gods and men, protector of kings, and the supporter of law and order, the avenger of broken oaths and other offenses; he watched over the state and the family, and over strangers and suppliants; his hand wielded the lightnings and guided the stars; he ordained the changes of the seasons, and regulated the whole course of nature. He dispensed both weal and woe to mortals; but the ancients disagreed as to his power over the fates themselves, as has always been the case when men have "reasoned high on fate, foreknowledge, and free will."

Zil'leh, a town in Asiatic Turkey, about thirty miles from Tokat. This was the scene of Julius Cæsar's battle with the Pharnaces, concerning which he wrote the famous report, "*Veni, vidi, vici*" (I came, I saw, I conquered). Scarcely any remains of antiquity are to be found in the place, a fortress of the middle ages having been constructed on the site of its beautiful temple. The town contains about 2,000 houses, the population being mostly Turkish.

Zinc (or *spelter*, as it is often called in commerce), is a hard, bluish-white metal, lustrous on its surface, and when broken exhibits a crystalline fracture. At ordinary temperatures it is somewhat brittle, but when heated above 212° it becomes very ductile and malleable, so that it may be drawn out into wire or rolled into thin plates. Since the discovery of this quality the uses of this metal, which was formerly chiefly employed in connection with copper in the manufacture of brass, have been greatly extended. It is used for roofing, spouting, baths, water tanks, and the like, also for covering ships' bottoms instead of copper. As a material for casting artistic works, zinc has the desirable properties of a low melting point, and of taking a sharp impression from the mould, so that it requires little labor from the chaser — it also possesses considerable hardness. It has, therefore, become a favorite material for making casts of statues and different kinds of ornaments. Another important use of metallic zinc is in the cells of electric batteries, in many of which the dissolving of the zinc is the source of energy. Zinc oxide, a white powder, is extensively used as a pigment, while other compounds of zinc, as the chloride and sulphate, are used in medicine.

Zi'on, Mount, the name of the hill on which stood the southwest part of Jerusalem, called the city of David or Upper City. At the present day the city wall runs obliquely over the hill, so that only the north half is included in the city. On the west side and still more on the south side it descends steeply into the vale of Hinnom to a depth of 300 feet. Mount Zion is 2,500 feet above the level of the sea. With the prophets and poets of the Old Testament it stands for the whole of Jerusalem (often called "Daughter of Zion"), particularly in reference to the temple.

Zis'ka, John, the famous leader of the Hussites, was born at Trocsznow, Bohemia, about the year 1360. While a mere boy he became a page to king Wenceslaus of Bohemia, but soon after embraced the career of arms and distinguished himself in the war against the Teutonic knights. Returning to Bohemia after the murder of John Huss, Ziska soon became prominent among those who sought to resist the decisions of the Council of Constance. After the outbreak at Prague, in the year 1419, Ziska was unanimously chosen leader of the Hussites, and the first great religious conflict in Germany was commenced in earnest. When the emperor Sigismund — the same who had allowed his safe-conduct to Huss to

be violated — advanced an army of 40,000 men into Bohemia, to obtain possession of the throne, his project was frustrated for a time by the Hussites, who defeated his army with a hastily levied force of 4,000 troops. The war against Sigismund was continued with the utmost vigor by Ziska, even after he became blind, until Sigismund became convinced that the conquest of Bohemia was impossible. He therefore proposed an arrangement with the Hussites, by which full religious liberty was allowed to them, and Ziska was to be their governor, King Wenceslaus having died soon after the war broke out. But the war-worn chief did not live to complete the treaty, for while besieging the castle of Przibislaw he was seized with the plague and died Oct. 11, 1424. He was buried in a church at Czaslav, and his iron war club was hung over his tomb.

Zo'diac, an imaginary zone of the heavens within which lie the paths of the sun, moon, and principal planets. It is bounded by two circles equidistant from the ecliptic — about 18° apart; and it is divided into twelve signs, and marked by twelve constellations. The signs are geometrical divisions 30° in extent, counted from the vernal equinox in the direction of the sun's progress through them. The whole series accordingly shifts westward through the effect of precession by about one degree in seventy-two years, requiring 25,868 years for a complete circuit. At the moment of crossing the equator toward the north the sun is said to be at the first point of *Aries* (Ram); some thirty days later it enters *Taurus* (Bull); and so on through *Gemini* (Twins), *Cancer* (Crab), *Leo* (Lion), *Virgo* (Virgin), *Libia* (Balance), *Scorpio* (Scorpion), *Sagittarius* (Archer), *Capricornus* (Goat), *Aquarius* (Water Bearer), *Pisces* (Fishes). The constellations bearing the same names coincided approximately in position when Hipparchus observed them at Rhodes, more than two thousand years ago, with the positions they designate. The discrepancy now, however, amounts to the entire breadth of a sign, the sun's path in *Aries* lying among the stars in *Pisces;* in *Taurus* among those of *Aries;* in *Gemini* among those of *Taurus*, etc. This gradual retrogression of the signs through the constellations of the zodiac will continue till they accomplish, in about 25,868 years, a complete circuit, after which period the sign and constellation of Aries will coincide as they did in the time of Hipparchus.

Zodi'acal Light. If an observer in the tropical regions of the earth on a clear, moonless night watches the western sky from sunset till the last trace of twilight has disappeared, he will notice that the twilight seems to linger longer near the point where the sun sank below the horizon, and that gradually a nebulous band of light, broad toward the horizon and narrowing first rapidly and then more slowly upward, begins to stand out clearly from the vanishing twilight, which spreads along a much wider arc of the horizon. This is the zodiacal light. When seen on a perfectly clear night, it will be noticed that it fades imperceptibly on both sides and toward the vertex, and that its light is distinctly brighter toward the base than at higher points. Its width at its base may be said to vary from 10° to 30°, and the height of its vertex from 40° to 90°. It is most clearly seen in our latitude during the spring months after sunset, and in the fall months before sunrise. This is not due to any change in the light itself, but to the fact that at other seasons of the year the ecliptic makes so small an angle with the horizon that light lying in or near it does not rise sufficiently high above the mists of the horizon to be seen after the twilight has vanished.

Zo'la, Emile, French novelist, was born at Paris, April 2, 1840, of a French mother and an Italian father, an eminent civil engineer. His distinguished son spent his boyhood at Aix, and was educated at the Lycée St. Louis. Settling in Paris, he was for a time in the employ of Messrs. Hachette, the well-known publishing firm. His first venture in fiction was *Les Mystères de Marseille*, and in this and in *Thérèse Raquin*, he at once displayed his remarkable power in the critical analysis of human character. Soon after this he formed with Flaubert, Daudet, and the Goncourts the naturalistic school of fiction, chiefly marked by a hideous though powerful delineation of the crimes, weaknesses, and loathsomeness of Parisian social life. The fruit in part of this was the series known as *Les Rougon-Macquart Family*, modelled somewhat after Balzac's *La Comédie Humaine*. The more notable subsequent stories are *L'Assommoir*, *Nana*, *Pot Bouille*, *La Joie de Vivre*, *Au Bonheur des Dames*, *Germinal*, *La Terre*, *La Bête Humaine*, *La Débâcle*, *Le Docteur Pascal*, whose nastiness is somewhat sweetened by *Le Rêve* (The Dream), and by a love-story, entitled *Lourdes*. The latter forms one of a trilogy, which he called Les Trois Villes — *Lourdes*, *Rome*, and *Paris* — all in the extreme realistic vein. His latest work, written in exile, occasioned by his courageous advocacy of the famous Dreyfus case, is entitled *Fécondité*. He is a knight of the French Legion of Honor, but has been refused admittance to a seat in the French academy.

Zone, literally a belt or girdle, a portion of the surface of a globe or sphere lying between any two circles of the same whose planes are parallel to each other, or that portion of the surface of a sphere cut off by the plane of a circle. As the earth's axis is inclined to the plane of the ecliptic, or the sun's apparent path around the earth, 23½°, the tropics of Cancer and Capricorn are located that dis-

tance north and south of the equator, respectively; and for the same reason the Arctic Circle and the Antarctic Circle are located 23½° from the north and south poles respectively. These circles are accordingly said to divide the earth's surface into five zones; to-wit, the North Frigid, lying north of the Arctic Circle; the North Temperate, lying between the Arctic Circle and the Tropic of Cancer; the Torrid, lying on both sides of the equator between the Tropic of Cancer on the north and the Tropic of Capricorn on the south; the South Temperate, lying between the Tropic of Capricorn and the Antarctic Circle, and the South Frigid, lying south of the Antarctic Circle. The area of a zone on any sphere is equal to the circumference of a great circle multiplied by the height of the zone.

Zoöl'ogy, the science of animal life. The scope of this subject has been greatly broadened in the latter half of the 19th century, and it has come to include questions that might not at first sight appear to have a direct connection with zoology. For example, certain discoveries (those of Von Lenhossék) on the nervous system of the earthworm opened the way to generalizations regarding the nervous system of higher animals, including that of the human body. Also, the studies of zoologists on cells are helping to solve broad questions of development and heredity. Thus, the science of zoology comes into direct relation with the work of the anatomist, physiologist, and psychologist. This relation is so close that medical schools are asking for a preparation in zoology as an introduction to medical studies. One impression that has gained wide currency should be corrected, *viz.*, that the chief business of the zoologist is to know the different kinds of animals and be able to name them. That is zoology of the past, and it has been replaced by a better kind of knowledge. Attention has been directed from the external appearances of animals, as shape, color, differences in horns, hoofs, etc., to their internal structure and life processes. An attempt is being made to analyze their vital activities, and to determine their position in the history of the universe. An examination of the text-books of a generation ago will show that emphasis was uniformly placed on the classification of animals. In this period, also, the museum collector and the hunter naturalist were dominant types of zoologists. It is quite true that students of zoology should not be drawn away from the fields, forests, and streams; nevertheless, that which is best and strongest in modern zoology is being worked out in the laboratory, by experiments and observations on a few forms. These studies, especially in the last half of the 19th century, are leading to large generalizations regarding the science of life, which should become known to all people of liberal culture.

Zoology as a science aims to give a picture of animal life on the globe, to consider its structure, to analyze its activities, to account for it by tracing its history in general and in detail, and to consider its relation to nature at large. The history of biology includes that of zoology, and the article on biology should be consulted, where a number of general considerations are entered upon that need not be repeated here.

The new way of looking at the animal world did not come all at once, but has been the result of growth. Knowledge regarding animal life has advanced by a series of steps, and its progress can be divided into a number of periods. The first of these is the period extending from the earliest writings about animals to the renaissance of science in the sixteenth century. Zoological study was cultivated among ancient peoples and reached its highest development in that period in the work of Aristotle, the Grecian philosopher-naturalist, who lived 384 to 322 B. C. He was a man of truly scientific mind and made many original observations on the structure and development of animal life. With him, classification was based upon structure, but was of secondary importance. His successors did not reach the level of the great "Father of Natural History," as he has been called. Their work took more and more the line of systematic classification of animals, and lost in observations on structure and development. Pliny the Elder (23–79) is the next prominent naturalist of antiquity. That Roman general and teacher has been unduly praised as a zoologist, for he was only a poor compiler, who mixed borrowed facts, fancy and fabulous stories. He replaced the natural classification of Aristotle by a highly artificial arrangement of animals, according to their place of abode, on land, in water, or air. It is noteworthy that nothing of importance was added to the work of Aristotle till the awakening of observation in the 16th century.

In the intervening period the intellectual life of mankind took a retrograde movement. Observations and inquiry into nature were discontinued and, in fact, were discouraged by the priesthood and other intellectual leaders. This led to mental imbecility and to superstition in reference to the natural universe. But an awakening came, and it was an epoch of unusual importance when men began once more to observe and experiment, and thereby lay the foundations of modern science. The new intellectual movement was led, in the 16th century, by Galileo, Descartes, and Vesalius. The work of Vesalius (1514–64) in anatomy had great influence upon the development of zoology (see ANATOMY). Progress in anatomy helped zoology by giving a knowledge of structure. At first, structural studies were mainly on the higher animals nearest man. Afterward, they were extended to other forms including the

invertebrates and made broadly comparative.

At the revival of learning the influence of Aristotle was mainly on the systematic classification of animals. His works were translated and extended by Wotton (1492–1555), Gesner (1516–65), Aldrovandi (1522–1605), and others who produced ponderous treatises on natural history written in Latin. These men, and their successors for about two hundred years, have been called the encyclopædists. The work of Gesner was of fine quality, and marks the beginning of careful observation and description of animals.

Passing over the notable work of naturalists like Malpighi (1628–94), Leeuwenhoek (1632–1723) and Swammerdam (1637–80) in the 17th century, who worked on minute anatomy and brought the microscope into use, we come to the period of natural history, characterized by the work of Ray (1628–1705), Linnæus (1707–78), and Buffon (1707–88). Ray laid the foundations upon which Linnæus built. The name of the latter is probably more widely known than that of any other naturalist. He was a man of prodigious industry, filled with a zeal for collecting and naming natural objects. He greatly extended the number of known animals and plants, but did little toward deepening the knowledge of animal life. His chief service was in systematizing the groups and introducing the method of naming animals and plants still in use. His great work, the *Systema Naturæ*, was first published in 1735, and reached the twelfth edition in 1768. Buffon was a man of more philosophical mind than Linnæus. He was also a graceful writer and created a popular interest in natural history. He must not, however, be thought of as a mere popular writer; he opened up new fields and led the way in matters of great importance. He paid much attention to the geographical distribution of animals, and treated for the first time scientifically the natural history of the various races of mankind. He reflected upon the relationships of animals, and is recognized as one of the early evolutionists. This particular line of thought was carried further by Lamarck (1744–1829), and by St. Hilaire (1772–1844), who are the most noteworthy predecessors of Darwin.

The next phase of advance is marked by devotion to the study of structure. The first step in understanding a machine is to observe its parts, to know their relation and how they act on one another. That the animal machine is very complex will be admitted by the casual observer in respect to the higher animals, but there is a complexity about the simpler ones that is not generally appreciated. As Huxley said, when an oyster is swallowed few people realize that there passes the lips an organism more complicated in construction than a watch. The study of the structure of animals was carried on extensively and made comparative by Georges Cuvier (1769–1832) and his followers. They dissected, observed, and reduced the architecture of animals to a science. Thus arose comparative Morphology which is now considered the first stage of zoological study. It will be readily seen that structure may be taken to refer only to the more obvious parts, visible to the unaided eye, or may be also extended to include the minute construction of animal tissues. Cuvier's work in anatomy was mainly on the organs, but his contemporary, Bichat (1771–1801) pushed the analysis a step further and carefully examined the tissues. His influence on the progress of zoology was much greater than is generally appreciated. For it is a fact that has been gradually forced upon naturalists that the processes of life take place deep in the finer structure of animals and plants. Bichat did not reach the units of structure in his work, and studies in microscopic structure were carried to a deeper level before they reached this goal. This work was done for animal tissues in 1840 by Schwann (1810–81), and led to the establishment of the cell theory (which see). In its original form the cell-theory was very imperfect; it was extended by the discovery that the cell is a globule of protoplasm containing a nucleus, and was moulded into the protoplasm theory mainly through the work of Max Schultze in 1860. See BIOLOGY.

There is still another aspect of structural study that was brought out by observations on the development of animals. The structure of animals is so complicated that it is difficult to comprehend. There are, especially in higher animals, many rudimentary organs and traces of structures that do not conform to the life of the animal, and to its position in the animal scale. Now, all animals begin their life in a microscopic rudiment — the egg which is, in reality, a cell set free from the body of the parent. This cell by division gives rise to new cells which remain connected, and form the many cells out of which the tissues are built. Thus, animals start in a state of simplicity and grow to complexity. By observing the various stages through which they pass we get clues to the meaning of the rudimentary organs, and to the relationships of animals, that would be completely lacking if we could not observe them in the process of becoming. Therefore, embryology or the development of life (which see) becomes the key to understanding animal structures. This important branch of zoology was started in its modern phase by Wolff, in 1759; but Von Baer (1792–1876) is designated the "Father of modern embryology" because, about 1827, he made this study a tracing of the history of the cell-layers.

The study of structure leads naturally to the question of use — What is the particular office or function of the organs, the tissues, and the cells? This line of study is called Physiology. It is to be understood that

while advances were being made in reference to the construction of animals, similar advances were in progress in reference to their physiology. William Harvey (1578–1657), Haller (1708–77), and Johannes Müller (1801–58) represent a succession of investigators in this line who pushed physiology forward. Müller, in particular by his extraordinary industry and great insight into both anatomy and physiology, had great influence on the progress of zoology.

Zoology up to the year 1860 is the product of the concurrent growth of knowledge in regard to the structure of animals (morphology), their development (embryology), and their vital activities (physiology). There was then introduced an additional element, which has illuminated the whole field. This was the doctrine of organic evolution, as set forth by Darwin in 1859. We must note in passing that this was not the beginning of the doctrine of organic evolution (see EVOLUTION); it was the particular form of Mr. Darwin's explanation that led to its taking firm hold for the first time upon the minds of naturalists. From that time to the present the study of zoology has been dominated by the idea of evolution, and animals and plants have been studied broadly, in the light of their ancestral history. Progress is still dependent upon advance in anatomy, physiology, and embryology, but the point of view from which the facts are considered has been changed.

We have now traced the rise of zoology in its principal phases down to the beginning of its especially modern aspect. The study of animal life is so great a field that naturally it has a number of divisions; it remains, therefore, to mention in a summary way its chief departments. That part of the subject which embraces the study of animal structure is *Morphology*. This word is generally used in a broad sense to mean something more than the word *Anatomy*, which is one division of Morphology. The study of microscopic anatomy is called *Histology*. It is not a different kind of study and is separated from anatomy merely as a matter of convenience. The investigation of stages in animal development is *Embryology*. These divisions make up *Structural Zoology*. The general description and classification of animals is *Systematic Zoology*. The modern name for classification is *Taxonomy*. The *Geographical Distribution* of animals has been widely studied and elevated to the rank of a special department. Another set of studies concerning the lineage of all animals (*Evolution*) has led to broad considerations of the relation of living animals to their surroundings, to the universe, and to man, and has given rise to *Philosophical Zoology*. Standing co-ordinate with the great field of morphology is *Physiology*, which, broadly speaking, concerns itself with the vital processes of all living organisms. *General Physiology* is clearly a department of zoology. Many experiments are being made to determine the responses and adaptations of animals to stimulations, and to changes in the medium in which they live. This has opened the field of *Experimental Morphology*. Studies of the mental powers and the mental phenomena in animals lead to *Animal Psychology*, which may fairly be considered a part of zoology. A division called *Ætiology* is often recognized, having as its object the investigation of the causes of zoological phenomena, but it need not be assigned an independent rank, as the study of all phenomena has as an ultimate object the discovery of their causes.

The animal world is too extensive to attempt to give an outline view of it here, and reference must be made to text-books for further consideration. Fuller accounts of some of the subjects touched upon in this article will be found under the headings, ANATOMY, DEVELOPMENT OF ANIMAL LIFE, EVOLUTION, CELL DOCTRINE, PHYSIOLOGY, PROTOPLASM, SPONTANEOUS GENERATION, etc.

Among the best books for the general reader and student of zoology are the following: Agassiz's *Methods of Study in Natural History* (17th ed. 1886); Huxley's *The Crayfish, An Introduction to the Study of Zoology* (1884); Hertwig's *General Principles of Zoology* (1896); Lankester's article *Zoology*, Encyclopædia Britannica; Sedgwick and Wilson's *General Biology* (2d ed. 1895); Parker's *Elementary Biology* (3d ed. 1897); Thompson's *The Science of Life* (1899), *The Study of Animal Life* (3d ed. 1896), *Outlines of Zoology* (3d ed. 1899); Verworn's *General Physiology* (1899); Jordan and Kellogg's *Animal Life* (1900); Bell's *Comparative Anatomy and Physiology* (1887); Parker and Haswell's *Text-Book of Zoology* (2 vols. 1898), *Manual of Zoology* (1900); Boas' *Text-Book of Zoology* (1896); Brook's *Handbook of Invertebrate Zoology* (1882); McMurrich's *Invertebrate Morphology* (1894); Shipley and McBride's *Text-Book of Zoology* (1901); Weidersheim's *Comparative Anatomy of Vertebrates* (new ed. 1898); Lang's *Comparative Anatomy* (1891–96); Romanes' *Darwin and after Darwin*, Vol. I. (1894); Osborn's *From the Greeks to Darwin* (1894); Balfour's *Comparative Embryology* (2 vols. 1880–81); Marshall's *Vertebrate Embryology* (1893); Hertwig's *Text-Book of Embryology* (1893); Korschelt and Heider's *Invertebrate Embryology* (1890–93); Wallace's *Geographical Distribution of Animals* (2 vols. 1876), *Malay Archipelago* (1869); Bates' *Naturalist on the Amazons* (new ed. 1892); Heilprin's *Geographical and Geological Distribution of Animals* (1887); *The Standard Natural History* (edited by Kingsley, 6 vols. 1888). For books on birds, butterflies, insects, etc., see under those topics. Among the best smaller zoologies adapted for use in secondary schools are those of Colton, Davenport, Kellogg, Needham, and Packard.

WILLIAM A. LOCY.

Zoophyte (*zō'o-fīt*), an old name for marine animals forming branching or tree-like colonies, and, therefore, presenting a general resemblance to plants. The sponges, hydroids, branching corals, and polyzoans were included under this very general title. The name signifies the plant animal, and is more especially applicable to hydroids and branching corals. See HYDROZOA.

Zoospore (*zō'ō-spōr*) (in plants), the swimming asexual spores of algæ, notably the green algæ. The name means "animal spores," referring to the fact that they move like aquatic animals. See SPORE.

Zoroas'ter is the name of the founder of what is known as the Parsee religion of ancient Persia. He seems to have been born in Bactria, but most of the legends concerning his history are utterly unreliable. Even the time when he lived is uncertain, but it may be safely estimated to have been as early as 1000 B. C.; probably he was a contemporary of Moses. The fundamental idea of Zoroaster's creed is its dualism. At the beginning there existed two spirits, *Ormuzd*, who represented the good, and *Ahriman*, the evil. Ormuzd is light and life, law, order, truth, and all that is pure and holy; while Ahriman is darkness, falsehood, corruption, evil, and death. These two spirits are represented as in perpetual conflict for the mastery of the world; but the final triumph of Ormuzd, the good spirit, is promised to comfort the hearts of all the faithful.

Other features of Zoroaster's system of doctrine may be briefly mentioned: (1) The principal duty of man in this life is to obey the word and commandments of God; (2) disobedience is punished with the death of the sinner; (3) those who obey the word of God will be free from all defects; (4) men should pray to God and worship, as he always hears the prayers of the good; (5) the souls of the pure and good will enjoy everlasting life, while those of the wicked will suffer everlasting punishment.

Zouaves (*zō-āvz'*), a body of troops in the French army, which derives its name from a tribe of Moors in Algiers, who were taken into the French military service after the conquest of that country in 1830. They were first united in the same battalions with Frenchmen, retaining their Moorish dress, but as it was soon found that the system of commingling the two races was not practicable, the French and Kabyles were formed into separate companies. Gradually, however, the Kabyles were eliminated, and since 1840 Zouaves have been correctly described as French troops in a Moorish dress. They are recruited from the veterans of the ordinary infantry regiments, who are distinguished for their fine "physique," tried courage, and hardihood. The uniform consists of a loose jacket and waistcoat of blue cloth ornamented with yellow braid, loose madder-colored trousers, brown cloak, madder-colored fez cap with a yellow tassel, surrounded by a green turban, a light blue sash of wool, yellow leather leggings, and white gaiters, and they are armed with a carbine and sword bayonet.

Zu'lu is the name of that portion of the Kaffir race who inhabit Natal and the region northeast of it, until they gradually merge into the mere negro of the east coast north of the Zambesi. The Zulu Kaffir is a far more amiable savage than his brother of the Cape frontier districts. He is less warlike, more industrious, and far more willing to act in the capacity of a farm laborer or domestic servant. He is by nature social, light of heart, and cheerful. His affections are steady and enduring, but his passions are strong and are called out in all their force in a state of war. Whatever better nature he may possess, when his chief commands war he is converted into a demon. That the warlike qualities of the Zulus have not decayed was seen in the war that broke out in 1879 between England and Cetewayo, the Zulu king.

Zu'luland is the country lying northeast of the colony of Natal, between its eastern boundary and Delagoa bay. Previous to the war of 1879, there was no good map of the Zulu country, and even yet we know very little of its geology or mineral productions. The principal rivers are the Umvolozi or St. Lucia river, which enters the sea about eighty miles northeast of the Natal frontier, and the Mapoota and its branches, which drain the north part of the region and fall into Delagoa bay. None of these rivers are available for inland navigation, although a large lagoon near the mouth of the St. Lucia river can be ascended for a few miles. The rivers which flow into Delagoa bay are sluggish streams, with scarcely perceptible currents and can be ascended for some distance. The principal inhabitants are of the Zulu race, but the Portuguese have a settlement on Delagoa bay where they carry on some trade with the natives and Dutch Boers. In December, 1897, Zululand was incorporated with Natal under the British crown. Its area is about 12,500 square miles, with an estimated population of 181,000, including 1,100 whites.

Zurich (*zū'rik*), a city of Switzerland, capital of the canton of the same name, is situated at the point where the Limmat issues from the lake of Zürich and unites with its tributary, the Sihl. It is one of the most prosperous manufacturing and commercial towns of Switzerland, yet the narrow streets and lofty houses of its older quarters give it the appearance of a mediæval city. There are many interesting old buildings, the most remarkable being the cathedral erected in the 11th century. The town library is an extensive one, and numerous museums of natural history and other similar institutions indicate the intelligence and cultivated tastes of the inhabitants. There is a Polytechnic school with 935 students and 455 listeners, and the

University of Zürich with 121 instructors and 731 students. Population 150,239.

Zu'rich, a lake of Switzerland, surrounded by the three cantons of Zürich, St. Gall, and Schwyz. It is between 20 and 25 miles in length, about two miles in breadth, and about 500 feet deep. It is noted for the beautiful scenery along its banks, the hills around it being covered with numerous gardens, vineyards, and orchards.

Zuyder Zee (*zoi'der zē'*), a bay on the coast of Holland, separated from the North sea or German ocean by the four islands, Texel, Vlieland, Terschelling, and Ameland. It is from 75 to 80 miles in length, its greatest breadth being 35 or 40 miles. In the time of the Romans, the Zuyder Zee was a marshy lake communicating with the North sea by a small river, but in the latter part of the 13th century two heavy inundations took place which broke down the dikes and submerged the whole territory, except the four islands above named, making it an arm of the North sea.

Zwingli (*tsving'le*), **Ulrich,** Swiss reformer, was born at Wildhaus, in the canton of St. Gall, Jan. 1, 1484, and after being educated at Bern and at Basel, became pastor in Glarus in 1506. Having begun to study Greek in 1513 he devoted himself from that time forward to the study of the New Testament, even going so far as to learn by heart the Epistles of Paul in the original language. In the year 1518, he was called to Zürich, and in 1522 the Reformation was formally established in that city. In 1524, Zwingli married and soon after published his work, *Of the True and False Religion*. Luther and Zwingli agreed on most points, but there was a serious breach between them in regard to the real presence of Christ in the Lord's supper, Luther adhering to this dogma and Zwingli denying it. A conference, arranged by Philip, landgrave of Hesse, was held between them at Marburg in 1529, but after spending three days in earnest discussion they separated without coming to any agreement on the point at issue. In 1531, open war broke out between Zurich and the Catholic cantons of Lucerne, Schwyz, Uri, Unterwalden, and Zug; and Zwingli, by command of the council of Zürich, had to take the field with the banner of a canton, which had always been borne by a priest. The Zürichers met their foes at Kappel, but were outnumbered and defeated, Zwingli being among the slain. A great bowlder, roughly squared, marks the place where he fell Oct. 11, 1531.

Zygomorphous (*zīg'o-môr'fŭs*) **Flowers,** those in which the parts of a single set are not all alike. The term is chiefly applied to irregularity of petals. For example, in the sweet pea the petals are very much unlike. In most of the mints the five petals are so modified that two form an upper lip and three a lower lip, making the so-called "bilabiate flower." The contrasting term is "actinomorphous flowers" (which see). See FLOWER.

Zygospore (*zīg'o-spôr*) (in plants), a spore formed by the union of two similar gametes, as in some of the lower Thallophytes (Spirogyra, for example). It is simply a sexual spore or "oospore," but the name is convenient in indicating the nature of the gametes. The word "zygote" is sometimes used instead of zygospore.

Zyg'ote. See ZYGOSPORE.
